According to the *Electrical News* (Toronto) some three million horse-power is available for development in the province of Quebec on the following rivers:—Chicoutimi, Aux Sables, Shipshaw, Saguenay, the Peribonka, and others, all within a radius of 50 miles of the small town of Chicoutimi, which a year ago had about 9,000 people. This town now claims 13,000 or 14,000 owing to power developments in progress in the vicinity, as the Quebec Development Company is completing a plant of 500,000 horse-power capacity on the Saguenay river, and plans are now under way for the use of the same water, under twice the head, about twenty miles downstream.

As already mentioned in these pages, the Premier of Quebec, M. Taschereau, recently stated officially that the Cabinet had approved plans, submitted to the Government by certain interests, for the development of the Chute à Caron, involving an expenditure of about $75,000,000. The promoters propose to start almost immediately building a model town with a thousand houses. The interests referred to are said to have informed the Government that they intend to lodge a population of about 6,000 families, or some 30,000 people in the vicinity in the near future. The power is being developed primarily for the manufacture of aluminium.

Two Large Electric Winding Installations.—Particulars are given in *Chemical Engineering and Mining Review* of two large mine hoist equipments recently installed at the Porphyry shaft of the Inspiration Consolidated Copper Co., Inspiration, Arizona. Both are of the Ilgner-Ward Leonard type, an automatic one for ore hoisting, and a hand-operated one with automatic safety features for handling men. The ore hoist consists of a 2,150-h.p., 650-V, d.c. motor, running at 51 r.p.m., direct connected to the hoist drums; and a motor-generator set consisting of a 1,600-kW, 500 r.p.m., 650-V generator, a 1,900-h.p., 500 r.p.m., 6,600-V, 3-phase, 25-cycle, slip-ring induction motor, and a 78,000-lb. flywheel. This equipment is capable of lifting 10,000 tons of ore in 16 hours from a depth of 1,485 ft. The main hoist consists of a 600-h.p., 400 r.p.m., 550-V, d.c. motor geared to the hoist drum, and a motor-generator set consisting of a 450-kW, 750 r.p.m., 550-V, shunt wound generator; a 500-h.p., 750 r.p.m., 6,600-V, 3-phase, 25-cycle, slip-ring induction motor; and a steel plate 16,500-lb. flywheel. Except that a master switch and contactors are used for controlling the generator field instead of a drum controller, the control for this equipment is the same as used on other hand-operated Ward Leonard equipment.

Modernising Electric Tramcars.

Some Interesting London Experiments.

Under the deluge of criticism levelled against electric tramcars, the general public has almost lost sight of the fact that the modern tramcar, at any rate so far as London is concerned, is a very different vehicle to its pre-war brother. This is not surprising because no generally noticeable alteration has been made as regards external appearance, and with few exceptions, although the equipment has been vastly improved, the only visible difference internally has been the use of white paint.

During the past few years, however, Mr. C. J. Spencer, general manager of the three tramway companies associated with the London Underground group, has been fully considering improvements, and numerous tests and experiments have been carried out in order to discover what would best suit the peculiar and strenuous conditions of the traffic dealt with by his undertakings.

Modern Electrical Equipment.

In the first place, 40 cars have been fitted with new Metropolitan Vickers motor equipments and 70 with the latest types of magnetic brakes, and the following tables indicate the improvement which has taken place as the results of the improved acceleration. Starting from rest, the cars accelerated to the following speeds in the times stated :—

Speed.	Time taken from standstill. New Equipment.	Old Equipment.
12 m.p.h.	8 sec.	9 sec.
14 m.p.h.	10 sec.	13 sec.
16 m.p.h.	13 sec.	19 sec.
20 m.p.h.	24 sec.	52 sec.

On a service test of 6 stops per mile, each stop being of 5 seconds duration, it was found that the cars fitted with old equipment averaged 11 m.p.h., whilst those having new equipment averaged 13½ m.p.h.

Speed on Grades.	New Equipment.	Old Equipment.
Grade 1 in 21	13½ m.p.h.	10½ m.p.h.
Grade 1 in 72	18½ m.p.h.	13½ m.p.h.

The new light-weight motors are provided with ball and roller bearings on the armature shafts; the weight of the motors is only 39 lb. per horse power, as compared with the 81 lb. per h.p. of the old motors, and it is interesting to note that the reduction in unsprung weight has resulted not only in very quiet and smooth running, but the experience gained after two years' running shows that there is a very distinct reduction in the liability of corrugations being formed on the rails.

Maag gears have been fitted to the cars, hardened by a special process, which has resulted in very quiet running, and

Fig. 1.—Improved Tramcar Interior and Novel Lighting Fittings.

it is anticipated that the life of the gear wheels will be in the neighbourhood of 15 years. The important feature of quietness has been gained by the use of these gears and light-weight motors, to which possibly the ball bearings, with consequent accurate alignment, have contributed.

Standard of Comfort.

The standard of comfort of travelling in London during recent years has become a very important factor where competitive forms of transport facilities are provided. It must be admitted that, from this aspect, tramcars generally have not made any real advance since they first commenced to run 20 years ago as a means of conveyance, with hard-wood seats and no real pretensions to comfort.

The internal appearance of the cars has received careful consideration and several have been entirely redecorated in harmonising colour schemes, such as light oak and white enamel, white and french grey, cream and brown, &c. The main experiment in seating has been with cross seats. Apparently, the London public has taken kindly to cross seats for the reason that, instead of looking at the passengers opposite they can look out of the window in the direction of travel.

The designing of really comfortable cross seats for tramcar is complicated by the necessity for reversing the backs at th termini, a difficulty that has been got over by mechanicall connecting the seat to the back so that the former moves fo ward slightly and also tilts so that the maximum comfort obtained in either direction. For the first time in London th top deck has also been fitted with spring upholstered seats an backs, both top- and lower-deck seats being covered wit moquette of pleasing blue and fawn colouring.

The lower saloon floor is covered with rubber ¼ in. thic instead of slats, and as the accompanying illustrations sho the lighting has been improved and additional lamps fitted special attention having been given to the equal distribution light and avoidance of glare; special ventilation arrangement

Fig. 2.—Improved Lighting and Cross Seats.

have been designed to give a clear current of air through th car, but avoiding draughts.

Amongst other details are open handgrips of washable mat rial on hand straps. On the top deck hand rails are fitted the roof for the convenience of passengers passing to and fro seats. Special headlights are fitted which give ample illumin tion, the colour of the light being slightly yellow with a vie to being effective in fog. Route numbers are fitted at the sid and ends of the cars and air-impulse bells are provided wit push buttons distributed at convenient points.

This type of car's seating capacity is reduced by a total six seats, but the tramcar, if it is to evolve out of its chrysal state of being chiefly the workman's vehicle, must follow th lead of the omnibus and give the public comfort and attractiv ness. The day has passed when utilitarianism is the on thing that matters, and the tramcar can do all that the omnibu does, and more, both in comfort and utility.

Quick acceleration and deceleration with a good averag speed, luxury, and safety, are the present-day requirements the London public, and to supply them costs money, but the can be considered cheap when compared with lost passengers

The Municipal Tramways Association.

"Far from tramways being a back number, I am of th opinion that there is no form of transport which can compe with the tramcar of the present day," said Mr. P. Priestle manager of the Liverpool tramway undertaking, in speaking a recent gathering at Plymouth in connection with the annu meeting of the managers' section of the Municipal Tramwa Association. "It is a significant fact that during the cour of a year the whole population of Great Britain is carried the tramways several hundred times," he continued, "and wonder if the man in the street who reads articles advocatin the scrapping of the tramways realises what it would mea if the tramcars of the United Kingdom were really done awa with."

These remarks were made in replying to the toast of "Th Municipal Tramways Association," proposed by the Mayo who remarked that the Association represented a capital e penditure of £71,000,000 and commanded an income £26,000,000, mostly in coppers.

Mr. John Barnard, of Bolton, in proposing "The Plymou Corporation Tramways," said that when he last visited th town eleven years ago the Corporation owned 34 cars and ha 230 employés; to-day it was running 140 cars and 27 'buses, an had 900 employés. In 1914 the undertaking carried nine m lion passengers and the gross profits were £16,000; to-day th number of passengers was 38,000,000, the receipts £240,000,00

and the gross profit £68,000,000, which was an answer to critics who asserted that municipalities were not capable of running tramways. Mr. Barnard firmly believed that transport in the big towns was as much the duty of the municipalities as was the provision of gas, electricity, and water supplies, and all they asked from the Government was that they should be put on an equal footing with private individuals.

Alderman W. H. Welsford, in replying on behalf of the Tramway Committee, said he remembered the first tramlines being laid in the streets of Plymouth 53 years ago. They had no fear for the future of the Plymouth tramway system while Mr. Stokes was at the head of affairs.

Mr. H. P. Stokes, who also responded, mentioned that Plymouth was the first town in this country to introduce street transport, and street transport by steam. So far as motor omnibuses were concerned, Plymouth had shown broad vision.

Mr. E. A. Earl presided over the dinner, during the course of which an excellent programme of music was rendered by the Plymouth Corporation Tramway Orchestra, directed by Mr. S. H. Palmer. The dinner was followed by a dance, and the conference, which met for the first time in the West of England, was attended by the managers of eighty tramway undertakings of the large towns of Great Britain and Ireland. It opened with a civic reception by the Mayor and Mayoress of Plymouth, Alderman and Mrs. R. W. Winnicott, and among the visitors were two from Australia, Mr. P. J. Pringle, of the Victoria Electricity Supply and Tramway Co., and Mr. Strangward, of Melbourne.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Portable Meter and Service Switch Cabinet.

Particulars are given in the *Electrical World* of a portable meter and service switch box made by the DAYTON POWER AND LIGHT CO., for outdoor emergency or temporary use. The cabinet is made in sizes suitable to carry installations of up to 400 A capacity, and is supplied equipped, wired and ready for use. The cabinet is made of wood and has a suitable roof and double doors, one at the top for the meter and the other at the bottom for the service equipment. Suitable weather-proof connections are made for the outlet wires to both the supply and consumers' mains. The service switch is of the safety type, with the main fuses separated from the consumers' fuses and sealed from access by the consumer. The service switch is operated by an external handle which is accessible to the consumer.

An Automatic Electric-Buoy Lamp.

The Venner-Dyke automatic electric-buoy lamp illustrated in fig. 1 which is made by MESSRS. VENNER TIME SWITCHES, LTD., 45, Horseferry Road, Westminster, London, S.W.1,

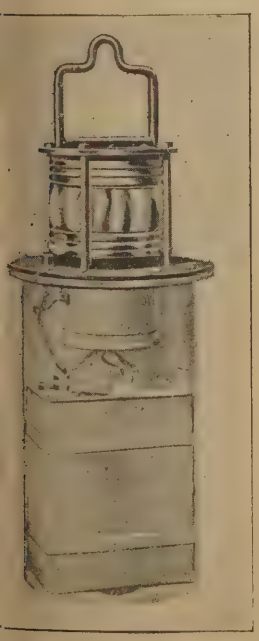

Fig. 1.—The Automatic Electric-Buoy Lamp.

Fig. 2.—Shade for Table Fitting.

has been designed principally for use on cable buoys in connection with the repair of submarine cables. The lower casing is of heavy gauge Manchester plate. It contains a 10-Ah, 4-V storage battery of 0.5-A discharge rate; and a "BF" type Venner time switch with an 18-day clock fitted in a cast metal box fixed to the underside of the closure plate which is held down by 12 brass bolts and nuts, a rubber gasket being used to make the joint watertight. The closure plate carries a 5-in. dioptric lens on its top side, in which are the electric lamp (2 W) and the lamp holder. A watertight, screw-down switch is also fixed outside the closure plate and is arranged in series with the time switch so that the lamp may be kept from being switched on when not required. Except the battery, the whole of the electrical equipment may be lifted with the container cover in one piece. By using special crosstrees provided for this lamp, its attachment to the buoy-staff takes only a minute or so, no lashings being necessary, and to facilitate the attachment, two brass lugs are provided at opposite diameters on the bottom rim of the container, and a handle on the top closure plate above the lens.

Reciprocating Switch with Moulded Composition Cover.

The latest product of the HART MANUFACTURING CO., 76 and 77, Rochester Row, Westminster, London, S.W.1, is the "Diamond H" switch fitted with a black moulded composition cover, illustrated in fig. 3. It has been designed to meet

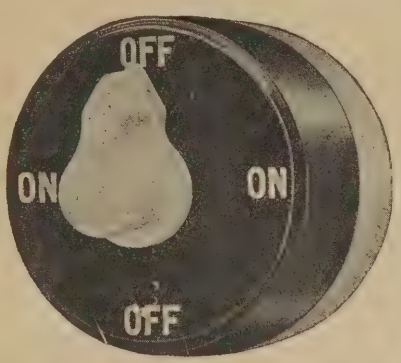

Fig. 3.—Reciprocating Switch with Moulded Composition Cover.

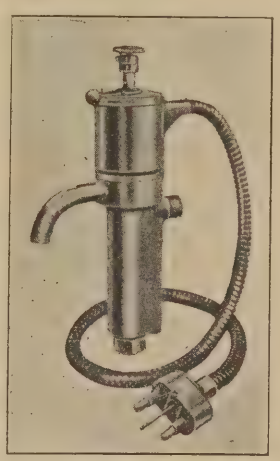

Fig. 4.—The Electric Tap.

the demand for a shockproof switch for use on electric cooking apparatus, &c., and it entirely obviates the necessity of earthing the switch cover. The cover is strong; it is claimed that it will withstand a 10-ft. drop test, has a very high heat resistance, and is absolutely non-hygroscopic. The switch is of the 3-heat type, and the indications are sunk into the face of the cover and filled with white compound, giving a distinctive result.

The moulded covers are being supplied in 7½- and 10-A sizes for 3-heat switches, and for 10-A single- and double-pole reciprocating switches. The switch has a quick action and is provided with a white porcelain arrow-indicating handle.

An Electric Tap.

The accompanying illustration, fig. 4, is of an electric tap which is being marketed by MR. ALAN WRIGHT, Sentinel House, Southampton Row, London, W.C.1. The tap is designed, it is claimed, to give satisfactory results at temperatures between 70 deg. and 140 deg. F. and regulation between these limits is easily obtained by turning the knob at the top of the tap. The loading is 2½ kW.

New Designs in Lamp Shades.

The illustration herewith, fig. 2, is of one of several types of lamp shades, marketed by the EFFICIENCY LAMP SHADE CO., 3, Took's Court, Furnival Street, Holborn, E.C.4. These all embody a somewhat unique design of hinged flaps which enables the glass panels to be instantly removed for cleaning or replacements and renders the insertion of transparencies and stencilled or written advertisements a simple and quick operation, without removing the shade from the lampholder. Another important feature is that the glasses are standardised and interchangeable, being made in two sizes, 6 in. by 4 in. and 6 in. by 5½ in. The shades are made in varying designs of the pendant, bracket and table fitting types and the glass panels can be supplied with any lettering, artistic design, trade mark, &c. The fitting illustrated is fitted with ornamental top and mounted on a silver oxidised standard for table use.

Two New Quick-make-and-Break Switches.

Two recent productions of MESSRS. THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, taking the form of quick-make-and-break switches, are shown in the accompanying illustrations. The suspension switch, fig. 5, is made in both one-way and two-way patterns; it is of robust construction and provided with a rapid movement. A novel feature in the design is the provision of black and white buttons on the pressel bar, for indicating whether the switch is on or off. This switch is claimed to be capable of effectively controlling 3 A at 250 V.

The " straight-through " pattern, fig. 6, is specially designed for insertion in the flexible of toasters, irons, and similar portable domestic appliances, enabling them to be controlled in

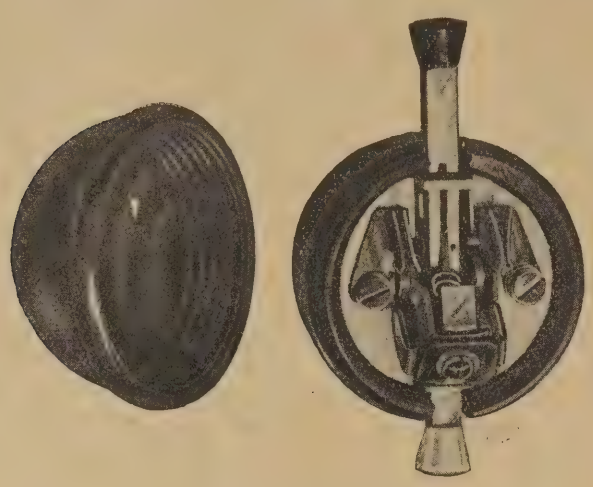

Fig. 5.—The Suspension Type Switch.

the most convenient manner. This type of switch is very desirable, and becomes almost a necessity where any particular piece of apparatus has no closely adjacent method of swit control, such as, for example, an iron being used from ordinary lampholder. The movement in this pattern is simi to that in the one-way and two-way switches, and is claim to be capable of carrying currents up to 3 A at 250 V.

The cases of both switches are of well seasoned hardwo

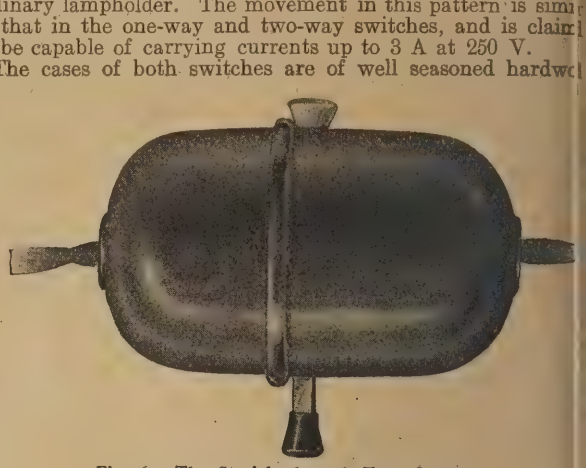

Fig. 6.—The Straight-through Type Switch.

(lignum vitae), and can be supplied in either the standa polished finish or white enamelled. They present a neat a pearance, and their overall dimensions are no larger th those of the old " flow make " type.

South African Municipal Electrical Engineers.

Review of the Proceedings at the Sixth Convention.

We have received a copy of the proceedings of the sixth Convention of the Association of Municipal Electrical Engineers of South Africa, held at Durban, Natal, from December 8th to 12th, 1924.* In the address of the retiring President, Mr. G. H. Swingler (Cape Town), reference was made to the inquiry by the Association early in 1924, into the vexed question of the allocation of profits made by electricity undertakings to the relief of the general rates. It was reported that the Electricity Department of the County Borough of Halifax had, during the course of its existence, contributed a net amount of over £90,000 to the relief of the rates, and because of this, there was an overdraft on the revenue account of £98,000, and the Department carried forward a deficit on revenue account of £36,000, against which there was a reserve fund amounting to only £1,800. The Halifax Corporation had, therefore, not only relieved the rates from the profits made by the undertaking, but had mortgaged future profits to the extent of the deficit. The case was an extreme one, but it was thought that the views of other undertakings on the matter would be of interest. A questionnaire on the subject was sent to a number of undertakings, and out of 119 replies received it was found that only 46 had received moneys at one period or other from the rates to make up deficiencies. Out of the 119 replies, eight were in favour of relieving the rates from electricity profits while every other reply was against such a policy. The President suggested that it would be to the benefit of the industry and the towns generally if it were made compulsory by law for all undertakings to be operated in a similar manner with regard to profits as applied in the case of the Commissioners' undertakings.

In his Presidential address, Mr. John Roberts, M.I.E.E. (Durban), in referring to the work of the Electricity Supply Commission, said that he hoped that the Commission would not adopt a too rigid control of new enterprises or insist on a uniformity of plant and method. Electrical machinery, as well as systems of supply, had been characterised by its great diversity of type. The best only had survived, and it was greatly due to the absence of central government control, which had resulted in a practical trial having been given to so many different methods, that the modern power station and distribution system to-day had evolved to the high state of efficiency and reliability it had reached.

Mr. Jacobs (Electricity Supply Commission), in reply to the President's address, said that the engineers of the Commission recognised that the development of the electric generator and prime mover to their present-day state of efficiency had been a slow process. They had not got to the end of that development and any new undertaking in connection with which the Commission might be consulted as to its economic possibilities, in so far as it complied with the Commission's idea of its duty, would be subject to no limitation of development.

A paper was read by Mr. Roberts and Mr. T. C. Shearer (Chairman, Durban Electricity Committee), on the " Control of Municipal Trading Undertakings." The authors suggested that the private company possessed an advantage over the municipality in having a more direct and simple organisation, also that the present system of municipal control entailed such an enormous amount of work by councillors, most of it co cerning comparative trivialities, that busy men grew impatie at the waste of time and gave up in disgust. They suggest that the work of the Municipal Council should be divid among six separate executives, with three councillors up each, and that the practice of the Legislative and Provinc Assemblies should be followed by payment of these executiv to the extent of £200 to £300 per annum per member, amou ing to the payment of councillors. Each of these executiv should be given full power to carry out the Council's instru tions.

After a lengthy discussion on " Standard Supply Pressure a resolution was carried, to the effect that the Conventi approved of 220 V as the uniform standard pressure at co sumers' terminals for lighting supply. (In the case of 3-pha this pressure was to be that between each phase and neutra

Mr. H. A. Eastman (Cape Town) read a paper dealing wi the commercial development of electricity undertakings, which he reviewed generally the progress of the electrici undertakings throughout the Union with particular attenti to installation work, which culminated in the following re lution being unanimously carried :—

" That the attention of the various Municipal Councils ow ing electricity undertakings be directed to the advisability calling the attention of the Architects' Associations in the district, to the necessity of embodying in their specificatio the provision of suitable and adequate accommodation in buildings for the installing of the Electricity Supply Authoritie service equipment."

After a discussion on the paper by Messrs. Roberts a Shearer, concerning the question of contributions to the reli of rates, the following resolution was carried unanimously :

" That this Convention of Municipal Electrical Enginee reaffirm the following resolution adopted at the 1917 Conve tion in regard to electrical contributions to the relief of rat and that the various municipal councils in the Union of S. owning electricity undertakings be advised accordingly.

" 1. That all charges arising between different departmen of a municipality should be based on standard tariff charg where such exist, and in the absence of such standa charges should be based on the net cost of services given received.

" 2. That we are of opinion that it is unsound policy militating against the successful financial operation of mun cipally-owned electrical undertakings to allocate net su plus profits for the relief of rates or for municipal funds, to make indirect charges so as to unfairly reduce net surpl profits.

" 3. That the rapid introduction of new and improve machinery for the production of electricity renders it im perative that every electricity undertaking shall set asid out of its net surplus profits an adequate amount to writ off obsolete plant.

" 4. That the only legitimate outlets for net surplus profi are the building up of an ample obsolescence fund, and th reduction of charges to the consumer in order to encourag the use of electricity."

* See Elec. Rev., January 23rd, 1925; p. 130.

Pulverised Fuel.

By DAVID BROWNLIE, B.Sc.

(Abstract of a Paper read before the Manchester Geological and Mining Society (Institution of Mining Engineers).)

The paper deals with recent developments in the use of pulverised fuel as applied to steam generation, briefly describing pulverised fuel installations, and the bearing of pulverisation on the subject of low-temperature carbonisation. It suggests to the colliery companies the adoption of low-temperature carbonisation at the pit head.

The first large boiler plant installation in Great Britain with pulverised fuel was at the Hammersmith electricity station, the original order for a "Holbeck" equipment for one boiler having been placed early in 1919, and the plant started up in December, 1920. Two more boilers fitted on this principle were set at work in April, 1923. It is unfortunate that detailed performance figures of this installation have apparently never been published, but it is stated the plant has been a success. In one comparative test with this pulverised fuel equipment there was shown, as against mechanical stoking, an advantage of 16 per cent. increase in thermal efficiency which is equivalent to £13,000 per annum.

To the mining industries the most interesting pulverised fuel fired power station is the 300,000 kW station at Cahokia, on the Mississippi, which belongs to the Union Electric Light and Power Co. and supplies the town of St. Louis. In this station "Lopulco" plant was adopted largely because of the difficult character of the cheap low-grade Illinois (Belleville) coal fuel, which is an almost impossible material to burn with any reasonable efficiency with mechanical stoking, but nevertheless the boiler plant efficiency with pulverised fuel was guaranteed at 85 per cent. for test conditions. The largest pulverised fuel equipment at present in operation in Europe is at the works of the Société anonyme Ougrée-Marihaye, Ougrée, Belgium. It consists of Raymond mills and the "Quigley" system of handling the pulverised fuel by means of compressed air conveyors at about 70 lb. per square inch pressure, "shooting" the charge to the burner bins, the total length of the conveyor type circuit being 2,300 feet and the capacity from 46 to 80 tons per hour. Both metallurgical furnaces and steam boilers are supplied, the capacity being 33 tons of coal per hour. In this case the degree of pulverising is excessively fine, 97 per cent. through 100 mesh and 84 per cent. through 200 mesh. The modern vertical gravity coal dryer on the "Wood" principle was operated experimentally at the Oneida Street station of the Milwaukee Electric Light & Power Co. for the two years 1921-1922, and the first large installation was that at the Cahokia station, whilst to-day the principle is in operation or being installed at Cleveland, Trenton Channel, and many other stations in the United States, at Vitry and Gennevilliers near Paris, and at Willesden, St. Pancras, Birmingham, and Derby in Great Britain. It consists of the use of a comparatively small vertical cylinder placed between the crushed coal bunker and the pulveriser containing inside two louvred pipes of narrow diameter cylinders, the coal passing downwards by gravity as taken away by the pulverisers underneath.

Part of the hot exit chimney gases, roughly about 10 per cent. of the total, equal to 3 lb. of gas and air per 1.0 lb. of coal, are taken by means of a fan and trunking, usually mixed with air to give a temperature of about 215 deg. F., and circulated continuously through the dryer back to the chimney again. The total power required is only about 3 kW per ton of coal, say, equal to 0.15 per cent. of the steam production of the plant.

The latest development of the continuous vertical gravity dryer is the use of air combined with exhaust steam heaters instead of air mixed with hot flue gas. The heaters are on the lines of the ordinary gilled steam radiator and are placed in the vertical drying cylinder, whilst the steam passed through them is either the exhaust of any convenient steam-driven auxiliary plant or "bled" specially from the turbine. The hot condensed water is returned to the boiler plant so that the dryer really functions as a condenser in which the heat is usefully employed in drying coal instead of being lost in the cooling water. In this new type of dryer about 30 square feet of heating surface per ton of coal per hour is required for every 1 per cent. moisture, whilst the amount of air passing through is about ⅓ that of the hot and waste heat dryer; that is, 1 lb. of air per lb. of coal. This is because the air from the boiler house is moderately dry and does not contain already a large amount of moisture as in the case of hot flue gases.

Fine grinding, such as 65 per cent. through a 200-mesh, is unnecessary, provided that uniform particles are obtained, say, 70 per cent. through 100 mesh. Roughly speaking, with modern mills and average fuel 90 per cent. through a 100 mesh is equal to all through 50 mesh and 70 per cent. through 200 mesh.

All kinds of refinements are being continually introduced. The Lakeside air-cooled walls of much lighter construction have been adopted with a 4½-in. patent brick ("Silocel") outer wall lined internally with steel instead of the heavy brickwork usually employed. The water screen is continued as usual, but the ash pit at the bottom slopes downwards at an angle of 38 deg., as compared with the previous flat shape, so as to facilitate the continuous discharge of the ash to the conveyor at the bottom. Another refinement is a housing over the outside of the arch setting and drawing over it the 10-15 per cent. of cold air required for combustion, which is passing to the adjustable-speed fuel feeders supplying the burners. This raises the cold air to about 75 deg. F., cooling the arches without wasting any heat.

One of the most remarkable of later inventions is the water-tube or "fin" wall, the invention of Thomas E. Murray, and first applied about 12 months ago at the Hell Gate power station, New York, in conjunction with multiple retort mechanical stokers. Essentially the principle consists in constructing the two side walls of the combustion chamber and the back wall as well, if necessary, of 4-in. steel tubes placed at 7-in. centres. To the side of each tube is welded a projecting steel plate or fin, one of which is 2½ in. and the other 1¾ in. from the tube surface. These plates or fins overlap, so that the wall is built up of 4 in. tube and 3 in. steel plate. The feed-water circulates through the tubes, and the result is an enormous increase in the net heating surface of the boiler next to the combustion space for the absorption of radiant heat, and remarkable results have been obtained at Hell Gate, up to 92.7 per cent. boiler plant efficiency, with mechanical stoking, by the use of this appliance.

One of the most striking results of pulverised fuel firing has been the size of water-tube boilers that is rendered possible. It is possible with one boiler for no less than 400 000 lb. of water per hour to be evaporated comfortably, and the Cleveland and Trenton Channel boilers will give this figure for long overload duty.

The flexibility of pulverised fuel firing has made possible the almost completely automatic boiler plant. The entire control of the working of a steam boiler from a distant switchboard was first developed at the Ford plant, and there has now been developed automatic control in which the rate of flow of the pulverised fuel and the air is controlled electrically by means of steam meter mechanism, which is operated by the actual flow of steam in the pipes. This regulates both the pulverised fuel feeders and the dampers, being so arranged that the relative proportion of fuel and air always remains constant for maximum efficiency.

The continuous thermal efficiency of steam generation that is being obtained by means of pulverised fuel firing can only be described as a revolution. The guarantees alone in a number of cases are over 86 per cent., whilst at Cleveland 87 per cent. is being obtained, with as high as 92.9 per cent. for single 24-hour tests.

The utilisation of refuse fuels is of importance to the colliery industry, and the Cahokia plant is therefore of particular significance. Pulverised fuel has enabled us to take practically any kind of fuel, except very low volatile anthracite and coke, and burn it at the highest efficiency, over 80 per cent. continuously, in any required amount so as to give in water-tube boilers an evaporation equal to the normal figures with good-class coal. That is to say, if a colliery had material of 50 per cent. ash and 25 per cent. water contents, it could still be utilised in, say, a 50,000 lb. per hour evaporation boiler and give this evaporation merely by increasing the amount of fuel passing through the burners. Mechanical stokers will not do this to the same extent, because they become clogged up with ash and clinker and all kinds of complications occur, such as the volatile content and the sulphur.

At the present time a "Lopulco" plant is being installed at the McCalls Ferry on the Susqehanna River, for the Pennsylvania Water and Power Company, where it is intended to burn anthracite refuse dredged up from the Susquehanna River above the dam. This material averages in the dry condition 15 per cent. ash, which includes some sand, and has about 4½-5 per cent. volatile matter. Another low grade fuel which is to be burnt by this method is Texas lignite, a plant now being in course of erection for this purpose in Trinidad for the Electric Bond and Share Company. In this case the raw fuel averages about 28-30 per cent. moisture and will be partially dried down to 15-20 per cent. before passing to the furnaces, while the ash content is low.

The position is so lamentable that it is difficult to give the plain facts without appearing to exaggerate, but this country could save with the greatest ease from 40,000,000 to 50,000,000 tons of coal every year, that is to say, from £50,000,000 to £75,000,000, simply by improving already existing methods and without spending millions of money on super-power station schemes. Out of the 260,000,000 tons of coal raised in Great Britain, about 75 per cent., that is, 195,000,000 tons, is consumed at home, apart from marine work. Of this something like 90,000,000 tons is used for stationary land boilers, and it will be remembered that the 58 per cent. average net working efficiency means that 20,000,000 tons every year could be saved in this direction alone, since the efficiency of boiler plant in general ought to average from 72.5 to 75.0 per cent.

The average hardness of the boiler feed water in Great Britain seems to be about 11 deg., representing 2,000 tons of scale a week deposited in the boilers, and probably a loss of 5,000,000 tons of coal per annum. Lack of superheating, efficient covering of steam pipes, including the flanges and condensation losses in general, probably represents another 5,000,000 tons. Many of the operations carried out in the iron and steel industries are so inefficient that less than 10 per cent. thermal efficiency is commonplace, in spite of the fact that producer gas firing would give 20-25 per cent. The author mentions two large iron and steel concerns that were squandering 500 tons of the best-quality coal per week on the boiler plant alone.

The colliery industry cannot expect that Great Britain will go on squandering 40,000,000 tons of coal every year, and pulverised fuel firing is a significant warning of this fact. It is suggested that the colliery concerns of this country should co-operate and concentrate on research and investigation work on low-temperature carbonisation and similar methods for the scientific use of raw coal.

Legal.

Stoller v. Davidson & Co.

At the Whitechapel County Court on July 29th, Mr. A. J. Stoller claimed the sum of £3 15s. 6d., representing the value of an accumulator which, it was alleged, was destroyed by fire while in the defendants' possession being charged. Judge Cluer pointed out that the plaintiff would have to prove negligence, and the latter held that leaving accumulators on charge at night unattended was negligence. The Judge, however, would not agree to that. He said that a point of law was involved which he would have to inquire into, and reserved judgment.

J. & M. Stone v. McCalla.

In the Lambeth County Court, on July 28th, before Judge Parry, Messrs. J. & M. Stone, 373, Brixton Road, S.W., electrical engineers, sued Mr. H. McCalla, Brixton, S.W., to recover £16 1s. 6d., for work done and materials supplied for the repair of the defendant's radio set.

Mr. Kauffman, in the employ of the plaintiffs, said that the firm supplied the defendant with a "Fellophone" valve set, in about 1922. There were no complaints until in 1924, when some new things were put into the set, but during that time they charged the accumulators.

Defendant said that he paid £66 5s. for the set, and was given no guarantee. The witness said that the firm did not give guarantees, as it did not get guarantees from the makers, but he went round to see that the set was in working order.

Judge Parry asked if the defendant had called anybody who knew something about radio, to give evidence for him. The defendant replied in the negative and the judge therefore adjourned the case for the defendant to bring an expert to state if the cost of the repairs was reasonable.

Miller v. The Scintillating Sign Co.

In the Chancery Division on July 28th, Mr. Justice Eve heard a motion in this case for leave to the Royal Bank of Scotland, the landlord of premises at Charing Cross occupied by the defendant company, to re-enter into possession. Mr. Beaumont, for the bank, said the motion was not opposed. The action was a debenture holder's action, in which a receiver of the defendants' property had been appointed. The receiver had written to say that he did not see how he could get out of the premises. The premises were let at £2,000 a year for the first year and £2,500 afterwards. The rent being in arrear, the landlord asked for leave to re-enter.

His Lordship granted leave as asked.

Tucker v. Wandsworth Electrical Manufacturing Co., Ltd.

Mr. Justice Tomlin, in the Chancery Division on July 29th, delivered his considered judgment in the action brought by Mr. John Bristow Tucker, of the firm of Tucker & Co., of Solihull, Birmingham, against the Wandsworth Electrical Manufacturing Co., Ltd., of Ludgate Hill, Birmingham, for an injunction restraining an alleged infringement of a patent relating to improvements in electrical switches. The defendants denied infringement, and alleged that the patent was invalid. (See Elec. Rev., July 10th, p. 53; and July 17th, p. 119.)

His Lordship said that electrical switches were made in various forms, the three principal being the rotary, tumbler, and knife-blade types. All these might be made with the quick make-and-break action whereby snap action was obtained, which produced rapidity of movement of make-and-break and adequate separation between the contact arm and the contact points, thus excluding danger of arcing. The plaintiff's first claim was for an electrical switch adapted to operate by quick make-and-break action by a compression spring element pivotally co-operating, on the one hand, with the contact arm, and, on the other, with an operating member, which member was utilised also for positively displacing the contact arm in the operation of make-and-break throughout the entire stroke as distinguished from positively displacing it only in the initial part of the stroke. The second claim was for a specific tumbler switch. The inventor did not limit his invention to any particular form of switch, though his drawings did not extend beyond the tumbler switch form. Switches had, in fact, been made in accordance with the drawings, and there had been a large demand for them. They were good switches and their utility was not questioned. The attack on the validity of the claim was based on prior specifications, the number of which was reduced to three, *viz.*, Rose, Cox, and Crabtree, prior user of Rose, and common general knowledge. It was admited that the first claim was not limited to tumbler switches and, having regard to Cox's patent and existing common knowledge as to the idea of positive actuation throughout the stroke of the contact arm, he did not think the plaintiff's first claim was valid. As to the second claim—for a tumbler switch—upon the material which he had before him, he had come to the conclusion that it could be supported. Cox's switch seemed to be substantially different in design and it remained to be considered whether the defendants' switch was an infringement of this claim. It was admitted that, with one exception, it could not be distinguished from the plaintiff's switch. It was true that the spring was of the push compression kind instead of pull compression, but the difference emphasised by the defendants was the fact that in a groove on the operating member there was a slide containing a small compression spring. It was said that the slide constituted an intermediate integer between the spring element and the operating member, and therefore the spring element was not positively co-operating with the operating member. In his opinion the slide element was an integral part of the operating member, and the spring element was pivoted on the operating member. The result was that the action succeeded with regard to the second claim, and there would be a proper injunction and an inquiry as to damages. The defendants must pay the costs, except so far as they were increased by the first claim, and the defendant's costs, as thus increased, must be paid by the plaintiff. There would be the usual set-off.

He granted certificates in respect of five particulars of objection, and agreed that the operation of the injunction should be suspended if the appeal was proceeded with speedily.

Reviews.

Practical Water Power Engineering. By W. T. Taylor, M.Inst.C.E., M.I.E.E. Pp. vi+270; figs. 33. London: Crosby Lockwood & Son. Price 36s. net.

Certain branches of engineering lend themselves less readily than others to exact quantitative treatment and consequently depend, for successful practice, very largely on the experience and judgment of individuals. Where the data, on which a design must be based, are difficult to obtain with exactness and the considerations to be weighed are numerous and conflicting, the application of hard and fast rules is impossible and the personal element is all-important.

Such a subject is that of "Water Power Engineering," and the position is aptly described by Mr. Taylor in the following terms (p. 147): "One of the characteristics of hydro-electric work is that it is almost futile to lay down fixed laws. . . . Each particular case must be governed by its own law—whether it be the catchment, the stream, the developed waterways and plants, or the power load."

In such a subject the existence of sound text-books is a matter of great importance and the difficulty of writing them is correspondingly great. To produce a treatise which will present a clear account of the somewhat indefinite principles involved and their application in practice is no small matter. Mr. Taylor has, however, succeeded admirably in this difficult task and has at the same time managed to steer clear of the danger of overburdening his book with the numerous scanty descriptions of existing installations, which make so many "practical" treatises little better than a sketchy encyclopædia or a collection of extracts from manufacturers' catalogues. This book, which is based to some extent on articles which appeared previously in the Electrical Review, is also free from the tendency to reiteration and lack of unity that often characterises books founded on a series of separate articles.

The subject of "Water Power Engineering" can be roughly divided into four branches: the study of the source of supply; the transport of the water to the power plant; the conversion of hydraulic into electric power; and the transmission of the electric power to the place of utilisation.

The first of these divisions is undoubtedly the one which presents the greatest difficulties. The only satisfactory basis for estimating the quantity of water available is a complete set of observations on stream flow extending over many years and it is seldom that these are available. Even where adequate rainfall records exist there still remains the problem of deducing therefrom the probable run-off in the catchment area. On pp. 26 and 27, Mr. Taylor lists twelve methods which may be used to express the relationship between rainfall and run-off (and these do not include all the formulæ that have been pro-

posed). These hydrometric questions of rainfall, run-off, storage and stream flow are dealt with very thoroughly in Chapters 1 to 5. As a matter of detail it may, however, be permitted to doubt whether the method suggested on page 78 for determining stream flow by adding salt in known quantities and measuring the conductivity of the water would give accurate results in view of the influence on the conductivity of the many possible impurities.

The design of conduits and pipe-lines is discussed in detail in Chapters 6 to 8. Numerous tables and charts are given to facilitate the computation of the formulæ required in this connection and should prove of assistance to the designer. It is to be regretted, however, in the case of these charts as well as those which occur elsewhere in the book, that the nomographic method of charting equations was not adopted instead of the system involving a network of scales. The very distinct advantages of the nomographic method, which does not yet appear to be used in this country as extensively as it deserves, lie in the small number of lines (one for each variable) constituting the chart, which is thus easily read. There is also a considerable gain in accuracy since interpolation is made along a scale rather than between curves, and furthermore it is possible to note instantly the change in one variable consequent upon changes in the others. It is to be hoped that this type of chart will be used when a second edition is contemplated.

A subject of special interest in relation to the possibilities of water power development in Great Britain is dealt with in Chapter 9, where the question of small water power plants with automatic control is discussed. Since there are few large water power schemes feasible in this country, future developments must largely take place on the lines of utilising the smaller powers. That there is room for such development is shown by the fact that Great Britain has developed less of her available water power (8 per cent. of the total) than any other large country except Russia. In the case of small water power plants automatic control enables operation costs to be reduced to a minimum and often becomes the determining factor in deciding whether a given scheme is economically possible. The development of these smaller water-powers can be gradually increased to meet the demand by linking up more plants with a central control station. The possibility of operating such plants in conjunction with large coal-using power stations is also a considerable advantage.

The question of high-voltage power transmission is dealt with in some detail in Chapters 12 to 14. Although this subject might at first sight appear somewhat removed from the scope of "Water Power Engineering," it is to be remembered that it is almost entirely due to the developments of the last thirty years in the possibilities of economical power transmission over long distances that many water power schemes have been rendered feasible, since many suitable sources of water power are situated at some distance from the place of power demand. It is therefore logical to assume that the water power engineer should be acquainted with the design and economics of transmission lines, as these form an integral part of any hydro-electric scheme which must be considered as starting with the rainfall in the catchment area and finishing at the place of consumption of the power generated.

On the whole, Mr. Taylor's book should be very welcome to those interested in hydro-electric engineering on account of its lucid exposition of fundamental principles and the application of them to the practical and economic problems involved.

A. J. V. Underwood.

An Outline of Automatic Telephony. By William Aitken, M.I.E.E., Assoc. A.I.E.E. Pp. 143; figs. 43. London: Ernest Benn, Ltd. Price, 5s. net.

This small handbook is written with the object of providing within a small compass a description of the various telephone systems in use in the world to-day. It will also be found to furnish an introduction to the author's large work "Automatic Telephone Systems."

There are, in all, ten chapters dealing with systems and apparatus, both self and power driven; and including the W.E. Co.'s rotary system and panel system, the Ericsson, Stockholm, system, the Director system, and semi-automatic working. Prominence has been given by the author to the details of the Director system because of its adoption in the London and other large areas. In this connection it is pointed out that the student should realise that principles and fundamental features of one system are frequently applicable to the solving of problems in others," and hence the necessity for avoiding a too exclusive consideration of one system only.

There are no fewer than 42 illustrations throughout the text to assist the reader in obtaining a clear idea of the actual apparatus described, and to enable him to trace the various switching operations by means of circuit diagrams. In addition, a lengthy extract is given from a paper read by Col. T. F. Purves, Engineer-in-Chief to the Post Office, before the Institution of Electrical Engineers, in which an outline is given of the A.T.M. Co.'s Director system for London.

The book will be of great service to those who desire to have a suitable introduction to larger works dealing with automatic telephony—conspicuous amongst which is the author's own three-volume work—and will undoubtedly be useful for class work purposes to students who are taking the City and Guilds courses in telephony.

Low Temperature Distillation. By S. H. North and J. B. Garbe. Pp. viii+216; figs. 40. London: Sir Isaac Pitman and Sons, Ltd. Price 15s. net.

An authoritative general treatise on this interesting and important subject is welcome, in view of the close attention that is being given to the better utilisation of our stores of coal, the provision of smokeless fuel, and the production of fuel oil within our own borders. That these problems will ultimately be solved we have no doubt, though much of the labour expended upon them in the past has proved unfruitful, yet we learn by failure as well as by success, and the authors, by giving the history of the subject and describing the earlier work as well as more recent developments, have done good service to the inventors of to-day. It is worthy of note that by low-temperature distillation the greatest yield of oil of good quality is obtained, and seeing that the use of oil as fuel is rapidly extending, whilst the natural supplies of oil are likely to be short-lived, the bearing of the matter on the production of energy with high economy is obvious. According to the authors, if low-temperature carbonisation became general (apart from gasworks and coke ovens, which consume 38 million tons per annum), 150 million tons of coal annually treated thus would yield at least 450 million gallons of motor spirit and 250 million gallons of crude oil, of which 50 per cent. is high-class Diesel oil, the result being an enormous reduction in the national coal bill and a great saving in subsidiary expenditures due to the burning of coal by the present wasteful methods.

The numerous systems projected or in operation are described and illustrated, the raw materials and the resulting products are discussed, and the possibilities of utilising lignite, peat, and shale are examined; and in an appendix a large amount of information in the form of analyses, &c., is given. As large users of fuel, electrical engineers are being led or forced by circumstances to study the nature and treatment of coal more and more closely, and the growing use of pulverised fuel is further stimulating attention to this subject, which is of fundamental importance in the production of energy by thermal methods. That they will eventually, either independently or in conjunction with gas producers, endeavour to use coal more efficiently and without loss of the valuable by-products, cannot be doubted, and this book should help towards that end.

French-English and English-French Dictionary of Technical Terms. By J. O. Kettridge, F.S.A.A., A.C.I.S. Pp. xvi+1,137. London: George Routledge & Sons, Ltd. Price 50s. net.

This is a monumental work, and the work not of a symposium but of one man, whose industry must be inexhaustible—for the same author has already written a similar dictionary dealing with financial and business terms. His aim has been to cover all branches of engineering, as well as of the numerous departments of science upon which engineering is based, and he includes a method of telegraphic coding to enable any entry in the volume to be expressed by a 10-letter word with indicator and check. The dictionary gives the translations of 100,000 words and phrases, arranged alphabetically on a consistent and efficient system which facilitates reference, and the user need not be familiar with both languages—a knowledge of either is sufficient. Not only single words, but also compound words and phrases are dealt with, and where the meaning of a word differs in accordance with the application of the moment, a separate paragraph is allotted to each sense; thus the word "box" in the English-French section appears 43 times, *e.g.*, "box car," "box connecting-rod end," "box-coupling," &c. The author has been generous in his selection of phrases; thus under "fit" we find "fit in," "fit out," "fit up," and under "form," "form a favourable opinion (to)." "Lord Kelvin's mirror galvanometer" appears as an entry.

We cannot but admire the author's achievement, which represents the fruit of immense labour. It is true that, covering so wide a field, which bristles everywhere with technicalities, he could not be expected invariably to grasp the true meaning of an unfamiliar word—for example, "commutatrice," which does not mean "commutator"; and in so great a mass of words and phrases, the specifically electrical items appear to be comparatively scarce.

The word "self" does not appear as an entry in the French section, though it is used in a translation, and the word "mil" is absent from the English section. No doubt we could find many faults in so huge a target; but we could doubtless find as many merits, and we prefer to commend the work as a most praiseworthy attempt to deal with a problem which can never find a perfect solution.

Electricity Supply Costs and Charges. By H. M. Sayers, M.I.E.E. Pp. 80; figs. 6. London: The Electrical Review, Limited. Price 2s. 8d. post free.

The author of this book describes it as an "attempt to set out the general relations governing the cost of electricity supply and to suggest methods of detailing the costs in forms which afford guidance to a progressive policy"; and every reader of it, whether or no he agrees with all its conclusions, will congratulate the author on the thoroughness with which he has treated his subject. In the unfortunate absence of efficient facilities for generating electricity for stock and storing it, as water can be pumped into a reservoir, or gas fed into a gasholder for a limited number of hours a day at a constant rate quite unrelated minute by minute to the demand of the moment, electrical generating stations (to quote the author's

words once more) "do not on the average work at their capacity for six hours per day, but they have all the costs of keeping running for 24 hours per day, as well as the capital charges which might well be spread out over . . . [a greater] production." The book discusses with great minuteness every item of the cost as it affects and is affected by these peculiar conditions, and deals with the problem not only as it arises in the generating station but also as it concerns the much more difficult area of the distributing system. The author does not hesitate to suggest that it may touch controversial subjects, but, as he says, "dissent and discussion . . . imply thought and examination, out of which come knowledge and assurance"—a sentiment with which it is impossible to disagree, provided the dissenting and the discussing are done by the proper persons. There has been far too much said in public, that is, in the hearing of consumers, about costs and charges and tariffs. These matters are for discussion amongst those who understand them and those who ought to understand them, just as medical subjects are debated more or less behind closed doors and not with a gaping crowd of possible patients looking on. It is not necessary even for every person engaged in electricity supply or in electrical engineering generally to understand them; they are, in fact, the province of a special type of mind, the fortunate possession of a few who are engineers gifted with a sense of economics and with imagination in addition—the type of mind that thinks of saying, as the author does on page 77: "The sweet simplicity of Kelvin's law expresses a truth which the author would be the last to condemn, but the requirements of a road authority in respect to excavation and making good a cable route may easily swamp the benefit of conformity to that law, when reduced to the common denominator of £ s. d." Just as an accountant is brought in from outside to design a set of books for a business concern, so the engineer-accountant, a very highly cultivated expert, should be entrusted with the task of examining the particular conditions of an electric supply concern and of designing a method of recording, in proper form, the information required, as the author points out, before any intelligent prediction can be made of the effect of new load on costs and therefore of what charge should be made when the new load comes on, both for it and possibly also for existing loads. It is scarcely to be expected that so specialised a piece of work can be carried out by the ordinary station staff; and the more suitably it is done in the first instance, the more easily will it be kept going by the ordinary staff afterwards.

The book deals with costs and with charges in a general way rather than with tariffs in particular, but the bearing of these on the question of tariffs is obvious. It is essential somehow to get down to a simple and easily applied tariff; and it is impossible to have it changing frequently even though conditions change. It is exceedingly difficult, or let us say impossible, to devise a tariff logically and correctly applicable to every consumer; here, as so often, compromise is the solution, and the value of the book under review is that it is a contribution to the understanding of its subject that will lead to the best compromise because it shows how to take into account all the factors influencing it. There is ample evidence that it is the present cost of electricity that prevents its wider adoption for both domestic and industrial purposes; and the better the whole subject is understood by those who ought to understand it, the more ably will they convince those who ought to use electricity that it is to their interest to do so.

Of the book itself it may be said that it is well-produced, except perhaps for a rather awkward four-page section between pages 44 and 49, and except for the few misprints that seem inevitable nowadays in every book. They are not serious; but it may be suggested that in a reprint it would be useful if the four diagrams (pages 41 to 44) were redrawn so as to match each other in their scales, and if the zeros of both axes were shown (the latter comment applies also to figs. 5 and 6), particularly because the whole point of the diagrams is that the coal consumption is not zero for zero output, and this is not obvious in their present form.

The writer of this review has no connection with any supply undertaking except as a consumer alleged to be too modest in his demands; he is therefore one of the "gaping crowd of possible patients," and, as such, ought never to have seen the book at all. But he is grateful for it; some of us have an insatiable inquisitiveness. So one who has absorbed every word of the book with thanks for its clearing-up of many important points would say to any other who may have come with him to this end of the review: Go, and do thou likewise.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The

Electrical Review

VOL. XCVII. AUGUST 14, 1925. No. 2,490.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone Nos.: Central 8260 and 8261.

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

London's Electricity Supply.

AT last—on July 31st—a definite stage has been reached in the reorganisation of the supply of electricity in the Metropolitan area—an area comprising a population of some eight million souls. The labours of the Electricity Commissioners, who have been engaged for five years in endeavours to solve this knotty problem, have at last borne fruit, and one can imagine them heaving a sigh of relief, though their work is far from finished. Under the new *régime* the aspirations of the Commissioners are only in part fulfilled, and compromise is written large over the Order which will now come into operation. The attempt to induce the public and private undertakers to work together for the common good broke down disastrously; like so many other projects designed to promote the welfare of the public, it was wrecked on the rocks of vested interests and parochial patriotism, and the dream of a single all-embracing scheme, such as that which is in successful operation in Chicago, was dissipated, or at least its realisation was postponed for half a century to come. But many changes may take place in that long time; and anyhow, it will fall to another generation to deal with the problem.

The proposal to divide London between the rival claimants was surely the last resource—as drastic a conception as that of King Solomon, and as little worthy of being called a "solution" of the problem as Alexander's cutting of the Gordian knot; it was, however, a way out of the blind alley into which the parties had strayed, and as such we must accept it. Had the Commissioners been endowed with larger powers the outcome would have been very different; and here again we see the inefficiency that invariably results from Parliamentary control of industry—particularly the electrical industry, which it has hampered from its birth. The Commissioners have made the best of a bad job, and they have our sympathy.

Accepting the situation we find London and the Home Counties shared out between two power companies, two groups of authorised supply companies, an uncom-

bined group of municipal undertakings, and a similar group of unassociated company undertakings, the whole subordinated—more or less—to a Joint Electricity Authority of which the constitution is mainly municipal. The power companies have statutory rights, and will be largely responsible for the conduct of electricity supply in their own areas; the London companies will operate as two separate undertakers; the other companies and the municipal authorities, apparently, will continue to work on individual lines, subject, like the company groups, to the Joint Electricity Authority. It will be seen that the unification of London's electricity supply is still a long way off.

And what will be the outcome of the new arrangement? Perhaps the most important factor will be the security of tenure granted to the London companies, in exchange for the adoption of a sliding scale of prices and dividends. It will no longer be necessary for them to build up reserves in anticipation of a crisis in 1931; they will be able to lay out capital on the extension of their mains, and to adopt a policy of welcoming new consumers and increased consumption, which some of them have hitherto endeavoured to discourage by charging prices which can only be described as exorbitant; they will be impelled by the operation of the sliding scale to lower their tariffs in order to increase their dividends; they will be able to generate electricity more economically by shutting down wasteful plant, erecting large up-to-date works, and interlinking their areas, and other economies will also become feasible. The position of the local authorities will not be so materially changed, but at least we may hope to get rid of some of the small stations and to economise on generation, and to see a forward policy adopted throughout the area. But all this will take time, and no appreciable improvement is likely to accrue for a year or more.

In conclusion, we would once more point out that, whilst abundance of supply can be achieved with ease by erecting large power stations, and various small economies can be effected on the lines mentioned above, real cheapness can only be attained in one way—and that is by supplying more energy per pound invested in plant. The utmost thermal economy, as we have shown, can have but little effect on the selling price: *a greater ratio of output to capital* is the one indispensable factor of cheapness. Let the supply authorities bear that fact in mind, and let them remember that to this end the co-operation of the consumer is essential. Hence an educational campaign is necessary to tell the public what electricity can do for it. If every private consumer in London doubled his average consumption, by increasing his use of electricity for purposes other than lighting, the price of electrical energy could at once be lowered by a greater amount than if coal were supplied to the power stations free of cost.

Electricity and the Coal Mining Industry.

Electricity supply in this country being almost wholly dependent upon coal as the prime source of energy, the fortunes of the coal mining industry are necessarily of immediate interest to electrical engineers. There is perhaps a tendency to look no farther than the pile in the coal store, or at most the loaded trucks on the station siding, but that is a somewhat short-sighted view; coal is the raw material from which the engineer produces light, heat, and power—a magical transformation indeed!—and the maintenance of a continuous and adequate supply is of the utmost importance not only to the station manager but also, though less directly, to almost every branch of the electrical industry. Our readers, therefore, must have received with a feeling of relief the announcement that for the next nine months at least peace in the coal mining industry is assured—whatever may be their views as citizens regarding the method employed to attain this result. We have on previous occasions recorded our opinion that the adoption of the seven-hour day and the minimum wage would bring disaster to the industry, a forecast which has proved only too accurate. We trust that the exhaustive inquiry into the conditions of the industry which is now to be carried out will lead to a solution of the difficulties which beset it, though we cannot affect to be optimistic on the subject.

But the mining industry in turn is a customer for electrical products, and in this relation the prospects are much more encouraging. In our issue for July 31st we summarised the report of the Secretary for Mines for 1924, which showed that the use of electricity for mining purposes was steadily advancing; out of 2,855 mines at work, 1,630 are electrically equipped, and the aggregate horse-power of the motors in use increased last year by 117,187 h.p. to a total of 1,481,932 h.p. Nearly half the coal-cutting machines in use are electrically driven, and the electric safety lamp is gradually ousting the flame type. But there is still immense scope for development in all departments. Over 1,200 mines are classed as not electrically equipped, and even in those which are more fortunate, full use is not yet made of electricity; for instance, though 216 conveyors were installed at the coal face in 1924, the total number of conveyors at work was only 1,373. Electric haulage below ground employed motors of 343,586 h.p., but this amount would be greatly increased if electric locomotives could be used to replace ponies, and it is to be hoped that the recent competition for the design of a suitable tractor will help to solve this problem, not only in the interests of economy but also on humanitarian grounds. That British electrical manufacturers are ready and able to cope with any requirement of the mining engineer was well shown at the Manchester Mining Exhibition, of which a report appeared in our last two issues, and the article on motors for electric coal-cutters which we publish to-day, explaining the severe conditions under which these machines have to work and the special designs which have been evolved to cope with them, will be found of interest even to those who are not directly connected with the mining industry.

Progress in Industrial Lighting.

It is satisfactory to see, in the annual report of the Chief Inspector of Factories for 1924, a very sympathetic reference to the importance of good industrial lighting. Here one may trace the influence of the co-operation of the Illuminating Engineering Society, and its representatives on the Home Office Departmental Committee. The experience of inspectors is that since the issue of the third report, two years before, there has been decided progress. These years have been utilised in bringing the suggestions of the Committee to the notice of managers of factories, and in inviting the co-operation of industrial councils in determining the conditions desirable in the various industries. We read that offers to send inspectors equipped with illumination photometers have been almost invariably warmly welcomed. Measurements thus made have given encouraging results. In most of the factories visited the working illumination exceeded the minimum recommended for "fine" work (3 foot-candles). In many cases the minimum for "very fine work" (5 foot-candles) was also exceeded, and one well-equipped installation (where originally only 1 foot-candle was recorded) now registers values of from 13 to 23 foot-candles. One knows, of course, that there is a very great deal to be done, and that there are still many factories of which the lighting is far behind modern ideals (some sections of the textile industry seem to be backward in this respect). But one forms the impression that these defects are due simply to want of knowledge, and that in course of time, as educational efforts are proceeded with, appreciation of better lighting will become more general. The essential thing is that assistance is welcomed. This, we believe, is ample justification of the lenient and sagacious way in which the Home Office has handled the matter. It is always easy to impose severe regulations, and it requires much more effort

and patience to bring about results by persuasion rather than by force. The former slow but sure method is much to be preferred, and the electrical industry should be grateful for the good work that the Home Office Factory Department is doing, and support its efforts in every possible way.

Electricity in Time-keeping.

That electricity is the handmaid of science and industry is a truism of which innumerable examples are readily forthcoming, and to the science of accurate time-keeping it has been especially helpful—indeed, its aid has been indispensable. The Royal Observatory at Greenwich, which was established by Charles II in order to facilitate the determination of longitude at sea, a matter which depends upon the accuracy with which the time is known, was enabled to distribute the true time to important centres on land by the adoption of the telegraph for this purpose, and the time service was later extended to the whole country and even to individual subscribers by similar means, whilst nowadays the B.B.C. has rendered it available by radio-telephony at infinitesimal cost to almost every householder.

But it is not only in the transmission of time signals that electricity is indispensable: it has also been of the greatest value in recording the time, and in securing uniformity of time-keeping throughout large establishments at small expense by means of master-clocks actuating subsidiary dials. The electric clock has always been a fascinating subject for study and invention, and has been steadily improved by the elimination of wheel after wheel until only a simple escapement remains to maintain the motion of the pendulum and to enable it to control, by electrical impulses, even the largest turret clock.

It would seem that one could go no further; but the ingenious device of Mr. W. H. Shortt, M.Inst.C.E., working in collaboration with Mr. F. Hope-Jones, M.I.E.E., chairman of the British Horological Institute, whereby the last vestige of clockwork—namely, the escapement—was removed and the pendulum was left absolutely free and untrammelled, whilst the work of control was transferred to a "slave" pendulum, was in reality the most important step of all. According to Prof. Sampson, of Edinburgh Observatory, as recorded in our "Notes" to-day, other clocks are "hardly able to serve as a check upon it," and thus the supremacy in accurate time-keeping, which was won for us by Tompion, Graham, and Harrison two centuries ago, but wrested from us by Germany in 1890, has now been regained for this country. Several other observatories, including Greenwich, have installed "free-pendulum" clocks of the same make.

Trade Representatives Abroad.

The need for securing new and larger export markets for the disposal of our manufactures, and the importance of cultivating inter-Imperial trade to the fullest possible extent, are points that have been so often stressed in public speeches, that it may seem unnecessary to mention the subject again so soon. The matter arises, however, in connection with a consideration to which we have frequently given emphasis when urging the efficient exploitation of overseas markets and to which Sir Edwin Stockton has given prominence when dealing with Malaya. The point is this: That we need the very best and the very keenest of the rising generation to go overseas to champion our cause and build up Imperial trade. The special fitness required of electrical men who are sent upon such expeditions has long been recognised, and some very good men have been produced by our manufacturing and trading concerns. The present active state of the electrical trade may be partly due to the attention that has been devoted to better export organisation in recent years, but as it is necessary for us not only to maintain, but wherever possible to increase, that trade, the work of selection, training, and promotion of export travellers and representatives is not a class of activity in which we can afford to slacken off. There are overseas markets from which the complaint comes to hand that they are seldom, if ever, visited by British commercial and technical trade representatives, although agents from other manufacturing nations are there full of zeal and energy. If the complaint of former days that there is a lack of suitable men still holds good, we must select and train more members of the existing home staffs for Colonial and foreign service. Sir Edwin Stockton has called attention to the need for proper treatment of our younger men who go overseas to build up our commercial fortunes, and at such a time as this when we are more challenged than ever by competition, the best men must be obtained, they must be well treated and encouraged, and given a reasonable chance of prosperity in their own and their families' interests. He holds that, if this matter is not properly attended to, we shall suffer for it not merely in the long run, but in the very near future. As we are not unfamiliar with the ungenerous terms which are sometimes offered to British engineers and traders when invited to leave these shores for British foreign technical and trading positions, and as we have had occasion to compare them with the better conditions, status, and authority accorded to such men by companies operating from across the Atlantic and from the Continent, we record Sir Edwin Stockton's views for consideration by electrical and allied authorities.

Workmen's Compensation.

All disputes between employer and employé in reference to compensation claims are settled by arbitration in accordance with the Workmen's Compensation Acts, 1906 to 1923. The arbitrator under such circumstances is the County Court Judge of the district in which all the parties concerned reside, or if they reside in different districts, the Judge of the district in which the accident happened or where the employer resides or carries on business.

In the case of "Hunter *v.* Stadtische Hochseefischerei Gemeinnutz Gesellschaft," difficulty arose as to the jurisdiction of the Court because English law is ineffective in foreign countries on account of the difficulty of its enforcement.

Briefly, the facts of the case were that on February 15th, 1922, Thomas Hunter injured his knee on the German ship *Konigsberg* lying in Tyne Docks, South Shields. The German firm admitted the liability and paid the workman until June, 1922. Later the knee became bad again, and a claim for compensation from May 16th, 1924, to date was made against the liquidator in Bremenhaven, as the German firm had since gone into liquidation. The liquidator denied liability on the ground that as he represented a foreign company registered in Germany, he was not within the jurisdiction of the Court. The workman contended that he had a right to compensation against any employer, and that if a foreign employer chose to employ a British workman to work in the United Kingdom he did so with the obligation to make compensation in case of an accident whatever his own nationality or the situation of the registered office of the company might be. The County Court Judge upheld the liquidator's objection and refused to hear the case. The workman appealed.

In the Court of Appeal the Master of the Rolls said that by Section 1 of the Workmen's Compensation Act, 1906, liability attached to the employer notwithstanding any contract to the contrary, and there, special facilities were given against the owners of a ship liable to pay compensation under the Act. A County Court Judge could issue an Order under Section 11 of the Act detaining the ship until compensation was paid, or security given for it. The terms of the Act brought within its ambit all contracts of employment in Great Britain and gave a remedy against a non-resident—a remedy now enlarged by Section 20 of the Act of 1923. The Master of the Rolls sent the case back to the County Court Judge for hearing. This point of law applies to all cases irrespective of the vocation or calling.

Electric Coal-cutter Motors.

The conditions under which they work, and the special features incorporated in their design.

By PERCY HUGGINS, Assoc.A.I.E.E.

THE reports of the Secretary for Mines and H.M. Chief Inspector of Mines for 1924 (abstracts of which were published in the ELECTRICAL REVIEW for July 31st last) revealed that at the end of 1924 there were 6,830 coal-cutting machines in commission in Great Britain, of which 3,044 were electrically driven. Daily association with collieries and coal-cutter manufacturers enables the writer to estimate that there must be now over 7,000 coal-cutters in commission in Great Britain, of which nearly half are electrically driven.

Thus the electric coal-cutter motor is beginning to form no mean contribution to the electrical engineering industry; while its novel features, and the departures in design devised to overcome its exceptional difficulties promise to be of great general interest in the industry, for in some respects they would appear to be leading in the science of dynamo-electric machine design.

The first patent for electric coal cutting was applied for by Robert Ridley, of Leeds, and James Grafton Jones, of Pentonville, in 1863; and the early history of electric coal cutting may be written around the period between that date and 1910. Such history records many weird contrivances and grave doubts, but out of many trials have evolved recognised types of coal-cutters which to-day are accepted as an essential part of the equipment of a modern colliery. In fact, their application is rendering it possible to work at a profit many coal seams (particularly thin seams of from 10 to 20 inches) which otherwise it would be economically hopeless to attempt to exploit. Contributing in no small degree to the successful development of mechanical coal-cutting has been the production of an efficient electric driving unit, for it is steadily outpacing its compressed-air rival on the score of cheapness of running.

Working Conditions.

The types of machines specifically mentioned and illustrated herewith are designed primarily for "long-wall" working, as this is the system chiefly adopted in this country, but the writer's general remarks on the motors are equally true of all coal-cutter motors and many underground-conveyor motors.

A "long-wall" machine has to undercut or otherwise cut a seam of coal so that its removal becomes a simplified matter. Cutting is effected by means of numerous small picks, which are projected at 250 to 500 ft. per minute into the mineral matter by being mounted on a rotating and travelling member which may take the form of a disk, a chain round a jib, or a bar. Hence these "long-wall" machines have sifted down to the following three types:—(*a*) The disk; (*b*) the chain; and (*c*) the bar. Each of these types is readily divisible into three parts, *viz.*, the cutting unit complete with gears; the hauling unit complete with gears; and the driving unit. The popular type for the average seam is the chain coal-cutter, a typical example of which is illustrated in fig. 1.

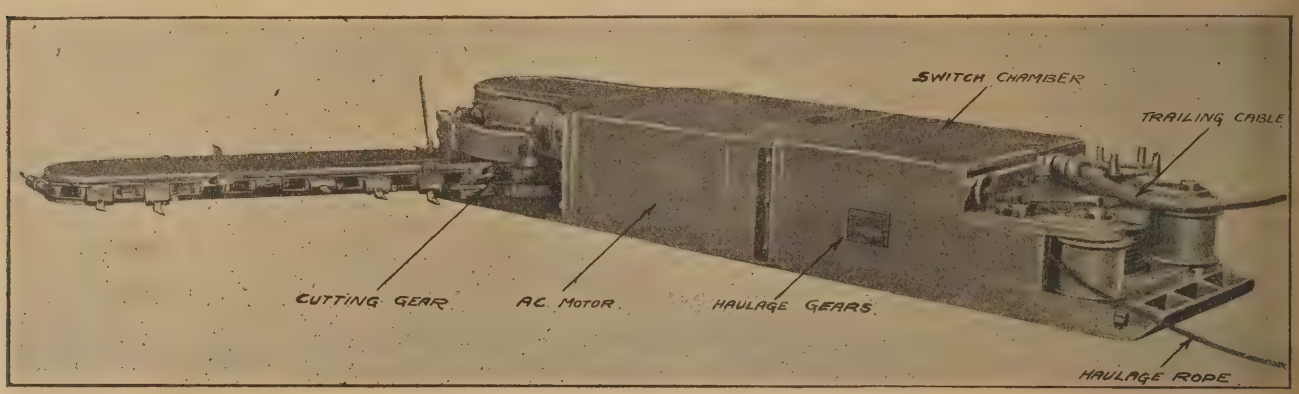

Fig. 1.—Chain Coal-cutter driven by A.C. Motor.

Often seams can be worked economically only by removing no more than the 4 to 5 inches depth of undercut, plus the bare seam of coal, which in this country may be anything up to 80 inches, but often is only 10 to 20 inches. The "long-wall" machine cuts in each travel a depth of 36 to 72 inches, and hauls itself along the face at a rate of 12 to 36 inches per minute, traversing from 90 to 180 yards per shift—the above figures are the extremes found in practice. Hence the coal-cutting machine must be able to follow, in the course of years, miles into the seam, and a standard machine for universal application must not have a height exceeding 12 to 17 inches.

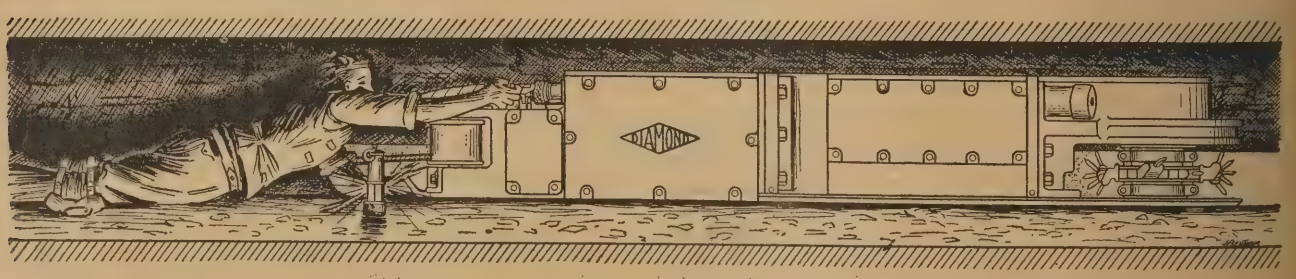

Fig. 2.—Chain Coal-cutter (side view) in working position.

Figs. 2 and 3 illustrate a chain coal-cutter at work as viewed from the side and back respectively. The end view (fig. 3) has been drawn as it would appear were a section cut through the face of the coal.

The conditions at the coal face are the most difficult under which electric motors are ever required to operate; dust and dirt are always present in the atmosphere, many coal faces are extremely wet, explosive gas may be present, and minor falls of rock from the roof and sides are frequent—a combination of circumstances which dictates, without question, total enclosure of the motor. Take into account, with the restricted height and total enclosure of the motor, the fact that a modern coal-cutter absorbs from its driving

unit anything up to 40 h.p., and it will be appreciated that no motor of the usual industrial type can be utilised to meet these requirements.

The Rating of Coal-Cutter Motors.

Generally speaking, present methods of describing the capacity of coal-cutter motors are extremely vague and cause much annoyance to their purchasers, who naturally want to know what they are buying. In America high rating of these motors is the convention, and the official publications of the U.S.A. Bureau of Mines indicate that it is the common practice in that country to state as the h.p. of a coal-cutter motor that which it would do for one hour only, with a temperature rise of 135 deg. F.; but in Great Britain manufacturers are more conservative in rating their motors, as regards both temperature rise and period of run. As a consequence, the nominal h.p. stated (which often is given without mention of the fact that it is a short-time rating) may be no fair indication of the actual capacity of a coal-cutter motor, and is misleading when comparing tenders.

However, it is intended here to indicate what coal-cutter motors actually have to do on site, as this is what the electrical designer has to ascertain to ensure that motors of his design shall be of adequate capacity, and to leave it to the consciences of the sales engineers to decide how to sell them.

The writer regards the b.h.p. absorbed during normal cutting as the b.h.p. at which the motor should be rated. However, under actual working conditions this load cannot be maintained continuously during a shift owing to such incidental work as periodic inspections, relaying haulage rope, changing picks, &c.; and a satisfactory 7- to 9-hour shift would include only three to five hours' actual cutting. Advantage is taken of the intermittent nature of the load to keep down the size and cost of motors by basing the h.p. on an intermittent or short-time rating.

The writer, as the result of spending many shifts with coal-cutters working in various districts, has established in one factory the undermentioned works tests as appropriate for coal-cutter motors. These tests

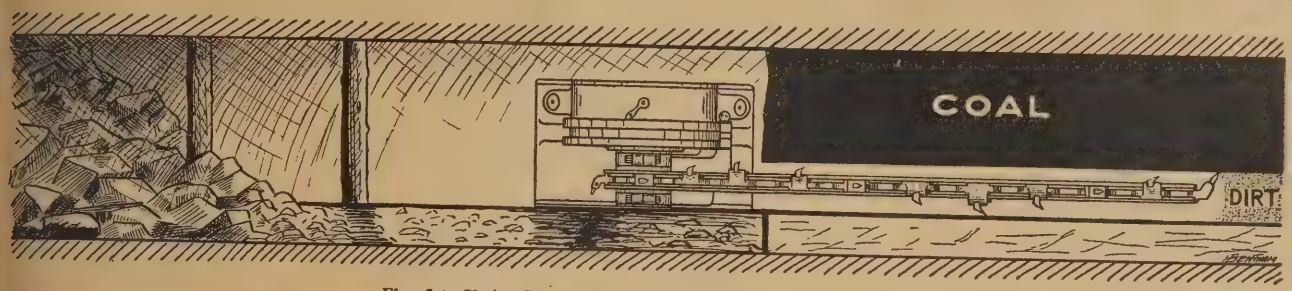

Fig. 3.—Chain Coal-cutter (end view) in working position.

are found to produce temperature-rises equivalent to the maximum produced under working conditions, even with double shift working, the permissible temperature-rise being regarded as 90 deg. F. as recommended for totally-enclosed motors by the B.E.S.A.:—

"The first three coal-cutter motors of any new design shall be run at rated h.p. for periods of 45 minutes with 30 minutes at standstill between runs. This cycle shall be repeated continuously for $5\frac{3}{4}$ hours, thus giving an aggregate of $3\frac{3}{4}$ hours on load during this time. In addition, they shall be tested continuously for two hours at rated h.p., starting cold."

The latter is the equitable short-time rating which

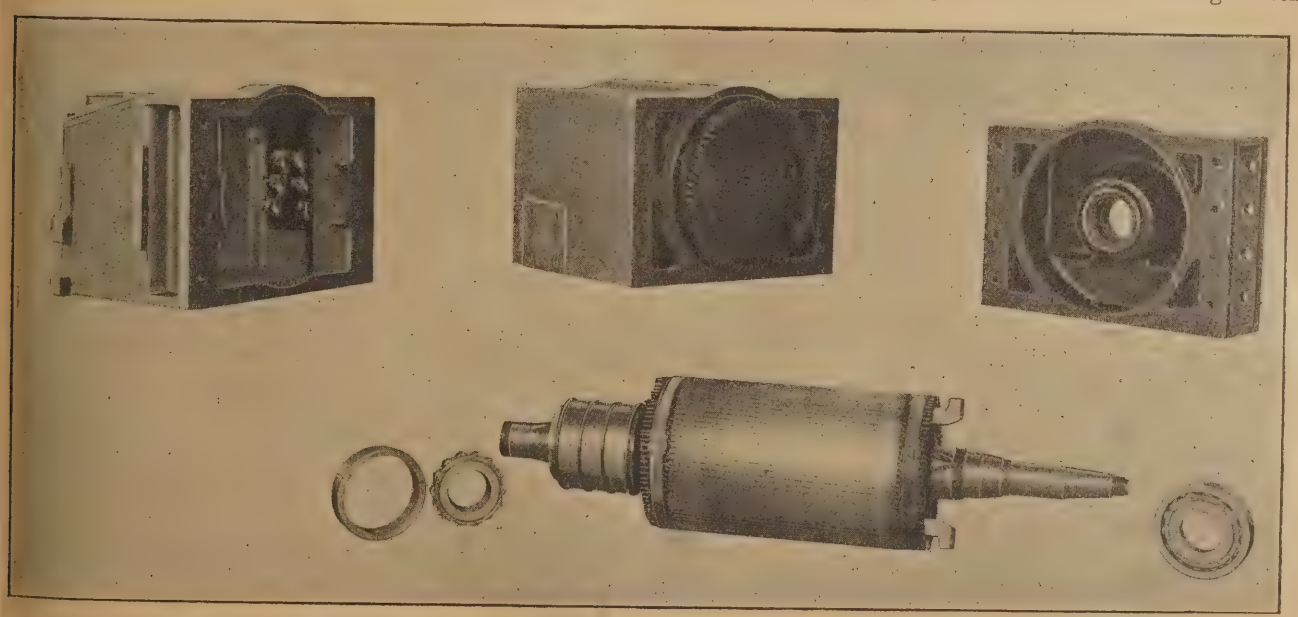

Fig. 4.—Typical Coal-cutter Motor Dismantled.

The actual h.p. transmitted by the motor shaft during normal cutting largely depends on (*a*) the type of coal-cutter; (*b*) the depth of cut; and (*c*) the nature of the substance cut. Manufacturers ensure satisfactory operation by basing a motor on the maximum conditions which could obtain on site with the particular type and size of coal-cutter which it has to drive. With the majority of coal-cutters the normal cutting load on the motor is of the order of 15 to 30 b.h.p., but this may be somewhat exceeded. The highest-rated b.h.p. motor which the writer has proved on site is on a battery of large modern disk machines cutting exceptionally hard clay in a pit in the Glasgow district, where the load on each motor is fairly consistent at 40 b.h.p.

is used for testing subsequent motors, and may be used for selling purposes. However, the intermittent test is considered to prove more positively the capacity of any standard construction of motor to *dissipate* heat under prolonged intermittent service; with a short-time run the capacity of the motor to *absorb* heat becomes a larger factor determining the temperature rise.

Core Dimensions and Performance.

When the electrical designer settles the proportion of diameter to length of an armature-core or stator-bore, he is acquainted with cost and performance curves plotted against varying values of this proportion for the given rating (and hence approximately settled

D^2L value); and for usual work it is expected that he will select proportions which will coincide with, or be a compromise between, the lowest cost-point and the point of highest efficiency. All text-books on design are laid out to assist the designer in basing his proportions on the above-mentioned considerations. However, it will be evident from preceding remarks that coal-cutter motors have to be proportioned entirely on the basis of permissible height, and the designer has to apply all his knowledge of the manner of change of performance and cost with varying diameter to determine how the former can be kept up and the latter kept down on machines with proportions departing considerably from usual practice. Happily cost and performance curves are very flat on the side of decreased diameter, and this enables coal-cutter motors, with their extremely small diameters and great lengths, to be constructed (as the following figures will illustrate) with quite reasonable performance characteristics, and at a cost of only about 130 per cent. of that of motors of usual proportions.

Fig. 4 is a view of a typical coal-cutter motor of the slip-ring type dismantled to reveal the general construction. It is two-hour rated at 40 b.h.p., 500 volts, 3-phase, 50 cycles, 720 r.p.m., and below are some interesting figures abstracted from the design and test sheets of this and also of a squirrel-cage coal-cutter motor and a direct-current coal-cutter motor. For purposes of comparison, corresponding values found on average industrial type totally-enclosed motors of exactly similar rating have been tabulated at the side.

—	Slip-ring motor, 40 b.h.p. 2 hr. rated, 3 phase, 50 cycles, 500 volts.		Squirrel-cage motor, 23 b.h.p. 2 hr. rated, 3 phase, 50 cycles, 500 volts.		Direct-current motor 40 b.h.p. 2 hr. rated, 500 volts.

Generally the stator bore or armature core of a coal-cutter motor has a diameter of 60 per cent. to 80 per cent., and a length of 200 per cent. to 350 per cent. of that of the average industrial type totally enclosed motor of the same rating.

Type of Enclosure and Other Salient Mechanical Features.

It will be apparent from preceding remarks that the cases of coal-cutter motors have to be flame proof (U.S.A. term: explosion proof), watertight, and not readily damageable by contingencies such as falls of rock from the roof, ignition of inflammable gas inside the motor case, &c.

As until recently there was doubt as to what constituted flame-proof enclosure, the writer proposes to mention some of the knowledge which engineers have acquired in designing plant to conform to the standard provisionally formulated by the British Engineering Standards Association, that "a flame-proof machine is one in which the enclosing case can withstand, without injury, any explosion of gas that may occur within it, and will not transmit the explosion to any inflammable gas outside." The test which is regarded as the most reliable consists of exploding, by means of a spark plug, a maximum explosive mixture of methane and air (specially transported from Welsh mines) within the motor, while the motor is within a chamber filled with a similar explosive mixture. Much assistance has been rendered to the mining industry by the Sheffield University, where in a laboratory specially equipped to conduct these tests was investigated the reliability of typical examples of manufacturers' apparatus in the presence of manufacturers' engineers. It is now general for purchasers to accept as evidence of the compliance of a motor with the clause *re* flame-proofness, a certified test on a motor identical in all essential details with the one purchased. It is extremely gratifying to the mining industry to find that through the happy collaboration of the B.E.S.A. and B.E.A.M.A., the Sheffield University, which hitherto has been regarded as the unofficial authority for issuing such certificates, in future is to be the recognised authority in Great Britain for this important function, which will proceed under the direction of an officer nominated by the Mines Department.

Experimenters have found that it is impossible to transmit an explosion of methane gas and air through small apertures, although spurts of flame are observed to pass; and it is now known that a definite minimum amount of heat, and not merely a flame, must pass in order to transmit the explosion. However, in order to ensure flame-proofness of a coal-cutter motor, all parts and covers of the motor frame are provided with machined joints of good depth—a minimum of 1¼ inches being accepted by most engineers as good practice. A joint of such depth accurately fitted will not pass flame; and any flame which can be passed owing to slight roughness has been observed during experiments to be so limited and cooled by the leakage surface as to fail to ignite inflammable gas with which the motor is surrounded.

By the use of manometers, the momentary internal pressure arising from an explosion of gas within a motor has been ascertained to be slightly higher if the motor is running at the time, owing to the then turbulent state of the mixture; but under all conditions the explosive pressure may be taken to be between the limits of 20 and 50 lb. per sq. in.

On no account must screw or bolt holes be drilled right through the case in such a manner that, if one is accidentally left out, a clear passage is left communicating between the inside and outside of the case.

The armature or rotor invariably is mounted on heavy roller or ball bearings, and the entire satisfaction which the arrangement has given affords yet further corroboration of the opinion generally accepted to-day that such bearings are eminently suitable for motors driving through gearing.

The motor frames are generally components of the complete coal cutter. If the air space which in an induction motor is so introduced in the corners and the sides exceeds certain proportions, it becomes advantageous to ensure that such air is not left "dead" by providing an air circuit having an axial return path between the rotor-core and the shaft, and preferably also small radial type fan-blades at one end of the rotor. Such fan-blades may be seen to have been fitted on the motor illustrated in fig. 3. By this means more heat is carried to the sides and corners of the frame, and the increased dissipation of heat from these parts has been ascertained to cause a reduction of from 10 to 23 deg. F. in the maximum temperature rise of the internal parts. This appears to accord with the principles of design practised in this country and America for many years, but it was recently proclaimed as new in German publications.

System of Electric Supply.

Much has been done to promote electric driving for coal-cutters by the excellent progress made towards the standardisation of electricity supply below ground. Not many years ago manufacturers had to cater for direct current of various pressures and alternating current of 60, 50, 40 and 25 cycles at all pressures from 190 to 650 V; but so much has been achieved in recent years that to-day the term "coal-cutter motor" almost necessarily implies one designed to operate on a three-phase, 50-cycle, 450/550-volt supply. It is interesting to note, in connection with the entire output of electric coal-cutters this year by one of the largest manufacturers, that nine out of every ten have been ordered for this system of supply. This will explain why the writer is dealing mainly with coal-cutter motors of the three-phase induction type, and is leaving further reference to examples of direct-current coal-cutter motors until the conclusion of this article.

The Stator Winding.

The exceptional length of core and small diameter of bore characteristic of the stators of coal-cutter motors render the winding process somewhat difficult, particularly with semi-closed slot construction. This construction has been preferred generally in view of the disadvantages inherent in open slot construction, namely, high magnetising ampere-turns necessary to overcome air-gap reluctance, and high-frequency rotor surface losses—a combination of factors which means that, for equivalent output with the same temperature rise, a coal-cutter motor having open slots requires not less than 25 per cent. more material and space than those necessary for a motor embodying semi-closed slot construction, while the efficiency of the former falls several per cent. below that of the latter. On the other hand, with semi-closed slots, the labour charges for winding are about 60 per cent. above those with open slots, and reliability rests to a larger extent on the human element of the winders. All British manufacturers have adopted in the past the semi-closed slot construction, but open slot construction is general in American coal-cutter motors.

The Americans have adopted cylindrical windings with their open-slot construction, in which the coils are completely formed and insulated prior to dropping in the slots. In Great Britain pull-through chain windings are the more general practice, but cylindrical windings are also used in which the coils are formed and then the conductors are dropped singly through the narrow slot openings.

Our present knowledge of appropriate calculations for predetermining high-frequency rotor losses of the nature mentioned is very incomplete. With the usual British practice of using semi-closed stator slots, this loss is generally a negligible quantity, but in America, in following the modern tendency of rating-up motors and using the smaller air-gaps permitted by the extended application of ball and roller bearings, they have had to face the fact that high-frequency rotor surface losses peculiar to open-slot construction become a serious item in motors for all purposes. For two years now some of their best known research laboratories, including that of the Westinghouse Electric and Manufacturing Company, of East Pittsburgh, have devoted much attention to the problem; and at the Midwinter Convention of the American Institute of Electrical Engineers, held at New York on February 9th to 12th last, the subject was introduced for discussion through a paper read by the research engineer of the above mentioned manufacturing company. It is interesting to note that the data presented at the convention, representing the results of the latest research work, corroborated the assertion of the author of the introductory paper that *in an ordinary American squirrel-cage motor the rotor high-frequency surface losses are of the same order of magnitude as the stator fundamental-frequency losses.* The writer has been identified with exhaustive investigation of the effect of open stator slots in coal-cutter motors, and the orders of magnitude thereby determined for the high-frequency rotor losses are remarkably similar to those recorded in America, but the investigation covered also slip-ring motors. The following average values may convey an interesting idea of the magnitudes which this peculiar loss was found to assume in coal-cutter motors.

Type of motor.	High-frequency rotor losses expressed as a percentage of the normal stator iron loss.
Squirrel-cage motor having open stator slots, semi-closed rotor slots (opening .06 in.), and uninsulated rotor bars	108 per cent.
As above, but with insulated rotor bars	90 per cent.
Slip-ring motor having open stator slots and semi-closed rotor slots (opening .06 in.)	67 per cent.
Squirrel-cage motor having semi-closed stator slots (opening 0.1), semi-closed rotor slots (opening .06), and uninsulated rotor bars	Approx. 10 per cent.

It was the problem of the coal-cutter motor which led the Diamond Coal-Cutter Company to carry out the research work in its laboratory at Wakefield which has resulted in the full realisation of the possibilities of winding in initially open slots and closing the slot openings with magnetic slot strips, a process which is arousing interest in several countries, particularly America, and which has been copied on ordinary industrial-type motors with economy. Although to the writer's knowledge the idea of magnetic-slot wedges has been in existence for at least fifteen years, the earlier productions were not satisfactory. Consisting as they did of powdered iron and a cement having electrical-insulating properties, they were utterly deficient of both magnetic permeability and the requisite mechanical properties.

The feature of satisfactory magnetic-slot strips is that the iron, instead of being in powder form, is in the form of fine strands which, while extending across the slot mouth so as to decrease the magnetic reluctance, are discontinuous along the slot so as to be substantially devoid of eddy-current loss. In one form iron strands are woven with hemp into a sheet, and the whole is rendered solid by floating with an insulating compound. The sheet so formed is then cut into widths suitable for slot strips. Alternatively iron wire of somewhat larger gauge is wound spirally upon a core of insulating material to form the closing wedge for the slots. The strips are retained in the slots by inserting them in grooves at the tops of the teeth. These magnetic strips are found to average the flux over the air gap, producing characteristics which are very similar to those of semi-closed slots. Thus they combine all the respective advantages of open- and semi-closed slots without any of their respective disadvantages. In coal-cutter motors the initially open-slot core may be made a practical construction, and such open-slot core, besides having the advantages already mentioned, may facilitate the adoption of a frame construction which permits of increased core diameter for given overall height consistent with greater security against water penetration. This may be achieved by extending the stator frame so that it overhangs the end windings—a construction which is not satisfactory with anything but former winding in initially-open slots.

The strength of these magnetic wedges has been proved in the following manner. Complete stator frames have been lifted by a bar passed through a slot on the underside of the stator core in such fashion that the entire weight has been carried on the closing wedge of one slot, and in no case has micrometical measurement revealed the slightest lifting of the wedge.

"Direct-on" Starting of Large Induction Motors.

The confined space and indifferent illumination in which coal-cutter motors have to operate make it of paramount importance that the system of operation should be of the simplest, while, as far as possible, wearing parts should be eliminated. Starting gear, which has to be carried on the coal-cutter, in particular is unanimously regarded by mining men as an evil, the only difference of opinion they seem to have on the matter being the extent to which they should submit to it. For the majority of coal-cutters, squirrel-cage motors are provided arranged for star-delta starting, and comparatively few coal-cutter motors are of the slip-ring type; but in the past the above-mentioned considerations have led engineers in several pits to short-circuit the slip-rings of slip-ring motors, and substitute "direct-on" switching for rotor-resistance starting. Fortunately there is not much in a pit to be inconvenienced by "kicks" on the line, and as no trouble resulted, they could not see why in future they could not have squirrel-cage motors with "direct-on" switching in all cases. To meet this demand squirrel-cage motors of up to 30 b.h.p. have been supplied arranged for "direct-on" switching—a practice which the writer has not found applied to motors of such large capacity in any other industry in this country. Owing to the large overload capacity for which these motors are designed, their short-circuit current is high, and

the momentary current peak with direct-on switching is of the order of six times the normal full-load current, the starting torque being about 130 per cent. of full-load torque.

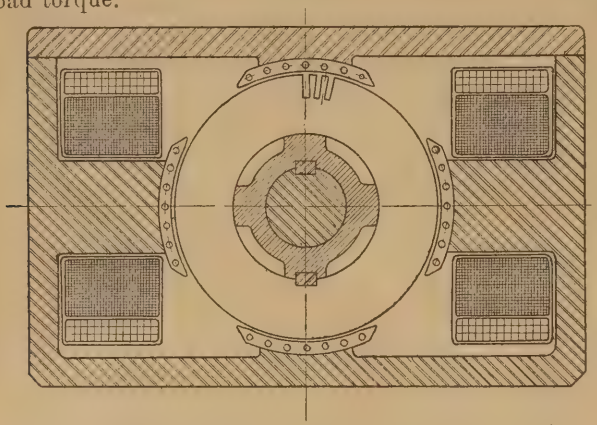

Fig. 5.—Two-pole (wound) Motor with two consequent Poles.

Examples of Direct-Current Coal-Cutter Motors.

In the production of a satisfactory direct-current coal-cutter motor, the limitation of height has necessitated the introduction, not only of armatures of great length and small diameter, but also of field forms of unusual sections and magnetic circuits. The principles of construction of the two common types of d.c. coal-cutter motors are illustrated in figs. 5 and 6 respectively; the first illustrated has two wound poles and two consequent poles; and the second illustrated has four wound poles and is also fitted with two interpoles. The latter with its very obvious advantages may be regarded as the modern standard. Cumulative compound winding of the main poles is the usual practice.

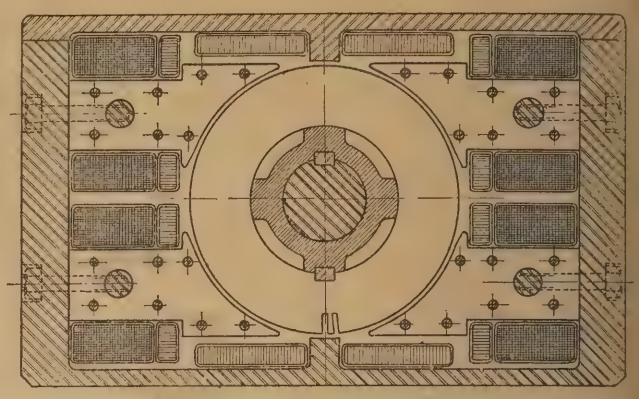

Fig. 6.—Four-pole (wound) Motor with two Interpoles.

The Definition of Capital.

By C. TURNBULL, M.I.E.E.

In discussing the financial position of municipal electrical undertakings, it is customary to take their capital expenditure as the total amount of capital expended since the undertaking came into existence, and to include all loans even when they have been paid off. Until recently this was not very objectionable, as the early loans were comparatively small and the proportion paid off was not great. The time has now come when the retention of extinguished loans is leading to absurd and misleading results. In many undertakings half the loans borrowed have been paid off, and yet in statistical calculations it is assumed that they are all outstanding! The effect on the public mind will become progressively unfavourable, as people will obtain the impression that the return on municipal capital outlay is getting smaller and smaller year by year.

Even now it is not uncommon to find critics complaining that municipal electrical undertakings provide no depreciation, while they are quite unaware of the fact that a very large part of the capital has been paid off. Actually the sinking funds are intended to extinguish the capital liabilities as quickly as their value disappears through depreciation and obsolescence, and in practice they are fully equal to this requirement.

The reasonable method of dealing with the problem would be to wipe out of the capital account all loans which have been redeemed, just as a company wipes out debentures or other loans when they are paid off. Credit should also be taken for sinking funds in detailed analysis, although for broad purposes it may be sufficient to take a loan as a liability, until it is entirely extinguished by being redeemed. Critics object to this proposal that it would lead to ridiculous results in the case of such an undertaking as the Glasgow tramways, which have practically paid off the whole of their loan. The critic states that the percentage of profit shown on the outstanding amount of loan would be absurdly great, and he therefore demands that a sum should appear in the capital account to keep the percentage of profit within reason.

The dispute, as is usual in disputes, arises from the fact that most people have no very definite conception in their minds as to what the word "capital" implies, and even experts sometimes fail to recognise that the word has two distinct meanings in common usage. The first meaning of the word is the value of the property used in a business. Thus, a millionaire is a man whose net assets are worth a million for the time being, and if the assets fall to half this value, his capital ceases to be a million. But this definition entirely fails in the case of public companies. The capital of a company may be a million, and its assets may be worth ten millions or ten pounds! There need be no relation between the value of the assets and the capital of the company, as many shareholders know well enough. For public company purposes, the capital may be defined as the liability of the concern to those who have provided the money. This definition may also be reasonable for municipal trading concerns. If it is adopted, then redeemed loans, having ceased to be liabilities, should cease to figure as capital, and the percentage of profit, &c., should be calculated only on the actual outstanding liability.

But how are we to deal with the problem of undertakings which have absurdly small capital expenditures outstanding? The answer is that these are merely the converse of other undertakings which have large capital liabilities and small profits. If one does not find it absurd to say that a concern has a capital of a million and no profit (or a loss), then it is also not absurd to say that a concern has a minute capital and a very large profit. Mathematically, we say that when dy/dx equals 0, then dx/dy equals infinity. There is no absurdity in using the "infinity" in this connection, and it is equally reasonable to say that a profit on zero capital is an infinite percentage. At the same time such cases are so rare, if not unique, that there is no reason why we should make our general returns absurd in order to make the unique case look reasonable.

One proposal is that we should value the undertakings at reasonable values, and calculate the percentage shown on them. This is really working in a circle, as the value would depend on the profits earned. Wherever an undertaking earned, say, more than 6 per cent. after paying sinking fund,, the assumed capital would be inflated to bring down the percentage to 6 per cent. If next year the profit fell off, the capital would be deflated sufficiently to bring the profit back to that figure! This method does not appear to be helpful, and one cannot but think that the method of taking the outstanding loans as the capital gives a truer method for comparison with company undertakings.

Some Graphical Methods.

Geometrical Solutions of Two Alternating-current Problems.

By PROF. WILLIAM CRAMP, D.Sc., M.I.E.E.

IN my experience it is characteristic of the English student to require some physical presentation of any numerical process with which he is dealing. Recognising this, recent elementary books, on the calculus for instance, emphasise the geometrical presentation of differentiation and integration; and the same psychological requirement doubtless accounts for the spread of graphical methods in statics, dynamics and electricity, as well as for the fact that the use of Cartesian co-ordinates now appears so early in the school curriculum. It has always seemed to me that this English proclivity is a very strong argument in favour of the introduction of graphic arithmetic into schools, and I have often urged its importance. Nor is this attitude of mind confined to the less intelligent scholars. Much of Newton's work was reared upon a geometrical foundation, and it is said that French mathematicians smiled at the necessity which Clerk Maxwell felt for mechanical models to express and to confirm his mathematical conceptions.

Whether as a generalisation this be true or whether it be a conclusion drawn from too narrow a personal experience, it is certain that English students find the

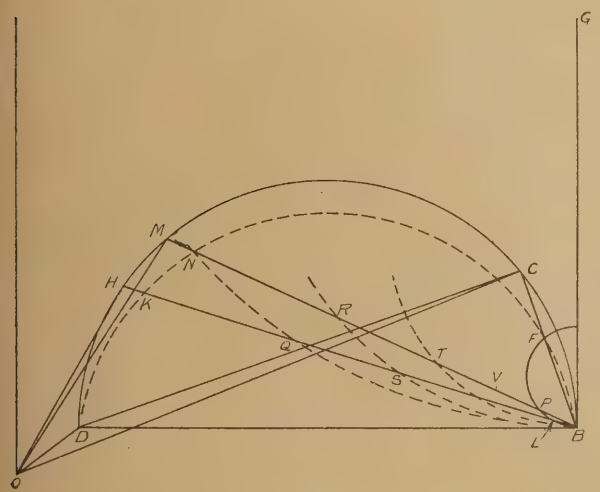

Fig. 1.

study and understanding of alternating-current phenomena much clarified by frequent reference to vector diagrams, and that comparatively few would master the simple transformer if all were compelled to approach its design and characteristics through the analytical equations alone. And this statement is even more true of the induction motor; where it certainly accounts for the vast amount of time and printing that has been expended upon various forms of the circle-diagram. Given a geometrical presentation of the subject, I find that the better English students may be trusted to develop for themselves the analytical calculations pertaining to any particular case, and that in this way they attain to a more thorough mastery of their subject and a greater self-confidence in dealing with new problems. This belief is my reason for putting forward here graphical solutions, not ordinarily appearing in text-books, of two alternating-current problems.

I. The first of these relates to the determination of the steps of the starting resistance for an ordinary polyphase slip-ring motor. In fig. 1 let OD represent the no-load current per phase of such a motor, OC the stator short-circuit current, DCB being the ordinary locus semi-circle. Then it is easy to show that very approximately to the same scale DB represents the stator applied voltage, DC represents $I_s(x_1+k^2x_2)$ and CB represents $I_s(r_1+k^2r_2)$, where k is the translation coefficient, I_s is the rotor r.m.s. current referred to the stator, and x_1, x_2, r_1, r are the stator and rotor reactances and resistances respectively. Further, the line CB may be divided at F, so that CF : FB $=r_1 : k^2r_2$; the usual arc (shown dotted) being drawn through D, F, and B.*

Now, with centre upon BG, which is perpendicular to DB, describe a semi-circle passing through F and B. Then, for any other stator current, OM, HK represents nearly the stator resistance drop, LB $\div k$, the rotor resistance drop, and KL $\div k$ represents the rotor rotational e.m.f.

Let us suppose that the full-load current of the machine is OH, and that it is desired to design a starting resistance such that the maximum current drawn from the line shall not exceed 120 per cent. of the full-load current on any stop. Mark off OM $=120$ per cent. of OH and join MB, cutting the semi-circle FLB in P. Then to the same scale that PB represents the rotor resistance per phase, NP represents the total resistance per phase to be inserted on the first stop of the rheostat so that the motor will start with the required current.

As its speed rises, M travels towards H, and finally arrives, and remains, at that point. Now, with its centre on BG, draw a semi-circle passing through N and B, and cutting KB in Q. Then KQ represents the rotational e.m.f. appropriate to the speed on this first stop, and in order to cause the current again to rise to OM, a length $=$ KQ must be subtracted from NP. Set off, therefore, NR $=$ KQ, and with its centre on BG, describe another arc passing through R and B, and cutting KL in S. Repeat the process, making, say, RT $=$ QS, &c., until an arc is arrived at that is either just within or just without the rotor resistance arc FLB. Then the total resistance to be inserted per phase in the rotor being NP, the tapping points are R, T, &c., and the sections are cut out in the order NR, RT, &c.

Some care is necessary in determining the translation coefficient. It can, of course, be obtained experimentally, and where no other data are available it is usually sufficiently near to take it as the ratio of turns of the stator to those on the rotor, due regard being paid to the systems of winding. Thus, if the ratio of turns be denoted by β and rotor and stator be wound both delta or both star, $\beta=k$ nearly. But if the stator be wound delta and the rotor star, $k=\beta/\sqrt{3}$, and so on.

In carrying out the process just outlined, difficulty will often be experienced with the large diameter of the larger circles NQ, RS, &c. On joining the points NQ and RS, the student will easily† prove that NQ and RS are parallel and that QB/NB $=$ DH/DM; so that the construction immediately simplifies to the following: Measure NB and KB and also the ratio DH/DM $=x$, say.

Then NR $=$ KB $-x$ NB,

RT $=x$ NR,

and if V be the next point along NB,

TV $=x$. RT $=x^2$NR,

and so on. Whence it follows that after the determination of the first stop on the resistance (*i.e.*, NR), the others follow in a geometrical progression having the common ratio $x=$ DH/DM. Note that the ratio is *not* OH/OM.

II. My second example concerns the grading of the P.D. to be applied to the terminals of a single-phase series a.c. motor to give even increments of current as the controller moves from tap to tap of the transformer. In fig. 2 the short-circuit characteristics of the motor are shown; OI is the full-load current and OC the corresponding terminal voltage when the motor is

*Cramp & Smith. "Vectors and Vector Diagrams," pp. 231 *et seq.*

†On second thoughts, these relationships are not so very obvious. I shall be glad to send the proof to any student who fails to deduce them.

locked. The angle COI is obtained in the usual way from the wattmeter reading, so that the product of BC and OI is the *whole* power absorbed under those conditions.

Let us assume that the motor is to start against full-load torque, but that the starting current is not to exceed the full-load current by more than 50 per cent.

Set off OI_1 and OE_1 to represent a current and voltage 50 per cent. in excess of OI and OC respectively. Draw E_1, F and CG parallel to OI. Then, when the current I_1 flows through the motor under the applied pressure E_1, the machine will start and accelerate until the current falls to I, and the pressure is the vector sum of OC and the rotational e.m.f. With centre O and radius OE_1, describe an arc cutting CG in D; OD, then, is equal to OE_1, and it is the vector sum of OC and CD. The latter is parallel to OI, and therefore in phase with the current, so that it represents approximately the required component of the rotational e.m.f. Draw DE_2 parallel to CE_1 and join OE_2. Then $E_1E_2 = CD$ and OE_2 is the vector sum of this rotational e.m.f. and OE_1; and if this P.D. be applied to the motor the current will immediately

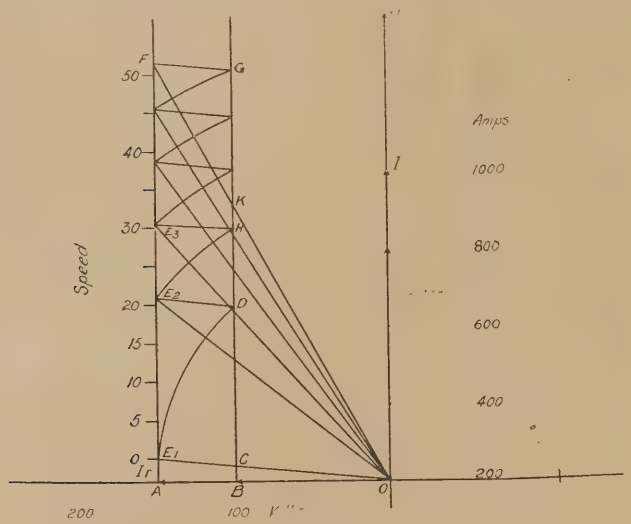

Fig. 2.

rise to I_1 again. Thus, OE_1 represents the starting P.D. to be applied to the motor, and OE_2 is the P.D. to be applied on the next stop of the controller. By swinging OE_2 up to H and drawing HE_3 parallel to DE_2, we obtain OE_3, the P.D. on the next stop; and repeating the construction we finally arrive at the maximum P.D. available, which in this case is assumed to be OF. Of course, any limiting current other than that assumed above for I_1 may be taken, the construction remaining the same. It is to be noted that, having taken the current ratio as fixed, the rest of the diagram follows from the motor characteristics, so that it may not be possible to find a line OF which exactly coincides with a given maximum P.D. It is possible, however, always to get a line on either side of a given maximum and to modify the tappings accordingly. The ratios BC/OC, BD/OD, BH/OH, &c., are proportional to the power factors reached on the corresponding tappings, and if one reading of the open-circuit armature voltage V at a speed, say, n, and for the field current I, is available, the corresponding speeds can easily be determined and placed along the line AF; for the point E_1 corresponds to zero speed, while E_2 will correspond very nearly to a speed $n_1 = CD \times n/V$, and, since the rotational e.m.f. is proportional to the speed, this fixes the scale along the line AF as indicated in the figure.

It is not essential that the speeds should be in revolutions per second or per minute. They may be in train miles per hour as calculated from the wheel diameters and gearing. As an example, suppose a single-phase series railway motor intended for, say, 300 volts and 1,000 amperes at full load. On locked test the motor requires 100 volts when the current is 1,000 amperes, the power factor being then 0.1. Then, $OI = 1{,}000$, $OC = 100$, $CB = 10$ nearly. Suppose, now, that the motor is to start against full load with a current not exceeding 1,500 amperes. Then $OI_1 = 1{,}500$, $OE_1 = 150$, and on completing the diagram and measuring the lengths OE_2, OE_3, &c., we find the tapping voltages are: 150, 190, 225, 254, 288, 310. The last, of course, is 10 volts too high, but in practice would be sufficiently near.

Suppose, now, that the machine is loaded lightly on test, and it is found that with 1,000 amperes through the armature and 150 volts across the machine, the speed corresponds to 20 miles per hour. Then, on the diagram $CD = 20$ and either CG or E_1F can be graduated in miles per hour from this single reading, the graduations being equal divisions of either line from C or E_1 as zero point. We are thus able, from fig. 2, to construct the following table:—

Tapping No.	Voltage.	Speed.	Power Factor %.
1	150	0	10
2	190	20.5	61
3	225	30.2	75
4	254	38.2	81
5	282	45	85
6	310	50	89

It will be objected that the short-circuit reading does not represent the running conditions, since the iron losses, &c., are different in the two cases. This is a valid objection, but a magnetisation curve can be taken, and if the machine can be run at a constant voltage with varying currents on test, the locked test may be avoided, and an effective resistance calculated, which, when multiplied by the full-load current, gives the point C in fig. 2. Thus, suppose we knew that with 300 volts and a current of 600 amperes, the machine ran at a speed corresponding to 40 m.p.h. with a power factor of 0.9:—

$$300 = \sqrt{(e + Ir)^2 + (Ix)^2}$$

where r and x are the effective resistance and reactance respectively of the motor, and e is the counter e.m.f. of rotation. Further,

$$\frac{e + Ir}{\sqrt{(e + Ir)^2 + (Ix)^2}} = 0{\cdot}9$$

whence

$$e + Ir = 270.$$

Now, from the magnetisation curve let the value of e corresponding to the given speed and current be 260 volts. Then $Ir = 10$, and $r = .0167$ ohm, and $BC = 16.7$.

From a series of such calculations mean values both of r and x can be obtained, and the lines OC and OE_1 drawn in accordance therewith.

From the designer's point of view it more frequently happens that between starting and full speed it is required to insert a given number of stops. This is the converse of the previous problem, and might therefore seem to be immediately soluble. Like many converse problems, however, it is not so simple as its complement, and it is well to approach it from an elementary case. Suppose that in fig. 2 the effective resistance r be assumed to be negligible in comparison with the reactance term. Then the data are the voltage, current, and power factor at full load, and the short-circuit voltage for full-load current at zero power factor. It is required to insert a given number of transformer tappings between these two such that the current increase from step to step is constant, and to determine what this increase will be.

In fig. 3 let OI represent the full-load current, OA the corresponding voltage at standstill, and OE the voltage at full load, with power factor = cos EOI. Then, on the assumptions made, EAO = 90 deg. and AE the e.m.f. of rotation at full load is known. Suppose the problem to have been solved as shown in fig. 3 for, say, three stops, so that the transformer e.m.f.'s are OB, OC, OD:—

Then $(OE)^2 = (EA)^2 + (AO)^2 = (DB)^2 + (BO)^2 = (FA)^2 + BO^2$

Therefore $(EA)^2 - (FA)^2 = (BO)^2 - (AO)^2$... ... (1)

Also $(FO)^2 = (FA)^2 + (AO)^2 = (CB)^2 + (BO)^2 = (GA)^2 + (BO)^2$

Therefore $(FA)^2 - (GA)^2 = (BO)^2 - (AO)^2$... ... (2)

Adding (1) and (2), $(EA)^2 - (GA)^2 = 2\{(BO)^2 - (AO)^2\}$ (3)

Again $(GA)^2 = (GO)^2 - (AO)^2 = (BO)^2 - (AO)^2$ ... (4)

Adding (3) and (4)

$$(EA)^2 = 3\{(BO)^2 - (AO)^2\} = 3\,(GA)^2$$

Or generally, for constant increments of starting current, the in-phase component of the given full-load

applied pressure is $\sqrt{n}$ times the component of rotational e.m.f. on the first contact, where n is the number of starting contacts required.

From this relationship the following construction is deduced:—From the given data set out OE, OI to a convenient scale to represent the applied voltage and full-load current at the given power factor. Now, to any convenient scale construct a diagram like fig. 4, OABCDE, having *n* radial lines, arranged so that OA = AB = BC = CD = DE, &c., the angles *a*, *b*, *c*, *d*, &c., being right angles. If five contacts be required, then the number of lines will be as in fig. 4. If three only, then OA, OB, and OC only are required. Adopting the latter supposition so as to complete fig. 3, we make the radius corresponding to the last contact equal to AE in fig. 3, producing it if necessary. Thus, OF (fig. 4) = AE (fig. 3). Next complete fig. 4 as shown, FG and GH being parallel to CB and BA respectively. Then AF (fig. 3) must be made = OG (fig. 4) and AG = OH. These in turn give in fig. 3 the lines OG and OF, which are the required transformer P.D.'s; OB is then found, being = OG, BD can be drawn and fig. 3 completed. To get the value of the maximum current, join AI and draw BI_1 parallel to it. Then OI_1 is the value required. The proof of the method is again left to the student, with the hint that in fig. 4 OC : OB : OA = $\sqrt{3}$: $\sqrt{2}$: 1, &c.

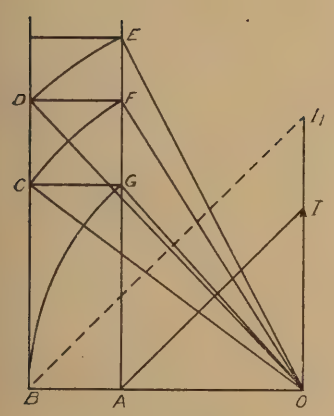

Fig. 3.

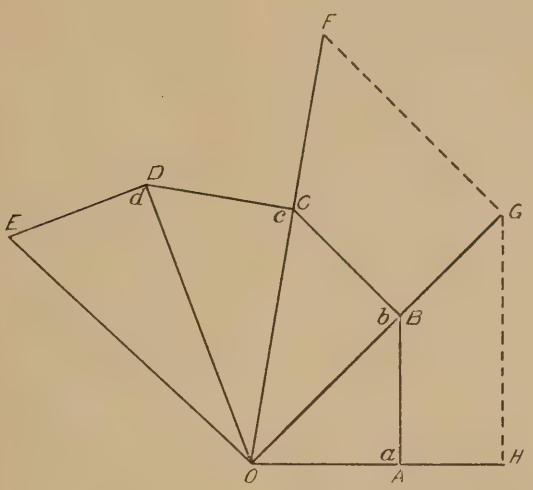

Fig. 4.

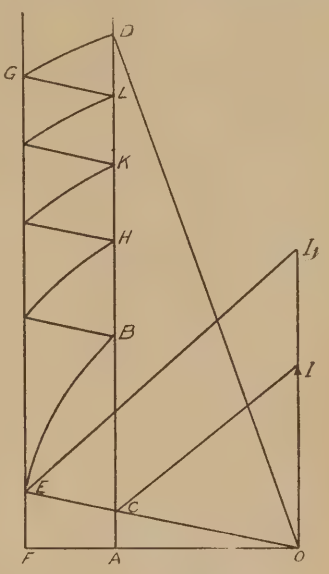

Fig. 5.

In those cases where the power factor of the motor at standstill is very low, the construction just outlined is sufficiently accurate. But it often happens that cos ϕ at standstill is considerable. The geometry then becomes far more intricate, but the following solution is very nearly accurate:—

In fig. 5 let OD be the full-load voltage corresponding to the current OI, and OC be the standstill voltage for the same current, both set out at their appropriate power factors. Draw the lines DCA and OA as usual. Let *n* be the number of contacts. Divide DC by $\sqrt{n}$ by the method of fig. 4, but instead of marking off the quotient from C, mark it off from A, as AB. With centre O and radius OB cut OC produced in E, and through E draw the perpendicular FEG. Complete the construction as for fig. 2. Then the required e.m.f.'s on the contacts (in this case five) are OB, OH, OK, OL, OD. The value of I_1 is found by the construction of fig. 4 modified as shown.

Throughout this article, on principle, any methods other than those of pure geometry have been generally avoided. But it is clear that in certain cases, as, for instance, in the last example, the division of DC by $\sqrt{5}$ could be more quickly carried out by arithmetic. Such a departure might, however, disguise one of the main objects in the development of these methods, *viz.*, that pure geometry knows nothing of the difference between commensurable and incommensurable quantities. Geometrically, it is as easy to find the square root of 5 as the square root of 4, and the result is achieved with similar accuracy in the two cases. In arithmetic the use of a conventional number system results in the multiplication table and in a process-accuracy which is in turn dependent upon the magnitudes involved in the process, being unique for certain cases, but only roughly approximate for many more. Thus, in taking the fourth root of 9 arithmetically, the first step is $\sqrt{9} = 3$, a definite result. The second is $\sqrt{3} = 1.73 + \ldots$ with an accuracy of quite a different order. True, the second step can be carried out to any desired approximation, but it still is of a different order to that of $\sqrt{9}$. By geometry the result can be achieved by the repetition of such a process as Euclid VI, 13, and each time the accuracy is dependent only upon the instruments available and the skill of the operator. To me there is something unnatural, almost grotesque, about the fitful vagaries of arithmetical coincidences: something utterly out of harmony with the rest of the universe, and obviously man-made. Indeed, if the application of geometrical method led to nothing more than meditation upon these matters, it would amply justify itself.

Novel Vehicle for the London Fire Brigade.—The latest addition to the equipment of the L.C.C. Fire Brigade is a Tilling-Stevens petrol-electric vehicle equipped as an emergency tender to deal with special conditions in fire extinguishing work and to facilitate rescue work in cases where part of a girder of a building has to be cut away. For this purpose an electric cutting plant and two electric drills are carried inside the new vehicle. Two drums of heavy cable for the cutting plant are mounted on bearings inside lockers near the rear of the vehicle so that they can be wound or unwound through apertures in the bottom; a spare drum is also carried below the rear floorboards. The connecting plug for the cable is at the extreme rear of the van, whilst the switch and resistances are at the front inside. For illuminating fire-fighting and other operations at night the machine carries three electric cluster lamps, each of 300 c.p. and two 18-in. searchlights of 10,000 c.p., which are adjustable to give a spot light or a 40 deg. flood beam. Light cables are wound on five drums mounted on spindles and furnished with brush and slip-ring connections so that current can be supplied with the drums in position. Alternatively the drums can be lifted out so that one or more lengths can be joined together up to a total length of 900 ft. All switches for the electrical equipment are mounted on a board immediately behind the driving seat, and are worked by the driver; the ends of the various cables are led to wander connections below the switchboard and can be selectively connected to six plugs according to the amperage required. The plug for the cutting plant cable is not connected to the switchboard and no fuse is included in the circuit, as the plant requires the full dynamo output of about 30 kilowatts, which can be supplied continuously. On the left of the switchboard are three automatic substitutional resistances, two for the searchlights and one for the cutting plant, which come into action when the arcs are broken. Oxy-acetylene cutting plant on a two-wheeled carrier also forms part of the equipment for use in positions which cannot be reached with the electrical plant.

The Rating of Resistances.

Constants that should always be stated.

By "ALPHA."

Rating may be termed a sub-heading of standardisation, and just as the standardisation of units is necessary for a comparison between different quantities, so is the standardisation of rating necessary for differentiating between various makers' products. The rating of such things as generators and motors is so obvious that the whole matter has been thoroughly discussed and settled, so that machines by different manufacturers may be fully compared as regards performance. The smaller pieces of electrical apparatus do not appear to be so obviously in need of standardisation for rating, although, amongst others, the standardisation of measuring instruments (B.E.S.A. 89-1919) is certainly necessary for progress in any branch of electrical engineering.

In connection with measurements, the provision of standards of resistance is of the first importance. A manufacturer will guarantee his standard resistance to be within a certain limit. He will usually specify the normal working current to be carried, in the case of a shunt or other low resistance, but for higher resistances which are intended to carry currents below that which would cause measurable heating, and consequent change of resistance, nothing is usually stated as to current.

A conductor has a definite ohmic resistance at any given temperature when measured with a certain current. An increase in the current used for measurement will cause an increase of temperature, and so an increase of resistance (unless the conductor is organic and has a negative temperature coefficient of resistance). The increase of temperature due to the passage of the measuring current is usually negligible, and is certainly below the maker's limit of inaccuracy. It is often necessary, however, to use standards at currents other than those for which they were designed, and so the need arises for a definite statement as to the maximum current that can be carried without getting beyond the maker's guaranteed inaccuracy. Further, should the current density exceed this amount, it is desirable to know the altered inaccuracy for the new conditions.

When the resistance and current are specified, two other constants are settled and can be determined. They are the power loss (I^2R) and the potential difference across the terminals. A standard resistance, then, to be completely specified requires that the four constants enumerated above, together with the temperature at which the measurement was made, should be given.

A statement of the maximum inaccuracy (commonly termed the "accuracy") completes the rating, in general. Other factors which at times are of great importance arise when the resistance is intended for alternating currents, when the above four constants are not a complete specification, the rating being altered entirely by a change of frequency. For ordinary direct-current work, such as bridge measurements, series resistances and shunts for instruments, &c., the above four constants are complete, and two of them must be noted in the standardisation report. The remaining two can then be directly calculated. With all these four constants available, the rating of one maker's product can be directly compared with that of another, although, of course, workmanship and general excellence of manufacture are obviously still beyond rating.

The case of rheostats is equally important, although the reason is different. Here the accuracy of the specified resistance is not important, but for general use it is more necessary to specify one of the other three constants at least. The "constants" for a rheostat are really far from being constant, and it is not possible to give any one rating to a rheostat, as the rating is determined by the temperature rise. The continuous rating is usually far lower than a short-period rating, the difference not being amenable to laws as the heat conductivity of all the surrounding media enters into the problem. A complete rating for a rheostat would take the form of one or more curves, the rating at continuous load being the lowest, and the rating for an "instantaneous" period "on" and a long period "off" being at the other end of the rating curve. This curve would not be a simple matter to produce, as "intermittent rating" is indeterminate. If a given rating is possible at, say, one minute "on" and three minutes "off," the same rating is possible at an infinite number of shorter and longer periods "on" and "off." If any law does connect these various intermittent ratings, then one curve will be sufficient with the help of the "law."

For rapid use it should be possible to read off on the nameplate of a rheostat the resistance, the current carried, the watts dissipated, and the voltage drop at continuous load, *i.e.*, the two quantities to be measured after such a period as enables the temperature to attain a steady value. Any two could be measured, but all four should be stated, as at times all of them are required to be known when selecting a rheostat, and so for quickness of working and absence of mistake the nameplate should include all four constants. If a manufacturer could give a definite statement as to the alteration of rating when run at all "intermittent ratings," the rheostat would be completely specified, but in the absence of this general statement a curve or curves would be necessary. A general statement, such as "50 per cent. increase of power loss permissible when 'on' and 'off' for equal periods, the 'on' periods not to exceed, say, one minute," would be useful as a general guide. For any particular intermittent rating this rating should be stated on the nameplate; then the rating would be quite definite. For general use, and not for a specific purpose, however, this is impossible again unless some definite law is found to hold as to the relationship between all possible intermittent ratings and the continuous rating.

Finally, the writer is of the opinion that the general provision of three terminals to all rheostats, and to a lesser extent resistance boxes, would extend the sphere of use of the apparatus. Of these three terminals, two would be connected to the ends of the winding and the third connected to the tapping, thus enabling the apparatus to be used as a potential rheostat as well as a series resistance, and so increasing the scope of application.

Punjab Hydro-Electric Development.—Some interesting details of the Punjab hydro-electric scheme are given in the *Indian Textile Journal*. Use is to be made of the snow-fed waters of the River Uhl, from which the water will be diverted through 2½ miles of tunnel, 9 ft. in diameter, in solid granite, and will then be dropped through a fall of 1,800 ft. to the first power station, which will be of 36,000-kW capacity, to be increased later to 70,600 kW. When the demand for power increases it is proposed to conduct the water along three miles of open duct and drop it over a second and lower fall of 1,200 ft., thus providing another 48,000 kW. The project involves railway communication to the power station. It is estimated that the scheme will take from 3½ to 4 years to complete, and it is hoped that by the summer of 1929 power will be available for 20 Punjab towns from Gurdaspur, at a cost of ¾d. per kWh. The second stage of the development will involve the supply of energy to Simla, Ambala, and Patiala in the east, Gujranwala and Sialkot in the north, and Montgomery in the west. The third stage will aim at supplying Delhi, Karnal, and possibly Rohtak in the far south of the Punjab, and Saharanpur, Meerut, and Panipat in the United Provinces. In its final form the scheme will supply 47 towns, from Rohtak in the south to Sialkat in the north, at an average cost of less than ½d. per kWh.

Manchester Mining Exhibition.—Correction.—We regret that the titles of the two blocks illustrating Ferguson, Pailin industrial switches, on page 167 of our July 31st issue, were accidentally crossed. Fig. 1, of course, is a view of the flameproof auto-transformer starter, and fig. 2 shows the 1,200-amp. circuit breaker.

Alternator Frames.

A Simple Mode of Construction.

By WILLIAM SHARP.

IT is recognised that "Necessity is the mother of invention," and some time ago, during one of our many strikes, necessity demanded that an alternator frame should be made without skilled labour. It fell to my lot to meet the demand, and consequently a frame was made which answered the purpose.

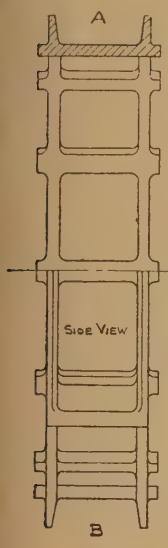

Fig. 1.

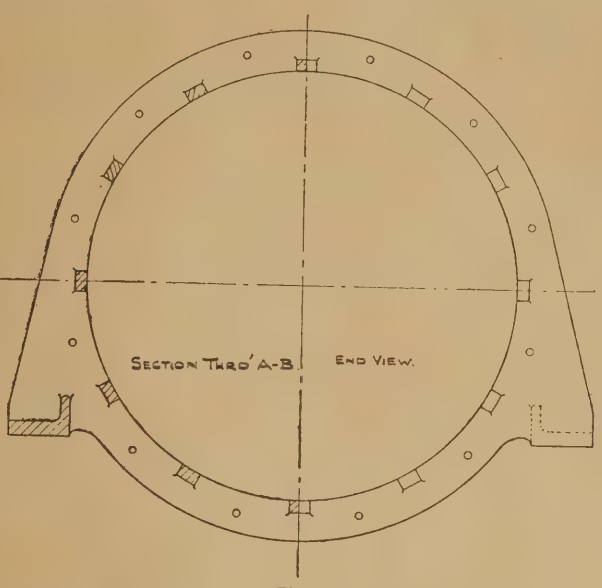

Fig. 2.

Having entered upon the scheme, I found it difficult to pass on without fully investigating its possibilities, and it is to this investigation and reconsideration that the drawings reproduced herewith owe their origin.

It will be seen (figs. 1 and 2) that the frame is of simple construction, having only two flanges held apart by fourteen ribs, two of which form the seating for the frame. The dominating features of this design are the elimination of all core boxes, and the number of sections which can be produced in two or three days, against our present-day minimum of two or three weeks for the complete unit. Should a whole pattern be made to fig. 1 it could be housed in three moulding boxes, as in fig. 4 or, alternatively, a half pattern would need four moulding boxes, as shown in fig. 5. It might be stated that the half pattern would necessitate special moulding, whereas the whole pattern could be made in jobbing moulding boxes. It is intended to make the sections in widths of about 300 mm. and to add as many sections (from the same pattern, see fig. 3) as are required for any particular machine. Each section can be registered and bolted together, and additional security will be obtained from the keys (holding the stampings to the ribs of the frame), which can be secured with screws or bolts as desired.

The clamp plates can be carried from the projecting lugs, while the terminal bracket can be attached to either the flange or the connecting ribs on the underside of the frame.

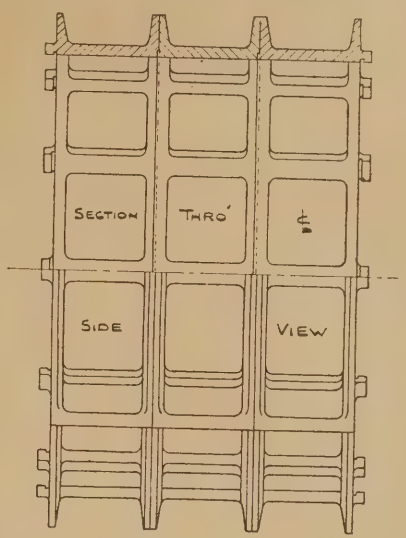

Fig. 3.

It is preferable to cover the finished article with planished steel, in order to add to its general appearance.

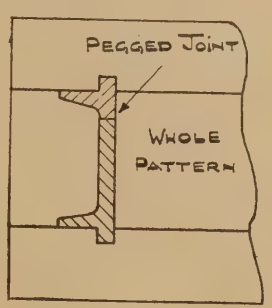

Fig. 4.

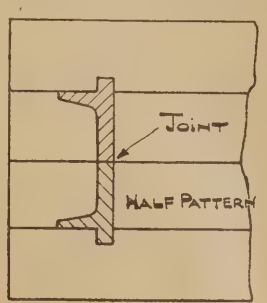

Fig. 5.

The design lends itself more especially to axially rather than radially ventilated machines, but, on the other hand, with slight modifications, this sectional scheme may be utilised for any system of ventilation.

The Generation of Electricity in Great Britain.

Statistics published by the Electricity Commissioners for the year ended March 31st, 1925.

WE have received a copy of the Electricity Commissioners' summary and analyses of the returns of fuel consumption and kWh generated made to them by authorised undertakers under the provisions of Section 27 of the Electricity (Supply) Act, 1919, and of the returns furnished by railway and tramway authorities and by certain non-statutory undertakings, for the year ended March 31st, 1925.*

Returns were received in respect of 584 generating stations, an increase of 43 on the figures for the preceding year. This increase is partly attributable to the fact that certain authorised undertakers owning more than one generating station submitted a separate return for each station, instead of a consolidated return for the undertaking as a whole as in former years. The actual number of new stations which came into operation on or after April 1st, 1924, was 23.

* Stationery Office. Price, 1s. 6d. net.

Of the 584 stations dealt with, 465 have been given places in order of results achieved (*i.e.*, based on thermal efficiency) in comparison with stations of the same group and class in their respective areas and also in Great Britain.

The remaining 119 stations are classifiable as follows:—(*a*) stations not in operation during the greater part of the year—39; (*b*) stations where the entire output was generated by waste heat, water power, &c.—48; and (*c*) stations where a large proportion of the output was generated by waste heat, water power, &c.—32.

The figures for the approximate thermal efficiency of the various stations have been calculated on the basis of average calorific values as indicated in previous returns. In arriving at the average consumption of fuel per kWh generated in the case of stations where more than one class of fuel (*e.g.*, coal and oil) was consumed, the actual fuel consumption at each station has been converted (on the basis of average calorific

values) into an equivalent tonnage of the predominating class of fuel used at the station. The figures thus obtained permit of closer comparison between individual stations, but are not directly comparable with the average values given in the previous returns. A number of instances where the returns do not state the calorific value of the fuel consumed still exist, and the Commissioners again impress upon undertakers the desirability of furnishing these particulars.

As compared with the corresponding figures for the previous year, the total output showed an increase of nearly 734 million kWh, or 11 per cent., whereas the total consumption of fuel showed an increase of 441,797 tons, or 5.8 per cent. only.

The first table is devoted to the area grouping of stations. England and Wales is divided into 20 areas (1 to 20), and Scotland 5 (S1 to S5), making with an additional one for Guernsey (21), a total of 26 area groups.

In Table 2 are classified the stations in letter groups from A to M according to the number of kWh generated during the year. Group A covers stations which generated over 200 million kWh and group M those which generated under 50,000 kWh.

The third table deals with steam stations grouped according to the kWh generated on Table 2. There were three stations which generated over 200 million kWh (group A), as in the previous year, and these showed a reduction in the average fuel consumption per kWh from 1.96 to 1.89 lb. for a total generation of 758,087,410 kWh, as compared with 715,219,124 kWh in the previous year. The Newcastle-upon-Tyne Electric Supply Co.'s station (Carville B) had both the lowest average fuel consumption and the highest thermal efficiency in this group, the consumption per kWh being 1.70 lb. and the thermal efficiency 18.78 per cent. The second group B, between 100 and 200 million kWh, is headed for both the lowest fuel consumption and the highest thermal efficiency by the Manchester Corporation (Barton) station, the average consumption being 1.51 lb. and the efficiency 19.85 per cent. The average fuel consumption for the group was 2.07 lb. for a total generation of 1,509,811,987 kWh.

The following are the details in brief of the remaining groups in this table :—

Group C (50 to 100 million kWh).—1,914,369,704 kWh, 2.41 lb.; Central Electric Supply Co., Ltd., 1.89 lb.; Rotherham Corporation (Prince of Wales station), 17.38 per cent.

Group D (25 to 50 million kWh).—1,219,706,096 kWh, 2.44 lb.; Mersey Power Co., Ltd., 1.88 lb. and 17.42 per cent.

Group E (10 to 25 million kWh).—1,047,123,268 kWh, 2.89 lb.; Accrington Corporation, 1.99 lb.; Wallasey Corporation, 14.90 per cent.

Group F (5 to 10 million kWh).—315,054,033 kWh, 3.70 lb.; Doncaster Corporation, 2.36 lb. and 12.09 per cent.

Group G (2.5 to 5 million kWh).—210,579,481 kWh, 4.03 lb.; * Finchley Urban District Council, 2.65 lb. and 12.22 per cent.

Group H (1.0 to 2.5 million kWh).—86,087,220 kWh, 5.24 lb.; * Wycombe Borough Electric Light & Power Co., Ltd., 2.89 lb. and 12.15 per cent.

Group I (0.5 to 1.0 million kWh).—15,917,850 kWh, 7.42 lb.; Melton Mowbray Electric Light Co., Ltd., 4.77 lb. and 6.50 per cent.

Group J (250,000 to 500,000 kWh).—8,391,502 kWh, 7.25 lb.; * Electric Supply Corporation, Ltd. (Exmouth), 4.48 lb. and 6.34 per cent.

Group K (100,000 to 250,000 kWh).—4,586,327 kWh, 12.60 lb.; Dawlish Electric Light & Power Co., Ltd., 5.43 lb. and 5.46 per cent.

Group L (50,000 to 100,000 kWh).—950,133 kWh, 16.20 lb.; * Ross Electric Light & Power Co., Ltd., 9.01 lb. and 3.29 per cent.

Group M (under 50,000 kWh).—91,639 kWh, 21.60 lb.; L.N.E. Railway (Silloth), 5.11 lb. and 5.26 per cent.

The foregoing stations generated a total of 7,090,756,650 kWh, as against 6,342,107,841 kWh in the year 1923-4. The total fuel consumed amounted to 8,001,687 tons, an increase of 439,696 tons.

A fourth table is compiled in a similar manner to Table 3, for gas producer stations. There are no stations above H Group (1.0 to 2.5 million kWh). This group accounts for the generation of 1,894,736 kWh and the average fuel consumption (converted to the basis of coal) is shown as 1.81 lb. The * Leek Urban District Council heads the list for both lowest consumption and highest efficiency, the figures in lb. and per cent. being 1.81 and 14.45 respectively. The details for the remaining groups are as follows :—

Group I.—4,400,004 kWh, 3.05 lb.; * Faversham Corporation, 1.98 lb. and 12.26 per cent.

Group J.—3,192,859 kWh, 2.27 lb.; Chippenham Electric Supply Co., Ltd., 1.67 lb.; * Bridgewater and District Electric Supply & Traction Co., Ltd., 13.68 per cent.

Group K.—4,359,220 kWh, 2.62 lb.; * Bude Electric Supply Co., Ltd., 1.54 lb. and 14.76 per cent.

Group L.—1,006,367 kWh, 2.86 lb.; * Ledbury Electric Supply Co., Ltd., 1.73 lb. and 12.31 per cent.

Group M.—123,660 kWh, 3.69 lb.; Mr. G. W. D. Assheton Smith and Successors (Port Dinorwic undertaking), 2.06 lb. and 10.32 per cent.

The gas producer stations account for a total generation of 14,976,846 kWh, as compared with 13,756,285 kWh in the year ended March 31st, 1924. The total fuel consumption is recorded as 17,394 tons, as against 16,161 tons, the average consumption being 2.60 lb. per kWh.

In Table 5 the statistics for oil engine stations are drawn up in the same manner. The largest generating station, Southend-on-Sea Corporation (Leigh) is alone in the Group G (2.5 to 5.0 million kWh). The total kWh generated was 2,670,510 and the respective figures for average fuel consumption (oil basis) and thermal efficiency are shown as 0.71 lb. and 26.60 per cent.

As in the preceding tables the brief details are :—

Group H.—17,049,300 kWh, 1.06 lb.; Electricity Co., of Macclesfield, Ltd., 0.68 lb. and 26.90 per cent.

Group I.—13,763,452 kWh, 0.91 lb.; East Anglian Electricity Ltd. (Felixstowe), 0.62 lb. and 29.20 per cent.

Group J.—6,464,394 kWh, 1.14 lb.; Bognor Gas, Light and Coke Co., 0.62 lb. and 28.22 per cent.

Group K.—1,798,914 kWh, 1.26 lb.; Cookham and District Electricity Corporation, Ltd., 0.73 lb.; Frinton-on-Sea and District Electric Light & Power Co., Ltd., 24.00 per cent.

Group L.—491,193 kWh, 1.13 lb.; Elgin Electric Supply Co., Ltd., 0.81 lb.; † Windsor Electrical Installation Co., Ltd., 22.45 per cent.

Group M.—301,518 kWh, 1.34 lb.; Sherborne Electric Supply Co., Ltd., 1.16 lb. and 16.30 per cent.

These stations generated a total of 42,539,281 kWh, as against 33,386,317 kWh in the previous year. The total fuel consumption is shown as 23,161 tons, an increase of 868 tons on 1923-4. The average consumption for the year was 1.01 lb. per kWh.

Statistics for stations generating by waste heat, refuse destructor, town gas and water power, are drawn up in the next table (6), under separate headings for the generation methods. The particulars of consumption and thermal efficiency are not given in this case. The table is arranged in the order of the group letters and the number of stations in each group and the kWh generated by them are given. The largest waste heat station was in Group B and the kWh generated amounted to 19,811,752. Group C held alone the largest refuse destructor station, generating 3,385,315 kWh. In the case of water power, one station heads the table in Group D with 35,019,736 kWh to its credit, and 1,134,830 kWh was generated by the largest town's gas station in Group H. The total kWh generated by the combined stations in this table was 267,102,752, a decrease from the preceding year from 292,270,829.

As in last year's summary, Table 7 shows comprehensively the best results obtained at stations of each size and class and also in each area group (Table 1) for the lowest consumption and highest efficiency. As was the case last year, Manchester (Barton) heads the list for both the lowest consumption and the highest efficiency for steam stations. It is pointed out that the figures given for fuel consumption and thermal efficiency in any one group and area do not necessarily relate to the same station, due to the variation in the calorific value of the fuel used by individual stations.

In the final table (8) particulars are given of the energy generated and the fuel consumed in all the 26 areas (Table 1). The total kWh generated in all the areas amounted to 7,415,375,529. Of this number 7,090,756,650 kWh was generated by steam stations or 95.63 per cent. The total for the previous year was 6,681,524,272.

Area 7, the London and Home Counties District, was responsible for the greatest number of kWh generated, the figure being 1,949,825,578, of which 1,936,812,565 kWh was generated by steam. The total fuel consumption for steam stations amounted to 8,001,687 tons, of which 2,173,399 tons was consumed in area 7. The largest number of kWh generated by gas producer stations in any one area was 2,513,705 in No. 8 area (West and North-West Midlands); 10,549,668 kWh was generated by oil in area 7, being the largest in the area. The greatest generation by waste heat is shown in area 16, the figure being 175,105,361. The percentages of the total kWh generated, for refuse destructor, town's gas and water power, are 0.35, 0.05, and 0.69 respectively.

* Composite stations.
† Partial bulk supply taken.

Non-Rusting Steel.—At the recent conversazione of the Royal Society, exhibits of several types of steel containing nickel and chromium and offering a high resistance to corrosion were exhibited. The specimens shown by Sir Robert Hadfield included two new alloy steels which are notable for their permanence on exposure to the atmosphere and to fresh or salt waters, differing from the ordinary non-rusting chromium steels in being independent of heat treatment. According to *Nature* the heating and cooling curves indicate a complete absence of critical points, and no change of phase is detected by microscopical examination, so that the structure remains homogeneous whatever be the heat treatment to which the steel is subjected. Riveting and brazing consequently have no effect on the capacity of the alloy for withstanding corrosion. The exhibit included turbine blades and test specimens showing the mechanical properties of the steel at atmospheric temperatures and at temperatures up to 650 deg. C, under prolonged loading, showing the absence of creep.

Reviews.

River Gauging. By M. A. Hogan, Ph.D., A.M.Inst.C.E. Pp. viii+70; figs. 24. London: H.M. Stationery Office. Price 2s. net.

This is a report on the methods and appliances suitable for use in Great Britain bearing upon measurements of river flow or of tidal and other currents, prepared by the Committee on Gauging of Rivers and Tidal Currents appointed by the Department of Scientific and Industrial Research.

The report describes the principle of construction of modern current meters and the methods of calibrating such meters, and also the design of rating stations. Many tests have been carried out by the Committee and the results are given in the report, together with curves plotted from the results. The merits of various types of meters are discussed fully and the results obtained are compared. Three typical current meters are described in an appendix, the Price electric current meter, the Amsler meter (1915 model), and the Stoppani current meter. The Price electric current meter consists of a wheel carrying buckets which rotates about a vertical axis. The upper portion of the axis passes into a contact box by which electrical contacts are made as the axis revolves and signals are produced in a telephone receiver.

The use of the ordinary current meters is found unsatisfactory for measurement in small streams and the Committee recommends and discusses the employment of weirs for this purpose. Several types of weirs are discussed and the results of tests taken with weirs are given.

Electric Welding. By L. B. Wilson. Pp. xiii+106; figs. 79. London: Sir Isaac Pitman & Sons, Ltd. Price 5s. net.

This elementary treatise on the subject contains concise descriptions of the different methods of electric welding, the equipment, and applications. A clear diagram illustrating each method renders the description easy to follow, and economic considerations in connection with the equipment and applications add an interest to the work. Arc, resistance, "Cyc-arc," and percussion welding are each dealt with exhaustively from an elementary point of view. The chapter on automatic arc welding is of particular interest; the construction and operation of an automatic arc welding machine is described and illustrated, and considerable valuable data are given for the performance. A short chapter on the Quasi-arc process contains some particularly interesting reproductions of photomicrographs of sections of joints welded by three different methods, (1) Quasi-arc, (2) electrical weld with bare wire, and (3) oxy-acetylene weld, accompanying descriptive comparisons of the methods.

The concluding chapter deals with probably the most delicate of operations in connection with electric welding, that of welding small studs on steel plates, which has been made possible by the introduction of the "Cyc-arc" automatic welding process.

The many excellent illustrations are an outstanding feature of the book and help to render it the work of value which it should prove to all students and practical men interested in the subject.

Magnets. By C. R. Underhill, Fellow A.I.E.E. Pp. xiii+468; figs. 467. London: McGraw Hill Publishing Co., Ltd. Price 20s. net.

This work is concerned mainly with the theory and design of electromagnets and with descriptive matter relating to practical applications of the subject. Permanent magnets receive but scant notice in a final chapter comprising 16 pages only. The author has attempted to develop the theory of electric and magnetic circuits whilst almost completely avoiding the use of mathematical symbols. We cannot congratulate him on his success, and have to confess that we find the theoretical portions of the book very difficult reading.

After an introductory chapter on the rudiments of electrical theory, direct-current electromagnets are classified into types and their mechanical and time characteristics are briefly investigated on elementary lines. Valuable chapters describe such practical applications as magnetic chucks and brakes, lifting magnets, contactor gear and relays. The design and operating characteristics of direct current solenoids are next treated in great detail, an abundance of test data, mainly the result of the author's own researches, being given. The treatment of the true characteristics of d.c. solenoids is somewhat obscured by the cumbersome methods of calculation described. The magnetic circuit and magnetic calculations are dealt with at length. We find on p. 287 a short demonstration based on the statement that the perimeter of a circle of 1 cm. radius is 12.5664 cm. We cannot but think that if the author had been content to express π and its multiples in the conventional symbolic fashion instead of by numbers giving various degrees of approximation, such a mistake would not have occurred, and his reasoning would have been followed more easily. The treatment of alternating current is equally confusing. On p. 344 the ratio of R.M.S. to maximum value is found by taking the square root of the mean of the maximum and minimum values of the square of the current value during half a cycle. The theory of power factor correction by static condensers is treated at some length in this chapter. The chapter on magnetic materials is unduly short, embracing only seven pages. The design and characteristics of alternating current magnetic and electromagnetic devices are treated in great detail. We are, however, rather surprised to find no account of the theory of the shaded pole magnet. The account of the a.c. induction watt-hour meter on p. 401 is merely an explanation of why the disk rotates, no attempt being made to show how proportionality of speed to watts is obtained.

The book will be of greatest use to the specialist, to whom the wealth of information regarding the characteristics of electromagnets will particularly appeal. To such readers the portions dealing with elementary theory will be somewhat redundant. The work would have been more acceptable to the general reader and to the student if the section describing modern electromagnetic apparatus had been considerably amplified. In view of the extensive and increasing use of protective and automatic gear in modern generating and distributing systems, one would expect to find copious descriptive treatment of the subject of relays in the work under consideration. Actually the space allocated to such an important matter is limited to eight pages.

The Production and Measurement of Low Pressures. By F. H. Newman, D.Sc. Pp. 192; figs. 48. London: E. Benn, Ltd., 1925. Price, 16s. net.

This monograph is written with the idea of furnishing the physicist, and engineer, with an account of the more important instruments and devices used in this branch of science. It will be found extremely valuable to those interested in the production of high vacua, together with the important discoveries that have been made due to the recent improvements in high vacuum processes. The various types of mechanical, mercury and diffusion pumps, and manometer and molecular gauges, are well described and illustrated, along with a wealth of secondary information, which all who are interested in the subject should possess. Dr. Newman is of opinion that the trend of modern scientific thought favours a more general adoption of mercury vapour diffusion pumps, and predicts their displacing all other types where rapid and efficient exhaustion is desired. In the early part of the volume, the various devices adopted for producing low pressures are summarised, the whole subject being considered in detail in the subsequent chapters. A brief sketch is given of the general principles of thermionic emission, a striking and important practical application of which is the thermionic valve now in general use in wireless telegraphy and telephony. Electrochemical processes used in the removal of gases are also described, including charcoal activation at liquid air temperatures, and its practical application in the use of charcoal in liquid air containers.

Descriptions are given of the phenomena of the disappearance of gas in the discharge tube, and in the presence of incandescent filaments and phosphorus. The modern method of exhausting incandescent lamps is based on the disappearance of gas in the presence of phosphorus. The tungsten filament is coated with an alcoholic suspension of red phosphorus and sodium silicate, the lamp quickly exhausted by the pumping system, sealed off, and a high pressure applied to the filament, the process known as "flashing," the phosphorus volatilising from the filament and removing the residual gases.

The book is devoted mainly to the practical side of the subject, and in spite of its omission of all mathematical formulæ, the author has attained a considerable amount of precision in his statements. The book will be a useful guide that will stimulate inquiry and further exploration in this attractive field.

The ground covered by the book is of considerable extent, the treatment is lucid and the volume abounds with practical information. To those who desire to study the subject, the volume will prove exceedingly useful as a handbook of trustworthy information. It is one of the most important publications of its class, is of definite practical value and no other book treats the subject with the same skill. An appendix tabulating vapour pressures, speeds of pumps, lowest pressures attained, pressure ranges for various manometers, and an index, are excellent features which deserve favourable comment.

The volume is well printed, the matter excellently arranged, and it only remains to say that Dr. Newman has accomplished a very commendable piece of work in which there are but few typographical errors.

Industrial Electricity. By William H. Timbie. Pp. xiii+735; figs. 469. London: Chapman & Hall, Ltd. Price, 17s. 6d. net. Answers to problems. Price 2s. 6d.

The title of this book does not seem a very suitable one for an elementary text book on direct-current electrical engineering. The work has, however, been written on excellent lines and will be a welcome addition to the already considerable number of elementary text-books available for the beginner. The author has started from first principles, and without the use of any but the most elementary mathematics, has covered the whole range of elementary direct current technology in a very able fashion. The student will be greatly assisted by the summaries which form the conclusion of each chapter, and by the large number of examples given for solution. The answers to these examples are not given in the book but are published separately. It is necessary to remark that the conformity to American usage in the matter of units, wire gauge sizes, and

so forth, may tend to confuse the English student. We notice this particularly in the chapter on the magnetic circuit, in which, by the use of ampere-turns per inch as the unit of magnetising force, the value of 3.19 is given for the permeability of air.

The author has taken pains to develop a clear treatment of magnetic calculations, but the derivation of the practical units which he uses from the fundamental system should have begun and not concluded this important chapter. The chapters on direct current generators and motors call for special praise, and give a very able exposition of the principles and characteristics of these machines. Another excellent chapter is that dealing with dielectrics, in which the theory of the electrostatic circuit is worked out on lines similar to those employed for the magnetic circuit, and the bearing of the theory on the distribution of stresses in insulators and cable dielectrics is clearly shown. Here again, however, the derivation of the formulæ, and of the constants, when inch units are used, might have been given for the benefit of such students as are not willing to take figures and formulæ on trust. Primary and secondary batteries and gaseous conductors are the subjects of two useful chapters. The subject of electrical instruments and measurements is covered by two chapters, one in the early part of the book dealing very satisfactorily with resistance measurements and touching briefly on the matter of fault localisation, the other, in the latter part of the book, dealing with direct current instruments and meters in which the treatment is somewhat superficial.

Subject to the limitations referred to, the work can be recommended as a sound and well-written elementary textbook, and it should be of particular use to such students and apprentices as are not able to work through a systematic course of instruction in electrical engineering, and also to electrical workers desirous of obtaining a knowledge of elementary theory. The book is excellently produced and the price is quite reasonable.

Principles Adopted for Electric Lighting in H.M. Naval Service, being the First Report of the Admiralty Electric Lighting Committee, 1924. Pp. 51; figs. 12. London: His Majesty's Stationery Office. Price, 9d. net.

It would be difficult to find a better illustration of the way in which knowledge of illuminating engineering is penetrating into all quarters than this report. Government Departments have often been accused of making obsolete recommendations, but we are bound to say that the ideas conveyed in this case are up to date. In an introduction (Section I) a summary of general principles applying to lighting in offices and factories is presented, and the application of most of these to naval practice pointed out. On modern ships of war much work must be done by artificial light, and inadequate lighting is liable to cause eyestrain; unfortunately many persons are attracted by excess of light and the visibility of naked lights, and disregard the important matter—illumination on the place of work.

Next we have a short account of the mechanism of the eye and the part played by adaptation (Section II). Miners' nystagmus is mentioned as an illustration of the results of too feeble lighting, and the drawbacks of glare are clearly pointed out. In Section III terms used in illuminating engineering are explained in simple language. The method of explaining the lumen hardly seems happy, as the illustration based on the screening of sources behind holes of varying size is liable to cause confusion with "brightness"; but the term is quite correctly defined in an appendix.

Section IV, "Recommendations," is the most important section of the work. It is impossible to review these in detail, but they cover a wide ground, and convey many practical suggestions in a condensed form. 3-5 foot-candles is regarded as a good average for most purposes, but more detailed values for different spaces on ships are given in an appendix. Great importance is attached to shading. Indeed, the recommendation that "no naked light shall be visible within an angle made by two lines from the eye, one being horizontal and the other at 40 degrees to the horizontal" is more severe than that made by the Home Office Committee in connection with factory lighting. There is sound advice on the avoidance of shallow conical reflectors, inefficient "crinkled" glass shades, limitation of portable fittings, avoidance of excessive contrasts, spacing rules, &c., and attention is drawn to several special problems on board ship, such as the lighting of gauges, hatches, &c. It is interesting to note the recommendation that gas-filled lamps should supersede arc lamps for coaling, &c., and that the blue lamps, tried for action circuits in the war, should be eliminated.

One notes with approval a final recommendation that lighting arrangements should be examined by an officer of the electrical engineering department, who should issue a certificate (with comments if necessary). Explanatory matter at the end of the book is assisted by numerous diagrams, which are clear and good. In many respects the book is a rather remarkable instance of judicious concentration. If these recommendations are generally observed a considerable improvement in the lighting of H.M. ships will be effected. This initial booklet is to be followed by separate reports dealing with the application of these principles to specific problems.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Our Advertising Competition.—We wish to advise advertisers and all who are responsible for the preparation of advertisement "copy" for the pages of the ELECTRICAL REVIEW that entries for our Competition are now being received from various directions. As there are probably some other firms among either existing or intending advertisers who still wish to enter the contest, we may state again that the prizes for £100, £50, and £25 respectively will be awarded on the finding of independent judges who will decide which series of full-, half-, and quarter-page advertisements appearing in the ELECTRICAL REVIEW during the current half-year, they consider the best. The names of the judges and full particulars of the conditions that have to be complied with are given in our advertisement supplement, page 44, this week.

Rubber Manufacturers and Restriction.—A group of British rubber manufacturers has made representations to the Government in connection with the high prices engendered by the working of the Stevenson restriction scheme. It is contended that restriction has gone too far and the result will be an acute shortage of supplies which will be taken advantage of by producers outside the British Empire.

Threatened Tramway Strike. — The threatened strike of the tramway employés of the Stalybridge Joint Tramways and Electricity Board which was to have begun at midnight on August 5th was averted, the employés having agreed to suspend the strike notice pending a mass meeting which was to be held yesterday (Thursday).

Electricity Meters Approved.—The *London Gazette* notifies the approval by the Electricity Commissioners of the following meters:—Metropolitan-Vickers "Type N" single-phase watt-hour meter, from 3 to 20 A, 100 to 600 V; the Ferranti polyphase watt-hour meter "Type C.T.," from 2.5 to 20 A, 100 to 500 V; and the Ferranti "Type C" a.c. meter for the same range of current and voltage.

A "Better Lighting" Campaign. — The Electric Lamp Manufacturers' Association is undertaking, during October and November next, an intensive national "campaign" to induce shopkeepers to pay more attention to the illumination of their premises. Apart from the distribution of booklets—including one on "Light as a Sales Force"—the Association is taking advertisement space in trade papers, and articles by illumination experts will appear in these papers during the campaign. Lectures and demonstrations will be arranged for shopkeepers' associations and chambers of commerce, and electrical retailers are asked to assist in this work.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from August 5th. In the case of foreign applications the name and address of the British representatives are also given:—

Spiroglide. No. 459,014. Class 6. Centrifugal pumps.—The British Electric Plant Co., Ltd., Alloa, Scotland.

Magnum (lettering and design). No. 451,980. Class 8. Receiving instruments, tapped coils, and coil holders, all for use in radio-telephony.—Burne-Jones & Co., Ltd., 288, Borough High Street, S.E.1.

Resonic. No. 456,002. Class 8. Instruments and apparatus for use in radio-telephony.—Thorp Roderick, Ltd., 12, Balsall Street, Bedford.

Tom Thumb, No. 458 867, and Le Petit Poucet, No. 458,868. Class 8. Radio-telephonic and telegraphic apparatus, sets and instruments, electric accumulators and batteries.—Richard Brenhley, 248, Rue de Rivoli, Paris. (S. Sokal, 1, Great James Street, Bedford Row, W.C.1.)

Cleartron, No. 459,275, and (same letters combined with design), No. 459,302. Class 8. Thermionic valves.—A. H. Carlisle, 4, Wetherby Mansions S.W.5.

Orion. No. 452,747. Class 13. Electric lamps (ordinary).—Magyar Wolframlampa-gyar Kremenezky Janos Reszvenytarsasag, VI Vaci ut 99, Budapest, Hungary. (Dicker & Pollock, 20-23, Holborn, E.C.1.)

Insuloid. No. 457,362. All goods in Class 13.—J. A. Crabtree & Co., Ltd., Lincoln Road, Walsall.

Xiattattaix (lettering and design). No. 457,428. Class 13. Electric light fittings, electric cooking installations, and electric heating appliances.—Attaix, Ltd., 36, Bernard Street, Southampton.

Local Exhibition.—HEBDEN BRIDGE.—The Electricity Committee proposes to hold an exhibition in October.

The British Industries Fair.—It is reported that the Board of Trade has asked the Government to guarantee the British Industries Fair for a period of four years. The prospects for the next Fair are considered favourable.

Art in Advertisement.—We have recently received an excellent example of publicity matter from Messrs. Cross-Courtenay, Ltd. This takes the form of a brochure, the leaves of which are samples of paper made by Messrs. Grosvenor, Chater & Co., Ltd., at the Abbey Mills, Holywell. Upon each page are printed drawings of various kinds—pen-and-pencil sketches, colour designs, &c.—and photographs. The results are very pleasing; the brochure should form a useful guide to advertisers who aim at distinction in their announcements.

Trade Announcement.—THE CURTIS MANUFACTURING CO., of Conduit Place, Paddington, W.2, has converted its business into a private limited company—the Curtis Manufacturing Co., Ltd.

Catalogues and Lists.—MR. I. ROSE, 227, Brooke Road, Upper Clapton, E.5.—A circular letter drawing attention to the "Forward" electrically-propelled carriage.

MICHELL BEARINGS, LTD., South Benwell, Newcastle-on-Tyne.—An illustrated booklet describing the "Michell" viscometer.

SIEMENS & ENGLISH ELECTRIC CO., LTD., 38-39, Upper Thames Street, E.C.4.—Illustrated price sheet of electrical appliances and accessories for August.

MESSRS. COLE, MARCHENT & MORLEY, LTD., Bradford.—Two illustrated leaflets dealing with "Colmar" metal and "Marcol" iron for casting.

THE NATIONAL CARBON CO., INC., New York City, U.S.A.—An illustrated folder advertising "Columbia" dry cells.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—Catalogue No. A.B.V. 202, dealing with three-phase induction motors. Fully illustrated. Also an August stock list of motors and dynamos.

MESSRS. R. O'BRIEN & Co., 66, Mosley Street, Manchester.—A comprehensive catalogue (109 pp.) of electric light fittings, including electroliers, bowls, standards, pendants, ship's fittings, and accessories. Fully illustrated and priced.

MESSRS. CECIL HODGES & Co., LTD., Empire Works, Dalston, E.—An illustrated pamphlet advertising standard switchboard moving-iron ammeters, milliammeters, &c.

Bankruptcy Proceedings.—G. W. TEMPEST, 40, Brazennose Street, Manchester, lately trading as the Northern Radio Co., Manchester and Leeds, also as the General Wireless Trading Co. at Leeds, radio and telephone engineer.—The first meeting of the creditors herein was held on August 5th at the Official Receiver's office, Manchester. The statement of affairs showed liabilities expected to rank for dividend of £1,632, with a deficiency of £1,079.

P. L. SYMONDS, 40, Victoria Road, Great Yarmouth, Norfolk, electrician.—The following are creditors herein:—

	£		£
Dew, Alfred J.	73	Guaranteed, Ltd.	29
Deacon, William	32	Charles White Electrical Co., Ltd.	55
Falk, Stadelmann & Co., Ltd.	63		

F. R. GRIFFITHS, Alexandra House, 36, Alexandra Road, Bedford.—At the Chelmsford Bankruptcy Court on August 5th the above debtor, against whom a receiving order was made on January 20th last on a creditor's petition, moved to rescind that order on the ground that all the debts and costs had been paid in full. The Official Receiver stated that the money had been deposited to discharge all liabilities. The order was accordingly rescinded.

W. T. ROBINSON and H. ATTERBURY, electrical engineers, trading as J. P. Beckett & Co., 134, Victoria Street, Great Grimsby.—Last day for the receipt of proofs for dividend, August 18th. Trustee, Mr. S. M. Forrester, 1, Town Hall Street, Great Grimsby.

G. W. HUMPHREY, trading as the Humphrey Electrical Co., electrical engineer, 24, Broad Quay, Bristol. Last day for the receipt of proofs for dividend, August 18th. Trustee, Mr. F. W. Darley, Official Receiver, 26, Baldwin Street, Bristol.

A. C. R. BIRKETT, electrical engineer, 22 and 24, Wheeler Gate, Nottingham.—First and final dividend of 3¾d. in the £, payable August 17th at the Official Receiver's offices, 4, Castle Place, Nottingham.

H. W. SLATER, trading as the Engineering Supplies Co., mechanical and electrical engineer, 24, Grey Street, Newcastle-on-Tyne.—Trustee, Mr. C. Woollett, Pearl Buildings, 4, Northumberland Street, Newcastle-on-Tyne, released July 8th.

THOMAS BARTON, electrical engineer, Ainsworth Street, Blackburn.—Receiving order made August 5th on a creditor's petition.

A. L. DYER, electrical engineer, 49, Whitfield Avenue, Newcastle-under-Lyme.—Receiving order made July 31st on a creditor's petition. First meeting to-day (August 14th) at the Official Receiver's office, 12, Lonsdale Street, Stoke-on-Trent.

Dissolution of Partnership.—CATLOW & BULLOUGH, radio engineers, Atherton, Lancs.—Messrs. J. Bullough and H. Catlow have dissolved partnership. Debts will be attended to by Mr. Catlow, who will carry on the business under his own name.

Company Liquidations.—E. S. Co., LTD., electrical and wireless dealers, 233, Tottenham Court Road, W.—Mr. B. A. Smith, 11, Queen Victoria Street, E.C., has issued a notice convening a meeting of creditors for to-day (Friday) at the Institute of Chartered Accountants, Moorgate Place, E.C. The company has already passed a resolution for voluntary liquidation, Mr. Smith being appointed the liquidator. A statement of affairs has been issued showing the position of the company as at June 26th last, the date of the appointment of a receiver for the debenture holders. The statement discloses first debentures of £12,397, and second debentures of £21,750, a total debenture issue of £34,147. The assets are estimated to realise £18,273, from which has to be deducted £509 for preferential claims, leaving free assets of £17,764. The assets are insufficient to meet the claims of the debenture holders by £16,382. With regard to the first debentures, the statement shows that £4,000 was issued to the guarantors of the bank loan which stands at £3,144. On that account there would be a margin which would be available for the repayment of other debentures. The claims of the unsecured creditors total £20,640, the deficiency as regarded the unsecured creditors being £37,023. The following are the principal creditors:—

	£		£
Deutsche Kabelwerke	6,000	Hart Accumulator Co., Ltd. ...	152
Anglo-Electric Co.	334	Igranic Electric Co., Ltd. ...	435
British Thomson-Houston Co., Ltd.	379	Kersons Manufacturing	222
Brown, S G., Ltd.	101	Longmore Bros.	167
Cable Accessories Co., Ltd. ...	364	Midland Electric Mfg. Co., Ltd.	168
Credenda Conduits Co., Ltd. ...	120	Metropolitan Water Board ...	113
Crabtree, J. A., & Co., Ltd. ...	395	Metropolitan-Vickers Electrical Co., Ltd.	292
Chloride Electrical Storage Co., Ltd.	193	Mullard Radio Valve Co., Ltd.	224
Cossor, A. C., Ltd.	241	McMillan & Co.	427
Davies, Kent & Stewart	114	Marconiphone Co., Ltd.	310
Edison Swan Electric Co., Ltd.	430	Radio Instruments, Ltd.	223
Siemens & English Electric Lamp Co., Ltd.	1,101	Sterling Telephone & Electric Co., Ltd.	341
Foster Engineering Co., Ltd. ...	289	Stella Conduit Co., Ltd. ...	155
General Electric Co., Ltd. ...	575	Thomas, F., & Co.	336
Graham, Alfred. & Co.	153	Vulcan Electric Co.	264
Hawkins, L. G., & Co., Ltd.	261	Wootton, H. A., & Co.	126
		Downes & Davies	104

The Sterling Telephone and Electric Co., Ltd., presented a petition for the winding-up of the company on August 7th; this is to be heard in London on October 13th.

INGLEBY & Co., LTD., electric motor manufacturers and engineers, Caledonia Works, Beeston, Leeds.—A meeting of creditors was held recently at Leeds. The chair was occupied by Mr. R. E. Starkie, 6, South Parade, Leeds, who had been appointed to act as receiver for the debenture holders and as liquidator in the voluntary liquidation of the company. An approximate statement of affairs was presented which showed ranking liabilities of £20,124, all of which was due to unsecured creditors. In addition there was a fully secured creditor for £225 who held a charge on certain land. The assets were estimated to produce £15,953. From the latter figure had to be deducted £704 for preferential claims and secured creditors, and £12,420 due on debentures, leaving net assets of £2,830, or a deficiency of £17,295 so far as the unsecured creditors were concerned. The issued capital of the company was £16,143, and as regarded the shareholders there was a deficiency of £33,438. It was reported that the business was an old-established one, but latterly had been carried on at a loss. A resolution was passed confirming the appointment of Mr. Starkie as liquidator, and a committee of inspection was elected.

CUTTING BROS., LTD., Park Works, Stamford, Lincs.—A meeting of creditors is to be held to-morrow (Saturday) to confirm the appointment of Mr. C. J. Pain, of 18, Low Pavement, Nottingham, as liquidator in the voluntary liquidation. Creditors are to send particulars of their debts, &c., to him by September 18th. Mr. Pain was appointed receiver and manager on behalf of the first mortgage debenture holders on August 11th, 1924. Since then he has carried on the business with a view to a beneficial realisation, but no satisfactory result has attended his efforts to dispose of the business privately as a going concern. In June the business was offered for sale by public tender, and three tenders of varying amount were received. The highest (£15,300) was accepted. The claims of the first debenture-holders amount to £12,000, to which must be added accrued interest for a period exceeding 18 months, the expenses of the sale, and the receiver's remuneration. There are, in addition, prior claims by the Board of Inland Revenue and other preferential creditors which it is expected will aggregate £1,056. Following the first debenture there is a second debenture for £32,000. It is doubtful whether, after discharging the various commitments referred to, there will be anything remaining for the second debenture-holders, and consequently no fund is available for a dividend to the unsecured creditors.

WALLACE (GLASGOW), LTD.—The liquidators (Messrs. A. Murdoch and J. Winning, 53, Bothwell Street, Glasgow), in paying a first dividend of 3s. 6d. in the £, state that they have disposed of the works at Paton Street, Ayr, Carmuirs, and machine-tools in the factory at Cardonald, &c. The works at Cardonald and a considerable quantity of the stock there have still to be disposed of, and the interests in Australia and Roumania have to be adjusted.

ALKLUM ELECTRICS, LTD., Waterside Works, Halifax, accumulator makers.—On behalf of petitioning creditors his Honour Judge Mossop, at Halifax County Court, on August 6th, made an order for winding up this company. There was no objection by the company.

Chase Electrical Manufacturing Co., Ltd.—Winding up voluntarily. Meeting of creditors August 18th at the office of the liquidator, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C.2.

Lelios Lamp Co., Ltd.—Winding up voluntarily. Liquidator, Mr. E. L. Butler, address not stated.

Deed of Arrangement.—F. Vigers and C. H. Vigers.—The trustees in this matter have issued a statement of accounts for the year ended July 20th, showing that a dividend of .8d. in the £ was paid on December 24th last on claims amounting to £126,658. It is stated that the next distribution will be made out of the profits earned in the year ended June 30th last.

Electricity at Poplar Carnival.—A carnival in aid of a fund for providing a New Year's treat for children was held in Poplar recently. The principal feature was a procession of decorated vehicles. The Poplar Electricity Department participated with two motor vehicles, each of which was

A Mobile Electrical Exhibition at Poplar.

decorated to represent the interior of a room, and bore a table upon which electrical appliances were arranged, as well as larger appliances round about, as shown in the illustration above. In this way a cooker, a fire, a geyser, kettles, fans, and other devices were displayed to exemplify the versatile nature of electricity.

French Electrical Industry.—The B.E.A.M.A. has issued, through its Electrical Publicity Bureau, a special publication (No. 2, price 2s. 6d.), dealing with the electrical industry of France. It is explained in the introduction that to give a complete idea of the part which electricity plays in the life of France emphasis has been laid upon finance, industrial electrification and electro-chemical and electro-metallurgical development as much as on the electricity supply and electrical engineering industries proper. The financial section comes first and after a general review of national finance with particular reference to the effects of inflation upon industry, attention is paid to the activities of the banks and industrial credit institutions. It is stated that finance is becoming more and more linked up with industry, and it will only be a matter of a few years before the system will be strong enough to develop outside of France and be of direct assistance to the French effort to open up foreign markets. The section on industrial electrification shows how the recovery of French industry and the reconstruction of the devastated territories has been assisted by electrical means. Some interesting figures are given relating to the use of electricity in mines and in the iron and steel industries. Electro-chemical and electro-metallurgical works are then dealt with and statistics of the capital of the principal concerns, the amount of electric power which they employ, and output are given. The report then considers the electrical industry proper commencing with a study of the production of electricity by water-power and steam. It is shown that the capital invested in hydro-electric power alone rose from 800 million fr. in 1923 to 2,800 million at the beginning of 1924. The financing for power development has been carried out not only by banks and finance companies but also by the leading electrical manufacturing firms, particularly the Cie. Générale d'Electricité and the French Thomson-Houston Co. The ramifications of the interests of these two firms are traced, showing participation in a comprehensive field. The close connections and special arrangements between other large groups are briefly mentioned. Dealing with the electrical engineering industry generally, the report states that the total amount of capital now invested in the industry is about 1,500 million fr., and that the value of production has risen from 193 million fr. in 1913 to 1,200 million fr. in 1923. The number of employés is given as 60,000. The firms engaged in the industry include five with a capital of 100 million fr. or more, and fourteen with a capital of over 30 million fr. The exports in 1924 are stated to have been 22.9 per cent. of the total output. In 1923 the value of the output per worker, in sterling, was £350, while during the same period the equivalent figure for British workers was £450. France from being at one time a market for British electrical goods, is now actively competing in European markets. The foreign electrical trade of France is analysed in the report under the main classes of goods and as to geographical distribution. After a section on railway electrification as affecting the industry, the report passes to a comparative study of wages in France and Great Britain. Broadly, it is stated that the French worker is getting almost exactly the same wage as the British worker if purchasing power alone is considered. Taking the actual figures, however, the French industrialist has now an advantage of 40 per cent. in wages alone and 25 per cent. in materials, and is able to quote prices 30 per cent. below the British prices and earn the same profits. The report is rounded off with a number of conclusions; these, in brief, are as follows: France is becoming self-sufficient electrically-speaking, and is one of our greatest potential competitors in Europe, Japan and South America. The financial participation of manufacturers in electricity supply schemes has given an impetus to electrical development. The industrial credit system is increasing in influence and is proving satisfactory. Although the French industrialist pays wages lower than those paid in Great Britain, he is protected from labour troubles by the better purchasing power of these wages. The communities of interest between groups are so close that it may be said that the French electrical trust exists in reality if not in name. Finally, however, it is pointed out that drastic deflation will have to take place if financial stability is to be restored. For this reason alone it would be dangerous to attach too much importance to those who look on the present industrial position of France as permanent. The electrical industry, however, through railway electrification and through the projected extensions of generating plant, will have a fairly sound demand for many years to come, but its expansion can only take place rapidly through development of exports, and the formation of a strong export policy may be expected.

Recovery from Fire.—Messrs. A. J. Stevens & Co. (1914), Ltd., state that thanks to the efforts of the builders, carpenters, &c., engaged in making good the damage caused by the recent fire at the firm's radio apparatus works, the position is reaching normal. The whole of the cabinet shop staff is already fully employed at the new works at Stewart Street, Wolverhampton.

Australian Tariff Inquiry.—The Australian Tariff Board recently heard an application by Australian firms for increased protection against American induction motor manufacturers who, it was alleged, charged lower prices for exported motors than for those destined for the American home market. One manufacturer said that certain firms calling themselves Australian manufacturers imported American stampings for induction motors and made them up in "Australian" motors. If these were produced in the Commonwealth the firms would have to employ 30 per cent. more hands and add about 30 per cent. to their plant. A representative of the Australian General Electric Co., Melbourne, produced invoices which, he said, proved that the export prices of the American machines were not lower than the home prices, and, indeed, were often higher.

Book Notices.—"Electrical Precipitation," by Sir Oliver Lodge, D.Sc., F.R.S. Pp. 40; figs. 7. London: Humphrey Milford (Oxford University Press). Price, 2s. 6d. net.

"17th Annual Report of the Hydro-Electric Power Commission of Ontario for the year ended October 31st, 1924." Toronto: Clarkson W. James.

"The China Year Book, 1925." Pp. xxx + 1,349. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. Price, 42s. net.

"Alternating Currents and Transients," by F. M. Colebrook, B.Sc.(Lond.), D.I.C., A.C.G.I. Pp. x + 195; figs. 97. London: McGraw-Hill Publishing Co., Ltd. Price, 15s. net.

Social Event.—The annual sports meeting of the staff and employés of Messrs. Johnson & Phillips, Ltd., took place at Kidbrook on July 25th. There was a record attendance and the programme was a very enjoyable one. One of the events,

A Pillow Fight at Johnson & Phillips's Sports.

a pole pillow fight, is depicted in the accompanying illustration. The prizes were presented to the successful competitors by Lady Dawson.

Brazilian Electrical Imports.—Imports of electrical goods into Rio de Janeiro during May were considerably higher than the figures for the two preceding months. The United States was the principal supplier, but there were large increases in French and German imports. The latter approached the American figure, being 195 metric tons as against 219 tons from the United States.

Hydro-Electric Plant for Australia.—Definite steps are soon to be taken in connection with the Sugarloaf hydro-electric scheme which was approved by the Victorian Government in 1923. Sir John Monash, chairman of the Victorian Electricity Commission, recently announced that tenders were to be invited at an early date for the construction of the hydraulic works (including a dam a mile wide) and the supply of the necessary plant. The plans provide for two generating stations with a combined capacity of about 25,000 kW.

Australian Tariff Decisions.—Among the recent rulings by the Australian Customs authorities are the following: Control switchgear for 6,600-V, 3-phase, 50-cycle sub-stations, and 5,000-kVA, 33,000/5,000-V transformers free under the British preferential tariff, 5 per cent. under the intermediate tariff; and 10 per cent. under the general tariff.

The Electrical Imports of Siam.—In the course of a report on the commercial situation in Siam at the close of the third quarter of 1924 (Stationery Office, 1s. 6d. net), Mr. H. R. Bird, Acting Consul-General at Bangkok, gives particulars of that country's electrical imports. These show that the value of imports of electrical goods and apparatus rose from 798,215 ticals (£73,298) in 1922-23 to 1,150,507 ticals (£105,648) in 1923-24. The most noticeable feature is the rapid expansion of Germany's share in this trade. In the last report upon Siam a gain of over twice the value of the preceding twelve months was recorded; this year the gain is nearly 300 per cent., the figures being 86,655 ticals (£7,957) in 1922-23, and 328,343 ticals (£30,151) in 1923-24. This puts Germany at the head of the list, the United Kingdom, whose exports have fallen from 307,173 ticals to 286,770 ticals, being second. Denmark and the United States follow with 150,073 ticals and 117,554 ticals respectively.

An Electrical Demonstration Car.—The electrical engineer of Haslingden (Mr. Barnes Kay) has sent us a photograph, which is reproduced herewith, of a lorry which was arranged to take part in a recent demonstration held in the town. As will be seen the lorry was tastefully decorated and equipped

An Electrical Demonstration Car at Haslingden.

with examples of the principal domestic appliances—a cooker, a wash boiler, a toaster, a fire, an iron, &c., and the whole was surmounted by an effective "slogan" which must have caused the residents to stop and consider.

International Fair at Salonica.—We have received from the Greek Minister in London a brief prospectus of the First International Fair, which is to be held at Salonica from October 18th to 31st next. The fair will have a wide scope and include electric motors, generators, transformers, lighting and heating appliances, and electrical tools.

The Leipzig Fair.—The address of the London representative of the Leipzig International Industries Fair has been changed to 1, Gower Street, W.C.1. Telephone Nos.: Museum 9523 and 4; telegrams: "Amtermesse, Westcent, London."

Concessions in Russia.—The Riga correspondent of *The Times* says that the Soviet Concessions Department, which is under the management of M. Trotsky, reports that 90 concessions have been granted to foreigners, the capital invested being £2,500,000, which is to be increased to £8,000,000. Of these concessions 22 are held by German interests, 17 by British concerns, and eight by Americans, the remainder being distributed among 20 other countries. The principal class is known as "commercial," there being 26 of these; there are 17 concessions in "productive industry"; 13 mining concessions; 12 concerned with transport and communications; 6 in forestry; and 3 of a miscellaneous nature. During the last economic year the turnover of the commercial concessions amounted to about £2,000,000, but the output of all the producing concessions was below £100,000. In discussing the matter recently, M. Trotsky said that the Soviet had decided that they must "compromise and traffic with their mortal enemies, and must attract capital to put their house in order." He further said that "foreigners had better not waste time; the conditions which Soviet Russia offered would not improve, but, on the contrary, would become more unfavourable and less flexible as time went on, and those who did not close on the offers made now might find themselves left out in the cold."

German Electrical Exports.—A report by Mr. J. W. F. Thelwall, the British Commercial Secretary at Berlin, upon the foreign trade of Germany during June, states that the exports of electro-technical products decreased in value by 5.7 million Reichmarks as compared with May.

For Sale.—As the Bexley Urban District Council now purchases electricity in bulk, offers are invited for the plant at the disused generating station. (See our advertisement pages to-day.)

New French Companies. — A company has lately been formed at Wolfisheim, in the Lower Rhine area, with a capital of 1,200,000 fr. and the title La Société de la Fabrique de Matériél Electrique, Téléphonique et Industriel "M.E.T.I."

A company has recently been organised at Grenoble with a capital of 400,000 fr. and the title La Société Electribloc, to manufacture electric motor vehicles.

Irish Free State Electrical Imports.—The imports of electrical goods into the Irish Free State during April last only amounted to a value of £25,785, as compared with £44,700 in April last year. The total for the first four months of the year is returned at only £99,189, as compared with £145,593 in the corresponding period of 1924.

Austrian Patent Fees Increased.—The fees in respect of patent applications and licences in Austria have recently been increased.

French Bauxite Production.—The production of bauxite in France in 1924 is reported to have amounted to 340,000 tons, of which 202,000 tons was exported, as compared with 192,000 tons in 1923, and 167,000 tons in 1922. As the German United Aluminium Works (Lauta) now obtains bauxite from Istria and elsewhere, the French exports are sent chiefly to Switzerland and England, and to a smaller extent to Italy and the United States. Despite the efforts to restrict the exports of bauxite it is said that the French Government seems not disposed to act in this manner as it is considered that the deposits of red bauxite in the Var and the Bouches du Rhône are inexhaustible.

German Export Bounties.—Among the various premiums or rebates which the German Steel Ingot Syndicate has decided to grant to consumers of materials used in the production of manufactures for export markets, may be mentioned the grant of 25s. per ton on dynamo and transformer sheets consumed in the execution of export orders.

A German Aluminium Works Combination.—A syndicate of the aluminium rolling mills is being formed in Germany for the consolidation of the entire industry, the promotion of sales both at home and abroad, and the prevention of underselling in the future. Apart from some small mills it is stated that all the others have joined the syndicate. Negotiations with large consumers will take place on August 14th, when sale prices will be fixed. At present the basis price for sheets is 295 marks per 100 kg.

American Enterprise in Rumania. — It is reported from Bucharest that American financiers are occupying themselves with an economic-financial scheme which aims at the utilisation of the water powers from the Iron Gates of the Danube as far as the Bicaz district in the Carpathians, by bringing into use in the first place the hydraulic forces of the Neajlov and Arges basin. All the details of the scheme have been worked out by a Rumanian engineer (M. Leonida), who proposes the construction of a works capable of yielding from 140,000,000 to 150,000,000 kWh per annum. American engineers are said to have already investigated the scheme on the spot and discussed it with the Minister of Industry. Moreover, the city authorities of Bucharest definitely decided at the end of July on the formation of an electricity supply company in connection with the scheme, whose chief object will be to furnish energy to the city for industrial and other purposes, and the Americans will assist in financing the project.

United States Foreign Loans.—In a *Commerce Reports* list of foreign loans raised in the United States during the first half of the current year the following appear: The Copenhagen Telephone Co. ($2,000,000); Burmeister & Wain, Copenhagen ($2,000,000); Allgemeine Elektricitäts Gesellschaft ($10,000,000); Siemens & Halske ($8,500,000); Electric Power Corporation of Germany ($5,000,000); Price Bros. & Co., Ltd., Canada ($5,000,000); Bell Telephone Co. of Canada ($10,000,000); Montreal Tramways ($7,000,000); the Toho Electric Power Corporation, Ltd., Japan ($15,000,000); and the Ujigawa Electric Power Co., Ltd., Japan ($14,000,000).

British Electric Trucks for Peru.—*Commerce Reports* says that the Central Railway of Peru has ordered from England a number of electric platform trucks for use at the Desamparados station in Lima. This is the first time that such trucks have been used in Peru.

Proposed Railway Electrification in Venezuela.—In the course of his speech at the recent annual meeting of the La Guaira and Caracas Railway Co., Ltd., the chairman (Mr. J. A. Goudge) said that the competition of road traffic had led the board to consider the electrification of the line as the only remedy. Two experienced engineers had been asked to report and their conclusions had favoured the carrying out of the work. The company, however, would require certain assurances from the Venezuelan Government before proceeding with electrification. If these assurances were obtained and the prospects still appeared good a scheme would be presented in a few months' time.

Bulgarian Order for Germany.—Various German and Austrian firms and the Brown-Boveri Company, of Mannheim and Vienna, recently competed for the contract for the establishment of a central station in the Bulgarian town of Plevna. The lowest offer, which was submitted by the Bergmann Electricity Works Company and amounted to 16,857,762 Bulgarian leva, has been accepted.

Luxemburg Commercial Fair.—An electrical section is included in the fourth annual Commercial Fair which is being held in the city of Luxemburg from August 14th to 24th.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report August 11th:—Copper (electrolytic) bars, £68 15s., £1 increase; ditto ditto sheets, no change; ditto ditto wire rods, £78 15s., £1 increase; ditto ditto h.c. wire, 9⅞d.

Messrs. James & Shakespeare report July 28th:—Copper bars (best selected), sheet and rod, £92, £1 increase; English pig lead, £38 10s., 5s. increase.

Messrs. E. Till & Co. report July 28th:—India-rubber, Para fine, 3s. 8d., 5½d. decrease.

Annual Holidays.—The works and offices of the Airedale Electrical and Manufacturing Co., Ltd., Bradford, will be closed from to-night (Friday) until the morning of Monday, August 24th.

Lighting and Power Notes.

Airedale.—CONFERENCE OF LOCAL AUTHORITIES.—At a recent meeting of the Skipton Urban District Council a report was given of the proceedings at the private conference of various local authorities of Airedale and the north-western area of the West Riding (Aire and Calder) Electricity District, convened by Keighley Corporation, on the subject of possibilities of co-ordinated effort in electricity supply. The delegates reported that the conference on July 23rd passed the following resolutions: (1) "That in the opinion of this conference it is desirable that the supply and distribution of electricity in this area should be developed under the supervision and control of the local authorities and that with this object in view a committee be formed to promote co-ordination and co-operation among the local authorities concerned"; and (2) "That the committee be constituted of representatives of the councils of Barnoldswick, Denholme, Earby, Ilkley, Keighley Borough, Silsden, Skipton Urban and Skipton Rural." It was also agreed that the next meeting of the committee should be at Skipton.

Audenshaw. — STREET LIGHTING. — The Urban District Council has appointed a committee to report as to the electric lighting of main roads.

Bangor.—CONTRIBUTION TO B.E.D.A.—There was some discussion at last week's meeting of the Bangor City Council on a recommendation to contribute £13 to the British Electrical Development Association. The main point of objection was that it was a manufacturers' movement, and the Bangor electricity works being in a flourishing condition, did not need advertisement. The recommendation was confirmed on its being explained that the department had benefited considerably from assistance rendered by the E.D.A.

Blackpool.—LOANS.—The Corporation has received sanction to a loan of £6,116 for a new traction feeder between the electricity works and Marton. Application is being made for sanction to borrow £12,000 for the purchase of a 2,000-kW turbo-generator for the electricity undertaking.

Bridlington.—LOAN.—The Town Council has received sanction to a loan of £5,398 for mains.

Chelmsford.—ELECTRICITY SUPPLY.—At a recent meeting of the Town Council the Electricity Committee reported that it had discussed with Mr. A. Hugh Seabrook, M.I.E.E., his preliminary report upon the condition of the electricity undertaking, its financial standing, the question of its acquisition by the Council and alternative suggestions of dealing with it if taken over. After full consideration it was resolved that the managing director of the Electric Supply Corporation, Ltd., be approached with a view to a conference being arranged for the discussion of the whole matter on a purely informal basis.

Continental.—CZECHO-SLOVAKIA.—Work is about to commence on the construction of a large new hydro-electric station to utilise the water power of the river Vetzva, a tributary of the Moldau, near Prague. Three turbo-generator sets capable of producing 130 million kWh per year are to be installed.

AUSTRIA.—It is announced that as a result of the financial support of the Swiss Bank for Electrical Undertakings, of Zurich, the Stern and Hafferl Electricitatswerke Gesellschaft, of Gmunden, is now making good progress with the establishment of a new 9,000-h.p. hydro-electric power station at Ranna and a 9,000-h.p. steam-operated station at Timelkam in the Wolfsegger coal mining district of Lower Austria. When these are completed the company will have thirteen electricity stations under its control with a total turbine capacity of 60,000 h.p. and an annual output of approximately 200 million kWh.

Among the schemes for the establishment of hydro-electric plants recently submitted to the Hydrographic Central Office of the Austrian Government is one for 10,780 h.p. on the Weerbach for the municipal authorities of Hall (Tyrol), and one of 2,000 h.p. on the river Mur at Niklasdorf, Styria, for the Brigl-Bergmeister Cellulose and Paper Works Co.

ITALY.—The Italian Government has decided again to grant subsidies to central stations in course of construction in order to give a fresh impetus to the establishment of new undertakings, the carrying out of which seems to have slackened during the past two years. According to the scheme, the amount of the subsidies, based on the number and power of the projected works, will reach from 30,000,000 to 35,000,000 lire. The most important central stations which will benefit from the subsidies are that of the Adamello Company on the San-Croce torrent and that of the Moncenisio at Calcinera, which will be of 100,000 h.p.

FRANCE.—*Le Journal* learns from Madrid that the work of electrifying the Spanish section of the international line Ripolle-Puigcerda-Aix has just commenced and that the resumption of work on the French side is announced as imminent. At the Tour de Carol, at an altitude of 1,231 metres and a distance of 39½ kilometres from Aix, a large international station is to be built at an estimated cost of 10,000,000 fr. The Spanish trains will run as far as this station, while the French trains will stop at Puigcerda.—*Reuter's Trade Service* (Paris).

Dalkeith.—PURCHASE OF UNDERTAKING.—The Town Council has agreed to make a final offer of £18,000 to the Electric Supply Corporation, Ltd., for the purchase of the Dalkeith electricity undertaking, and if the offer is not accepted to let the matter go to arbitration. The company stated that the undertaking was approximately valued at £22,000, but it was willing to accept £19,000.

Eastbourne.—LOAN SANCTIONED.—The Corporation Electricity Committee has received sanction to a loan of £6,689 for mains and equipment.

Gisborough. — ELECTRICITY SUPPLY. — The Urban District Council is to proceed with the electricity scheme which recently received Government sanction, and a contract has been placed with the Craven Electrical Construction Co. for laying the cable and for the construction of the transformer station and equipment. The Council will receive a bulk supply of electricity from the Cleveland and Durham Power Company.

Glasgow.—DALMARNOCK STATION PROGRESS.—Satisfactory progress is being made at the Dalmarnock power station, and it is expected that at least one of the Parsons turbo-alternators will be in commission in time for the winter load.

Hastings.—YEAR'S WORKING.—The report on the working of the Corporation electricity undertaking (engineer: Mr. R. F. Ferguson) for the year ended March 31st last shows a total income of £63,228, as compared with £55,543 in the preceding year. Working expenses increased slightly from £28,134 to £30,912, and the gross profit was £32,316, as against £27,409, to which was added a sum of £347 received as aid in connection with unemployment relief schemes, making a total of £32,663. After providing for capital charges there remained a net surplus of £8,626, as compared with £12,045 in 1923-24. A sum of £2,000 was contributed to the borough fund. The capital expenditure during the year amounted to £126,469, and included £49,991 for machinery, £25,966 for buildings, and £17,758 for mains. The electrical energy sold increased from 2,292,993 to 2,790,418 kWh, and the maximum supply demanded from 1,730 to 1,895 kW.

Hereford.—ELECTRICITY EXTENSIONS.—The Town Council is applying for sanction to a loan of £4,000 to meet the cost of extending the mains from Glewstone to Ross, a distance of about four miles. The Council is to supply electricity in bulk to the Ross Electric Light and Power Co., Ltd., on the following terms:—The company to guarantee a minimum annual bill equal to 20 per cent. for three years on the expenditure incurred by the Council; the company to pay for the cost of the line; the price to be paid for electricity to be £6 per kW, plus 0.6d. per kWh, with a coal clause. The Council has also decided to apply for a loan of £843 to meet the cost of laying a cable to supply electricity to 56 Council houses.

Irish Free State.—DUNGARVAN (CO. WATERFORD).—At a recent meeting of the Urban District Council, the Dungarvan Electric Light Co.'s tender for lighting the streets of the town for 12 months at £4 per lamp was accepted.

Keighley.—INAUGURATION OF EXTENSIONS.—The Right Hon. Philip Snowden, M.P., will formally open an extension at the Corporation electricity works on September 19th.

Lancaster.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer, Mr. G. C. Milnes) for the year ended March 31st last, record a total revenue of £26,035, and working expenditure of £20,826, leaving a gross profit of £5,209. The figures for 1923-24 were: Income, £25,066; working expenses, £16,404; gross profit, £8,662. To the gross profit was added bank interest and contributions to loan charges making a total of £9,036. After providing for capital charges there was a balance of £1,365, of which £1,000 was contributed to the borough fund and the remainder transferred to reserve. The sales of electrical energy increased from 1,354,365 to 1,498,234 kWh. The maximum load on the generating station was 1,526 kW.

Leyton.—ELECTRICITY IN BULK.—The Electricity Committee has recommended to the Urban District Council that agreements be entered into with the County of London Electric Supply Co., Ltd., and the Walthamstow Urban District Council for a bulk supply of electricity of approximately 2,000 kW and 5,000,000 kWh from each authority, and that application be made for sanction to a loan of £25,000 for the installation

of the necessary converting plant to carry the scheme into effect.

Manchester.—STREET LIGHTING.—The Electricity Committee is seeking sanction for a loan of £25,000 for the extension of street lighting.

LOAN.—The Finance Committee has approved a recommendation of the Electricity Committee that application be made for sanction to a loan of £420,000 for h.p. trunk mains, transformer stations, distributing stations, and a feeder and ordinary mains.

Merstham.—ELECTRICITY SUPPLY.—At a meeting of the local Council on August 4th, a representative of the County of London Electric Supply Co., Ltd., which is applying for an order to supply electricity within the district, attended and gave particulars of the company's proposals. He stated that the company was prepared to extend the mains through Merstham directly the Order was granted, and the price of electricity would probably be 7d. per kWh for lighting, and 3d. per kWh for power (maximum). The Council decided to support the application.

Nelson.—ELECTRICITY IN BULK.—The Town Council, on August 5th, approved a resolution quoting terms to Burnley for a bulk supply of electricity.

Northern Ireland.—ARMAGH.—The Urban District Council has asked Mr. P. Spalding, manager and engineer of Dundalk electricity works, to prepare a scheme of electric lighting for the city, the estimated cost being £10,000.

RATHFRILAND (Co. DOWN).—A ratepayers committee has asked the Rural District Council to grant facilities for the installation of electric lighting in the town.

Price Reductions. — Reductions in the charges for electricity have been made or recommended in the following districts:—

LEYTON.—Lighting: Flat rate from 6½d. to 5½d. per kWh.
MAIDENHEAD.—Lighting: 6½d. per kWh.

Retford.—NEW POWER STATION.—The Town Council has decided to proceed with the construction of a new generating station and has appointed the present gas and water engineer, Mr. J. R. Bradshaw, as electrical engineer at an increased salary.

Special Orders. — The following Orders have been submitted by the Electricity Commissioners to the Minister of Transport for confirmation: Wolverhampton Electricity (Extension) Special Order, 1925, for the supply by the Corporation in parts of the rural districts of Cannock and Seisdon; Preston Corporation Electricity (Extension) Special Order, for the supply by the Corporation in part of the rural district of Preston.

Applications for Special Orders have been made by the following authorities: Bedford Corporation, for the supply of electricity in the urban district of Ampthill and parts of the rural districts of Ampthill and Biggleswade; St. Helens Corporation, in the parish of Windle and part of the parish of Eccleston.

Torquay.—LOANS.—The Town Council has applied to the Electricity Commissioners for sanction to the following loans: £1,100 for transformers; £1,700 for an e.h.p. main to Abbots Kerswell; £850 for transformers and e.h.p. switchgear at substations; £165 for oil-purifying and testing plant.

Watford.—EXTENSION OF SUPPLY.—The Town Council has decided, subject to the sanction of the Electricity Commissioners and the Unemployment Grants Committee, to carry out an extension of its electricity supply to Bovingdon at an estimated cost of £11,169.

Wolverhampton.—ELECTRICITY EXTENSIONS.—The Corporation Electricity Committee proposes to make a number of important extensions which include an expenditure of £26,000 for extending the supply to Codsall, Brewood and Coven, subject to a grant in aid, £56,956 on the Low Hill Housing estate where the Town Council proposes to erect 3,600 houses ultimately, and £19,000 on additional converter plant at the power station.

Tramway and Railway Notes.

Continental.—FRANCE.—According to the *Electric Railway and Tramway Journal*, a series of torrential thunderstorms broke over Paris on the night of July 22nd. The electric generating station at Gennevilliers, on the edge of the city, was put out of action, and the electric power by which the trains are taken from the Gare d'Orsay, the terminus of the Orleans Co.'s main line, was cut off. The station had to be closed, and intending passengers had to go by cab to Austerlitz Station, where steam locomotion is employed.

The electric tramway system in the town of Saint Quentin has recently re-inaugurated. During the war the company's power station was destroyed and the directors decided not to rebuild it but to obtain the necessary energy from the local municipal central station. The current is three-phase a.c., and to convert it to d.c. a sub-station with Brown-Boveri mercury rectifiers has been equipped by the Compagnie Electro-Mécanique, of Paris.

BELGIUM.—Good progress has been made with the work of electrification of railways in the province of Antwerp, and the provincial government is to commence the preparation of supplementary plans which were only to be started when the main project had been accomplished. It is anticipated that the plans will be ready during the autumn.

ITALY.—A new electric railway has recently been completed and opened for traffic between Rome and Ostia. The line works on the 2,600-V, d.c. system, the necessary energy being supplied by the municipal central station at Acilia, where three transformers have been installed by the Italian Brown-Boveri Co.

SWITZERLAND.—The Swiss Federal Railway authorities have voted a credit of £163,320 towards the cost of electrification of the line between Rothkreutz, Rupperswil and Brugg, a distance of nearly thirty-four miles, and one of £478,160 for the electrical equipment of the Plezieux-Berne line, a distance of 47½ miles.

Croydon.—ROUTE ABANDONED.—The Corporation is to abandon the tramway track in Oakfield Road.

TRACK RENEWALS.—The Wellesley Road route is to be reconstructed at a cost of £13,437.

Darlington.—RAILLESS CARS.—The reconstruction of the Corporation tramway overhead equipment for the operation of railless-cars has now commenced, the work being carried out by Messrs. Clough, Smith & Co., Ltd., and it is hoped to have the complete system in operation by the end of the year.

Doncaster.—RAILLESS CARS.—The Town Council is to promote a Bill for the running of railless cars between the town and Bentley.

Dover.—RAILLESS CARS.—The Town Council has decided not to promote a Bill for the adoption of a system of railless cars on the route from the Lord Warden to New Bridge, but to continue with the present system.

Halifax.—LOAN.—The Tramways and Electricity Committee is applying for sanction to a loan of £11,520 for the proposed double tramway track along Barum Top.

Irish Free State.—DUBLIN AND LUCAN ELECTRIC RAILWAY.—The Dublin City Administrative Commissioners recently reconsidered their decision as to allowing an extended lease of 40 years to the Dublin United (Electric) Tramway Co. on an agreement to take over the Dublin and Lucan Electric Railway, which closed down some months ago, and ensure a continuous service from Lucan throughout the centre of the city, and intimated acceptance of the company's offer subject to certain conditions. The company now states that it is unable to accept some of the conditions laid down by the Commissioners, and negotiations have reached a deadlock.

Leicester.—NEW ROUTE.—The Tramways Committee has recommended to the Town Council that a single tramway track be constructed along Coleman Road between Uppingham Road and Green Lane Road, at an estimated cost of £12,500.

Preston.—TRAMWAY IMPROVEMENTS.—The Tramways Committee is to confer with the Streets Committee on the question of the proposed doubling of the tramway track from Cannon Street to Corporation Street.

Thornaby-on-Tees. — TIME EXTENSION. — The Minister of Transport has extended the period stipulated for the completion of the Corporation's tramway, authorised in 1919, from August 15th, 1925, to August 15th, 1926.

Walthamstow.—FARES.—The local Council is to reduce the tramway fares between Stratford Broadway and Chingford to 1½d. for the whole journey with corresponding reductions in the intermediate, children's and workmen's fares. The Council's decision is due to the recent reductions in omnibus fares on the route by the private companies, the new fare comparing with 2½d. now charged by the companies.

Wolverhampton.—YEAR'S WORKING.—The accounts of the Corporation tramway undertaking (general manager, Mr. C. Owen Silvers) for the year ended March 31st last, record a total revenue of £99,094, as compared with £102,449 in the preceding year. Working expenses amounted to £64,606, as against £73,189, leaving a gross profit of £34,488 (£29,260), to which was added bank interest and a contribution towards capital charges in respect of a through running agreement from the Wolverhampton & District Electric Tramways, Ltd., making a total of £35,492. After providing for capital charges there was a net surplus of £14,837, as compared with £9,143 in 1923-24. The number of passengers carried fell from 14,870,878 to 14,494,020, and the car mileage from 1,213,548 to 1,070,514.

The railless-car system showed a total revenue of £18,018, and working expenditure of £11,892, leaving a gross profit of £6,126. The previous year's figures were: Income, £6,239; working expenses, £4,140; gross profit, £2,099. After deducting interest and other charges there was a net surplus of £3,196. The number of passengers carried increased from 874,802 to 2,541,808, and the car miles run from 93,406 to 252,767.

There was also a net profit from the omnibus service of £7,648, making a total surplus on the three systems of £25,682.

During the year the Bushbury tramway route was converted to the railless-car system and extended from Bushbury to Fordhouses.

Telegraph and Telephone Notes.

Cable Rates.—Press Rate Reduced.—The Pacific Cable Board, on August 1st, reduced the rate for Press messages exchanged between Canada (except Vancouver City) on the one hand, and Australia and New Zealand on the other hand, from 5d. per word to 4d. per word, and further reduced the rate from August 10th to 3¾d. per word. The Press rate for traffic between Vancouver City and Australia or New Zealand has been reduced from 3¼d. per word to 2¾d. per word.

Irish Free State.—Taxi "Fare Alarm."—Dublin is experimenting with a new adaptation of the public telephone kiosk which has the triple object of increasing telephone revenue by means of *inward* public calls; providing the general public with means of calling taxi-cabs and thus reducing traffic congestion by making the cab rank more profitable for taxi-owners than "cruising" for fares. When a bell rings opposite Trinity College the nearest taxi-cab driver on the stand answers the call at a kiosk specially installed for incoming calls, and the next taxi-cab awaits the succeeding call.

Italy.—New Cable.—It is announced that the new direct telegraph cable between Rome and Buenos Aires, *via* Madeira and St. Vincent, will be inaugurated for business on October 12th next.

Long-Distance Telephony. — London - Germany. — Four weeks' experiments in an endeavour to establish telephone communication between Frankfurt-am-Main (Germany) and London were successful on August 7th, when excellent communication was obtained *via* Cologne and Amsterdam.

The Telephone Service.—Liverpool Development.—The Liverpool and District Postal Telegraph and Telephone Advisory Committee has under consideration a report foreshadowing the conversion of the Liverpool system from manual to automatic operation; the work is expected to be entered upon in five years' time. The new portion of the exchange in South John Street is approaching completion and will accommodate additional subscribers' junction switchboards, a new and more commodious school for the training of telephonists, and a modern observation room with up-to-date local and trunk service observation equipment.

Radio Notes.

Australia.—Licence Revenue.—Information regarding the number of broadcast licences in the Commonwealth was given in the House of Representatives recently by the Postmaster-General (Mr. Gibson), who said that on May 30th 61,518 licences had been granted in the Commonwealth; of these 33,964 were in New South Wales. The total amount of licence fees collected throughout the Commonwealth was £113,658, and the amounts paid to the various broadcasting companies were:—Farmer & Co., Ltd., Sydney (2FC), £34,628; Broadcasters, Sydney, Ltd. (2BL), £12,018; Broadcasting Co. of Australia, Melbourne (3LO), £14,444; Associated Radio Co., Ltd., Melbourne (3AR), £4,089; Westralian Farmers, Ltd., Perth (6WF), £4,220.

Dealers' Licences.—Some time ago, at the Camberwell Court, a Mr. A. L. Rowell, was proceeded against on information charging him with being a person to whom a dealer's licence had not been granted, pursuant to the wireless telegraph regulations; he, contrary to the said regulations, manufactured certain equipment for use as broadcast receivers, to wit, four-valve receiving sets. Mr. Wade contended that there was no case to answer. According to a Melbourne message, five separate judgments in the Full Court of High Court, consisting of the Chief Justice (Sir Adrian Knox), Mr. Justice Isaacs, Mr. Justice Higgins, Mr. Justice Rich, and Mr. Justice Starke, upheld the contention of Mr. Wade that the regulations governing the issue of licences for the manufacture of wireless equipment are *ultra vires*.

New Zealand.—Deadlock.—Some 18 months ago the Government announced a project for providing the Dominion with a broadcasting service, but so far very little definite progress has been made and, according to the *Electrical Engineer*, there would have been no development had it not been for certain traders who recognised that they would sell no apparatus were there nothing for people to listen to. An attempt was made by private interests to put a stop to even such services as were being given, on the grounds of infringement of patents, but the Government intervened on behalf of the broadcasters, and allowed them to carry on under its protection. The Government has decided on a definite minimum standard of service, but the subsidy paid to the broadcasters out of licence fees has not been adequate for the maintenance of that service; the broadcasters, however, have carried on. The scheme which the Government had under consideration provided for the licensing of four main stations operated by one privately financed company. A syndicate was formed 14 months ago in order to float the company and arrive at an agreement with the Government. It was not till March, 1925, however, that regulations were gazetted, and even then they were of such a nature that no company could undertake services with a prospect of success. After some trouble the Government was prevailed on to amend the regulations, but, although the syndicate is ready to form the company and has submitted all its requirements to the Government, the agreement is still awaiting finalisation. In the meantime the licence fees for listeners have been raised from 5s. to 30s. in order to pay for the improved service. The delay is quite unjustifiable and it seems remarkable that it should take 18 months to draw up satisfactory regulations and come to an agreement with one company.

Poland.—New Stations.—The Polish Government is desirous of developing radio broadcasting; the *Daily Mail* reports that new stations are to be built at Krakow, Lwow, Poznani, and Warsaw.

The B.B. Co.—Advisory Committee.—A committee of I has been appointed "to advise as to the proper scope of broadcasting services and the management, control, and finance thereof, after the expiry of the existing licence on December 31st, 1926, and to indicate what changes in the law, if any, are desirable in the interests of broadcasting." The Committee will probably meet in November next. Further details will be found in our "Parliamentary News."

Anniversary.—Monday night last, August 10th, was the 1,000th night on which the British Broadcasting Co., Ltd., has provided its listeners with a programme, and Capt. P. P. Eckersley, chief engineer of the company, was chosen to speak in celebration of the occasion.

United States.—A Mobile Transmitter.—The American listener, it seems, will in future not be content with less than two good sets, one for his home and another always ready to take away at short notice. According to the *Evening News* one firm has fitted up a large motor-boat as a transmitting station for the benefit of campers and cottagers round the shores of the Great Lakes. A party of artistes is carried on board and concerts are given every day and more or less all day to holiday-makers. The boat is using Detroit as its base until the winter, when it will go to Florida.

Wavelength Tests.—The Schenectady station (WGY) of the General Electric Co., is now broadcasting a its items on the following wave-lengths simultaneously namely, 38, 109, 379.5, and 1,660 metres. The scheme was started for research purposes and the power used on each of the four wave-lengths will be varied from time to time, while the aerials will also be transferred for different purposes in turn. Listeners will thus be able to judge under which conditions they obtain best reception.

"Wireless on Tap." — War Seal-mansions, Walham Green, which were established for the accommodation of disabled ex-Service officers and men and their dependents, have been equipped throughout with wireless receiving apparatus. The mansions contain 138 flats, and each has now a set of four pairs of ear-phones. Listeners have only to plug in their individual line to the main supply line to receive the broadcast programmes, each flat being separately served from a central receiving set. The service is thus "laid on" on the same principle as water and light, says *The Times*, but there is no charge for it.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Melbourne.—State Electricity Commission. September 21st. 250-kVA, 22,000-V transformers and spares.

September 15th. Postmaster-General's Department. (Sched. C.36). Telegraph equipment. Tender forms from High Commissioner, London.

September 29th. Postmaster-General's Department. Telephone protective apparatus.*

October 20th. Switchboard cable. Sched. C.39, jumper wire Sched. C.40, bells and buzzers.*

New South Wales.—New South Wales Railways. October 7th. One 20,000-kW turbo-alternator for White Bay power house.

November 11th. New South Wales Railways and Tramways 5-ton 3-motor electric overhead travelling crane, 56 ft. 2 in. for iron and steel foundry, Eveleigh workshops.—*Tenders.*

September 23rd. Four feed-water meters for White Bay power house.

Newcastle.—September 22nd. Caledonian Collieries, Ltd. Ward-Leonard electric winding engine for Aberdare central colliery, complete with balancer, exciter, and the necessary switchgear. (July 31st.)

October 15th. City Council. 2,000-kW or, alternatively, 1,500-kW turbo-alternator, complete with condensing plant. *Tenders.*

Dundee.—August 19th. Town Council. Electric lighting for Lawton housing scheme (200 houses) and Stirling Park scheme (20 houses).

Egypt.—Cairo.—September 9th. Ministry of Education. One 50-h.p. Diesel engine, generator, electric motors and machine tools for the Mansurah Trades School.*

Ministry of the Interior. Supply and installation of an electric power station and distributing system for the town of Minieh.

Edinburgh.—September 14th. Royal Infirmary. Supply of X-ray and electro-medical equipment for the new Radiological Department. (See this issue.)

Fleetwood.—August 24th. Urban District Council. eeder cable and pillar. (August 7th.)

Greetland (near Halifax).—August 15th. Electric light- ıg and ventilating at Greetland Liberal Club. (Particulars om Secretary.)

Ilford.—August 18th. Urban District Council. 660-V aper-insulated cable.

Leeds.—August 25th. Property Committee. Electric ghting work required for public wash-houses and slipper baths Stocks Hill.

Kettering.—August 28th. Electricity Works. One cool- ıg tower and tank circulating water pipe. (July 31st.)

London.—METROPOLITAN ASYLUMS BOARD.—August 26th. ıstallation of additional electric lighting at North-Eastern ever Hospital, Tottenham. (July 31st.)

ACTON.—August 28th. Borough Council. Overhead wiring the Council's Isolation Hospital, Wales Farm Road, Acton. ugust 7th.)

Manchester.—August 20th. Electricity Department. ıpply and erection of constructional steelwork at Burnage sub- ation.

New Zealand.—WELLINGTON.—September 22nd. Post and elegraph Department. Bituminous tape.*

September 29th. Public Works Department. 560 galvanised eel transmission line towers, complete with cross-arms, round stubs, and accessories. (A.X. 2,250.)*

MARLBOROUGH.—Electric Power Board. September 22nd. wo 750-h.p. turbines, with generators, switchboard, &c., for Vaihopai River development.—*Tenders.*

Rochdale.—September 9th. Paving and Sewering Commit- e. Motors and electrical gear, together with the necessary iring in connection with the electrification of sludge pressing achinery at Roch Mills sewage disposal works. (See this sue.)

South Africa.—JOHANNESBURG.—October 13th. Electricity upply Commission of South Africa. Equipment and build- ıgs for an electric power station at Durban. (July 31st.)

October 1st. Railways and Harbours. Four 4-ton electri- lly-driven portable jib cranes, complete. (AX.2299.)

BULAWAYO.—September 29th. Municipal Council. Plant for ıe extension of the electricity works.*

Stockport.—September 5th. Board of Guardians. Con- ersion of lift at Stepping Hill Hospital from hydraulic to ectric power. Particulars from the Steward at the hospital.

*Further particulars can be obtained at the Department of verseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—MELBOURNE.—City Council. Accepted :—
Four 500-kVA, 3-phase transformers (£1,748).—Weymouths, Ltd.
Meters.—Lascelles, Parrington, Ltd. (£1,450); Measurement, Ltd. (£357); W. G. Watson & Co., Ltd. (£940); Landis & Gyr, Ltd. (£650); Noyes Bros. (Melb.) Pty., Ltd. (£26).

Melbourne Tramways Board. Accepted :—
Conversion of the cable tramways on the St. Kilda Road and elsewhere to electricity (£144,800).—Foundation Co. of London.—*Reuter's Trade Service* (Melbourne).

Victorian Railways. Accepted :—
Cabin transformers, 10 kVA.—E. M. F. Electric Co., Ltd.

Victorian Electricity Commission. Accepted :—
V.i.r. control cable (£1,708).—British Insulated & Helsby Cables, Ltd.
—*TENDERS.*

SYDNEY.—Works Committee. Accepted :—
Electric derrick crane (£425).—Hodkinson & Co.

Electricity Supply Committee. Accepted :—
Maximum demand indicators (£6,363).—Edison Swan Electric Co., Ltd.

NEW SOUTH WALES.—Postmaster-General's Department. Ac- pted :—
Accumulator plates and separators (£2,678).—T. K. Steanes & Son.

COMMONWEALTH.—Department of Works and Railways. ccepted :—
Erection of electric goods elevator at G.P.O., Sydney (£2,436).—Standard-Waygood, Ltd.

Postmaster-General's Department. Accepted :—
Creed telegraph apparatus (£3,705).—Amalgamated Wireless (Australia), Ltd.
46 magneto floor-pattern switchboards (£4,214).—Western Electric Co. (Aust.), Ltd.
Telephone repeater equipment (£2,821).—Western Electric (Aust.), Ltd.

WESTERN AUSTRALIA.—Government Tender Board. Accepted :
Two 3-phase transformers (£247 each).—Metropolitan-Vickers Electrical Co., Ltd.

Bath.—Town Council. Accepted:—
One h.p. truck-type switchboard (£1,041).—Ferguson, Pailin, Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—
Erection of sub-station at Swadlincote (£1,170).—George Hodges & Son.
Erection of sub-station at Overseal (£488).—Richard Kershaw & Sons.

Carlisle.—Electricity Committee. Accepted:—
Erection of new buildings in connection with the electricity works (£18,238).—Durham & Vevers.

Chelmsford.—Town Council. Accepted :—
Rewiring the Public Library Museum (£172).—Christy Bros. & Co., Ltd.

Darlington.—Corporation. Accepted:—
Extension of the trolley omnibus system on the Haughton Road, Eastbourne, Cockerton, and Harrow Hill routes.—Clough, Smith and Co., Ltd.

Hull.—GERMAN TENDER REJECTED.—The Corporation Telephone Committee recently decided to accept a German tender for bronze wire and cable, but at last week's meeting the Corporation reversed this decision in favour of British goods.

Irish Free State.—DUBLIN.—Electricity and Public Lighting Department. Recommended :—
Arc lamp carbons.—Beacon Carbons, Ltd.; E. A. Langrish & Co.

Lamp Contracts.—Government of Northern Ireland.
Gasfilled lamps.—The Edison Swan Electric Co., Ltd.
Aberdeen Line.
Part supply of lamps until December 31st, 1925.—The General Electric Co., Ltd.

Leek.—Urban District Council. Accepted:—
One 600-b.h.p. gas engine for the electricity works (£7,765).—National Gas Engine Co., Ltd.

London.—GENERAL POST OFFICE. Accepted :—
Conversion of telephones in the Southport area to automatic working (Strowger system) :—Southport (3,700 lines), Birkdale (1,600 lines), Churchtown (1,000 lines), and Ainsdale (800 lines).—Automatic Telephone Manufacturing Co., Ltd.

Manchester.—Town Hall Committee. Accepted:—
Switchboard for the Town Hall.—Metropolitan-Vickers Electrical Co., Ltd.

Tramways Committee. Accepted :—
Copper trolley wire.—R. Johnson & Nephew, Ltd.
Tramway rail bands.—T. Bolton & Sons, Ltd.; and Forest Electric Co., Ltd.
Permanent-way portable turnout.—Hadfields, Ltd.
Special track work.—Edgar Allen & Co., Ltd.; and the Titan Trackwork Co., Ltd.
Span wire brackets.—B. O. Barton & Son.
Centre pole brackets.—Naylor Bros., Golborne.

Electricity Committee. Accepted :—
Composition and plastic magnesia.—Sutcliffe Bros. & Bryce, Ltd.
Crucibles.—Morgan Crucible Co., Ltd.
Dynamo and copper tape brushes.—F. W. Potter & Co.
Fuse boxes.—Callender's Cable & Construction Co., Ltd.; Macintosh Cable Co., Ltd.; Siemens Bros. & Co., Ltd.; Sykes & Dyson, Ltd.
Cables.—W. T. Glover & Co., Ltd.; Pirelli-General Cable Works, Ltd.; Callender's Cable & Construction Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Western Electric Co., Ltd.; British Insulated & Helsby Cables, Ltd.; Hackbridge Cable Co., Ltd.; Siemens Bros. & Co., Ltd.; Connollys (Blackley), Ltd.; Macintosh Cable Co., Ltd.
Meters.—Ferranti, Ltd.; Chamberlain & Hookham, Ltd.; Measurement, Ltd.; Edison Swan Electric Co., Ltd.; Aron Electricity Meter, Ltd.; Metropolitan-Vickers Electrical Co., Ltd.
Potential and current transformers.—Ferranti, Ltd.
Auto-transformers and auto-balancers.—General Electric Co., Ltd.; Johnson & Phillips, Ltd.
Trifurcating boxes.—British Insulated & Helsby Cables, Ltd.; Johnson and Phillips, Ltd.; Siemens Bros. & Co., Ltd.; Sykes & Dyson, Ltd.
Time switches.—Venner Time Switches, Ltd.
Electric kettles.—Premier Electric Heaters Ltd.
Portable centrifugal oil purifier.—De Laval Chadburn Co., Ltd.
Distant reading water gauges, &c., for Barton boilers.—Kelvin, Bottomley & Baird, Ltd.; J. Hopkinson & Co., Ltd.; Babcock & Wilcox, Ltd.

Oldham.—Electricity Committee. Accepted:—
Cable.—Union Cable Co., Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Recommended :—
Metering equipment (£321).—Bailey Meter Co. of U.S.A.
Switchgear (£250).—English Electric Co., Ltd.
Erection of sub-station at Salt River (£1,998).—C. R. Haywood & Co.

Accepted :—
Cables (£360).—W. T. Glover & Co.
Switchgear (£437).—A. Reyrolle & Co., Ltd.

Stoke.—We are asked to state that the contract for wiring at the central power house was placed with Messrs. Hawley and Ingram, of Stoke-on-Trent, at £1,068, not as stated in our issue of July 31st.

Notes.

A Lead-Hardening Process.—It is reported from Chicago that engineers of the Western Electric Co. have discovered a process for hardening and tempering lead.

Institution of Electrical Engineers.—The Council has awarded the following scholarships to students for 1925-26 :—
A David Hughes scholarship of the value of £50 to Mr. G. N Peel, B.Sc. (Armstrong College, Newcastle-on-Tyne).
Salomons scholarships of the value of £50 each to Mr. R. O. Carter (City & Guilds (Engineering) College), and Mr. H. S. Leman (East London College).

Wind Power Plant in Austria.—What is described as the first large wind-operated electric lighting and power plant in Austria has recently been completed at Asparn-an-der-Zaya, in the Mistelbach district. The wind turbine, which has a diameter of 32 ft., is mounted on a 65-ft. tower and by means of a dynamo and battery of accumulators is supplying current to the three hundred inhabitants of the village. It is stated that during the first four months of operation the wind turbine never stopped, and it has enabled from 5 to 45 h.p. to be developed.

A Large Hydro-Electric Installation.—Some interesting details are given in *Power* of the installation of the hydro-electric plant of the Alabama Power Co. on the Tallapoosa River, Ala. The installation will total 135,000 h.p., consisting of three sets of 45,000 h.p. each. These are claimed to be the largest in the Southern States, and with the exception of those at the Niagara Falls, the largest in the United States. All the generators are being supplied by the American G.E.C., two of the waterwheels by the Allis-Chalmers Manufacturing Co., and the third by the Wm. Cramp & Sons' Ship and Engine Building Co. The generators are rated at 37,500 kVA, 88 per cent. power factor, 120 r.p.m., 12,000 V, three-phase, 60 cycles. They are carried on vertical shafts, fitted with spring thrust bearings, and directly connected to exciters. A storage reservoir will form the greatest lake in the world, having a capacity of 530,000 million gals. The Roosevelt Dam Reservoir, at present one of the largest artificial lakes, holds 420,000 million gals.

An International Electricity Producers' and Distributors' Association.—The *Journée Industrielle* of Paris reports that an Association of French, Belgian, and Italian electricity producers and distributors has been formed with Signor Ponte, of the Italian Association of Electricity Producers as first president and M. G. Martz, of the corresponding French Association, as secretary. The object of the new body is to collate information and statistics relating to the production and distribution of electricity in the different countries with a view to the unification of methods. An international congress is to be held every two years, the first of which is to be held in Paris in 1926. It is hoped that other countries will join the new Association in order to render it a truly international body.

Ignition of Firedamp.—There is an intimate connection between the subject matter of two papers recently published by the Safety in Mines Research Board (H.M. Stationery Office, 6d. each), and they should be read in conjunction. The first, on "The Ignition of Firedamp" (No. 8) by Messrs. H. F. Coward and R. V. Wheeler, constitutes a concise and practical summary of the objectives of research on the ignition of firedamp with reference to the requirements of the coal-mining industry, and the results so far attained. The objectives are (1) to ascertain the conditions under which firedamp will ignite, in order that means may be taken to avoid the occurrence of such conditions in the pit, and (2) to ascertain which are the most readily ignited mixtures of firedamp and air, in order that these mixtures may be used when determining the liability of colliery equipment, such as flame and electric lamps, electrical apparatus generally, and explosives, to ignite firedamp. Phases of the subject, such as ignition by heated surfaces and wires (including incandescent filaments of electric lamps), frictional sparks, flames, and electric sparks are discussed. It is shown that a mixture of firedamp and air can be ignited without the application of flame, merely by raising it to a certain temperature either directly by the application of heat, or, indirectly, by submitting the mixtures to adiabatic compression (that is, compression without loss of heat to the containing walls before the process is complete). The fact that a firedamp-air mixture can be ignited by pressure alone may have an important bearing on the possibility of the ignition of pockets of gas in crevices by the pressure produced when a shot is fired, even though the flame of the explosive is entirely suppressed.

When an inflammable mixture of firedamp and air is raised to, and maintained at, a temperature higher than the "ignition temperature" it ignites—but not immediately; there is a certain interval, termed the "lag on ignition," the length of which depends upon the temperature and upon the composition of the mixture. This lag, which is dealt with in the second paper (No. 9) by Messrs. C. A. Naylor and R. V. Wheeler, is not peculiar to firedamp, but is more marked with it than with some other inflammable gases, such as hydrogen, for example. Lag on ignition has an important bearing on safety in coal mines. It accounts for the fact that it is very difficult, if not impossible, to cause an external ignition of firedamp by the gauze of a miner's flame safety lamp heated by firedamp burning within it; and it provides grounds for the hope that it may be possible to compound explosives, the flames from which (being of exceedingly short duration) could not ignite firedamp despite their high temperature.

In a third paper (No. 10), firedamp explosions within closed vessels and the effects of turbulence are dealt with by Messrs. G. B. Maxwell and R. V. Wheeler. Inasmuch as mining electrical machinery, such as motors, may sometimes comprise enclosures in which rapidly revolving parts induce turbulence, it is important to determine the extent to which such turbulence modifies the character of an explosion of firedamp and air that may occur within the casing, since the speed at which flame spreads through an inflammable mixture is demonstrably dependent on the degree of mechanical agitation imparted to the mixture. The effect of turbulence on the development of firedamp explosions in closed vessels has been studied in relation to (*a*) the maximum pressures produced, and (*b*) the time taken to attain the maximum pressure. It is shown that, whereas considerably enhanced pressures can be obtained from weak mixtures of methane and air when they are turbulent, the most explosive mixtures (containing between 9 and 10 per cent. of methane) are not much affected even by extreme turbulence. The maximum pressure obtainable from any quiescent mixture of methane and air, initially at atmospheric pressure, when exploded in a closed vessel is about 105 to 110 lb. per sq. in. The effect of turbulence is to increase this maximum pressure by about 4 per cent. On the other hand, with both weak and strong mixtures the effect of turbulence is greatly to increase the rapidity with which the maximum pressure is attained. Neither the slight increase in maximum pressure from turbulent mixtures, nor the greatly increased rapidity of development of pressure, affects the safety of "flange protection" devices for flame-proof mining electrical apparatus.

Railway Collision Report.—We have received a copy of the report made to the Minister of Transport into the cause of the collision which occurred on May 22nd, in the tunnel at the south end of Snow Hill Station, Birmingham, on the Great Western Railway. The collision was brought about by the signalman wrongly assuming that the train in front, in the tunnel, was proceeding in the normal manner, when it was actually standing at the up starting signal in the tunnel, owing to this signal having been prematurely brought to danger by the track circuit in advance of it which had failed, and allowing the second train to follow up in the rear. The depression bars functioned properly, but lack of faith in these on the part of the signalman due to the fact that they had previously failed several times, and to his not being aware of the track signal failure, led him to assume also that they had failed. The failure of the track circuit was attributed to the batteries being run down due to intermittent failure of insulation brought about by two of the long transverse tie bolts touching the fang bolts on the circuit. Similar battery troubles had occurred previously. The following are among the recommendations made: That all running movements be controlled by the home signals; that a "limit of shunt" indicator be substituted for the existing "starting" signal in the tunnel; and the provision of back locks, and, if necessary, front locks on the home signal levers.

Appointments Vacant.—Test assistants, for the Ignition and Electrical Department of the Royal Aircraft Establishment; electrical assistant required for the Straits Settlements (commencing salary about £40 per month); meter tester, repairer and inspector for Middleton (Lancs.) Corporation; superintendent to take charge of the generating works of the Sunderland Corporation; the salary offered is £650 per annum. Sunderland Corporation; the salary offered is £650 per annum; lecturer in the department of electrical engineering at Bradford Technical College. (See our advertisement pages to-day.)

Fatalities.—An August 6th, a middle-aged man threw himself upon a live electric rail at Twickenham station on the South-Western section of the Southern Railway, and was immediately killed.

On the previous day a young girl was killed by electric shock on the line between Wandsworth and Earlsfield.

Harry Light (46), while repairing the roof of a house at Sebastopol, Monmouth, on August 5th, came into contact with a "live" wire and received a fatal shock.

Observations on Ferromagnetism. — We learn from *Engineering* that as a result of experiments by Messrs. L. R. Ingersoll and S. S. de Vinney, of the University of Wisconsin reported in the *Physical Review*, it has been found that thin films of nickel appear to be non-magnetic until rendered crystalline by heating. A film of nickel was deposited on a cover-glass by spattering a nickel disk in a hydrogen bulb. The deposit, though bright metallic and hard, was originally amorphous, and in that state non-magnetic and incapable of producing magnetic rotation of the plane of polarisation. After heating to 400 deg. C. in a hydrogen atmosphere the film was distinctly magnetic and also crystalline; films thicker than 120 $\mu\mu$ may be magnetic to start with and thick non-magnetic films are not obtained. From these and other observations, as well as on coloidal iron, Ingersoll concludes that ferromagnetism is not an atomic property, but connected with crystalline structure. The removal of hydrogen by heating might also account for the appearance of magnetism. Some films were spattered over with gold; they developed blisters apparently of escaping hydrogen, during the heating, which also diminished the electric resistance of the film, sometimes to a fifth of its value. The spattered nickel might first be in the oxidised condition and be reduced by the heat treatment with hydrogen, but Ingersoll considers this unlikely because heating in a Bunsen flame also rendered the film magnetic, though the flame might oxidise the nickel.

Rugby Radio-telegraph Station.—With reference to our recent description of the Post Office radio-telegraph station at Rugby, we are informed that the Mullard Radio Valve Co. Ltd., in conjunction with Philips' Glowlampworks, Ltd., of Eindhoven, Holland, has supplied thermionic valves for the station.

Electricity in Time-keeping.—Annual Report of the Astronomer Royal for Scotland.—The record of the work done at Edinburgh Observatory during the past year under Prof. R. A. Sampson, F.R.S., Astronomer-Royal for Scotland, has a very important bearing upon the accurate measurement of time, a subject to which special attention has been devoted at Edinburgh. Since 1918 Prof. Sampson has contributed a series of papers to the Royal Society of Edinburgh and the Royal Astronomical Society on time-keeping; he employs an oscillograph and a kinematograph film with continuous motion by means of which each vibration of a pendulum can be recorded, and with the aid of a reading microscope the record can be measured to the thousandth of a second. In his labor

tory were installed the following standard clocks: Riefler No. 258, said to be the best ever made of that type; Leroy No. 1,230, similar to those used at the Paris Observatory, which control the time signals from the Eiffel Tower; and Shortt No. 0, the original "free pendulum" clock of the Synchronome Co. The performances of all three were automatically recorded on the same strip, and he reports that "the daily comparison demonstrated a decided superiority in the rate of clock Shortt; indeed, the other two were hardly able to serve as a check upon it. Therefore, with a view to carrying time work to the limit that the appliances will allow, a second model of the clock (Shortt No. 4) was installed in January, in one of the vacant clock cells in the basement. The connections for temperature control are the same as in the other cells. The original clock of these series (Shortt No. 0), which was erected here for trial by Mr. Shortt in 1923, and which has shown such remarkable going, has been generously presented to the Observatory by the Synchronome Co., Ltd., in association with whom Mr. Shortt had prepared his model. Briefly, it may be said that the only discernible faults in the going of Shortt No. 0 are a small temperature coefficient showing when an accident disturbs the temperature control of the cell, and a minute leak in the case, which has not been located."

All time determinations are based upon transit observations, but the latter are far less reliable than modern clocks, being about 100 times as rough as the clock observations, so that the clocks have to be rated from a long series of daily transit observations. This process has been greatly facilitated by the use of wireless telegraphy and the "time vernier," which enables observatories to compare their times with precision. Hitherto there has been an appreciable discrepancy between them, which, though apparently trifling, has given astronomers much embarrassment, and Prof. Sampson has been seeking the cause of the error. He now states that "owing to improvements in the clock and chronograph system in this observatory, and in receiving apparatus for wireless telegraphy signals from other observatories, it has proved possible to bring this investigation to an issue. It has been found that during the whole of 1924 the whole of the large erratic or systematic errors are removed if the level error, determined as usual by the mercury bath, is rejected, and the observations are reduced instead by an azimuth error derived from one of the collimators, in combination with the usual observations of polar stars. The implications of this result are of high interest and importance to astronomers and will be pursued."

Proposed Street Lighting Practice.—A table is published in the *Electrical World* showing the recommendations made by the Street and Highway Lighting Committee in its report to the N.E.L.A. at San Francisco. The streets are classified according to the lighting requirements and to the populations of the cities, &c. For cities of 100,000 population and over, the principal business streets are recommended to have illumination of 15,000 to 50,000 lumens, each source placed 18-25 ft. high, with spacings of 100-150 ft. The following are brief details of some of the remaining recommendations: Cities of 100,000 population: Primary thoroughfares, 10,000-15,000 lumens, 15-20 ft. high, 100-150 ft. spacing; secondary thoroughfares, 4,000-10,000 lumens, 15-20 ft., 100-150 ft.; residential streets, 2,500-4,000 lumens, 13-20 ft., 125-200 ft. Cities of 30,000 to 100,000 population: Principal business streets, 10,000-30,000 lumens, 15-20 ft., 80-125 ft.; main thoroughfares, 6,000-15,000 lumens, 15-20 ft., 100/150 ft.; secondary thoroughfares, 4,000-10,000 lumens, 15-20 ft., 100-150 ft.; residential streets, 2,500-4,000 lumens, 13-20 ft., 125-200 ft. Cities of 5,000 to 30,000 population: Business streets, 6,000-15,000 lumens, 14-18 ft., 80-125 ft.; main thoroughfares, 4,000-10,000 lumens, 15-20 ft., 100-200 ft.; residential streets, 2,500-4,000 lumens, 13-20 ft., 150-250 ft. Cities up to 5,000 population: Business streets, 4,000-10,000 lumens, 13-16 ft., 80-110 ft.; thoroughfares, 2,500-6,000 lumens, 15-20 ft., 100-200 ft.; residential streets, 2,500 lumens, 13-20 ft., 150-300 ft. Highways: Light pavement, 2,500-4,000 lumens, 25-35 ft., 300-400 ft.; dark pavement, &c., 2,500-4,000 lumens, 25-35 ft., 200-300 ft.

Educational.—Loughborough College.—We have received a copy of the calendar for 1925-26 of Loughborough College—the only institution of its kind in this country, the equipment being such that engineering students receive both theoretical and practical training concurrently; the course covers a period of five years, during half of which the student is engaged in productive work in the workshops, passing through every department of the works. The shops are equipped with up-to-date machinery, the scope of which is well shown by numerous photographic illustrations and lists of tools in the calendar. The Department of Electrical Engineering, under Dr. J. F. Driver, is well equipped with machines and apparatus for experimental work, and includes the college generating station. Residential accommodation is provided.

The New Gallery Kinema Lighting Installation.—Some features of this recent London installation are of interest. The lighting of the attractive main entrance is produced through the medium of six floodlight projectors equipped with 100-W gasfilled lamps, which are fitted in line at the back of the frame supporting the illuminated facia sign. In addition, two flood projectors are fitted just inside the entrance, one on each side. The main entrance hall is covered by an illuminated dome, which has a large number of white lamps, concealed from view, fitted round the lower portion.

It is in the auditorium that the charm of coloured and decorative lighting is most pronounced. The dome is illuminated by a large number of colour-sprayed lamps. Each colour is arranged on a separate circuit and connected to a dimmer. By the operation of the dimmers exceedingly pleasing effects can be produced. On the side walls of the kinema a number of lighting units take the form of old-time wooden ships with sails; both ships and sails are gilded. The bow of each ship contains an entirely concealed lamp from which the light is projected from the inside on to the sail, whence it is reflected into the auditorium. Over the circle is a special type of mirrored cornice reflector, in which coloured light is employed with excellent results. The illumination of the proscenium arch is another special feature. A number of floodlight projectors, equipped with 200-W lamps and colour screens, flood the arch with coloured illumination which is very effective. For the stage lighting a special footlight system of compartmental design is in use; the compartments, each accommodating a colour-sprayed lamp, extend to 30 ft. and are designed so that maximum horizontal and vertical flooding is obtained. Above the screen a number of horizon floods fitted with colour filters are installed. The circuits are connected to dimmers so that direct

Interior of the New Gallery Kinema.

colours, or any combination of colours, can be projected upon the screen.

The general lighting scheme for the kinema was prepared and carried out by Mr. E. C. Nicholls, chief engineer of the Provincial Cinematograph Theatres, who is to be congratulated upon the excellent results obtained; the electrical equipment is chiefly of the G.E.C. design and make.

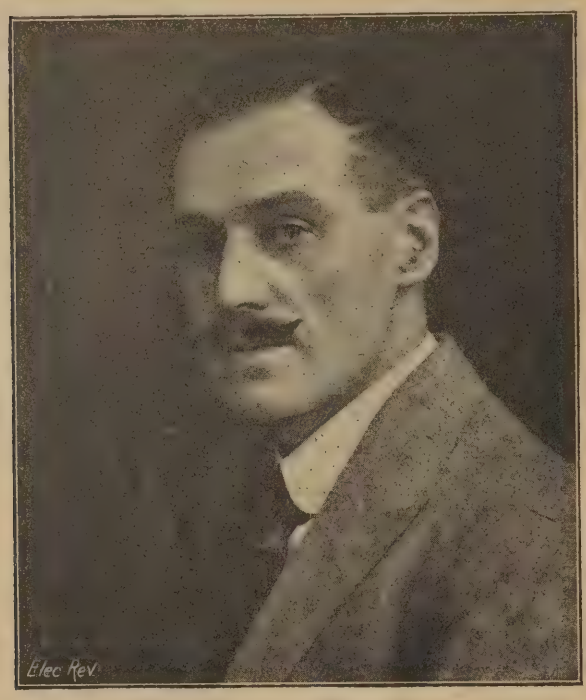
Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. S. F. Ricketts, vice-president and sales manager of the Western Elevator & Motor Co., Ltd., Winnipeg, is in this country on a holiday and business trip. He is an old Finsbury College student, and left England in 1903 for China, where he built the big power house in Canton, and later built up a large machinery department for Shewan & Tomes in Hong Kong. After spending eight years in China, he has since resided in Canada, and has been connected with several large engineering schemes. Firms which are desirous of doing engineering trade in Canada are invited to communicate with him at 83, Grove Road, Windsor.

The *Electrical Engineer of Australia and New Zealand* reports that Mr. H. A. Curtis has been appointed chief engineer and general manager of the Hydro-Electric Department of Tasmania. Mr. Curtis, who is a native of New Zealand, has been with the department since 1915, and upon the retirement of Mr. J. H. Butters last year he became acting chief of the department.

The Electricity Committee of Luton Town Council has recommended that the salary of the electrical engineer be increased from £1,000 to £1,200 per annum as from August 1st, and that of his chief clerk, Mr. R. Harding, from £275 to £300 per annum, from the same date.



Messrs. Mavor & Coulson announce that Mr. Geoffrey M. Gullick, who has been general manager of their Mining Department for between four and five years, has now been appointed a director of the company.

On Saturday last, according to the financial Press, Sir Glyn West, the chairman of the Armstrong Whitworth Co., left for America by the *Aquitania*. The company has been developing hydro-electric power in Newfoundland and has constructed paper mills at Corner Brook, and Sir Glyn is attending

the official opening of these mills by the Governor on August 24th.

Hastings Town Council, in view of the additional work in connection with the new generating station, has made a grant of £500 to the Borough Electrical Engineer, and has increased his salary from £850 to £1,000 per annum, as from August 1st. The salary of the Deputy Borough Electrical Engineer has been increased to £600, and he has been granted an honorarium of £250.

We reproduce herewith a portrait of Mr. William Weekes, who is shortly succeeding Mr. C. Newton Russell as borough electrical engineer at Shoreditch, on probation for a period of twelve months. After completing his academical training in 1889, Mr. Weekes had four years of practical training with Messrs. W. T. Goolden & Co., electrical engineers, London. In 1893 he became electrical engineer in charge of traction contracts, &c., for Messrs. Easton, Anderson and Goolden, Erith. Shortly afterwards he secured a post in the Blackpool Corporation Tramways Department as assistant engineer having general supervision of the power station and electrical plant. Mr. Weekes went to Shoreditch in 1897 as shift engineer in charge of the Coronet Street generating station, remaining there until 1900, when he went to South Africa with the Imperial Yeomanry as an armourer.

Mr. W. Weekes,
who is to succeed Mr. C. Newton Russell as Borough Electrical Engineer at Shoreditch.

While in South Africa he assisted in the supervision of the locomotive repair shop of the Beira-Salisbury Railway. Returning to Shoreditch, he became shift engineer in charge of the Whiston Street power station, and in 1907 was appointed chief assistant electrical engineer and mains superintendent. Mr. Weekes served for a time with the County of London Yeomanry during the war. He has been an Associate Member of the Institution of Electrical Engineers since 1912.

The Hereford City Council has granted an honorarium of £100 to the City Electrical Engineer.

Mr. H. S. Persey, of Fulham, London, was last week appointed resident electrical engineer to the Ulverston (Furness District of North Lancashire) Urban District Council. There were 187 applicants for the post. Supply is expected to be available in the district by the end of September.

Mr. T. Thorne Baker has been elected a Fellow of the Institute of Physics.

Mr. T. W. Ellis, consulting engineer, of Westminster, is leaving for the United States immediately on special business and hopes to return in October.

Obituary.—Mr. E. A. Cannell.—We regret to learn that Mr. Ernest Edward Cannell, who has been associated with our contemporary *Electricity* for more than 26 years, passed away on the 9th inst. in his 51st year. He will be much missed by a wide circle of friends in the electrical world.

Mr. C. Wooller.—The death has taken place from injuries received through being knocked down by a motor-car of Mr. Charles Wooller, of Mitcham, a shift charge engineer at the electricity works of the Beckenham Urban Council. He was 35 years of age.

Wills.—The late Mr. John Bilbie, of Bilbie, Hobson and Co., gas engine makers, left £6,487 gross and £6,285 net personalty.

Mr. J. Archdale (James Archdale & Co., machine tool makers, Birmingham) left £28,896 gross and £20,678 net personalty.

New Companies Registered.

Larne Electric Light and Power Co., Ltd. (N.1,263).—Private company. Registered in Belfast on July 28th. Capital, £5,000 in £1 shares. Objects: To take over the Larne Electric Light Co., at Larne. The subscribers (each with one share) are:—W. Crawford, 85, Main Street, Larne, merchant; W. H. Brandon, 7, Donegall Square West, Belfast, chartered accountant. W. Crawford is the first director. Secretary: William J. Allen. Solicitors: L. Estrange and Brett, Chichester Street, Belfast. Registered office: 79, Scottish Provident Buildings, 7, Donegall Square West, Belfast.

Mullard Wireless Service Co., Ltd. (207,669). — Private company. Registered August 4th. Capital, £10,000 in £1 shares (5,000 "A" and 5,000 "B"). Objects: To acquire, maintain, use, and supply telephones, telegraphs, and machines and valves, apparatus and appliances for use in connection with the transmission of signals, sounds and other communication, &c. The subscribers (each with one share) are:—S. R. Mullard, 27, Crane Drive, Surbiton, electrical engineer; H. J. Owens, 8, Milner Road, Kingston-on-Thames, secretary. S. R. Mullard signs as director. Half of the directors are to be appointed by the "A" shareholders and half by the "B" shareholders. No person connected with any person, firm or corporation engaged in the manufacture of radio valves or incandescent electric lamps or similar products other than the company or the Mullard Radio Valve Co., Ltd., or the N. V. Philips Gloeilampenfabricken, of Holland, shall be eligible for appointment as director of the company, except with the consent of all the directors. Remuneration, £50 each per annum. Solicitors: Godfrey, Wirr and Co., 85, Gracechurch Street, E.C.3. Registered office: Orient House, New Broad Street, E.C.

The Greater London Power Co., Ltd. (204,674).—Registered as a public company on August 4th, with a nominal capital of £100 in £1 shares. The objects are:—To carry on the business of an electric light and power supply company in all its branches. The subscribers (each with one share) are:—W. J. Rowles, 18, Austin Friars, E.C.2, solicitor; R. J. L. Scott, 18, Austin Friars, E.C.2, solicitor; A. G. Austice, 18, Austin Friars, E.C.2, articled clerk; P. J. Bellis, 18, Austin Friars, E.C.2, clerk; A. C. Dowsing, 4, Larden Road, Acton, W., accountant; A. K. Sterne, 18, Austin Friars, E.C.2, clerk; W. F. Marlow, 18, Austin Friars, E.C.2, solicitor's clerk. Minimum cash subscription, £7. The first directors are not named. Registered without articles of association. Solicitors: Slaughter and May, 18, Austin Friars, E.C.

Energo Products, Ltd. (207,621).—Private company. Registered July 31st. Capital, £3,000 in 2,000 cumulative 10 per cent. participating preference shares of £1 and 20,000 ordinary shares of 1s. Objects: To acquire the registered design and trade mark "Energo" as applied to electrical transformers from A. L. Vandervelde, and to carry on the business of manufacturers of, and dealers in electrical, telephonic and wireless goods and apparatus, brass and other metal parts for all purposes, goods appliances and sundries, insulated wire and cables and all forms of wire and cable, castings, electric light, general electrical and wireless engineers, &c. The directors are:—A. L. Vandervelde, 1, St. James Street, E.C.1, engineer; V. B. M. Mallentjer, 57, Scarsdale Villas, W.8, merchant (joint managing directors for life, with a minimum remuneration of £360 each per annum). Qualification, 250 shares.

Thermo Path Company, Ltd. (207,639).—Private company. Registered July 31st. Capital, £1,260 in 1,200 10 per cent. preference shares of £1 and 1,200 ordinary shares of 1s. Objects: To acquire certain processes and full information as to the processes for manufacturing and the right to manufacture and deal in certain dielectrics suitable for the manufacture of electrical heating apparatus and other electrical applications, and to adopt an agreement with A. Van der Moersch. The subscribers (each with one preference share) are:—C. Evans, 172, High Street, Acton, W.3, draper; A. F. A. Ashfield, The Warrens, Woodlands, Kemsing, Kent, cigar importer; A. W. Poore, of 59, Eardley Crescent, S.W.5, is managing director. Qualification of directors, 100 shares. Remuneration, £26 5s. each per annum. Solicitors: Woodbridge & Sons, 7, New Square, Lincoln's Inn, W.C.2.

Electroflo Meters Co., Ltd. (207,682).—Private company. Registered August 4th. Capital, £21,000 in £10 shares. Objects: To acquire the trade marks "Electroflo," No. 434,026 and 444,505, to acquire the business of the Electro Flow Meters Co. carried on by B. Dunglinson, A. Bursill, and J. W. Healy at Abbey Road, Park Royal, N.W.10, and carry on the business of electrical, gas, hydraulic, and general engineers, jig and tool and scientific instrument makers, &c. The directors are: B. Dunglinson, 9, Gunterstone Road, Kensington, W.14, engineer (managing director); A. Bursill, 25, Spencer Road, Chiswick, W.4, engineer; W. J. Healy, 143, Sutton Court, Chiswick, W.4, engineer. Qualification, £10. Remuneration as fixed by the company. Solicitor: A. R. Lord, 48, Bedford Row, W.C.1. Registered office: Abbey Road, Park Royal, N.W.10.

Official Returns of Electrical Companies.

Newcastle-upon-Tyne Electric Supply Co., Ltd.—Acknowledgment of further indebtedness dated July 17th, 1925 (supplemental to trust deeds dated October 16th, 1913, and December 9th, 1921), to secure further debenture stock for £170,000, ranking, *pari passu*, with £1,376,000 like debenture stock secured by trust deed and previous acknowledgments of indebtedness charged on property comprised in the original deed and supplement; charge dated March 4th, 1925. Trustees: Law Debenture Corporation, Ltd.

Cheddar Electric Supply Co., Ltd.—Debenture dated July 24th, 1925, to secure £2,500, charged on the company's undertaking and property, present and future, including uncalled capital, but excluding freehold hereditaments and premises. Holders: Lloyds Bank, Ltd.

North Somerset Electric Supply Co., Ltd.—Mortgage dated July 15th, 1925, collaterally securing £40,000 primarily secured by debentures dated October 30th, 1922, and February 23rd, 1925, charged on various properties in Somerset. Holders: Solicitors for H.M. Treasury.

Haworth & Williams, Ltd.—Particulars filed of £300 debentures authorised July 8th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount now being issued.

Specialities (Liverpool), Ltd.—C. M. Dolby, of 51, North John Street, Liverpool, was appointed receiver and manager (1) on July 22nd, 1925, under powers contained in debenture dated September 28th, 1922; and (2) on July 23rd, 1925, under powers contained in charge dated January 26th, 1924.

Cooper & Smith, Ltd.—A. F. Lovell, of 5, South Street, Finsbury, E.C.2, was appointed receiver on July 28th, 1925, under powers contained in a first debenture dated March 2nd, 1922.

Scintillating Sign Co., Ltd.—A. H. Partridge, of 3, Warwick Court, Gray's Inn, W.C., was appointed receiver and/or manager by order of Court dated July 17th, 1925.

Colombo Electric Tramways and Lighting Co., Ltd. (72,864).—Capital, £150,000 in £10 shares. Return dated June 2nd, 1925. 13,084 shares taken up. £840 paid. £130,000 considered as paid. Mortgages and charges, £120,000 5 per cent. debenture stock.

West African Telegraph Co., Ltd. (21,626).—Capital, £400,000 in £10 shares. Return dated June 24th, 1925. 23,109 shares. £231,090 paid. Mortgages and charges, nil.

Astro Electric, Ltd.—F. Wilcock, C.A., of 1, Great Winchester Street, E.C.2, was appointed receiver and manager on July 23rd, 1925, under powers contained in debentures dated November 8th, 1923, in place of R. R. Jones, of 15, Elm Grove, Wimbledon, who has ceased to act in those capacities.

Premier Accumulator Co. (1921), Ltd. (178,158).—Capital, £40,000 in £1 shares. Return dated July 6th, 1925. All shares taken up. £18,749 paid (£1 on 11,249 and 15s. on 10,000). 18,751 shares credited as fully paid. Mortgages and charges, nil.

Lancashire Dynamo and Motor Co., Ltd. (61,447).—Capital, £250,000 in £1 shares (200,000 ordinary and 50,000 preference). Return dated April 22nd, 1925. 174,120 ordinary and 48,800 preference taken up. £222,920 paid. Mortgages and charges, £75,000.

Hart Accumulator Co., Ltd. (60,059).—Capital, £200,000 in £1 shares (180,000 ordinary and 20,000 preference). Return dated June 3rd, 1925. 156,708 ordinary and 19,523 preference taken up. £38,411 paid up on 31,352 ordinary and 7,059 preference. £137,820 considered as paid on the remainder. Mortgages and charges, nil.

Bromley (Kent) Electric Light and Power Co., Ltd. (54,127).—Capital, £100,000 in £1 shares. Return dated April 20th, 1925. 90,000 shares taken up. £75,000 paid. £15,000 considered as paid. Mortgages and charges, £63,726.

Metallic Seamless Tube Co., Ltd. (47,966).—Capital, £65,333 6s. 8d. in 20,000 preference shares of 13s. 4d. and 260,000 ordinary shares of 4s. Return dated May 29th, 1925. 15,245 preference and 260,000 ordinary taken up. £36,163 6s. 8d. paid on 15,254 preference and 130,000 ordinary. £26,000 considered as paid on 130,000 ordinary. Mortgages and charges, nil.

Anglo-Portuguese Telephone Co., Ltd. (24,545).—Capital, £500,000 £1 shares. Return dated June 1st, 1925. 400,000 shares taken up. £301,046 paid. £98,954 considered as paid. Mortgages and charges, £66,280.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Enfield Cable Works, Ltd.

Lord Verulam presided at the annual meeting on August 7th, and in moving the adoption of the report (*vide* our last issue, p. 227), said that the balance sheet more than came up to the forecast which he made a year ago as to the prospects of the company. They had to remember that the period with which the report dealt had been a normal one so far as the labour and political situations were concerned, and, further, that there had been a considerable volume of orders in the country for the goods which they manufactured. They had had a fair share of those orders, and the results were reflected in the balance sheet. Referring to the investments in subsidiary companies, the chairman said that they held the whole of the capital of £5,000, with the exception of £6, in the Enfield Cable Works (Australasia), Ltd. They had formed that company to work their Australian agency, and although orders in that country had to be taken at very cut figures, the company had succeeded in making a profit of just over £2,500. That profit was kept in Australia for financial reasons. The business done in that country was entirely in the products of their factory at home, and therefore there was a small profit made on the Australian business in England. The other subsidiary company was the Enfield Rolling Mills, Ltd., which they had formed with a capital of £27,775. The mill had been erected, and the directors were satisfied that it was going to be a profitable investment. It was the only plant of its kind in the South of England, and they had no fear that there would not be plenty of work for the mill to do. It was of advantage to them to have the company for many reasons. One reason was that they would be able to buy copper in bar form instead of rods, and, further, it enabled them to obtain any odd-sized wire or copper strip at any time. The profit for the year, after charging directors' fees, depreciation, &c., amounted to £104,000 odd. The dividend on the preference shares and the interim dividend on the ordinary shares absorbed just over £25,000. They proposed to increase the reserve, which now stood at £5,151, to the round figure of £20,000, and to declare a final dividend of 15 per cent. on the ordinary shares, making 20 per cent. for the year. That would leave £34,079 to be carried forward, against £14,892 brought into the account. Sir T. O. Callender seconded the motion, which was adopted.

Kalgoorlie Electric Tramways, Ltd.

The annual meeting was held in London recently, under the chairmanship of Mr. A. H. P. Stoneham. In presenting the report and accounts, which were reviewed in our issue of July 31st (p. 189), the chairman said that the net profit for the past year had declined from £7,445 to £5,148, owing mainly to the reduction of the population of Kalgoorlie and the competition of motor-omnibuses. Since 1905 the population had fallen from 33,000 to 18,000 owing to the gradual decline of the mining industry of the district. A Royal Commission had inquired into the position of the industry, and it was found that costs could be reduced and the tonnage increased, enabling the field to be worked at a profit for some years. It was recommended that a gold bonus should be paid to the Western Australian mines; this, it was considered, would increase the number of employed by 50 per cent. in two years. With regard to the motor-bus competition, the chairman said that representations by the company had resulted in restricting the 'buses to certain routes.

Mr. W. H. Stanley, director in Western Australia, said that private enterprise was not encouraged in Australia; wages were high, and so was the cost of material. The depreciation of the system had also had to be taken into account; they would have to look forward to attending to that matter if conditions enabled them to keep on. The report and accounts were adopted.

Manila Electric Corporation.—The *Financial Times* reports that the Associated Gas and Electric Co. is offering valuable subscription rights to all stockholders and security holders having the right to become stockholders by conversion. The offer will apply to the "A" stock, now being exchanged for the Manila Electric Corporation stock, and also to the Associated Co.'s 6½ per cent. Manila Electric "B" debentures, issued previously in exchange for Manila Electric stock. In May last, under a scheme of reorganisation of capital, stockholders of the Manila Electric Corporation were offered 6½ per cent. debenture obligations of the Associated Gas and Electric in exchange for their holdings. The latter concern acquired two-thirds of the Manila stock, and in July last offered to exchange "A" stock for the remainder of the Manila capital stock.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted:—

Calcutta Electric Supply Corporation.—133 ordinary shares of £1 each, fully paid, Nos. 1,216,573 to 1,216,710.

Fife Tramway, Light and Power Co.—500,000 ordinary shares of £1 each, fully paid, Nos. 1 to 500,000, and 500,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 500,000.

Siemens Bros. & Co.—45,000 10 per cent. cumulative preference shares of £1 each, fully paid, Nos. 360,001 to 405,000.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Shropshire, Worcestershire, and Staffordshire Electric Power.—39,315 "A" ordinary shares of £1 each, fully paid, Nos. 810,001 to 849,315; 307,863 "B" ordinary shares of £1 each, fully paid, Nos. 1 to 300,000 and 600,001 to 607,863.

Anglo-Argentine Tramways Co., Ltd.—The Special Committee appointed by the Municipal Executive to study the proposals of the Anglo-Argentine Tramways Company and of Messrs. Dodero and Benigni for new underground railways reported on August 10th, advising the acceptance of the Anglo-Argentine Company's project. The Committee admitted the justice of the increased tramway fares so as to provide quotas for the pension fund, salary increases, and a fair return on capital.—*The Times.*

Tyneside Tramways and Tramroads Co.—The report for the half-year to June 30th last shows a surplus of £1,963, and the addition of £751 brought forward makes £2,714. The balance available, after providing for interest, &c., is £830, which is being carried forward. The directors regret that they are unable to recommend a dividend for the half-year; the traffic receipts show a decrease of £1,456, as compared with the first half of 1924. The decline is attributed to the depressed state of trade in the district.

Waste Heat and Gas Electrical Generating Stations, Ltd.—An interim dividend of 1½ per cent. on the issued share capital of the company has been declared in respect of the half-year ended July 31st.

Chatham and District Light Railways Co.—An interim dividend at the rate of 5 per cent. per annum has been declared on the ordinary shares, as in 1924.

Mansfield and District Tramways, Ltd.—A dividend at the rate of 6 per cent. per annum has been declared on the ordinary shares in respect of the past half year, as in 1924.

Cork Electric Tramways and Lighting Co., Ltd.—An interim dividend of 3 per cent., less tax, has been declared on the ordinary shares, as in 1924.

Clyde Valley Electrical Power Co.—An interim dividend of 3 per cent. (actual), less tax, has been declared on the ordinary shares in respect of the half-year to June 30th.

East African Power and Lighting Co., Ltd.—A dividend at the rate of 3 per cent. per annum is announced for the past year.

Lanarkshire Tramways Co.—The directors state that they are unable to declare an interim dividend.

Fuller's United Electric Works, Ltd.—At the resumed meeting on Monday last, the scheme for the creation of a prior lien debenture for £75,000 in favour of the company's bank, and increasing the interest on existing stock was approved.

Tyneside Electrical Development Co., Ltd.—An interim dividend of 3 per cent. has been declared on the preferred ordinary shares for the half-year ended July 31st.

Stocks and Shares.

MONDAY EVENING.

THE principal financial excitement of last week the Bank of England furnished by reducing its rate to 4½ per cent. as against the previous 5 per cent. The step came as a complete surprise. It was only three or four weeks ago that people in the Stock Exchange talked of the possibility of a rise in the

Bank Rate. For it to come down to 4½ per cent was so unexpected that its import was scarcely grasped at first. Very quickly, however, investment stocks responded to the change in the position, and, with the rises in British Government securities, there followed a general hardening of gilt-edged stocks in other sections. Investment securities of all kinds are better. The new County of London Electric preference, for instance, strengthened to 1s. 1½d. premium. Most of the quotations in our price-lists show little variation. There is, nevertheless, more change in them than actually appears, in that it has become less easy to buy stock than it was even a week ago.

The effect of the arrangement made by the Government in connection with the coal crisis, after being sharply criticised in the Stock Exchange, was subsequently deemed to be as satisfactory as could have been expected in the circumstances, and the settlement of the trouble, though considered to be more or less temporary, led to revival of confidence and of quotations. The usual August holiday feeling is noticeable in Stock Exchange markets, although there is still a good deal of business going on in various directions.

A sharp fall in the price of rubber to about 3s. 4d. per lb. caused a general shake-out amongst rubber share values, while at the same time it brought about a corresponding improvement in the share prices of Henleys, Callenders, Siemens, and various others in companies connected with the industries which use rubber in large quantities.

Towards the end of last week there were published the returns of the Electricity Commissioners for the year ended March 31st last, showing that the use of electricity is extending rapidly. The Chancellor of the Exchequer stated the other night in the House of Commons that the surplus to the credit of the Road Fund may be employed temporarily in assisting electrical schemes, and this seems to be a very commonsensible method of dealing with money which is appropriately due to public utility works. The Electrical Distribution of Yorkshire is expected to issue fresh capital in the near future, and the price of the ordinary shares, which was standing about 30s. before the statement appeared, has risen to 35s. Shares changed hands to-day, Monday, at 35s. 6d.

In connection with the further employment of electricity, it is particularly interesting to note that the Ministry of Transport, according to an answer given in Parliament last week, continues to press on the coal-mining companies the desirability of electrification. A member asked if the electrification of railways was delayed by any question affecting the supply of current, and the Government's answer was that this is a matter of opinion. The chairman of the La Guaira & Caracas Railway mentioned at the recent meeting that it is proposed to electrify this railway in Venezuela, but that the board had not received certain assurances which they required from the Government of Venezuela, and without which they did not care to proceed with the change-over in the system. That they would receive these assurances, the chairman remarked, he had every reason to hope.

Westminster ordinary eased off to 44s. 6d. Charing Cross strengthened to 47s. 6d. and St. James's at 13⅞ are 5s. higher. Beyond these changes, there are no alterations of consequence in the list of electricity supply shares, and business has been quiet. The City of London announces an interim dividend of 1s. per share, payable on September 26th. This is the same rate as that declared a year ago.

Callenders are better at 3 1/16. Henleys rose to the same price, and several other advances occurred in consequence of the reaction in the price of raw rubber. Babcock & Wilcox stand out with a substantial recovery, being 3s. 3d. up at 52s., thanks to the settlement of the coal dispute. Siemens hardened to 27s. 6d. Enfield Cable ordinary shares are firm at 65s. 6d., the preference remaining at 25s.

Metropolitan Consolidated at 70 and Districts at 44½ are 10s. up and down respectively. The market in Home Railway stocks is better, material recoveries having occurred in the prices of the steam companies' stocks. The public, however, are shy of touching Home Railways, and a great part of the improvement is due to a marking-up process, rather than to any increase of actual investment on the part of the public.

The cable market is uninteresting. Advances have occurred in Anglo-American preferred, Eastern extensions and Globe preference, while United River Plate Telephones at 7⅞ are ⅜ higher. The wireless group has scarcely moved. A little investment demand has arisen for Marconi 5½ per cent. debenture on the basis of 103. Amongst miscellaneous shares, Victoria Falls ordinary are better at 46s. Rangoon Electric preference have gone back to 4⅝.

Mexican issues remain heavy, not to say depressed. Mexican Light & Power Firsts shed 2 points to 61½. The rise in Brazilian Tractions was checked by a little profit-taking, and the price stands ½ lower at 60. British Columbia deferred strengthened a trifle; other issues in this section have not moved. The iron and steel market is better all round. Babcock & Wilcox, as already stated, stand out with the principal rise. Rubber shares are weaker by reason of the fall in the price of the raw material. This cold douched the recent fever-heat of optimism, and brought about a considerable reaction in values.

London's Electricity Supply.

Three New Measures, Inaugurating a New Era.

The House of Lords on July 29th approved the London nd Home Counties Electricity District Order, 1925, nd on July 31st the London Electricity Bills, Nos. 1 nd 2, received the Royal Assent.

The three measures which have thus become law re inter-related, and between them open up possibilities f considerable improvement in electricity supply in the ondon district. Their passing marks the end of a pro-racted and difficult series of negotiations and discus-ions which commenced in 1920, as soon as the Electri-ity Commissioners appointed under the Electricity Supply) Act, 1919, were able to get to work.

The two London Acts are similar in effect, but a little ifferent in machinery, because the two groups, the Four Companies" of No. 1 Act and the "Ten Com-anies" of No. 2 Act, preferred different methods of co-peration. The most vital provisions of both Acts re:—

(1) The tenure of the companies in respect of their reas of supply in the County of London is extended om August, 1931, until the end of 1971.

(2) The statutory prohibition of amalgamation or ssociation between the London companies is repealed, nd some definite arrangements of that character are nfirmed and enjoined upon the two groups respectively.

The "Four Companies" of the No. 1 Act are the ity of London, County of London, South London, and outh Metropolitan.

The "Ten Companies" of the No. 2 Act are the haring Cross, Brompton and Kensington, Chelsea, ondon Electric, Metropolitan, Kensington and Knights-ridge, Notting Hill, St. James' and Pall Mall, West-minster, and Central Companies.

The extension of tenure will have the immensely im-ortant effect of permitting the London companies to end money in extension and development with the rtainty of ample time for the capital to fructify. The rospect of compulsory purchase in 1931 on terms which nvolved a material sacrifice of capital value, and the ture returns on unexhausted works, have discouraged uch expenditure.

This is specially important with regard to distribution xpenditure, but it is not negligible with regard to the xtension of generating resources, particularly where is involves the scrapping of existing stations.

The London companies, relieved of the prospect of ss of capital on purchase at a near date, will now have rong incentives to exercise enterprise where they have r some years been obliged to proceed with caution. ery shortly, it may be hoped, no parts of their areas ill be without distributing mains, and the lack of sh in some quarters with regard to domestic supplies r cooking, &c., will give place to active propaganda.

The London companies have had to give something r this. The consent of the London County Council—the holder of the purchase powers—was necessary, so at body was in a position to make terms. These rms are set out in agreements between the L.C.C. and e two groups, scheduled to, confirmed and made bind-g by the two Acts. One of the terms is that the divi-nds on the ordinary capital of the Companies are to be gulated by a sliding scale relating the dividend rates the prices charged.

Until 1931 (later in the case of two companies for ecial reasons) the standard rate of dividend is to be per cent.; after 1931, 7 per cent. The building-up reserves is strictly limited. "Standard prices" are be fixed for each company, and in any year in which company's receipts aggregate less than would have been oduced by actual sales at those prices, the company ay—if it has the necessary funds—distribute as addi-nal ordinary dividend one-sixth of that difference. the company's costs are reduced as compared with those of the year taken for the standard price calculation, it must have given its consumers six-sevenths of the savings by prices below the standards in order to be able to distribute one-seventh as an addition to the standard dividend.

Standard prices will be fixed by taking the costs and charges of the last elapsed year (possibly either 1924 or 1923), adding a calculated sinking fund instalment, and the standard dividend, making some minor adjustment for return on investments and other matters; dividing the total by the number of units sold, and splitting the average into four standard prices for railway and traction, bulk supplies, street lighting, and private consumers. The true value of the ordinary capital is to be arrived at by setting off the available reserves against the depreciation of existing assets; and any balance of "free reserves" may be capitalised and rank for dividends at a reduced rate.

Standard prices may be revised every three years, and must be for 1932.

The prices charged in the year of reference will not enter into the calculation. The companies will not be under an obligation to charge the standard prices; they will have an incentive to charge less, as described; they may charge more, but cannot retain as profit or reserve any net revenue beyond the permitted dividends and reserves.

For several years the London Companies have paid good dividends, and have put large sums to reserve. This was justified by the expectation of loss of capital at purchase. The necessity for these large reserves now disappears, as the sinking fund entering into the standard price calculation is to make good the difference between cost and the purchase prices to be paid in 1971. Prices should consequently be reduced by the difference as soon as the sliding scale becomes effective.

The Commissioners have to fix the date from which it will operate. If, for example, they fix January 1st, 1926, the first application of the sliding scale and the consequent regulation of dividends will be to the accounts for the year ending December 31st, 1926.

The second important provision, permitting and enjoining the co-operation of the companies in each group, takes the form in Act No. 1 of an agreement between the "Four Companies" either to amalgamate or to make arrangements satisfactory to the Commissioners for the centralisation of their generating resources, which means interlinking and unified control of the generating stations.

The stations belonging to this group include Barking (County Company), Bankside (City Company), and Blackwall Point (South Metropolitan Company). These are all Thames-side stations well placed for economical working. Barking, with 100,000 kW of plant and site room for perhaps six times as much, and Bankside, with 55,000 kW and room for considerable extension, will be the mainstay of the group. Loughborough Junction (South London) and City Road (County) will probably become distributing sub-stations very shortly. Wandsworth (County) and Blackwall Point may remain as peak load stations for a time; both are hampered by site area as regards large extensions. These stations are interlinked, or will be so, by 33,000-volt transmission mains, laid or being laid.

The ten companies have undertaken to lease their generating stations and transmission lines to the London Electricity Joint Committee, Ltd., incorporated by the No. 2 Act, which is empowered to operate the stations, to build new ones, and lay transmission mains. The new company will generate for the whole of the constituent companies, which will be the distributors. It will be financed by them and supply them at cost, including capital charges, &c.

Probably Bow Road (Charing Cross), Deptford (London Electric), Willesden (Metropolitan), and Grove Road (Central) will form the mainstay of the group. But Deptford is largely pledged to the Southern Railway, and to 25 cycles; Willesden is largely pledged to the outer areas of the Metropolitan Company, and Grove Road is restricted by site and water supply. Bow Road can be extended.

The engineers informed the House of Commons Committee that it was intended to build a large Thamesside station as soon as the Bill passed. Until that is ready, several of the smaller stations must be kept at work; but with unified control, the existing stations are capable of working at low costs.

The London and Home Counties Electricity District Order, 1925, constitutes a district nearly identical with the area delimited by the Commissioners in their first announcement of 1920. It extends from St. Albans to Dorking, from Windsor to Gravesend, has an area of about 1,860 square miles, and a population (1921 Census) of about 8¼ millions. At the very last stage—approval by Parliament—the Watford Corporation's supply area was cut out, which makes an ugly dent in the north-western quadrant of the boundary.

The Order establishes a Joint Electricity Authority of 33 appointed and elected members, who may co-opt and pay a chairman. The members are thus apportioned: Municipal undertakers, 14; companies, 5; L.C.C., 6; City Corporation and Middlesex County Council, one each; other county councils, 2; workers in the industry, 2; the Railway Companies' Association, 2. This gives authorised undertakers, 19; local authorities, including undertakers, 24; clear majorities on either line of division.

The Authority may raise £10,000,000 for capital works, generating stations, transmission lines, acquisition of undertakings, &c., subject to the approval of the Commissioners.

It may supply in bulk to authorised generators generally, but only with the consent of the four power companies in some portions of their areas. It has to consider, elaborate and report to the Commissioners upon a technical scheme set out in the Order which classifies the existing generating stations for extension, limited extension, and shutting down, and proposes some interlinking mains. The London Companies are pledged by the agreements scheduled to the Acts to carry out their own parts of the scheme after approval by the Commissioners; and to dispose of any surplus generating capacity as the Joint Authority may direct. The scheme provides for the standardisation of frequency and transmission voltages.

The Authority has to submit to the Commissioners plans for supply in any areas which have none and require it, within a limited period. The North Metropolitan Power Company has to do this for its own area.

The Joint Authority may—by agreement—take over and operate the generating stations or the whole undertakings of any authorised undertakers; but it has no compulsory power to control generation, or to acquire any undertakings excepting those of the London companies, as provided by the two Acts.

It will have to be notified of any applications to the Commissioners for consents to the extension of stations &c., required by the Electricity (Supply) Acts, and can make representations thereon. It can also address representations to the Commissioners on matters affecting the efficiency of supply in the district or the necessity for alterations, improvements and extensions.

The Authority may appoint and pay the necessary officials, and may appoint certain committees, including a Technical Advisory Committee, which need not be composed of its own members.

It may promote or oppose Bills in Parliament.

It will have no call upon the rates or taxes. Its administrative expenses must be met by contributions to be levied ratably upon the sales of the authorised undertakers represented; and its supply costs by its sales. Its annual estimates must be submitted to the Commissioners for approval; and any proposals for capital expenditure are also subject to the Commissioners' approval and consent.

The powers of the Joint Authority are largely permissive, and the benefit of its activities will depend upon the extent to which the authorised undertakers agree to carry out its plans.

The Commissioners indicated that they would have preferred to give the Authority more power, but the Order embodies the greatest common measure of agreement which emerged from five years of negotiations and discussions. The Commissioners can give the Authority directions under the 1919 Act; they can make amending Orders, and the Authority can promote Bills; so that if local patriotism hinders development, further powers may be asked for.

It will help greatly to have a deliberative body before which local interests will assume their proper proportions, and the general interests of supply over the whole district will take the first place. It may be that in such an atmosphere, consents will be given which would make mandatory powers superfluous; time will show, and time may allay local feelings.

The three measures at least make possible an early approach to a cheaper and more abundant supply of electrical energy to one-fifth of the population of Great Britain. It is to be devoutly hoped that the possibilities will be realised.

Russian Electrical Notes.

Soviet Electrical Industry. — *Reuter's Trade Service* (Moscow) says that according to a report of the "Glavelektro" on the programme of the electro-technical industry during the year 1925-26, production is to be increased by 72 per cent. compared with 1924-25, the value of the gross output rising by 51 per cent. The number of workers will be increased by 43 per cent. and of salaried officials by 22 per cent. It is hoped to increase the individual output on an average from 15 to 33 per cent. and wages are to be raised from 1 to 13 per cent.

The Electrical Manufacturing Industry.—The General Electrical Commission has included in the working plan for next year (1925-26) schemes for the specialisation of the manufacturing works for increasing their productivity. In the case of the former Vek works at Kharkoff, it is proposed to specialise in the construction of motors and fittings; in generators and large transformers at the Electroforce works in Leningrad; in tramway and railway motors, train lighting, and railway train equipment at the Dynamo works; and in transformers at the Volt works. By this means it is calculated that the production can be increased by from 20,000,000 roubles to 38,000,000 roubles per annum. In the case of the erection of entirely new works, the programme provides for the construction of one works for the production of standard machines at a cost of 5,000,000 roubles and one for small motors at an estimated outlay of 3,500,000 roubles. Moreover, the scheme contemplates the erection of four works for the manufacture of measuring instruments and meters, insulating materials, installation materials, and porcelain. The production of measuring instruments and meters at existing works will be concentrated in the near future in the shops of the former Kasints works in Leningrad and that of automatic telephones at the former Ericsson works.

The Electrification Conference.—As a result of the recent general conference which was held in Moscow over several days, resolutions were adopted emphasising the necessity for the preparation of a plan for the re-equipment of the existing manufacturing works and the erection of new works, this plan to be completed next September so as to render it possible for the expenditure to be included in the Budget estimates for 1925-26. In the meantime the trusts are recommended to undertake bulk production to meet the growing demand as far as possible; it is suggested that the imports should cover the difference between the maximum demand and the actual productive possibilities of the native works; that the import duties on raw materials and semi-finished products should be reduced; and that the trusts should be authorised to arrange with foreign firms for the sending of goods on consignment for the satisfaction of the needs of customers. At the same time the conference instructed the General Electrical Commission to make an investigation with a view to bringing about a general revision of sale prices.

Peat Fuel Stations.—The first 10,000-kW set at the Nischni Novgorod station in Balakhn, which is eventually to have a capacity of 80,000 kilowatts, is to be put in service shortly, and the second generator of the same power is intended to be started soon after. The station is to employ peat as fuel, and six of the proposed ten boilers are in position. The expenditure on the station for the plant of 20,000 kW has been about 8,000,000 roubles, including 2,000,000 roubles for the purchase of foreign equipment. As a result of the rapid growth in the consumption of energy in Leningrad, the Electric Planning Commission has decided that it is necessary to increase the capacity of the peat fuel station of Leningrad by 40,000 kW in the next few years.

Cable Manufacturing.—The Central Electrical Trust has made application to the higher authorities for a loan of 1,500,000 roubles for the purpose of concentrating its two cable works and two lamp factories, which, under existing conditions, are unable fully to meet the demand, at the premises of the former Provodnik works in Moscow. It is proposed to install new machinery for the manufacture of armoured cables. It is reckoned that the alterations and extensions would be completed in the summer of next year, and that the value of the annual output, which now does not exceed 16,000,000 roubles, would then be increased to 45,000,000 roubles.

A Large Generator from France.—The Azneft (Baku Oil Trust) has been authorised to purchase a 17,500-kW turbo-generator for the Belgorod station in Baku, this being the largest of its kind in Russia. The set has been ordered from a French firm.

Electricity Supply in the Moscow Region.—A plan for the electricity supply system for the region of Moscow for the next five years has been considered by the Electric Planning Commission. The scheme provides for an increase in the supply of energy from 320 million kWh in 1924-25 to 430 millions in 1925-26, 540 millions in 1926-27, and 1,000 millions in 1930-31. In order to meet this estimated growth in the consumption, it is considered necessary for the capacity of the stations in Moscow and region to be increased from 102,000 to 300,000 kW by means of the installation of new generators at the works of the Electric Transmission (Peredach), the raising of the capacity of the Schatur station to 48,000 kW, the augmentation of the output at the industrial stations which feed into the general network, &c. It is calculated that by 1927-28 it will be possible to reduce the costs of production by from 35 to 40 per cent.

Electrification of the Crimea.—The Electric Planning Commission has prepared a scheme for the electrification of the region of the Crimea. It provides for the construction of a hydro-electric station on the River Chernoi of a capacity of 9,000 kW for supplying, among other towns, Sebastopol, Simferopol, and Yalta, but owing to the inequalities in the level of the river it is considered necessary to establish a steam power reserve station of 2,850 kW. The expenditure on the hydro-electric works and the transmission lines is estimated at 4,100,000 roubles, of which the sum of 2,800,000 roubles has to be provided in 1925-26.

Electricity in White Russia.—The Electrical Planning Commission has under consideration a plan for the electrification of White Russia, which provides for the construction of three regional stations for the supply of Minsk, Vitebs, and Polots. The expenditure on these works is computed at 16,000,000 roubles, while a number of smaller local stations are also in contemplation.

Moscow Radio Exhibition.—It is proposed to continue until September 15th the exhibition of radio apparatus that was recently opened in Moscow, the extension being connected with the delay in the receipt of exhibits from abroad. Foreign firms have been permitted to import 12 sets of apparatus of small size, six sets of medium size, and three sets of large size free of duty for the purpose of the exhibition. Five German firms were expected to participate, as well as a big American company.

The Shteroff Regional Station.—It is expected that the Shteroff regional station in the south of Russia will be completed and put into operation by the end of the current year. As a result of the receipt of further applications from industrial and other prospective customers, the General Electrical Commission has brought forward the question of acquiring a further set of not less than 16,000-kW capacity for this station.

Large Radio Station.—The Weak Current Trust has received an order to construct a radio station in Leningrad with an effective radius of 1,320 miles, all the equipment to be made at the Kosints works. The trust has also on hand orders for telegraph stations for Kazan and Voronesh.

Progress in the Ukraine.—A conference was held at Kharkoff in the third week in July to consider the question of electricity supply in the towns in the Ukraine. According to reports presented at the meeting, the capacity of the generating stations in this republic at the end of the current year will amount to 180,000 kW, permitting of a large reduction in the time costs as compared with the present time. As to the projected Dnieper works, it was mentioned that it would probably be necessary to add from one to two generating sets to the six which are already in contemplation, and that the works would yield a profit of 16,000,000 roubles in the first year of its activity.

India's Electrical Imports.

Principal Sources of Supply.

Full details of India's import trade in 1923-24 in electrical goods, showing the principal countries of supply, have recently been issued. From these the following particulars have been extracted. The corresponding figures for 1922-23 have been added for purposes of comparison and a note of increases or decreases given. The value of the rupee in the years in question varied approximately between 1s. 3½d. and 1s. 5d.

	1922-23 Rs.	1923-24 Rs.	Inc. or dec. Rs.
Control and switchgear.—

Canadian Notes.

[By Our Special Correspondent.]

A decision of great importance to those interested in hydro-electric power development in Canada has recently been made by the Dominion Government. Application was made some time ago by certain private interests for permission to develop power at Carillon Falls on the Ottawa river. It was stated that some 400,000 h.p. was available for development at this and certain other sites in the vicinity. The primary object of the promoters was to export hydro-electric power to the United States, and, according to various newspaper reports, it was intended that Canada should be allowed 100,000 h.p. to supply the needs of Ontario and Quebec.

Several advocates of this scheme made statements purporting to show that Canada would not be able to absorb 100,000 h.p. for very many years. Both Ontario and Quebec provinces made vigorous protests against the proposal to export power in this way, for it was sought to change the existing law (which provides that electricity shall only be exported under leases valid for one year renewable annually at the discretion of the Government) to permit of a long-term lease being obtained. It is noteworthy that the privately-owned power interests in Quebec were in full agreement with the Hydro-Electric Power Commission of Ontario regarding the matter of the exportation of power from Canada, for both were able to show definitely that not only would 100,000 h.p. be utilised in Canada very quickly, but even the whole 400,000 h.p. involved would be required in the near future. The Dominion Government has decided that the present system of yearly licences shall continue, and, further, that hereafter no licence for export of power beyond that already granted shall be issued except with the concurrence of the provinces in which it is proposed to develop such power and of any adjacent provinces interested therein. According to the *Electrical News* (Toronto), the Member of Parliament who moved the finally accepted amendment to the motion on this matter in the Canadian House of Commons stated that:— "For every 1,000 developed horse-power, the investment at the point of development was $250,000, and at the point of application $1,616,000; the number of employés at the point of development was 8.6, and at the point of application 376.4." If such figures be even approximately correct it would clearly be the uttermost folly for Canada to export, for long periods, power which she will herself need at an early date. How early this date may be can be gauged from the fact that the load on the systems of the Hydro-Electric Power Commission of Ontario is increasing at the rate of 60,000 h.p. per year at the present time, and there is every indication that the rate of increase will itself go on growing for a good many years to come. Similar conditions obtain in Quebec.

Another matter of interest at present is the fact that the Dominion Government a few months ago placed a tax on all electricity exported from Canada of .03 cent. per kWh. On the 650,000,000 or more kWh exported annually by Ontario and Quebec the tax represents nearly $200,000 per annum. This would affect Ontario more seriously than Quebec, since the former province exports almost twice as much energy as the latter. Furthermore, since, by Provincial Government regulation, electrical energy must be sold by the Hydro-Electric Power Commission at cost, and since that body supplies about 85 per cent. of the energy exported from Ontario the only way of paying this tax would be for the Commission to raise the rates at which it sells electricity to its customers—the municipalities—in Ontario. The Commission cannot absorb the tax in profits since no profits are made, and it cannot pass on the tax to its customers in the United States because the supply is given under contracts which were made years ago by the private companies whose properties the Commission has since acquired. Up to date the Commission has paid no tax, though three monthly payments are now due—it is believed that the Provincial Government of Ontario is seeking to have the imposition of this tax removed in the case of the energy exported by the Commission.

A Vertical Alternator for New Zealand.

It is interesting to learn of the installation of a comparatively large vertical alternator in New Zealand, particularly as the machine is of British manufacture. This machine, a 1,750 kVA, 3-phase, 3,000/3,300 volt, 50-period, vertical alternator for water-wheel drive, has been supplied recently to the Tauranga Borough Council, for the McLaren Falls power house, by the Brush Electrical Engineering Co., Ltd.

The alternator, which runs at a speed of 375 r.p.m., is directly coupled to a water turbine, and is designed to withstand an overspeed of 80 per cent.

The stator, illustrated in fig. 1, consists of a massive iron casting of the box girder type, bolted to a cast-iron skirting which in turn is bolted to the foundations. The stator core is built up of laminations of annealed low carbon steel of a quality such that losses due to hysteresis and eddy-currents are a minimum. In the stamping of the laminations the utmost care has been taken, so that with the core finally assembled the slots present a clean and smooth appearance and there is no necessity for filing or machining. The laminations are insulated from one another by a thin coat of insulating varnish, and are clamped solidly between two end plates which are firmly keyed in position. No bolts pass through the core. The stator has open slots and the coils are completely formed and insulated before insertion. Those portions of the coils which are embedded in the slots are contained in seamless micanite tubes, this being done by means of a specially heated press ensuring that the tubes are solid, and hardwood wedges are inserted over the windings to retain them in the slots. The end turns of each phase are reinforced with additional mica insulation as protection against surges. The coils have been impregnated, dried under vacuum, and treated with liquefied compound under pressure.

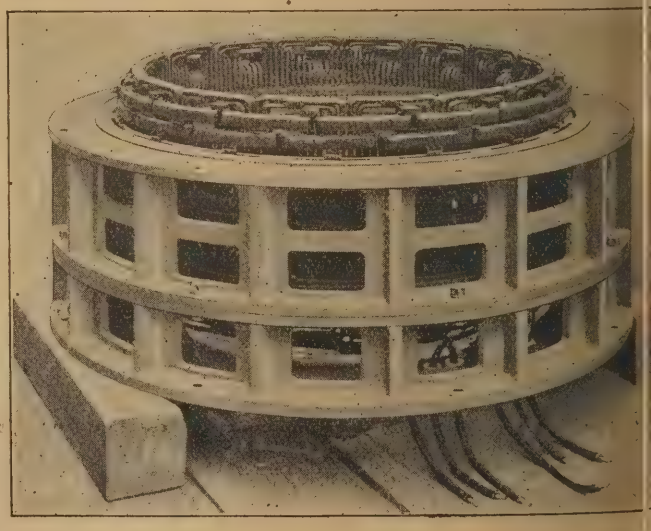

Fig. 1.—Stator of Vertical Turbo-Alternator.

Fig. 2 is a view of the rotor and flywheel. T

ıub, which is constructed of cast steel, is firmly keyed to the haft, turned and accurately ground from a mild steel forging of high tensile strength. It is dovetailed on its periphery or the reception of the poles. Each pole, which is held rigidly n position by means of two tapered wedges of mild steel inerted in opposition to each other, carries a separate field coil f high conductivity soft drawn copper strip. The turns are round on edge and the complete coil is subjected to hydraulic ressure to remove any irregularities in the copper and o ensure a tight and compact coil. The coils are thus ractically indestructible, and are so wound that the onnections between adjacent coils are all at the ottom.

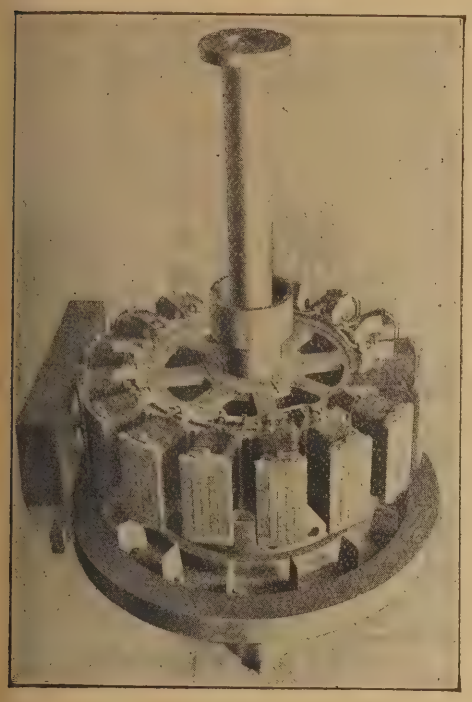

Fig. 2.—Rotor of Vertical Turbo-Alternator.

A chamber below the alternator provides cooling air for vention through ducts in the foundation. Fan blades fitted the rotor hub and also on the machine side of the flywheel, aw air through the rotor and stator, the air being expelled rough holes in the outer periphery of the stator frame and d casings.

A water-cooled Michell thrust bearing at the top of the alternator carries the whole weight, 28 tons of the alternator rotor and turbine runner. It is also designed to take up the unbalanced hydraulic thrust. Two water-cooled guide bearings are also provided, one being incorporated in the thrust bearing and the other immediately below the alternator rotor,

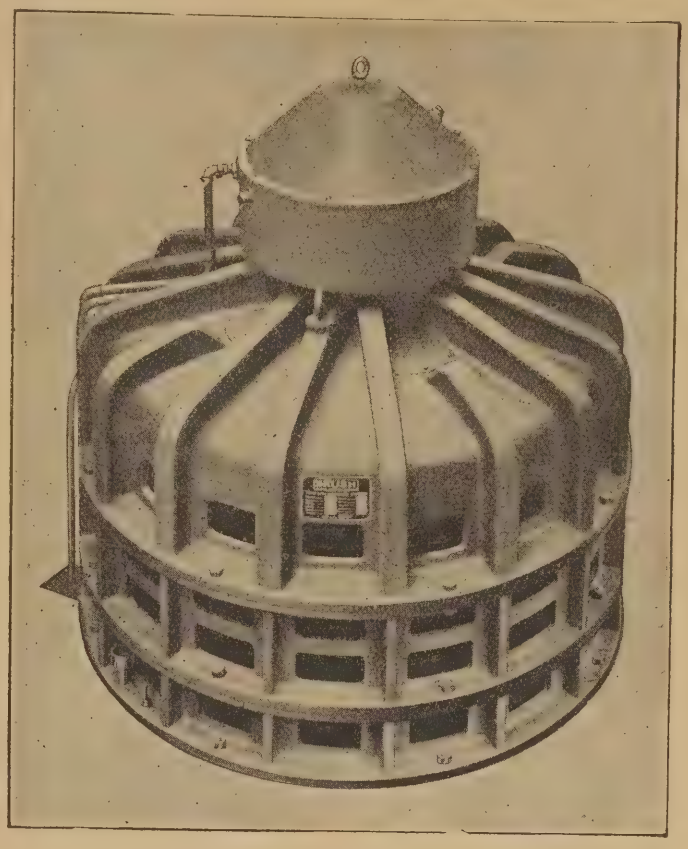

Fig. 3.—External View of Vertical Alternator.

the casing for the latter being carried by the skirting. The phosphor bronze slip rings are easily accessible, being placed immediately below the thrust bearing. Brush holders of the radial plunger type are used, access to them being provided by doors in the top end casing. Fig. 3 shows an external view of the vertical alternator.

The Situation in Czecho-Slovakia.

R. A. A. Adams, the Commercial Secretary to the British gation, Prague, has forwarded to the Department of Overs Trade a report * upon the industrial and economic situaon in Czecho-Slovakia, dated March, 1925.

In the introductory chapter, Mr. Adams says that in 1924 ogress was more clearly visible, and was evidenced by the eater ease and confidence shown in business transactions ring the year. A few more years like the last two, coupled th energetic Government action in reducing expenditure, will the country out of financial danger.

The principal industries of Czecho-Slovakia showed conuous improvement in 1924. In general the manufacturers getting to that point of organisation and efficiency which ll enable them to compete with the products of other ntries both in the geographical area of their old markets d in others. As in general only some 20 per cent. of indusal products is consumed in the country itself, the effort to d export markets turns not only upon costs and quality, but o to a considerable extent upon credit facilities and delivery, well as the technique of salesmanship; to these matters a eat deal of attention is being given. It has been stated thoritatively that many industries during 1924 forced up oduction to reduce overhead charges, necessitating unreerative sales in export markets. Thus, although exports ched a higher level, profits were less than might have been pected.

Import Trade.

The expansion of the market for British goods in Czechovakia is hampered by the system of import restrictions and h duties. There are, however, distinct potentialities which likely to develop, especially if the import restrictions should be abolished. Although the demand is likely to be principally for raw and semi-manufactured materials, there is also a demand for finished articles of good quality. Among the goods considered by various Prague business men as likely to command a sale, particular mention is made of electrical machinery. In this direction both Switzerland and Germany are serious competitors. During 1923 arrangements were made by several British firms to have their products manufactured under licence in Czecho-Slovakia, and it is likely that this system will be further extended to get behind the import restrictions and Customs duties. The more important of such arrangements cover steam wagons, electric motors, aircraft, automatic telephones, and radio apparatus. It is stated that power schemes and the electrification of railways provide possible opportunities for British trade. An appendix shows that during 1924 Great Britain exported 7,866 kg. of electrical machinery, valued at 757,041 Czech crowns (about £4,700), to Czecho-Slovakia; at the same time imports of electrical machinery from that country into the United Kingdom amounted to 37,250 kg., valued at 1,797,147 crowns (approximately £11,200).

Reference is made above to railway electrification, and it is stated in another part of the report that tenders have been made for an electric power station, 16 electric locomotives, and other materials in connection with an extensive scheme which has been decided upon by the Government. It was hoped to start working on the suburban lines in the vicinity of Prague early in the spring.

Methods of Business.

The methods of transacting business in Czecho-Slovakia vary greatly with different trades. Firms wishing to market a specialty product very often adopt the form of agency representation either in Prague or working from a central agency

* Stationery Office. 1s. 6d. net.

in Vienna. The geographical dispersion of customers and the best points of location for either agency or branch representation vary considerably from trade to trade, and firms sending out a representative to look over the market might ask him to call at the office of the Commercial Secretary, when the purchasing potentialities of the various districts could be discussed before any decision was taken.

Competition is particularly acute in the country. Although Germany has the advantage of proximity to the market, local manufacturers put up extensive competition at level prices. Generally speaking, British goods are of a better quality, and despite hindrances there is a demand which could be catered for by progressive firms. Owing to the high rate of interest in Czecho-Slovakia long credits are desirable if these can be arranged. A warning is given regarding import restrictions; firms are advised to ascertain whether customers in the country are able to secure the necessary licences without delay to avoid loss and difficulty.

Slovakia and the Ruthene Territory.

A separate report upon the above provinces is contributed by Mr. R. T. Smallbones, the British Consul at Bratislava. In the course of this it is stated that there are six electric light and power companies in the district for western, central, north-western, southern, and eastern Slovakia, and for the Ruthene territory. They generate electricity with coal and oil fuel. Though plans for utilising water power have been elaborated, the companies have, with one exception, devoted their attention to building overhead lines and increasing the number of consumers. Only the Central Company has built a water-power station, at Ulanka, near Banska Bystrica, which during 1924 was nearing completion. It is the aim of these companies to keep the price of electricity as near as possible to the cost of production, and they are therefore not accumulating reserves to engage costly capital expenditure. Money for this will have to be raised in some other manner. The Central Company was founded with a capital of 8,000,000 kronen, of which the Government subscribed 2,000,000 kronen. The towns interested in the scheme found 90 per cent. of the remaining 6,000,000 kronen. Subsequently the capital had to be raised to 12,000,000 kronen.

The Blackstone Spring Injection Oil Engine.

This engine, which is made by Messrs. Blackstone & Co., Ltd., Stamford, works at a moderate pressure on crude or residual oils, but differs from the ordinary crude oil engine in that the fuel is injected into the cylinder by mechanical means only and at a considerably lower pressure than injection by compressed air. The makers claim that the result of this mechanical injection is a prolonged and more perfect combustion of fuel, producing a flat-topped indicator diagram, and this claim certainly appears to be substantiated by the results obtained from tests carried out on two "Blackstone" spring injection engines by Mr. J. L. Chaloner, consulting engineer.

The fuel-injection arrangements are shown in fig. 1; the essential details of the devices are a low-pressure fuel-measuring pump, a high-pressure fuel-injection pump, and a spring-loaded fuel-injection valve. The fuel is first pumped into the fuel chamber by the low-pressure fuel-measuring pump

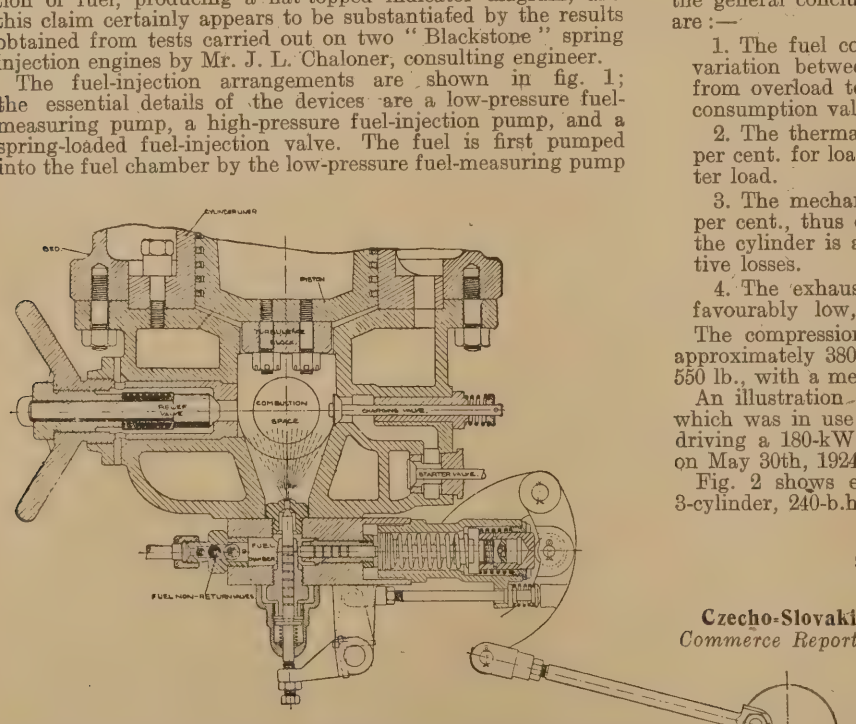

Fig. 1.—Section of Fuel Injection Arrangements in the Blackstone Engine.

and displaces the plunger of the high-pressure pump. The length of the stroke of the measuring pump, which has a separate plunger for each cylinder, is controlled by the governor and is proportional to the load. The fuel is then transferred, under the influence of the high-pressure pump, to the annular space around the fuel valve. The h.p. pump plunger consists of two members with a spiral spring between them; the spring is compressed by a lever which presses upon its outer member, the inner member being held by abutting upon the fuel, which is retained by the spraying valve and the non-return ball-valves at the outlet of the low-pressure pump.

The fuel or spraying valve is held on its seat by a spring and a lever, which controls both the opening period and the total lift of the valve. When the lever is lifted, the high-pressure or injection pump spring pressure overcomes that of the fuel valve spring, the spring is lifted, and the fuel is admitted into the cylinder.

This mechanical injection ensures that the fuel is always injected at the same point during the stroke and under the same pressure irrespective of the speed of the engine. The fuel spray velocity is constant and the period and quantity of spray is proportionate to the load on the engine. The h.p. section of the injection system is confined to the spray-box machined from a solid steel block, and there is no length of fuel-oil piping under high-pressure, either momentarily or permanently.

The engine is started up from compressed-air containers which are charged automatically from the engine cylinder

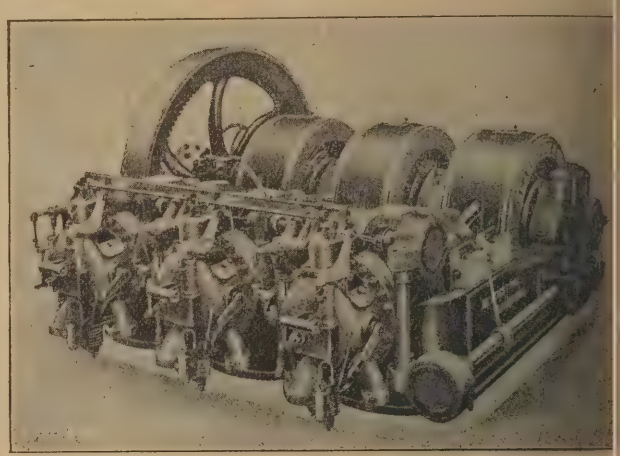

Fig. 2.—Exterior View of Engine.

whilst the engine is at work. Engines of 100 b.h.p. and below can be started by hand without compression, by means of a special patented device consisting of a removable plug to which is attached a smouldering rag. This will fire the first few charges and get up sufficient speed to enable the full compression to be overcome when the ignition becomes normal.

The results of the tests referred to are most interesting and the general conclusions arrived at by the consulting engineer are:—

1. The fuel consumption is favourably low and the total variation between consumption figures for loads ranging from overload to half load is less than 5½ per cent. on the consumption value for full-load conditions.

2. The thermal efficiency (on a basis of b.h.p.) is over 3[illegible] per cent. for loads varying between full load and three-quarter load.

3. The mechanical efficiency at full load is as high as [illegible] per cent., thus only 15 per cent. of the developed power in the cylinder is absorbed in frictional and other non-productive losses.

4. The exhaust temperatures for the different loads are favourably low, indicating a high combustion efficiency.

The compression pressure of the Blackstone S.1 engine is approximately 380 lb., and the initial pressure on full load is 550 lb., with a mean indicated pressure of 100 lb. per sq. in.

An illustration of a 300-b.h.p. twin S.1 Blackstone engine which was in use at the British Empire Exhibition last year, driving a 180-kW,. d.c. generator, appeared in these columns on May 30th, 1924.

Fig. 2 shows externally the injection arrangements on a 3-cylinder, 240-b.h.p. Blackstone engine.

Czecho-Slovakian Hydro-Electric Scheme.—According to *Commerce Reports*, a scheme for the production of electricity from the Dyje River (Moravia) has been drawn up. It is proposed to dam the river and erect four stations which will have an annual output of 100 million kWh. The dam is to have a height of 55 metres and a width of 40.5 metres. It will be erected at Vranov, and the cost of the dam and the station at that town will be 102 million crowns (about £600,000). The funds will be provided jointly by the National and provincial Governments, and the Western Moravian Electricity Co., Brun.

The First International Congress of Radiology.

Exhibition of X-Ray and Electro-Medical Apparatus.

(*Concluded from page* 230.)

Newton & Wright Exhibits.

The electro-medical devices displayed by Messrs. Newton and Wright, Ltd., included the Snook interrupterless transformer plant, the main points of which are the solid mounting of the motor, the large margin of safety in the oil-insulated transformer, the rectifier which breaks the circuit in two places at each reversal, and the silent running of the entire mechanism. The universal couch and fluoroscopic stand are both alike in smoothness and rigidity of movement; also they are claimed to comply entirely with the recommendations of the X-ray Protection Committee as regards protection. The fluoroscopic stand is shown in fig. 8. "The "Holway" Potter-Bucky diaphragm is of new design and combines smooth and easy control of the rate of movement as a means of cutting off secondary radiation. The unique feature of the X-ray sterescope shown in fig. 9 lies in the fact that the adjustments are embodied in the mirror fittings with their very convenient access, rather than in adjustments of the photographic plates. The "Hercules" X-ray tube is robust and is exhausted with argon gas, thereby producing a vacuum of great stability.

The "Metalix" X-ray Tube.

One of the novelties in X-ray apparatus has already been referred to (see page 192, July 31st issue). It is the new metal tube that has been developed in several types for various purposes by Messrs. Philips Lamps, Ltd., of Holland.

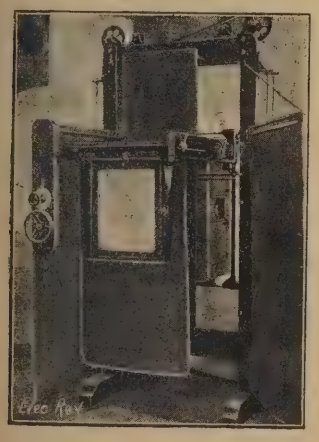

Fig. 8.—Fluoroscopic Stand.

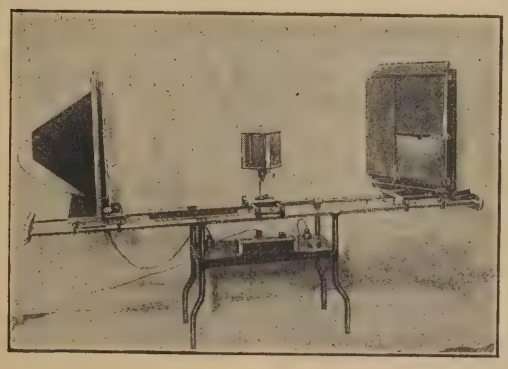

Fig. 9.—X-ray Stereoscope.

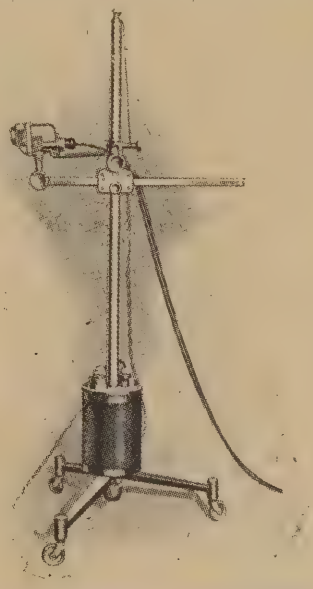

Fig. 10.—The D.C. Kromayer Lamp.

Two patterns of the new tube are illustrated in fig. 11, and it may be remarked that the use of a protecting bowl round it is quite superfluous, as the lead sheet of the tube is the only necessary protection; the beam is automatically centred to the window and a simple clip only is needed to fix the tube to its support. The special construction of the anti-cathode enables the new tube to be more heavily loaded than glass ones and the focus can be fixed with great precision. The metal middle-part of types D and E can be connected to earth; when using a suitable transformer the same can be done with the cathode parts of types A, B, and C, and in both cases, the X-rays being produced in a chamber consisting of metal only, the patient can touch the radiating part of the tube without any danger. Therefore, the tube can be operated quite near the patient, so that much smaller currents are sufficient for obtaining good results in diagnostic and superficial therapy work, owing to the fact that the intensity is inversely proportional to the distance. The "Metalix" tube has a diameter of about 2½ inches, while it is clear that it must be much less fragile than glass tubes.

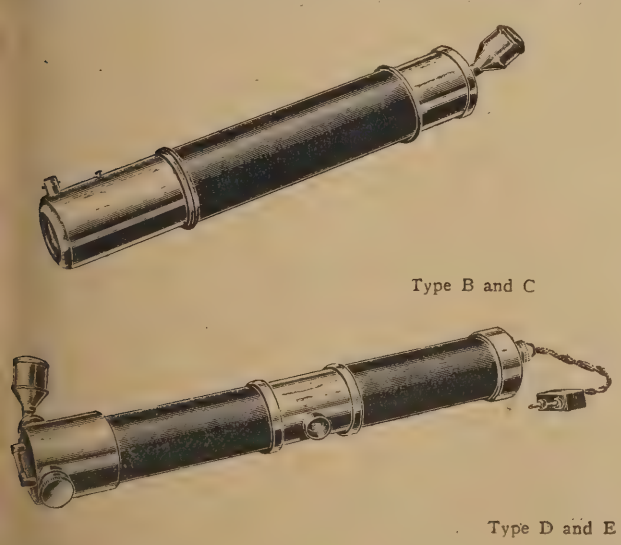

Fig. 11.—Philips "Metalix" X-ray Tubes.

"Hanovia" Lamps.

The subject of actino-therapy) is of special interest in view of the public attention that is being directed just now to the treatment of many diseases, *e.g.*, tuberculosis of bones and rickets, by ultra-violet rays or artificial sunlight.

Therapeutic results of value seem to have been obtained and in this connection the British Hanovia Quartz Lamp Co., Ltd., displayed lamps of several types. The Kromayer lamp is used for treating local areas under compression and for orificial conditions where the rays are required to be focused on particular points. A d.c. model is illustrated in fig. 10; the burner grip enables the lamp to be tilted for starting the arc and the burner is a ∩-shaped tube of the evacuated mercury-anode type with an evacuated quartz jacket and it is water-cooled. Ultra-violet irradiation is claimed to be a roborant in almost every case and an adjuvant to nearly every other method of treatment, particularly during convalescence; it produces a skin reaction which accelerates and increases the healing effects of other medicaments and modes of procedure, and it is said that over 60,000 "Hanovia" quartz lamps are in use.

Schall Apparatus.

Amongst the exhibits of Messrs. Schall & Son, Ltd., the radium balance of Dr. Russ was noticed. In this instrument a constant source of alpha radiation ionises the air in a small chamber; the radium tube to be tested is allowed to influence the air in a second chamber, and the two chambers are connected in series with a steady e.m.f. In one of the chambers is a gold leaf electroscope which is subject to deflection, the amount of deflection being a measure of the difference in degree of ionisation in the two chambers, and in this way the radium tube to be examined can be balanced against the constant source of alpha radiation. The instrument is useful for hospitals and other institutions using radium, in which it is necessary to have a rapid method of checking the radium tubes before issuing them and after receiving them back. The X-ray radium balance shown in fig. 12 is built on the same principles as the balance described above, but it is so dimensioned that X-rays are balanced against a constant source of alpha radiation. In this way is obtained a measure of the intensity of an X-ray beam, expressed in terms of radium, an advantage in X-ray therapy because the biological effect of radium rays has perhaps been more thoroughly investigated, and is certainly capable of somewhat more accurate dosage than is X-radiation at the present time.

The application of X-ray diagnosis to dentistry is becoming more and more frequent, and the apparatus illustrated in fig. 13 has been designed to meet the needs of the dentist in as economical a way as possible. It consists of a static transformer which converts the alternating main supply to a pressure of about 65,000 volts, which then passes through a Coolidge X-ray tube, the whole apparatus being a complete

and practical unit. The rules formulated by the Röntgen Society, in conjunction with the National Physical Laboratory, for the protection of operators and patients, have given a considerable stimulus to the construction of accessory apparatus and fig. 14 shows a modern tube stand to which there is added a box, so designed that it wholly encloses a gas or Coolidge X-ray tube; being surrounded with protection equivalent to 2.3 mm. of sheet lead, the weight of such a box is of course considerable, and the necessity of making it comparatively

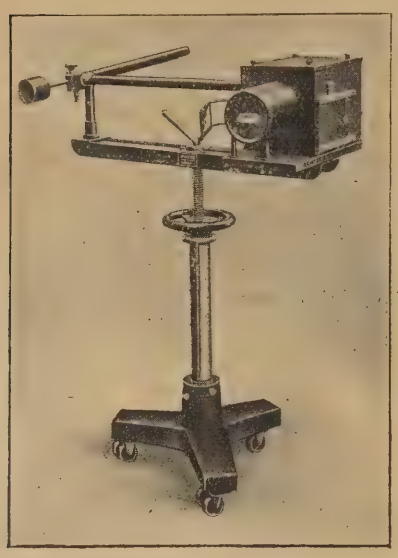

Fig. 12.—X-ray Radium Balance.

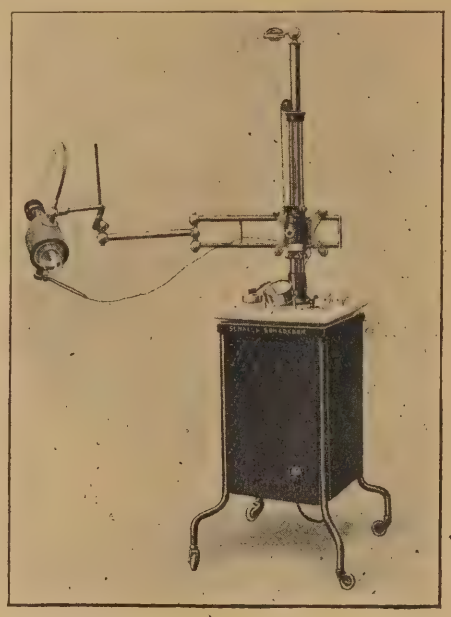

Fig. 13.—Dental X-ray Outfit.

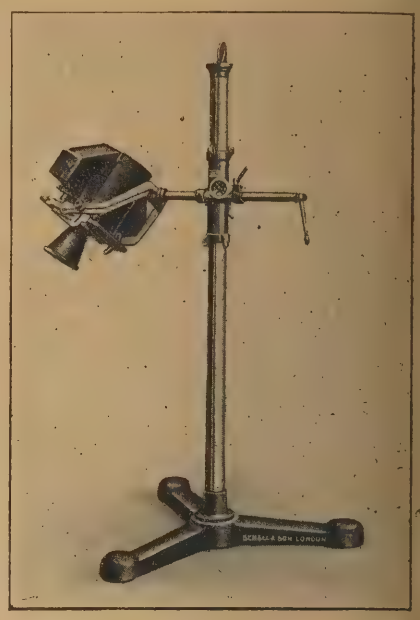

Fig. 14.—X-ray Tube Stand with Heavy Protective Box.

easily movable in all directions has given rise to the extensive use of ball bearings throughout the stand and careful mechanical work.

"X-Rays" Products.

One of the items on the stand of X-Rays, Ltd., which attracted considerable attention was the "Metalix" tube, which is of novel construction and should revolutionise the existing heavy form of apparatus with heavy protection and the consequent solid construction. The protection afforded by the "Metalix" tube itself complies with the requirements of

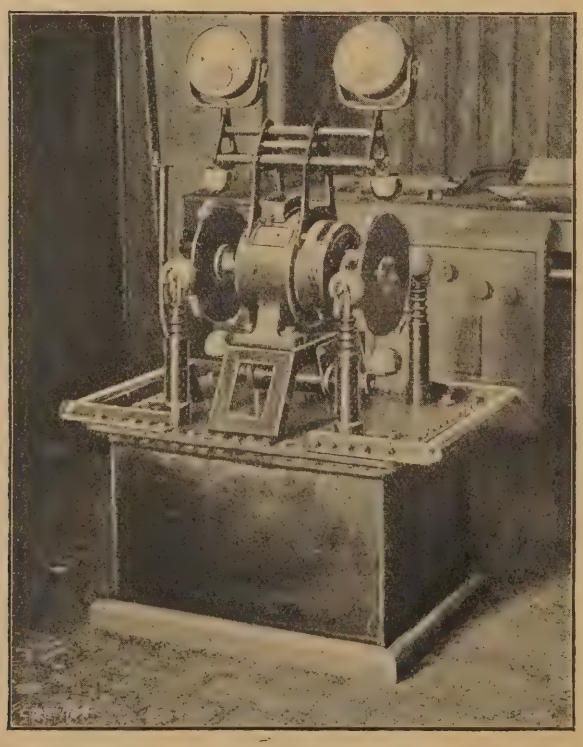

Fig. 15.—New Double-rectification Transformer.

the X-ray and Radium Protection Committee. It is an advance also on the Coolidge tube, as greater current can be obtained from it for the same size of active surface on the anti-cathode. Messrs. X-Rays, Ltd., have been appointed agents for the sale of this tube. The company also showed a new type of transformer with double rectification. Depicted in fig. 15, this equipment is designed to give an output of 50 milliamperes at a voltage of about 80,000, r.m.s. The method of double rectification employed with coronaless spheres and collectors means that the equipment is of small dimensions when taking the output into consideration. Other material exhibited included the usual couch and screening stand giving protection to comply with the N.P.L. standard.

Dean Apparatus.

The piece of apparatus on the stand of Messrs. A. E. Dean and Co. which drew most attention was the constant potential plant capable of delivering 10 milliamperes at 200,000 volts and the company believes it is the only manufacturer of such apparatus in Great Britain. The firm's Potter-Bucky table for diagnostic work is provided with a moving grid which absorbs all secondary radiation from the body, and is also fitted with mechanism which provides against the possibility of the X-ray tube being used out of centre with the plate. The company showed, in addition, a range of mercury-vapour lamps for administering artificial sunlight treatment.

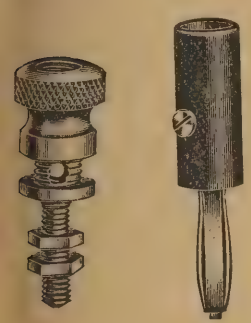
Other Exhibitors.

Other exhibitors included the following firms: Patterson Screen Co., U.S.A. (fluoroscopic screens); Electricitäts-gesellshaft "Sanitas," Germany (X-ray apparatus and accessories); C. H. F. Muller, Germany (X-ray tubes); Victor X-ray Corporation, U.S.A. (X-ray apparatus); Chas. Zimmerman & Co. (Photographic), Ltd. (X-ray films, plates, &c.); Radium Belge (Union Miniere du Haut Katanga); Kodak, Ltd. (films and accessories); C. A. F. Kahlbaum Chemische Fabrik, Germany (fluorescent and intensifying screens, preparations for opaque meals, &c.); Acme-International X-Ray Co., U.S.A. (X-ray apparatus); Cuthbert Andrews (X-ray tubes); Tintometer, Ltd. (a radiometer for the measurement of X-ray dosage); W. S. Rothband & Co. (X-ray protective clothing); Radiguet and Massiot, France (X-ray apparatus); Holborn Surgical Instrument Co., Ltd. (electro-medical requisites); Chas. Zimmerman & Co. (Chemicals), Ltd. (radium and "radiogen"); Dr. Seeman, Germany (a spectrograph for the qualitative measurement of the wave-length of soft and hard rays); and G. C. Aimer (X-ray tubes and ultra-violet apparatus).

New Steam Stations in U.S.A.—A few details of the 30,000-kW steam station of the Pennsylvania Water & Power Co. at Holtwood, Pa., are given in the *Electrical World*. The station was built to supplement the Holtwood hydro-electric development, and will enable the company to handle its load more easily and eliminate any necessity of purchasing power. The initial installation consists of two 15,000-kW units with provision made for an ultimate installation of 150,000 kW if required. It will feed into the same sub-station that handles power generated by the hydro-electric plant, and its energy will be transmitted over the company's existing 110,000-V lines. The initial cost was about $4,500,000, including equipment which will be adequate for future additions.

Particulars are also given of a new 60,000-h.p. steam plant which is to be built in Louisiana and run by a new company to be formed and known as the Central Louisiana Light and Power Co. The station, which is to be built on the Mermentan River, near Crowley, La., will generate energy for transmission over Southern Louisiana and sale to existing companies or for distribution over systems to be acquired by the company. The plant will cost about $10,000,000.

Selected Radio-Telephone Apparatus.



Recent Developments and Improvements.

"Excel" Tags.

We have received samples of the above-named terminal tags, which are made by the S.H. Collett Manufacturing Co. in a number of types, to meet a variety of requirements. They are obtainable in bright and tinned brass, tinned copper, and nickel finishes; being no larger or heavier than is necessary, they take up little room.

A New Tripart Terminal.

The new tripart terminal illustrated in fig. 1, a specimen of which has been sent us by Messrs. Ward & Goldstone, Ltd., should prove to be distinctly useful to the home constructor. The terminal serves three purposes: it will take the standard wander plug and consequently act as a plug base; it will accommodate the standard size of fork terminal, and also the usual pin terminal as fitted on telephone cords, while the advantage of having a plug-in terminal will be appreciated.

Figs. 1 & 2.—New Tripart Terminal and Wander Plug.

In fig. 2 is shown a new wander-plug attachment, the particular feature of which is that it is provided with phosphor-bronze springs to ensure good contact. These plugs are made with black and red insulating tops for distinction and are manufactured throughout at the firm's Pendleton works.

The B.T.-H. Portable Receiver.

Outdoor recreation is the great summer competitor of "wireless," but there is no reason why proper radio apparatus should not be just as capable of providing entertainment out of doors as in the house. The British Thomson-Houston Co.'s new portable receiver uses three B.5 valves with a total consumption of 0.18 watt. The filaments are heated by a l.p. dry battery fitted into the case of the receiver, which is thus completely self-contained. A circuit on the super-heterodyne principle is employed to reduce the frequency of the incoming carrier wave, amplify the current at the reduced frequency, and then rectify it to obtain audio frequency. The process of frequency reduction is carried out by means of an oscillating valve, the frequency of which can be approximated to that of the incoming frequency, the two being then combined and rectified to give a third frequency equal to the difference between the two primary ones, which improves amplification and selectivity. For coupling the oscillating valve and aerial circuits to combine the two frequencies, the company has adopted a circuit, covered by patent No. 197,405, which makes possible reactoaction in the aerial circuit, and so increases the received current. For use on wave-lengths below the B.B.C. range, plug-in coils will lower the oscillator frequency to a suitable figure, and the fact that the frame aerial is contained within the case of the receiver makes the set directional. It is contained in a leather cloth-covered or mahogany case, fig. 3, and the companion amplifier and loud-speaker, similarly encased, employs two B.6 power valves, taking a total of 0.24 ampere at 3 volts and operated from dry batteries. The two sets can be easily carried by one person.

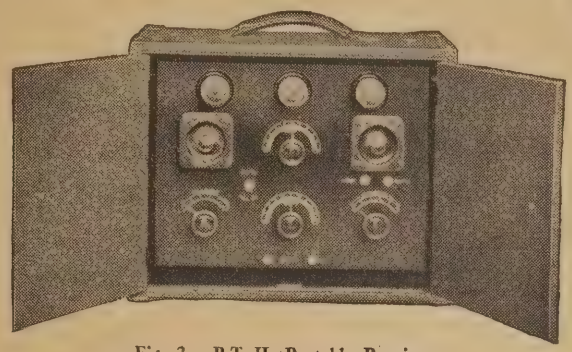


Fig. 3.—B.T.-H. Portable Receiver.

"Radio Conduit."

A new speciality has been placed on the market by Messrs. Autoveyors, Ltd., which they have called "radio conduit." It is well known that electric currents which are subject to high-frequency oscillation, function only on the skin of conductors; the use of solid wire incurs a "dead-end" energy absorbing effect, while multi-strand wire induces an alternate magnetic impedance to every cycle. Radio conduit is therefore been introduced as a h.f. conductor which is claimed to present the following advantages: it has the minimum h.f. resistance; a maximum conducting surface with a minimum of capacitive metal; eliminates lateral surging, cross magnetic induction, and energy absorption. It is composed of copper tube, the internal and external surfaces of which are burnished to provide highly-polished conducting surfaces, and is now available in a diameter equivalent to 16 S.w.g., but we understand that it will be marketed in due course in diameters equivalent to all standard wire gauges used in radio work. The conduit is sold in packets of six tinned 24-in. lengths.

Choke Amplifiers.

Messrs. A. J. Stevens & Co. (1914), Ltd., have sent us samples of their newly-designed choke amplifiers, which are finished in dull egg-shell black with nickel-plated fittings.

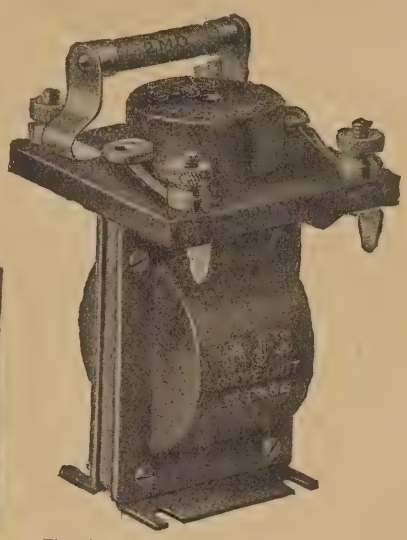

Fig. 4.—Choke Amplifier, 1st Stage.

They are obtainable in three types: the choke only; the first stage unit, as illustrated in fig. 4, which comprises a choke, combined by-pass and grid condenser, and a grid-leak; and the second-stage unit, which is similar, but has no by-pass condenser and a different value of grid-leak. The units only need the addition of a valve holder, resistor, and the necessary connections to complete a low-frequency amplifier; their use is claimed to reduce atmospheric disturbance and assist sensitivity, combined with consistent amplification, and they are supplied with diagrams and working instructions.

A Combined Rheostat and Grid Leak.

Designed to simplify control, a combined filament rheostat and variable grid leak has been placed on the market by the Igranic Electric Co., Ltd. It is suitable for use in practically all kinds of receiving sets and is particularly valuable for short-

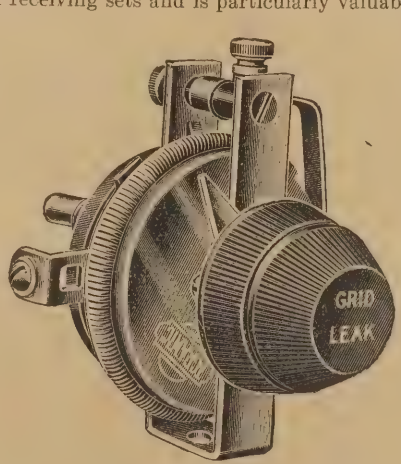

Fig. 5.—A Combined Rheostat and Grid Leak.

wave reception, enabling the wiring of a receiver to be considerably reduced, thus minimising stray capacity losses and the attendant decreased efficiency which may be occasioned by the use of long and closely-spaced parallel leads, especially in h.f. circuits. In addition, economy in panel space is effected and simplified control is obtained by the use of this dual-purpose instrument, while the advantage of a grid leak of the variable type is obvious. Fig. 5 shows that the control knobs of both units are close together, and the variable leak is mounted at the rear of the rheostat, with the result that it is effectively shielded by the rheostat frame which is at earth potential, and consequently hand-capacity effects are reduced. It may be had with a filament resistance of 4, 6, 8, or 10 ohms as required, in conjunction with a grid leak which is variable between 0 and 5 megohms.

Electrical Notes from New Zealand.

(From Our Special Correspondent.)

There is a scheme afoot to harness the famous Bowen Falls in the Fjordland of the South Island not far from Milford Sound and Mitre Peak, for the purpose of generating power for the extraction of manurial nitrates from the atmosphere. The Bowen Falls Nitrates Company, Ltd., has been formed with a view to commencing operations, but the Government has withheld the issue of the necessary licence on account of the public resentment against the scheme which involves the destruction of a well-known scenic spot. Bowen Falls is situated on Milford Sound alongside deep water, and is well placed with regard to the Australian ports. There is an available flow at the Falls of 700 cusecs, and an available head of approximately 600 ft. The estimated power on a 50 per cent. load factor is 35,000 h.p., or 25,000 kW. The site is ideal for the erection of plant, and the scheme is easily the most suitable for the purposes of the company proposing to exploit it.

The matter of commencing operations at Lake Waikaremoana has been held up pending an agreement between the Government and the Poverty Bay Power Board. As a result of negotiations just concluded the Government will immediately proceed with the construction work at the lake. The scheme provides for a final power supply of 60,000 kW at an estimated cost of £2,600,000. At the present time the Public Works gang on the site has erected a small plant of two 350-kW Pelton-wheel units utilising a head of 680 ft. The power is transmitted about twenty miles to the town of Wairoa where it is used in driving flax mills and freezing works machinery, as well as for lighting, heating and general power purposes in the town of Wairoa itself. It is intended that these two units shall be used to excite the main 60,000-kW set to be installed in the major plan.

Up to the present the city of Christchurch, N.Z., has been supplied from the 12,000-kW plant installed by the Government Hydro Electric Department at Lake Coleridge. The recent wintry weather, however, was responsible for such a heavy overload that new works are being undertaken with a view to increasing the capacity to 36,000 kW. There is some agitation for an additional stand-by plant, preferably on the Waimakariri project, to relieve the demand on Lake Coleridge at peak hours, and in view of the number of breakdowns and other interruptions, there is some prospect of additional works being put in hand.

Experiments are being made with a trackless tram operating over the Thorndon-Kaiwarra section of the Main Hutt Road. The car is a solid-tired motor-bodied vehicle working on the overhead trolley system. So far the results have been entirely satisfactory, and the council contemplates extending the service.

The Railway Department has been making experiments with a new type of rail coach with a view to countering the motor-'bus competition over the Lambton-Lower Hutt and Thorndon-Johnsonville suburban routes. To date about ten different types of vehicle have been tried but without any satisfactory results.

The failure of the tramways to satisfy the need for quick and comfortable locomotion, has led to the private inauguration of several motor-'bus services in Wellington. The City Council is somewhat perturbed in view of the difficult situation that has arisen in Auckland where the 'buses have made the trams unprofitable, and contemplates placing 'buses on the road in competition with the private companies.

Parliamentary News.

[By Our Special Parliamentary Reporters.]

Municipal Installation Powers.—We mentioned in our last issue that the Burnley Bill, which contained a clause empowering the Corporation to sell electrical fittings and wire consumers' houses, had been read a third time in the House of Lords in spite of opposition to this clause. The Burnley Bill was one of three containing clauses of this nature; the other two were promoted by the Bath and Barrow Corporations, and they were considered together by a House of Lords Committee recently.

Sir Lynden Macassey, K.C., for the Bath Corporation, pointed out to the Committee the difficulties which confronted municipal electrical undertakers in developing the use of electricity in working-class dwellings, owing to the inability of the occupiers to pay for the wiring of their houses in a lump sum. Consequently, the undertakers were not in a position to lay mains in streets containing these houses, because they would prove unremunerative. If, however, an arrangement could be provided whereby the owners or occupiers of houses, instead of having to pay in one sum the first cost of wiring their houses and laying down the service lines, could pay by a system of deferred payments, they would, as evidence in other towns showed, go in for wiring. Then the Corporation could get enough consumers in a street to make it worth its while to lay the necessary mains. Many electrical contractors were not in a position to wire houses and supply fittings on the deferred payment system. When the three Bills were before the House of Commons no petitions were deposited by the electrical contractors. The clauses now objected to were passed by the Local Legislation Committee of the House of Commons. It was not the practice of electrical contractors to supply fittings and carry out wiring on the hire purchase or deferred payment system, and he contended that, if the Corporation wanted to do that business, it was not competing unfairly with the contractors, as was alleged. There would be no obligation on the part of any consumer to go to the Corporation as against a private contractor.

Mr. F. W. Purse (Borough Electrical Engineer, West Ham) said that the West Ham Corporation had obtained powers in 1898 to sell fittings and carry out wiring, and the experience was that the deferred payment system had encouraged working-class consumers to use electricity. The Corporation was in competition with the contractors, and he urged that the possession of these powers by the Corporation would help contractors, in that more mains could be laid, and fresh fields of business opened up to contractors.

Mr. Walter Barrett (a member of the Bath City Council and an electrical contractor) was in favour of the Corporation obtaining powers to do wiring, because he was confident that in his business as an electrical contractor he would benefit thereby. He believed that practically the whole of the electrical contractors in Bath would also benefit from it. Very often he lost business because the Corporation had not a main in the area in which he was asked to wire a house.

Mr. J. W. Spark (Borough Electrical Engineer, West Hartlepool, who is about to take up the position of City Electrical Engineer at Bath) said he had had nearly seven years experience at Devonport of operating the powers now sought by the Bath Corporation, and had found those powers to be of considerable value. The result was an increase in the number of consumers, and an increase in the operations of the electrical contractors.

The Hon. Evan Charteris, K.C. (Counsel for the Burnley Corporation) said that Burnley had been seriously hampered in the development of its electrical undertaking by the absence of the powers now sought. If they were obtained there was no doubt that the undertaking would go ahead and develop.

Mr. J. E. Starkie (Borough Electrical Engineer, Burnley) gave evidence to the same effect.

The case for the granting of selling and wiring powers for the Barrow-in-Furness Corporation was then put by J. Villiers Bayly (Counsel for the Corporation), who was supported by Mr. H. R. Burnett (Borough Electrical Engineer).

Mr. L. G. Tate (Secretary of the Electrical Contractors' Association) said there were sufficient contractors in Bath to carry out the electrical work there. One of the main objects of the Association was to prevent competition with municipal trading. It was unfair for the Corporations to open up this trading business, because they were trading with the ratepayers' money; it was immaterial to them whether they made a loss or a profit, and experience had shown that where Corporations were exercising those powers the private traders could not carry on their business. The best canvassers for the Corporation business were contractors, who were trying to get business for themselves. Witness then dealt at length with the history of legislation in this connection, and said that while it was true that, up to 1904, about 70 or 80 Corporations had obtained selling powers without opposition, since 1904 the Association had successfully prevented the grant of these powers to municipal undertakings. In the course of cross-examination Mr. Tate said he was not against municipal trading, so far as it could be utilised by all the ratepayers, but where one ratepayer was going to benefit to the disadvantage or loss of another ratepayer, municipal trading was wrong.

There were contractors present from the three towns concerned who were prepared to give evidence. Mr. Drucqu[illegible] who appeared for the opposers, said the evidence showed that the contractors in those three towns were strong enough to carry out the wiring work and the sale of fittings. He submitted that the Committee should reject the clauses sought to be inserted in the three Bills. The onus was entirely upon the corporations concerned, because, from 1902 or 1904 down to the present day, both in private and public legislation, the House of Lords had set its face against the particular powers asked for in these Bills. The policy of the Electricity Commissioners was not to grant any other powers apart from those laid down in the 1919 Act unless special cause were shown. If the Committee granted these powers to the three corporations now applying for them, it would have no reason for refusing them to any corporation that applied for them in the future.

Mr. Villiers Bayly (on behalf of the Corporations of Bath and Barrow) said that the Electricity (Supply) Act, 1919, did not provide that special cause had to be shown for the granting of these powers. All it said was that corporations should not sell unless expressly authorised by special Act.

Mr. Charteris asked the Committee not to be influenced by the fact that since 1919 these powers had not been granted. The matter was before the Committee for judicial decision. The Electricity Commissioners were in doubt on the matter and had appointed an advisory committee to consider the point.

The Chairman announced the Committee's unanimous decision in favour of the granting of the powers asked for.

Bills Passed.—The following Bills were read a third time and passed on August 4th:—In the House of Lords: The T[illegible]

graph (Money) and the Darlington Corporation (Transport, &c.) Bills. In the House of Commons: The Uckfield Gas and Electricity Bill.

Railway Electrification. — On August 5th, Mr. HANNON asked the Minister of Transport whether he could make any statement on the progress which had been achieved in the past six months in the development of railway electrification with the object of reducing unemployment; whether he had received a series of reports, prepared by experts, all of which tended to prove that the increase of railway transport facilities through electrification would be economically advantageous to the railways themselves and a great convenience to the travelling public, while providing large orders for the electrical industry which was now suffering seriously from foreign competition; and whether he was aware that the schemes of electrification which were regarded as absolutely necessary would, if provided with, provide employment for upwards of 20,000 skilled artisans during the next few years.

Colonel W. ASHLEY said he was aware that the views referred to were widely held by qualified persons. So far as the general question of railway electrification was concerned he would refer to the reply to a question on the subject asked on June 30th and to the remarks he made when the Ministry of Transport Bill was under discussion on May 21st, since which date electrical working had been started on several sections of the Southern Railway.

Replying to further questions, Colonel ASHLEY said that the Ministry was continuing to impress on the companies that electrification was desirable, and he hoped that when the Government proposals with regard to electrification became law they might increase the supply and distribution of electricity, and thereby improve the chances of electrification for the companies.

Electricity Commissioners.—On August 5th, Sir F. HALL asked what was the expenditure involved in the transfer of the Electricity Commissioners to Savoy Court from Gwydyr House, and the use of the last-named premises for the Air Force; and why it was not possible at a time when national economy was vital to avoid this change.

Mr. LOCKER-LAMPSON said that the total expenditure involved was estimated at £7,820. The removal was necessary in the interests of more effective co-ordination between the Air Ministry on the one hand and the other Service departments and the Committee of Imperial Defence on the other.

Severn Power Scheme.—On August 5th, the Duchess of ATHOLL informed Col. Woodcock that the Committee appointed to inquire into the feasibility of the Severn tidal-power scheme had submitted a report which was now receiving the consideration of the Government. The amount expended on the inquiry up to date was £2,562. Should the Government decide to proceed with the inquiry, it was estimated that the total cost would be from £70,000 to £90,000.

The Broadcasting Inquiry.—On August 7th, Sir W. MITCHELL-THOMSON, the Postmaster-General, informed Sir F. Meyer that the terms of reference to the Broadcasting Committee of inquiry would be: "To advise as to the proper scope of the broadcasting service and as to the management, control and finance thereof after the expiry of the existing licence on December 31st, 1926." The Committee would indicate what changes in the law, if any, were desirable, in the interests of the broadcasting service. The Committee would be constituted as follows: Lord Crawford (chairman), Lord Eyleigh, Lord Blanesborough, Mr. Macpherson, M.P., Mr. W. Graham, M.P., Sir Thomas Royden, Dame Meriel Talbot, Sir Henry Hadow, Capt. Fraser, M.P., Mr. Rudyard Kipling, Mr. W. E. Weston, G.P.O. (secretary). It was expected that the Committee would commence its sittings during November.

Royal Assent. — On August 7th, the Royal Assent was given, by Commission, to the following Acts: Telegraph (Money), Wireless Telegraphy (Explanation), Burnley Corporation, London, Midland and Scottish Railway, Uckfield Gas and Electricity, Mersey Tunnel, and London County Council (General Powers).

Adjournment.—Parliament adjourned on August 7th until November 16th.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

A Proposed Institute of Radio Engineers.

With reference to the statement issued by the Institution of Electrical Engineers regarding the qualifications necessary for a wireless engineer to become a member of the Institution, there are one or two points which appear to have been omitted.

In the first place, it does not state that an application must be accompanied by the signatures of three corporate members as proposers and three corporate or associate members as supporters, all of whom must endorse the application from personal knowledge of the applicant. As the prospective candidate for admittance to the Wireless Section will not, in the majority of cases, have been connected with electrical power engineering, his chance of being intimately acquainted with members of the Institution is very remote. Furthermore, the majority of the members of the Wireless Section are resident in and around London, which does not give the provincial applicant much chance of making their acquaintance. This condition must be published by the I.E.E. owing to the fact that the Council is powerless to act unless these signatures are obtained by the applicant.

Secondly, no explanation is given as to how one may discriminate between the wireless engineer and the electrical engineer (there must be a difference, otherwise why have a Wireless Section?) Again, does the Institution realise that by accepting a wireless engineer with no power engineering experience it is proclaiming him a chartered electrical engineer, and in doing so is rather slighting the truly professional electrical man?

Thirdly, the letters M.I.E.E. and A.M.I.E.E. denote professional electrical standing, and give no indication that the member is in any way connected with wireless, a point which is more important than anything else. True, he may add the words (Wireless Section), but this conveys nothing definite.

Fourthly, the I.E.E. does not govern the professions of radiology and electro-chemistry, which professions utilise electricity in a much smaller proportion than do wireless engineers. The I.E.E. could sponsor wireless as it appeared in 1914, but now that wireless is almost as important an industry as electrical engineering, it should be governed by its own body.

In view of the above conditions there still appears to be room for a separate Institute, and I am asked to state that the organisation of the proposed new society will still be carried forward with a view to providing the wireless engineer with a definite professional standing as distinct from the electrical engineer. Proceedings will be issued dealing only with wireless subjects, thus providing 100 per cent. wireless instead of the minimum percentage as at present published in the Proceedings of the I.E.E. The first meeting of the proposed society will take place during the early part of September, at which date the articles of association will be drawn up and presented in the usual way.

Y. W. P. Evans,
Hon. Sec. (temp.) proposed Radio Institute.

Manchester, *August 7th*, 1925.

Is There an Age Limit?

With reference to Major Porter's letter in the REVIEW of August 7th, I do not think he is justified in his remarks, and I must take exception to his inferences from my letter in your issue of July 24th on the above subject. He is correct in stating that I did not serve with the forces during the war, but, like many more engineers, I offered my services on the outbreak of hostilities to the Army, Navy, and Transport authorities, but was not accepted. Fortunately, I was able to render war services at home in one of the largest coal, iron, steel and munition works in the country, and during the war and post-war periods I put in the most strenuous years of my life, holidays and amusements were cut out entirely, it was a case of working night and day under very severe conditions. I think your readers, even the regular Army and Navy men, will agree that their civilian friends who were engaged in engineering and munitions work had not exactly a picnic while the war was on, and they appreciate what their pals at home did for them in the munitions line.

I can assure Major Porter that I should be the last man to forget the debt I owe to the men like himself who were privileged to fight for our country, but as to "making profit out of their patriotism," he is entirely wrong in his assumption, and owes me an apology for making such a statement.

Your correspondent "M.I.E.E." writes a very sporting letter in the same issue, but I can only advise him to cheer up, as when the present troublous times are over a man of his experience and calibre is sure to find a suitable outlet for his abilities. I wish him luck.

Too Young at Forty.

August 7th, 1925.

Wireless and the Solar Eclipse.

After reading Dr. R. L. Smith-Rose's rejoinder (page 730) to my article on the above subject, I at once sent you a reply to his observations. This has not so far appeared in the ELECTRICAL REVIEW, so I assume that you may have deemed it too lengthy, or considered that the interest had passed. As, however, I should not like it to be thought that I accept Dr. Smith-Rose's views, I should be grateful if you would kindly accord me a brief space in your "Correspondence" columns to enable me to say that I am quite unconvinced by his arguments, which seem rather general in character and evasive of the fundamental conditions which I referred to in my article.

Taking his main points briefly, I should like to say that I did not consider it necessary to enlarge on the effects due to the altitude of the sun, as I felt that the disclosures of Senatore Marconi were too recent to be absent from the minds of any students of the subject.

Dr. Smith-Rose said that it was doubtful if any of the "most prominent wireless experts" would have been prepared to prophesy as I did. As to this, I venture to suggest that the title does not necessarily imply a knowledge of astronomy. As, however, he said that full details of the eclipse were previously known, I can only feel additional surprise at the enthusiasm which was shown.

His remark that the signal intensity was greater on the day of the eclipse than on the preceding or succeeding days is not disputed, but attention is again called to the differences between the two last-mentioned days and to certain curious points in the records which I mentioned in my article.

Dr. Smith-Rose attached importance to the fact that all stations taking part in the tests (some of them 400 miles apart) produced curves of a characteristic shape, but such coincidences might easily have arisen from some atmospheric conditions over the Atlantic quite unconnected with the eclipse, particularly when it is remembered that the signals converged from one point on the American side. My reasons for thinking that the eclipse could not possibly bring about the effects noticed were fully stated in my article, and I see no reason for changing my views.

He made special reference to a rapid fall of signal intensity coinciding with the passage of totality across the great circle, but I fail to see how this helps the eclipse theory—on the contrary, it strikes me as damaging to the same in view of the general experience that obscuration or reduction of solar rays tends to increase signal strength.

Arthur E. Cotterell.

Beckenham, *July 28th*, 1925.

Non-Metallic Switch Covers.

It is interesting to see the notice given in your issue of the 7th instant under "New Electrical Devices," pointing out the development of a switch with a shockproof cover which obviates the necessity for earthing the switch cover.

We have for the past four years, at least, been making non-hygroscopic fireproof covers for all switches and switch-plugs, and our products are made throughout, in this country, and from "all British" materials.

Baron Abinger and Another v. Lochaber Power Co.

Judgment has been issued in the Court of Session, Edinburgh, in an action by Baron Abinger of Abinger and another against the Lochaber Power Co. Pursuers are the trustees acting under the trust disposition and settlement of the fourth Baron Abinger, and as such trustees are proprietors of the estate of Inverlochy, Inverness-shire. They sued the defenders, who are incorporated by Act of Parliament, for implement of an agreement dated March 30th, 1925, under which the defenders agreed to purchase nearly the whole of the estate, except the castle, policy, and fishings, for £82,500. The substantial question involved in the case was whether, in the circumstances, the pursuers had power to sell the subjects. Lord Constable sustained defenders' plea to the effect that the pursuers were not in a position to tender to them a good title to the subjects, and dismissed the action.

British Insulated & Helsby Cables, Ltd., v. Atherton (Inspector of Taxes).

When the Law Lords re-assemble on October 22nd the case British Insulated & Helsby Cables, Ltd., *v.* Atherton (Inspector of Taxes) will be heard. It raises some interesting points in connection with deductions from profits set apart towards a pension fund for employés in their relation to income tax. The original case and a subsequent appeal were reported in our issues of July 4th, 1924 (p. 44), and November 14th, 1924 (p. 760).

Bufton v. Kidderminster and District Lighting and Traction Co., Ltd.

At the Kidderminster County Court recently, before Judge Ingham, George Bufton (14), sued the defendant company (a subsidiary of the Shropshire, Worcestershire, and Staffordshire Electric Power Company), claiming £70 for damages, &c., arising from an accident caused by the explosion of a pavement fuse box last December. It was stated that the plaintiff stepped on the surface cover of the fuse box, when there was an explosion, the cover being blown off. The boy had to be rescued from the testing chamber, having sustained personal injuries, which incapacitated him from his employment for eight weeks.

The defendants claimed that the charge of negligence had not been established, stating that gas might have percolated through from other sources, a gas supply having previously been laid at the place where the fuse box had been placed.

Mr. Eaden, for the plaintiff, argued that the extent of liability of the company went beyond the initial operation of laying the system, and for this he relied on the words "by reason of and in consequence," which were in an Act under which the company operated.

The jury found that the accident was not caused by the manner in which the defendants constructed the boxes and ducts and that they were not guilty of negligence in the construction of the boxes. Judgment was accordingly entered for defendants.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Self-Depreciation—and the Penalty.

SOMETIMES American visitors, observing at close quarters our attitude towards our industrial and other problems, venture the friendly criticism that we are prone to be self-critical and self-depreciatory, while they, on their side, living in a land overflowing with milk and money, are inclined to be over-confident and self-congratulatory.

Occasionally when we are inclined to brush depressing signs aside and adopt a thorough-going optimism, we are warned by some of our own critics of the folly of shutting our eyes to the incontrovertible facts, or hiding our heads in the sand.

Both kinds of criticism are useful if they lead to absence of panic, sane thinking, and reasonable action. But in addition to these two views, there is another to which we need to pay greater heed under certain circumstances; we refer to the observations of the Britisher abroad. Our business men who are operating in colonial and foreign markets on our behalf are able to judge at close quarters the effect of our self-criticism and depression upon the minds of other people. These business men are face to face with actual trading difficulties, and if British spokesmen and newspapers represent us as industrially on the down grade, overdoing it so as to indicate that unless this or that happens we shall soon be at the end of things, those difficulties will grow worse.

The *Journal* of the British Chamber of Commerce in the United States has uttered a protest against "Too much cabled pessimism." Englishmen in the States find that too much stress is being laid on unfavourable industrial conditions in Great Britain. Whether the Press reports that they have in mind be true or false, whether justifiable or otherwise regarded in the light of the facts, the publication of our troubles does not assist them in their efforts to secure business. The potential purchaser, however much allowance he may be disposed to make for our natural inclination toward self-criticism and depression, is likely to take us at our own valuation and perhaps at even less than that. The *Journal* makes the definite statement that too much cabled pessimism is doing England harm rather than good in the U.S.A., and it adds: "the quicker this is realised the easier will be the task that the business interests of England are fulfilling so nobly."

Let us quote how British business men in New York regard the old country, for it may do us all good to see ourselves as they see us:—

"Admitting that official trade returns show that manufacturing output might be better, and that the trade totals of exports are below par, England is still doing a lot of business with the world. She has not lost her trade to competitors, as one might infer from reading the dispatches published in metropolitan papers, and emanating in part from official sources. She has not lost her supremacy in shipbuilding, even though the wording of the latest Lloyds' reports might be so construed. The business instinct which has placed England in her present proud position still lives. She faces the situation calmly—at least, her business men do—and they are not to be moved or alarmed by hysterical conjectures, theories, or prognostications that, for Great Britain, the sun has set. Far from it, they are looking for the sunrise of better times to come and with indomitable courage and perseverance will carry on. The war has been ended only about six years, yet England has restored the pound sterling to gold parity. She is paying her heavy debt to America, and the position of her banks, business houses, manufacturing plants and shipping enterprises is warrant not only that all is well, but that all will be well."

As we have stated on several occasions, the data that have had to be published here for the information of the community, including industrial workers, on high costs of production, are used against us by our competitors abroad, the effect being to create an impression that, on price, we are out of the running. We are not questioning the wisdom of letting the truth be known among our own people, for it is only when the facts are fully understood that real co-operation among all classes is likely to be secured. But we need not in the gloom forget all the bright spots. The electrical industry, at any rate, has ample justification for optimism in most of its sections.

It is a pity that so much is made of an occasional lost contract, while far too little is made of our manufacturers' successes. We are always pleased to publish particulars of British achievements for the information of potential purchasers in other lands. The more publicity that is given to what our works are doing the more likely is there to be a return flow of inquiries and orders from the oversea markets.

Pulverised Coke for Electricity Generation.

At the annual dinner of the Mersey and North Wales (Liverpool) Centre of the I.E.E., last February, Sir Max Muspratt referred to the importance of a cheap supply of electricity to the chemical industry, to enable it to meet the competition of countries that had water-power at command, and expressed approval of a suggestion that had been made —that coal should first be used for the production of gas, and that afterwards the resulting coke should be pulverised and burnt in boilers, thus making the best use of the coal. He suggested that problems of this kind should be worked out by co-operative action on the part of the representative institutions. Mr. W. B. Woodhouse, president of the I.E.E., said that the views expressed by Sir Max corresponded with those of the most advanced electrical engineers, and that with suitable plant it would be possible to supply electrical energy to the chemical industry at prices comparable with those resulting from the use of water power.

A point which we would emphasise in this connection is that, whilst the cost of fuel has comparatively little influence on the cost of electricity for short-hour loads, such as our public electricity supply stations have to deal with—the load factor rarely exceeding 30 per cent. —it is of first importance in relation to an industrial load, such as that of many electrochemical operations, with a load factor of 90, or even 100 per cent. Water power is cheap for long-hour loads, but not necessarily cheap for loads of short duration, because in the former case the heavy capital charges are distributed over a larger area, whilst the running costs are small. Thus, as Sir Max Muspratt pointed out, for electrochemical processes, in order to compete with water-power cheap fuel is essential, to keep down the running costs.

Sir Max's suggestion that pulverised coke should be used for this purpose is hardly capable of realisation, so far as it applies to ordinary gas coke, for this material is difficult to pulverise, and besides consuming far more power in the process than coal, is very abrasive, rapidly wearing out the pulverising plant. But an announcement in the daily Press last week puts the matter in a new light. A process for the low-temperature carbonisation of coal, it appears, has been developed and successfully tested on a commercial scale, in which the coal is pulverised before carbonisation, resulting in the formation of powdered coke. In an interview with a representative of the *Morning Post* the inventor, Mr. McEwen, stated that by the recovery of the by-products —oils and tars, &c.—from the carbonisation process, as well as of the gas, and the use of the powdered semi-coke for generating electric power, it was hoped to reduce the cost of power by half. An installation capable of carbonising 200 tons of fuel a day, he said, had been ordered by the Milwaukee Electric Railway & Light Co. to work on these lines.

Further information will be awaited with interest. Obviously, such a process would be capable of utilising coal to the best advantage, in the light of our present knowledge: fuel oil, motor spirit, tar, and gas would be derived from the coal, before the residue was burnt under boilers, and though the highest thermal efficiency as yet attainable in steam practice is only 20 per cent., still the reproach that all the valuable by-products of coal were wastefully consumed in the furnace would be removed and an important commercial economy would be effected.

Electricity Supply in South Africa.

In his valedictory address to the South African Institution of Engineers, Mr. T. G. Otley explained the circumstances under which the Witbank power station was put in hand by the Electricity Supply Commission of South Africa; the scheme had been criticised on the ground that the Victoria Falls and Transvaal Power Co., Ltd., was to obtain a bulk supply from the new station at cost price. Under the Electricity Act, said Mr. Otley, the Commission was bound to supply all consumers at cost, and in order to reduce that cost to the minimum, it was essential to enrol the Power Company as a bulk consumer; unless the Commission could supply electricity as cheaply as private enterprise could do it, the Control Board could not authorise the Commission to erect the station, and the load in the Witbank district, apart from the Power Company's demand, was not sufficient to justify the erection of a generating station. The Power Company could have extended one of its existing power stations, or built a new one elsewhere, in which case the Government scheme would have fallen through.

However, the company desired to co-operate with the Commission, and agreed to take from the new power station all output that was not required by the Commission for its own consumers, thus enabling the plant to be operated on the most economical basis, at the maximum load factor. This would appear likely to react upon the Company's other power stations, but the terms of the agreement provide for sharing the benefits equitably between the two parties. The arrangement will enable the Commission eventually to supply energy to the railways at a much lower rate than would be possible if a separate station for traction had to be erected.

The case is unique within our experience, and admirably illustrates our contention that increased output per unit of capital outlay is the essence of cheapness. Merely installing the most economical plant cannot result in cheapness of supply. In this instance arrangements have been made before-hand to ensure that the essential condition shall be fulfilled.

Boiler Practice on the Rand.

In the same address, which is abstracted elsewhere in this issue, the retiring president brought out some interesting facts relating to the four steam stations of the Power Company, in which 102 boilers are installed. Twenty-four of these boilers have been steaming at a load factor of between 70 and 80 per cent. for 17 years, representing, in comparison with average British conditions, a working period of 30 or 35 years;

yet they are to-day "virtually as good as when installed," and they are steaming at higher efficiencies than at any previous time in the history of the Company. The other boilers have worked for 13 or 14 years at the same load factor, and every boiler on the system is considerably exceeding the makers' rating, though they are burning coal of far lower calorific value than they were originally rated on. The high output is obtained by applying forced draught over a short length of the grate at the front end, and running the grates 12 or 14 per cent. faster than the speeds they were designed for. It was found advisable to use a separate fan for each grate, and by means of these the output can be increased by 15 or 20 per cent. when necessary. The induced draught is also to be increased, and it is hoped to raise the output by about 40 per cent. above normal rating.

Mr. Otley is a believer in large boilers; he sees no good reason why more than one boiler should be required to feed one turbine—even of 50,000 kW—except that it would take some time to heat up a spare boiler in case of need. Hence he urges that the boiler should be made as reliable as the turbine, and points out that in the experience of the Rand Power Companies the great majority of boiler stoppages are due to the mechanical parts—the grates, gear-boxes, &c.—and not to the boilers themselves; it is up to manufacturers, he says, to make these parts, which are simple compared with turbines and generators, at least as reliable, and to station staffs to maintain them immune from involuntary stoppage. The result of installing such large boilers would be reduced capital cost, simpler piping, &c., and—especially in the Transvaal, where coal is extremely cheap—simplicity of design should be the watchword. High thermal efficiency can be bought at too great a price for installation and maintenance.

Gas on Trains.

The terrible accident which took place at Amiens on Thursday last week affords further evidence of the danger of carrying gas on railway trains. According to the *Morning Post*, "the only carriages which took fire were the fifth and sixth, which were the only ones on the train fitted with gas tanks." As we have observed on previous occasions, the horrors of a railway collision are ghastly enough without adding to them the mental agony of awaiting the approach of the flames and the physical tortures of a lingering death by fire.

Long ago the French Government realised that such risks must be removed, and issued a decree that before January 1st, 1923, gas lighting on express trains should be abolished; on suburban trains electricity was to be the sole lighting agency by the beginning of 1924, and in the course of that year all other trains must be lighted with electricity (Electrical Review, October 28th, 1921, p. 555). Similar action had been contemplated in 1914, but was delayed by the war. Apparently the decree had not been fully carried out, though only two of the 21 coaches involved in the Amiens disaster were equipped with gas lighting. It has been officially stated that all the regular express trains are lighted with electricity, and only on holiday trains are gas-lighted coaches still in use.

There is no need for gas on trains at all. Electricity can not only provide illumination and ventilation, but can also perform all the cooking operations required on restaurant cars. The decree above-mentioned was the immediate result of the frightful disaster in the Batignolles tunnel; are we to wait for a similar holocaust in this country, before our Government will intervene and abolish gas on trains?

The Cost of the Electricity Commission.

In the *Gas World* of August 15th, editorial criticism is levelled at the Electricity Commission on the ground that this body, "ostensibly established for the purpose of co-ordinating the electric supply of the kingdom," is pursuing competitive methods, of which the evidence is a circular letter with regard to the Advisory Committee on Domestic Supplies and Methods of Charge, addressed by the Commissioners to all authorised electricity undertakers. We are not concerned to defend the Commission against the charge of exceeding its authority, though we fully believe that it is acting in accordance with the spirit of its constitution; but we wish to point out that incidentally it is said to be "financed at the taxpayers' expense," and the statement is made that "The taxpayers' money is being used for promoting the well-being of one industry." This is a mistaken impression. It is true that the Exchequer advanced funds in 1919 to enable the Commissioners to make a start, but that loan has now been wholly repaid, and the Electricity Commissioners' expenses are borne entirely by the electricity supply industry, the excess of expenses over receipts being apportioned among the authorised undertakers of the country *pro rata* to their output. Last year the amount so apportioned was £75,000. The matter was fully covered in the Acts of 1919 and 1922, and we feel sure that our fair-minded contemporary, on having its attention drawn to the error, will rectify it.

On Exaggeration.

Overstatement is a weapon often employed by propagandists. It startles the reader or the listener and fixes his thought upon a subject when possibly the truth and nothing but the truth told in moderation might leave him uninterested. "Stunts" on occasion justify themselves in the result, but the public tires of stunts, and once bitten becomes twice shy. Ordinary mortals clothe themselves in protective armouring, proof against exaggeration, and become critical and sceptical. Now, slogans are excellent in their way, and they serve their purpose for a time, but new ones should be ready to take their place before they are worn out. Electricity has had its slogans, and we could do with some arresting ones now, but they need not express exaggerated claims. Electricity is able to do so much and to do it all so well that exaggeration is quite unnecessary. The merits of electrical service—when it is given proper trial—are self-demonstrative. The purpose of the slogan or the propaganda claim is to impress the minds of those who do not *know*, but who need to be brought to fixity of thought regarding electricity and compelled to interest themselves in it. Therefore, publicity must be efficiently employed, forcefully but fairly stating its merits. Some criticism may be offered of those who have advocated it as a panacea for all industrial ills at a time when hundreds and thousands of men have been earnestly searching for a way out of most serious situations. Its advocacy as the householder's way of solving domestic problems requires discretion too, because, say what we will, in large numbers of homes there is not money to spare for electrical installation and supply at present costs. Convenience is worth much to many, but it cannot be paid for by all. Even with the "All-in" rate of the Electric House, the bill is not small compared to previous bills for lighting and heating—it is in convenience and cleanliness and labour-saving that electricity scores, and these are things which must be paid for. The consumer who is led on to the mains under false impressions as to cost is not going to be a help in the long run—he may even be a hindrance if he spreads abroad an anti-electrical experience. Overstatement or optimism is a very pronounced weakness with some who have the drawing-up of electrical company prospectuses, but Nemesis relentlessly dogs the steps of such, and extravagant promises have to be paid for by somebody. We have known extravagant statements to be issued to the Press by manufacturers' publicity departments—a most short-sighted practice to adopt. Self-respecting editors do not admit such into their pages, and the unavoidable result may be an inclination so to deal with over-statements as to make them briefer than they would otherwise be. Another class of over-statement that occurs to the mind is excessive praise of men; if it be laid on with a trowel it often fails in its intention, for it raises a smile but is not treated seriously by listeners. It does little harm, however, for most of us are wonderfully clever at discovering the depth of sincerity of such utterances.

Water Power in New Zealand.

The Government Hydro-electric Scheme at Mangahao.

(From a Special Correspondent.)

From its wealth of physical features New Zealand is able to derive a potential water-power supply of about 36 kW per square mile, and is second only to Switzerland in this respect. Resources examined by public works engineers indicate that from sources of over 1,000 kW capacity the country can produce a grand aggregate of over five million kW, and power from minor sources is estimated to amount to another two million kW. At the present time there are not more than thirty schemes

Fig. 1.—The Mangahao Dam.

in operation throughout the country, the great majority of these being small local schemes developing at most a few hundred horse-power. There are, however, several Government schemes already in operation, and these provide the great bulk of the 100,000 kW developed in the country at the present time.

Government schemes in contemplation include the harnessing of the Arapuni Rapids on the Waikato River, developing 120,000 kW at a cost of five and a half million pounds. The Waikaremoana Lake project is now being commenced, and involves the development of 60,000 kW at an estimated cost of two and a half million pounds. Other schemes for the future include the utilisation of Lake Te Anau to develop over a million and a half horse-power—this will be one of the largest works in the world.

One of the completed Government schemes is the Lake Coleridge development on the Rakaia River for the purpose of supplying the city of Christchurch and other towns on the Canterbury Plains with electricity for lighting and power. The present plant utilises the waters of the lake by taking them through a tunnel a mile and a quarter long, giving a head of 480 ft. The capacity of the plant is 15,000 kW, consisting of four 1,500-kW and three 3,000-kW sets. Power is generated at 6,600 V, three-phase, and transmitted about 60 miles at 66,000 V to a main sub-station on the outskirts of Christchurch. The primary distribution is at a pressure of 11,000 volts, at which it is sold to the local retailers. Secondary distribution is at 3,300 and 400 volts. Work is proceeding upon the extension of the capacity to 36,000 kW.

The largest Government scheme is the newly-finished Mangahao station at Shannon designed to cater for the city of Wellington and the provincial towns. The construction of this project presented some difficult and unusual features, and the work was constantly interfered with by a regular succession of heavy floods, which time and time again nullified the accumulated efforts of the large body of men employed. The principal works at Mangahao are two large storage dams at Mangahao and Tokomaru, 186 chains of concrete tunnelling, a surge chamber 75 ft. deep, pipe lines and power house, and transmission lines and nine sub-stations.

The construction of the dam at Mangahao (fig. 1) was the most difficult job in the contract. It was originally intended to erect an arched concrete dam containing about 9,000 cubic yards, but owing to vagaries in the rock it was decided to build it partly as a core-walled earth-filled dam, and partly as a gravity section overtopped concrete dam. The concrete core wall is carried down into the country rock for a distance of several feet. The gravity section portion contains two automatic tilting gates, which are so constructed as to retain the water at a constant level against floods. The passages in which the gates operate are each 64 ft. wide and 10 ft. deep, and the gates operate on pivots placed just less than half way up their sides. These gates are balanced in such a way that, when the level of the dam rises above normal, water enters a siphon and flows into a chamber behind the lower portion of the gate. The balance of the gate is then disturbed and it tilts slightly forward and permits water to run over the dam face. The amount of water entering the chamber determines the tilt which can be as much as right angles to normal, and this represents a sudden rise of three inches in the level of the dam. When the level of the water again falls to two inches below the normal level of the dam, air is drawn into the siphon, whose action is then interrupted, the water in the chamber drains away and the gate resumes its normal position. The installation of this device obviated the necessity of raising the level of the Mangahao and Tokomaru dams another 10 ft. The tunnels joining Mangahao dam with Tokomaru dam, and the latter with the surge chamber, are controlled by motor-operated gates, which enable either dam to be emptied without affecting the level in the other. The surge chamber (fig. 2), which is situated at the lower end of the second tunnel, is shaped like a volcanic crater, and is 87 ft. in diameter at the top, 75 ft. deep, and 19 ft. in diameter at the bottom. From the surge chamber a 72-in. pipe line in duplicate

Fig. 2.—The Surge Chamber at Mangahao.

emerges, passes successively into 66-in. and 60-in. pipes, and then breaks into four 41-in. and finally 36-in. pipes on entering the power house.

The power house (fig. 3) is a substantial concrete building, 215 ft. long and 84 ft. wide. In the basement of the building are the main pipe and valves, bus pipe, turbine and generator pits. The main floor contains the turbines and generators on one side, the reactances and l.p. switchgear in the centre, and the

transformers on the other. Above the l.p. switchgear is the switchboard gallery, with the offices alongside.

The main pipes, bus pipes, and valves are so arranged that any pipe or turbine may be isolated without interfering with any of the others. The generator room contains three 8,000-h.p. and two 4,000-h.p. Pelton wheels, driving respectively 6,000-kVA and 3,000-kVA alternators. All the machines can be excited by two independent 250-kW d.c. generators. Governing is by needle valve and deflector operated by oil pressure and driven off the main generator shaft.

In the transformer room are two banks of three 4,000-kVA single-phase transformers and one in reserve, capable of raising the pressure from 11,000 to 110,000 V*. The various Power Boards will receive the current at 11,000 volts from the sub-stations and transmit it at their own pressure to their clients. The Wellington City Council has arranged to take over 12,000 kW from the Mangahao undertaking. The City Council's own plant at Evans Bay will continue to operate for the purpose of relieving the Mangahao supply at peak hours. A typical transmission line pole is shown in fig. 4.

Mangahao is the largest Government station in existence at the present time, developing 24,000 kW, and has cost approximately £1,600,000. Further works consist of an additional storage dam behind the Mangahao dam, and the erection of several sub-stations, together with the duplication of the main transmission lines, finally linking up with the Arapuni and Waikaremoana schemes.

We are indebted to the Publicity Department of the New Zealand Government for the illustrations in this article.

Induction Heating by Low-Frequency Currents.

The Use of the Induction Furnace for Melting Non-ferrous Metals.

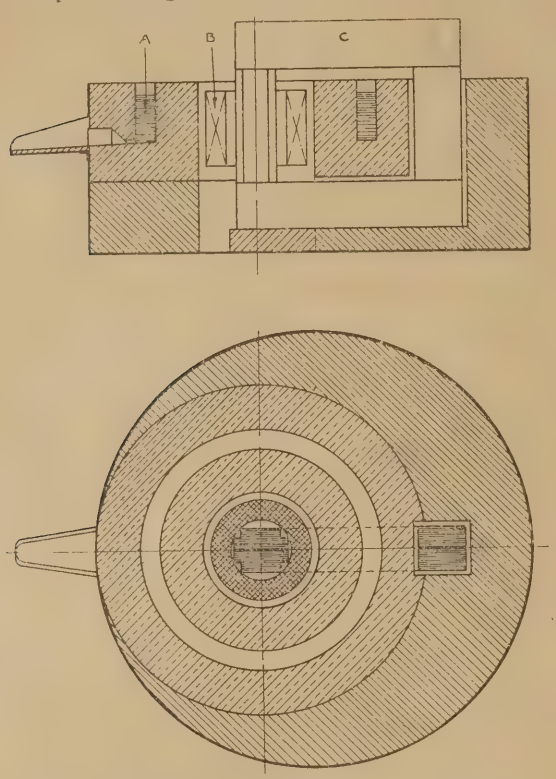
By G. E. TAYLOR, A.M.I.Mech.E., A.M.I.E.E.

The heating and melting of metals by means of induced electrical currents is perhaps the nearest approach to the ideal method of heating that science has yet made possible, for the heat is generated in the material itself. Thus, the necessary containers or crucibles are at a lower temperature than the charge, and a maximum heat efficiency is obtained.

The first to recognise the great possibilities of this form of heating was de Ferranti, who took out a patent in this country in 1887. The same year Edwin Colby, of Newark, N.J., took out patents in the United States, and some time later he constructed an induction furnace which consisted of a single ring of molten metal, forming the secondary, placed round an iron core, the primary being placed outside the secondary.

Kjellin, and subsequently Frick and Rodenhauser, were responsible for the design of the induction furnaces in European works, which were successful for limited metallurgical applications in the steel trade, but this development has almost ceased in recent years on account of the better metallurgical conditions obtained in the arc furnace, which is superior for refining purposes. The necessity of using extra-low frequencies, such as 5 to 15 cycles per second, was also an important factor in preventing the development of induction heating as applied to the steel trade, owing to the capital expenditure necessitated by the installation and maintenance of special generators which were not suitable for other purposes.

The application of induction heating to the non-ferrous metals has given a new impetus to this type of furnace, and as this is usually performed in small units, the furnaces now used can be designed to give good power factors when working at normal commercial frequencies.



The principle of the low- and normal-frequency induction furnace is that of the static transformer, that is, it has primary and secondary circuits which are magnetically interlinked by a core of iron, the power supplied to the primary being transferred to the secondary by means of a fluctuating magnetic field and there turned into heat; as a transformer, it is extremely efficient, for whereas the heat generated in the secondary of a transformer is a form of loss, in the induction furnace it is utilised.

Its design also closely resembles that of a transformer. This is illustrated in fig. 1, which is a usual method of construction.

* See Elec. Rev., October 20th, 1922; p. 557.

The metal (A) is contained in a horizontal ring, placed concentrically with an iron core (C) of transformer iron, on which is placed the transformer winding (B).

It will be seen from the sketch below that whereas in the transformer the primary and secondary windings are close together, in the induction furnace a very large space of necessity exists, filled with refractory lining, thus forming a large leakage area for the magnetic field and giving a correspondingly poor power factor. This space varies greatly with the temperature of the metal to be melted and the size of the furnace, but in the most favourable circumstances it is comparatively great, and also, as the secondary channel has to take the complete charge, the cross section of this channel is

(A) Molten metal; (B) Primary coil; (C) Iron core.

Fig. 1.—Low-Frequency Induction Furnace for Melting Steel: Vertical and Horizontal Sections.

large, if its diameter is to remain within practical limits; thus again we get adverse conditions for maintaining a high power factor.

Many methods have been adopted by different inventors to reduce the magnetic leakage, and to a certain extent the power factor has been improved.

In starting up an induction furnace it is necessary to pour into the secondary channel sufficient molten metal to form an electrical circuit of a cross section large enough to take the current required to heat the charge. After this has attained the desired temperature, cold scrap is added in small quantities until the complete charge is molten. After pouring the metal, a sufficient quantity is left in the channel to form the necessary circuit for the next charge.

With the open-channel type of furnace, the cross section of the bath varies according to the weight of metal charged; its resistance will likewise vary, so that with constant voltage the current flowing in the channel will be smaller at the commencement than after the complete charge is molten.

For example, if a furnace, when charged to half its capacity, takes a load of 143 kW at a power factor of 88 per cent. with 10 volts across the secondary channel, we shall have the following electrical conditions:—
kW 143; p.f. 88 per cent.; volts 10; amperes 16,200; ohmic resistance 0.000544; reactive resistance 0.000292 ohm.

When the full charge has been added, the ohmic resistance will be halved; the reactance will be as before, and the power factor will be cos ϕ, where tan $\phi = .000292/.000272$. Then cos $\phi = 0.68$. The impedance is now .0004 ohm.

The current flowing will be, assuming the voltage to be constant $10/.0004 = 25{,}000$ A, and the power taken will be $10 \times 2{,}500 \times 0.68 = 170$ kW.

From the above it can be seen that the power factor varies considerably according to the state of the charge in the furnace. The rate of heating also varies—that is to say, although the charge has been doubled, the kilowatts have only increased by about 20 per cent. However, if a means of voltage regulation is adopted, the power may be increased to a certain degree, depending upon the current density of the bath.

Owing to the phenomenon known as "pinch" effect, there are well-defined limits beyond which the current cannot be increased. Therefore the maximum electrical power of the furnace equipment cannot be used throughout the whole charge, unless a large proportion of the molten metal be left in the bath; consequently the load factor will be low.

When large furnaces of the simple ring secondary type are used, it is necessary to reduce the frequency, the usual practice being to install machines of the motor-generator type so that three-phase currents may be taken from the line, and a single-phase current of the required frequency delivered to the furnace. As the motor is usually of the synchronous type, it is used to advance the power factor.

The Rochling-Rodenhauser furnace deviates from the usual method of construction and makes use of polyphase currents. This is perhaps one of the greatest improvements in the induction steel furnace. Its arrangement is such that it may be connected to standard supply circuits without having an unduly low power factor.

Dr. Carl Hering noticed that when current was passing through a molten conductor contained in an open trough, deep depressions of the liquid metal took place on the current reaching a certain density. This effect is known as the "pinch" effect, and has considerable bearing on the design of modern induction furnaces.

It is well known that parallel conductors carrying current in the same direction attract each other. The molten liquid contained in the secondary of an induction furnace may be looked upon as an indefinite number of parallel paths, through which the current is flowing. Each of these paths will tend to move towards the axis of the conductor, and should the current density be raised beyond a certain point, the force will become great enough to interrupt the circuit momentarily. Hence there are limits to the current density which may be allowed in the molten secondary.

The force due to what is known as "motor" effect also has a very important bearing on induction furnace design, especially in the case of the Ajax-Wyatt furnace for melting non-ferrous metals, which is described later.

Most of the earlier induction furnaces were developed for the melting of high-resistance metals, such as steel, &c., very little attention having been paid to the melting of non-ferrous metals and alloys, such as copper and brass. Experiments, however, were carried out some years ago on the melting of non-ferrous metals by an induction furnace of the open-channel type, but without much success. The poor results of this type of furnace for non-ferrous metals and alloys were principally due to the low power factor and "pinch" effect.

Owing to the higher resistance of steel, the current density required to melt at a practical rate may be adjusted so that the "pinch" effect does not reach a sufficient magnitude to break the secondary, but in the case of low-resistance metals the current density for practical melting in a horizontal ring furnace may be so great that the "pinch" effect will break the molten metal circuit. The power factor of the secondary channel will also be lower than that of steel, and the resistance may be so variable that the furnace will become impracticable.

It is, however, in the melting of non-ferrous metals and alloys of the copper-zinc type that the characteristics of the induction furnace are much more favourable than those of the arc furnace. In melting steel and ferrous alloys, unless very pure expensive scrap is used, it is necessary to refine the molten metal. To do

this, it is important that the slag should be hotter than the molten steel, so that the chemical actions for the removal of impurities may take place. In the arc furnace these required conditions exist, whereas with the induction furnace, as the slag is a poor conductor of electricity, it is extremely difficult to generate sufficient heat in it to hold it at the required temperature.

On the other hand, when melting copper-zinc alloys, owing to the low volatilisation point of zinc, it is important that no part of the bath shall be heated to an excessive temperature. In the arc furnace this condition is not easily obtained, but with induction heating the temperature can readily be kept within the desired limits.

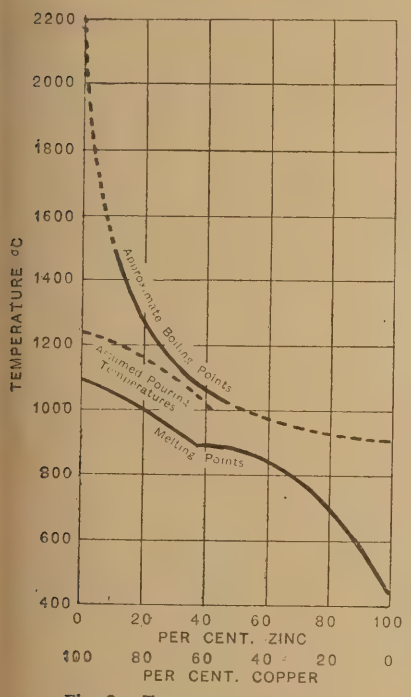


Fig. 2.—Temperature Curves for Copper-Zinc Alloys.

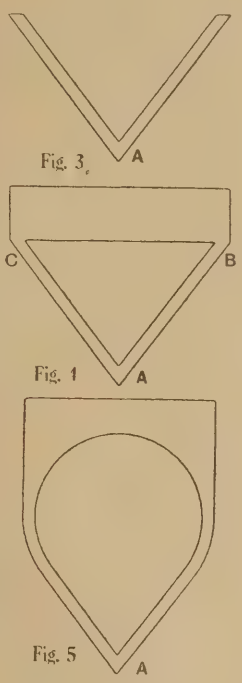

Fig. 3. Fig. 1 Fig. 5

Figs. 3, 4 and 5.

The above three curves, fig. 2, were prepared by Mr. H. W. Gillett, of the U.S. Bureau of Mines. The upper curve shows the temperature at which zinc volatilises in the various copper-zinc alloys; the lower curve is that of their melting point, and the centre curve the temperature at which they are usually poured.

In the case of the important commercial alloys, namely, those containing from 30 to 40 per cent. of zinc, very little difference exists between the temperature required for successful pouring and that at which the zinc in these alloys volatilises. Therefore, the control of heat and the temperature at which the heat is applied to the metal are of the utmost importance.

It is obvious then that for these alloys the open horizontal-channel induction furnace is limited in its application, owing to the low power factor, the varying input, and "pinch" effect, and the arc furnace is unsuitable, owing to its heavy zinc losses.

To overcome the various difficulties, C. P. Schneider constructed and described the original closed-channel type of furnace, in which the ends of the channel terminate in a bath of molten metal placed above them, which maintains pressure in the channel. The circulation of the metal in the secondary channel was not sufficiently great to prevent the metal becoming overheated, and the furnace therefore was not practical.

James Wyatt, when carrying out experiments in the development of the electrode "pinch"-effect furnaces invented by Dr. Carl Hering, noticed that a peculiar action was taking place in the molten metal. Experiments were carried out to find its cause, and from the data gained the type of closed-channel furnace known as the Ajax Wyatt was developed.

From the experiments undertaken by Wyatt, it was found that on passing current through a molten metal conductor contained in a rigid channel, a strong repelling action took place wherever a well-defined angle was formed, this action tending to bank up the metal against the side of the channel. When an acute angle was formed, as shown in fig. 3, a strong action took place which tended to bank the metal at A and caused a flow of metal away from that point.

If we join the two ends of the conductor in a bath of metal as shown in fig. 4, banking will take place at A as before, but the flow of metal away from this point will be retarded owing to a similar effect, although of less magnitude, taking place at B and C.

If we require the metal to have a maximum rate of flow along the sides adjacent to A, we must round off the corners at B and C, as shown in fig. 5.

From these experiments it was clear that wherever a sharply defined angle was formed, a certain magnetic effect was taking place on the molten metal. Also, where such a force is exerted, it tends to eject molten metal from the channel, and the corners at the point where the ends of the channels meet the bath must be rounded off to obtain a maximum rate of flow.

The present type of Ajax-Wyatt furnace has been designed to utilise the force due to "motor," "pinch," and "Joule" effects to the best advantage.

(To be continued.)

Cheaper Power.

Suggested Combination of Gas and Electricity Production.

By W. D. WYLDE.

The present-day advocacy by the powers that be of the super type of super-power station as a means of producing a plentiful supply of cheap electrical power, will no doubt to the layman appear to be the stepping stone to real and rapid progress towards putting our staple industries on their feet, and towards the conservation of the nation's fuel resources. The fact remains, however, that the most up-to-date plant in existence as a commercial proposition at the present time, utilising steam as the working medium for power production, only makes use of 25 per cent. of the heat value of the raw coal consumed; and what is more, this figure is only obtained and maintained by the adoption of the most modern types of fuel economisers, ceaseless vigilance, and scientific methods of plant operation applied continuously. In the absence of these aids, the figure would fall to 15 per cent., which may be taken as that obtaining in the majority of modernised municipal and power companies' power stations at the present time. It does not require a great deal of calculation to show that, assuming that the super-station with the higher efficiency supplies energy to large consumers at 0.75d. per unit, by adopting methods of power production resulting in a 40 per cent. coal utilisation efficiency the price of energy to the same consumer would be a maximum of 0.5d. per unit, taking it for granted that the power supplier would be content with the same profit margin as before.

To enable the higher efficiency of coal consumption to be attained, it is absolutely essential that the efficient methods of coal treatment developed by the gas industry be combined with the modern methods of utilising at maximum efficiency the heat at its disposal evolved by the electricity supply industry, and as a means to this end amalgamation of the two industries is suggested. The reason for the foregoing suggestion

will be seen when the valuable elements that make up the conglomeration that goes by the name of coal are taken into consideration.

Coal is well known to contain in varying quantities volatile hydrocarbons—valuable substances which by the distillation process are recoverable in crude forms, the degree of further refinement being decided by the market values of heavy and light fuel oils ruling at the time. The residual solid matter in the form of a baked carbonaceous mass is a useful commodity for the domestic fire, steam boiler firing, and other industrial heating requirements.

The main deciding factor is, of course, the value of the hydrocarbons in question: whether their value in by-product form exceeds the value of the heat produced by burning them immediately they are liberated from the raw coal, which is the case when utilising raw coal in the boiler furnace.

It may be useful to examine briefly the cause and effect of splitting up the coal disintegration period into two distinct, although interdependent, processes for the ultimate realisation of the aims in view, which are included under the title of conservation of the potential assets of coal. The cause is simply the fact that at the present time this country is dependent for 80 per cent. of its oil fuel needs on supplies from abroad, the 20 per cent. produced at home being from the high-temperature carbonisation process of existing gas works and coke ovens—maximum gas yield per ton of coal carbonised taking precedence with the former, and maximum coke yield per ton of coal with the latter.

Also included in the cause are existing economic demands, which make compulsory the utilisation to the full of the potentialities of the nation's most valuable natural asset, which the present-day method of consuming raw coal industrially and domestically does not do. By the universal adoption of the gas industry's most modern methods of coal treatment, an augmented supply of fuel oils would be available, with the beneficial result of reducing the dependency of this country on supplies from abroad.

There are other by-products, such as alcohol (which, incidentally, mixed with the by-product benzol, produces a motor fuel bordering on perfection); ammoniacal liquors, for fertiliser production; creosote oil, for disinfectant and wood-preserving purposes; and pitch, for road-making—to mention only a few of the products of commercial value that are recovered.

There is also smokeless fuel, the residue remaining from the aforementioned process, available to meet household and industrial requirements and to promote smoke abatement.

Coupled with the foregoing products there is a large volume of gas of relatively high heat value, an outlet for which is easily found, *viz.*, boiler firing for electrical power production and the augmentation of existing town's requirements, in the event of gas making further headway as a heating agent for household purposes.

The total effect realised by the removal of the coal distillates, as part and parcel of power production, is the conservation of the valuable chemical ingredients which in the ordinary way would either be partly destroyed and their heat value diminished, or wasted entirely in soot production and atmospheric pollution. The former is the result of boiler firing with raw coal, the latter the result of using coal in its mined state for domestic purposes.

In stating the reasons for the advocacy of a gas and electricity supply combine, it is not intended to convey the impression that such a combination would cause the original power production efficiency to increase by leaps and bounds. The inherent properties of steam as a power-producing medium with present-day boiler pressures and methods of steam utilisation unfortunately do not allow more than, say, 5 per cent. increase in the maximum efficiency to be obtained by up-to-date plant. There would, however, be an increase of at least 20 per cent. in the overall efficiency of the coal utilisation—in other words, 20 per cent. of the initial heat value would be recovered in the form of tarry vapours, and gas, with their subsequent use to the best advantage, chemically and thermally, resulting in a saving of the equivalent of 4 cwt. of raw coal for every ton originally consumed in its mined state in the boiler furnace. The foregoing simply means that the self-contained process of smokeless fuel, by-product, and electrical power production, enables a 20 per cent. increase in the overall efficiency of coal consumption to be effected. The economic advantages of the joint operation of the two industries under consideration may be itemised as follows:—

(*a*) Conservation of potential heat in liquid form.
(*b*) Recovery of the chemical constituents of coal.
(*c*) Introduction of semi-coked fuel for universal use.
(*d*) Incandescent coke used for boiler firing.
(*e*) Surplus gas available for boiler firing.
(*f*) Utilisation of waste heat from coal-treatment plant.

The economy derived from (*a*) will be appreciated when it is realised that the consumption of raw coal for domestic purposes results in the deliberate waste of 25 per cent. of the potential heat value of the coal, in the form of tarry vapours passing away to the atmosphere unburnt.

Applied to power plant, the economy is less pronounced, being about 10 per cent. for the older types of boiler-firing equipment, and from 3 to 5 per cent. with modern boiler-house practice.

Referring to (*b*), the economy accrues from the recovery of the alcohol and benzol compounds, which in the ordinary way of burning coal in its mined state give off only a fraction of their real heat value previous to their being classified as waste gases.

The beneficial asset (*c*) is the saving of the raw coal's material value by the low-temperature carbonisation process, coupled with smoke abatement and decreased expenditure on household soot removal. These results in turn would benefit humanity by the healthier atmospheric conditions that would prevail in our large industrial centres when their existing smoke screens were removed. In the case of (*d*) the economy is the result of utilising the carbonised coal forthwith for boiler-firing purposes, for electricity supply, without its being quenched, thus cutting out the heat loss incurred by slaking the product previous to its being stored or transported.

Item (*e*) plays a prominent part in the realisation of economy due to the surplus gas being used for steam production with a corresponding decrease in the consumption of solid fuel used in conjunction with the gas for boiler firing.

The last, but not least, item (*f*) materially assists in the maintenance of maximum efficiency by making use of heat which, although it has done the work primarily intended, is still capable of being exploited as a means of obtaining further economy in preference to the slipshod practice of allowing it to go to waste. In the light of the foregoing, the conclusion may be safely arrived at, that compliance with the demands of progress necessitates the abolition of the present-day methods of coal destruction and the substitution of methods whereby the maximum economy of conversion from coal into oil and power may be attained, and the elimination of waste may become a reality.

As a means to this end, the changing-over of gas works and coke ovens from the present high-temperature process of gasifying coal to the more progressive process of low-temperature carbonisation is suggested, which is simply the lowering of the temperature to which the coal under treatment is subjected, and the necessary increase in the capacity of the distillation and by-product recovery plant for dealing with the increased tar-oil recovery. This, in conjunction with the utilisation of the surplus gas for power production, a ready market for the smokeless fuel at a price comparing favourably with that of raw coal, and the reclamation of the most valuable fractions of the crude oil, should at any rate be the forerunner of the rightful demand of industry at the present time, *i.e.*, cheaper power.

On Finding the Right Man and Keeping Him.

Some Suggestions regarding Procedure.

By W. ROLAND NEEDHAM.

Much has been written urging the advisability of finding men suitable employment; and certainly one can scarcely over-emphasise the importance of that training which fits men the better to succeed in their life work. Less has been written in the different, though not necessarily opposed, sense of stressing how necessary it is that the right man be either found or *grown* for a particular job. The latter is, of course, one of the commonest quests undertaken in commercial and industrial life. Every Press advertisement for a man to occupy a certain position is a case in point. Scarcely 10 per cent. of those appointed through these media, however, really *fill* the positions they occupy. Many, indeed, may be likened to circular pegs which fail even to touch the square holes they are placed in. They are misfits who make no real contact at all.

In this matter of seeking the man for the job, even given the most wisely conceived, carefully engineered recruiting scheme possible, more often than not the results would be below rather than above what would probably be considered a reasonable mean; and as things are, it is not at all surprising that in the majority of cases the end desired is but very indifferently realised. It would indeed be strange were it otherwise, having regard to the haphazard means employed.

It frequently happens that the advertisement column of a newspaper or technical journal provides a man with his only avenue of approach to betterment in position. Whether he deserves such advancement or not is here beside the point. As a plain matter of fact this facility offers him his chance, and many a man eagerly accepts the opportunity.

But how about finding the right man for the job? It is very questionable whether, in the majority of cases, he will be captured in this way. How is an employer to be guided? What standards of comparison will he establish? What criteria will he adopt? Can he hope by a series of carefully chosen questions to test a candidate's qualifications rigorously enough? Shall he trust to his skill in cross-examination, or to his more or less instinctive appraisal or distrust of a man's general deportment and calibre? Are the candidate's credentials, or is the ostensible range of his experience, to decide matters? Some uncertainty there needs must be. This may not be obviated. The aim should be, however, to reduce the element of risk to a minimum. The present writer is strongly of opinion that the ordinary Press advertisement medium, and the customary procedure attendant thereupon, do not tend to liquidate this uncertainty. It may be worth while to consider a little more fully what are some of the points at issue.

Many a specious fellow has boundless assurance. If he have just sufficient knowledge and acumen to enable him to dissemble and cloak his limitations, he can by sheer nerve and bluff deceive even the shrewdest observer *for a time*. It is upon more intimate knowledge, and up against the real issues which test a man's worth, that the material is found to be under specification.

A good testimonial is not always the thing it purports to be. It is by no means a thing unknown for an amiable employer to present a man, whom secretly he is relieved to release, with notable credentials. He presumably works on the easy-going principle that if an employé is not good enough to be retained, he need not be penalised on that account. Thus a good-natured gesture is made, and "the poor fellow is given the best reference possible." Despite the fact that more and more the practice is growing whereby a testimonial is made to be a plain, unvarnished record of services rendered, the older variety is by no means dead.

Then as to the range of a candidate's experience, the employer should nicely discriminate and seek the golden mean. Between the radicalism of the rolling stone and the conservatism of the stick-in-the-mud, there is well-nigh infinite variety of gradation. Range of experience may be as necessary as depth. Into the equation must enter the psychological and the temperamental factors as well. An energetic, forceful applicant will insist upon scope and elbow room. His nervous energy must find outlet. In parenthesis, be it said, the employer who on other grounds is favourably disposed towards such a candidate will seek to provide at least air space wherein such a man may breathe freely. If, on the other hand, the job demands that a man shall apply himself closely, that intensive detail work be required, then a more studious type of worker should be sought. Where the difficulty really arises is, however, just in the matter of the employer's judgment upon the miscellanea he has to inspect. He has to remember that a fine presence is not a necessary concomitant of a well-balanced, liberally equipped, and tactful personality. It is not all men who have journeyed far who really know much of the countries they have traversed. Many men understand Nature, are intimate with its lore, hear its voices, who have seldom wandered from one particular stretch of moorland or countryside. Nature's treasures are no secrets to the lovers of Nature. And so, on paper, a man may be able to reel off a most formidable itinerary of service, but in fact he may be a most ignorant person. Ostentation without substance, froth without body, swank wedded to incompetence—these things are of those which happen, and even keen judges of character do well to remember this. A solitary interview may not be sufficient; in fact, it is seldom sufficient. Actual working conditions provide the only valid test.

As a necessary corollary to the foregoing, a very modest, unassuming paper record may really have reference to sterling work and most valuable experience. The range may be limited, and looked at from that *partial* standpoint only, the data must be extremely incomplete. The ground, restricted though it be, may at the same time be well broken up, thoroughly reclaimed, and intensively cultivated. The employer should on no account overlook this possibility. Here again, however, from a merely paper programme, and from first impressions of an applicant's demeanour, how can he hope to form other than a haphazard opinion? Sometimes your best qualified man suffers from temporary nervousness. If this be at all apparent, what construction is the alert interviewer to put upon it? Is it necessarily a sign of weakness? On the other hand, is boundless assurance a sure mark of competence? It is well to emphasise how onerous, not to say thankless, is the task which devolves upon those who are called upon to make these important decisions. The data should be as complete as is humanly possible; but where the ordinary advertising methods are in vogue, are the desired conditions realised? Can they be realised under such auspices! Is there any other method available by which the gaps may be bridged, or at least reduced? The present writer believes that in many instances more facts might be educed, fuller knowledge gained, and thus material be at hand by means of which a sounder judgment is possible. The present article concludes, it is hoped, on a constructive note. The suggestions are not to be regarded as original. The deductions which may be drawn from them, however, should help matters forward quite appreciably.

Excellent results can be, and in fact often are, obtained when employers grow their own men. So long as it is realised that no one expedient, however good, can be relied upon to meet every case, no one key release every lock, the principle is sound. No horticulturist seeks to raise every kind of plant from antecedents he happens to possess at one particular time. New strains

must on occasion be introduced, lest such variations as eventually appear be too limited in range and depth. These limitations, be it remembered, are emphasised as time goes on, both depth and range of operation decreasing. Similarly it is vitally necessary at times to recruit the human material, to infuse fresh blood into the organism. Stipulating this proviso, it is suggested that the proven men on the spot are, in the majority of cases, more promising material upon which to draw, than is the stranger who must of necessity be selected in a hurried and somewhat fortuitous manner. Better men may, of course, apply for a given post than any to be found on the existing staff. It is highly problematical, however, whether any one of these better men will be the successful candidate. More likely than not the choice will fall upon one less equal to the task than several at the time in the particular firm's employ. This kind of thing happens times without number. Wise and far-sighted policy will insist that the intelligence department of a concern be wide awake and functioning. Thus, whether John Brown himself know it or not, if he show promise for doing better things than the very good things his restricted conditions permit, then John Brown should most certainly be ear-marked for the larger position which one day shall fall vacant. If John Brown is not so docketed, his employer richly deserves to lose him. Unquestionably by accepting a more lucrative and responsible position with a competitive firm, Brown inflicts upon his former employers a double loss. They lose directly, in that valuable service is withheld from them, indirectly because it is transferred to a leading competitor. The latter loss may quite easily be as serious as the former.

It is a veritable truism that nothing so crushes initiative as constant, unvarying repression. This repression need not be of the virulent aggressive type. Indeed, the most dangerous form it can assume is when it results from sheer inertness. Let men once conceive the idea that promotion is only possible with *another company*, and the best men will leave. Such as remain are seldom better than second rate, and even good men lose their zest and zeal and, so doing, lapse into mediocrity. Wideawakeness, initiative, the ability to visualise requirements and satisfy them—these are things to encourage; and encouraged, they pay extremely well.

Where it is necessary to seek afield for new talent, it is well to cut the risks as much as possible. If it is a really responsible post which has to be filled, it is excellent policy to hasten slowly. It takes time to make a good search. Not one interview only, but a serious collecting of facts, and a painstaking verification of them are often well worth while. The writer has known of enlightened engineers who have thought well ahead of events. They have arranged special interviews for the sole purpose of getting into touch with promising men. Then, when in later months the position has actually become vacant, relevant facts have been at hand and have been pressed into use. Responsible engineers can, if they will, acquire a surprising grip of salient facts. To do this, they must keep eyes wide open, and they should especially cultivate the scout sense. This is at once a gift and an acquisition.

Messrs. Benjamin Bent & Co., Ltd., requiring an assistant works manager, advertise locally and in the leading technical journals. Out of some 80 applicants, interviews are arranged with eight. Seven duly appear, and eventually, without undue difficulty, the running falls to two. The one with the better paper record, unfortunately for himself, exhibits some slight signs of nervousness. Benjamin Bent, being all out for *presence*, offers the post to the more feasible candidate, who, whatever else he lacks, has confidence enough. Six months later Mr. Bent offers the post to Mr. Nervous Man. He, having formed unfavourable opinions of Mr. Bent, refuses. Next, another of the seven has his chance. He, a really capable man, accepts provisionally. His own people, however, are loath to release him, and make him a firm counter-offer, which, after due consideration, he accepts. Then, and not till then, does Benjamin Bent get down to facts. He noses round, and finds that his assistant chief draughtsman has had an exceptionally good record, has effected marked economies, not only in office and routine work, but in certain workshop processes also. Further, he discovers that foremen moulder, pattern maker, machinist, and storekeeper value his advice and opinion very highly. In the end Mr. Assistant Chief Draughtsman becomes Mr. Assistant Works Manager, and eventually works manager, and secures at the same time a place on the board of directors.

The foregoing is a purely hypothetical example. It is also a parable.

The Motor Repair Shop.

Some Notes and Instances.

The following notes have been based on experiences gained in the running of a motor repair shop by the Walker Electrical Service, Edinburgh.

The main generator supplying a large tweed mill, a 460-volt, 100-kW, 4-pole machine with 4 nine-brush spindles, developed heavy sparking at the commutator. The trouble was entirely due to badly carbonised

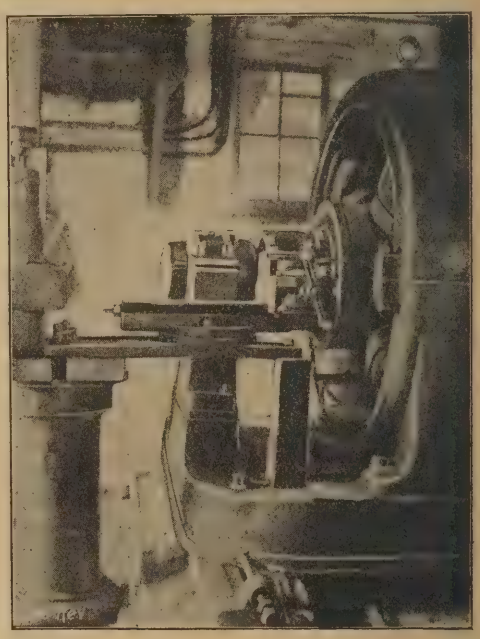

Fig. 1.—Method of Turning a Commutator.

intersegment micas, and also the breaking down to earth of the front mica vee ring. The front ring was removed, and the cast-iron vee was taken back to the repair shop to have a new mica ring fitted, it being thought inadvisable to attempt to make such a mica ring on site. The vee was 15 in. in diameter and 4 in. wide. As some of the micas were very badly burned down between the segments, the micas were scraped out and the spaces filled up with commutator cement. Some of the micas were actually burned down a distance of $\frac{1}{2}$ in. or so below the surface. A drop test was taken all round before filling in the cement to ensure that no "shorts" would be locked in with the cement. After reassembling the commutator, final tests for "earths" and "shorts" were made, when arrangements were made for the truing up of the commutator. A temporary cutting device was built up around the commutator, and the generator was driven by means of a motor fed from a small stand-by set.

Fig. 1 shows the method of turning the commutator. More time was spent on the rigging-up of the turning gear and the turning of the commutator than on the actual electrical repairs. After seven weeks' running without trouble, heavy sparking again developed. This time the complete armature was withdrawn and removed to the repair shop, and the commutator was rebuilt with

new micas, and after seven months' service the generator is giving entire satisfaction. The rebuilding of the commutator was not put in hand to begin with because, owing to pressure of work, the quickest repair possible was necessary.

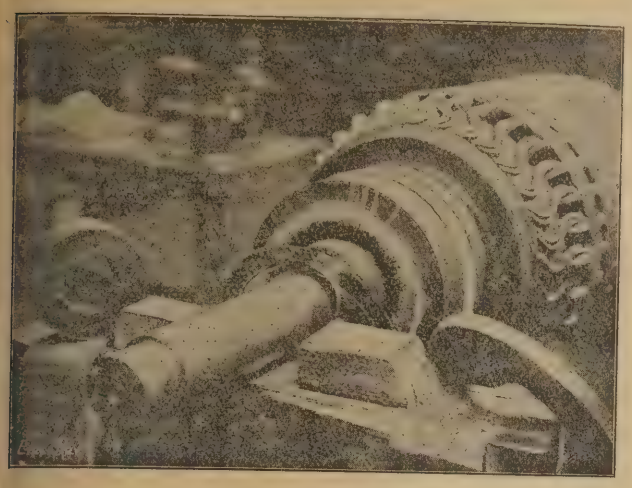

Fig. 2.—A Faulty Commutator.

Another instance of commutator trouble shutting down a main set in another mill has recently occupied the attention of the repair squad. A low-voltage set having a commutator 24 in. in diameter with 306 bars developed a number of badly carbonised "shorts" between commutator segments, and it was decided to replace the faulty mica; 24 mica segments were replaced, but as the work was in progress it was found that others were also showing signs of going, and it was agreed that the commutator should be removed and rebuilt. The commutator hub was duly removed, together with all the bars, to the repair shop. After dismantling the commutator the total number of faulty mica segments was found to be 64. This suggests that when a few of the mica segments become faulty, the others follow closely, and it is only a matter of time until they all give out.

Fig. 2 shows another case of an armature going to earth at the front mica vee ring, the beginning of the trouble in this case being a few bad joints in commutator lugs causing pitting of the mica which had then become carbonised.

Many complaints are received of motors throwing oil all over the commutators and brush gears. In two recent cases the commutators and brush gears were in a filthy condition, and on removing the end plates, it was found that the brushes were not properly designed as regards the cutting of the gutters. An oil gutter was cut along the whole length of bush and allowed oil to travel right to the end of the bush to the collar and then on to the brush gear and commutator. The gutters should terminate in a circular gutter about $\frac{1}{8}$ in. from the end, and a hole should be drilled through the bush to meet the circular gutter and allow the oil to drain into the oil well. In the case in question, two grub screw holes were drilled close together right through to the shaft. This, of course, was gross carelessness; the holes should not have been drilled completely through the bush.

Modern Steam Practice.

Recent Developments in the Transvaal Power Stations.

We abstract from the valedictory address of the retiring president of the South African Institution of Engineers, Mr. T. G. Otley, which he read before the annual general meeting of the Institution on June 17th, and of which a report is published in the *Journal* of the Institution, some very interesting details concerning recent developments in the power stations of the Victoria Falls and Transvaal Power Co., Ltd., and also some observations of the author relating to modern steam practice generally in South Africa. He said, *inter alia*:—

Early in 1925 it was realised that a crisis might very easily arise towards the end of the present year and, although the Witbank power station, designed and being built by the Victoria Falls and Transvaal Power Co., Ltd., is scheduled to commence supply at about the end of the year, yet the board of the company took the heroic measure of ordering a new 12,500-kW machine in February for the Rosherville station, to be delivered in June and July, and to be running about the end of August. It is not for me to say whether it was really obligatory on the company to provide any such temporary relief, seeing that the delay to the Witbank scheme was not of its seeking, but the fact remains that the power company shouldered the burden in a generous spirit in order to safeguard the interests of the mining industry and other consumers.

Although additional turbine plant is on order and will have to be steamed, no additional boiler plant has been or will be installed in the existing station. There are 102 boilers installed in the four steam power stations—40 at Rosherville, 24 at Simmerpan, 20 at Vereeniging, and 18 at Brakpan; the numbers steamed over the peak each day are 36, 21, 17, and 16 respectively.

The boilers that are not steaming cannot be considered as immediate spare and available to meet the load, because of cleaning, inspection, &c. Now, 24 of our boilers have been steaming for about 17 years at a load factor of between 70 and 80 per cent., so that, measured by average British conditions, they have steamed the equivalent of 30-35 years' normal life, and to-day they are virtually as good as when installed, and indeed are steaming at higher efficiencies than at any time in the history of the company. The other boilers range from 3 to 14 years of life at the same power factor, and again the efficiency has been maintained, but the most striking thing, from an engineering point of view, is the fact that every boiler steaming on the system is doing very considerably more than the makers' rating; and the makers' guarantees of evaporation were given when burning Witbank district coal of an average calorific value of about 11,600 B.th.u. per lb., whereas to-day we are burning about a million tons per annum of what may be termed low-grade coal of a calorific value varying between 9,600 and 10,000 B.th.u. per lb.

Innumerable trials and experiments were made, and we ultimately concentrated on what we term selective draught. This consists of applying forced draught over a short area towards the front of the chain grate, which not only increases very considerably the furnace temperature and CO_2, but interposes a barrier of pressure between the curtain and the rest of the combustion space of the furnace, so that for about 12-18 in. at the front of the grate next to the curtain there is what virtually amounts to balanced draught. The higher furnace temperature also tends to accelerate ignition, and the majority of our chain grates now run 12 to 14 per cent. faster than the speeds for which they were designed by the makers, and low-volatile and low-value coals can be burnt very efficiently and at a high rate per sq. ft. of grate area. The first experiments were made with air taken from the blast pipes to the Prat ejector nozzles, but it was quickly realised that separate fans for each stoker grate would be justified. The Schlotter blower fan was brought to our notice, and these high-speed and efficient little fans worked in very well indeed for the scheme we had in mind, and at the present time we have about 150 of these running, which enable us to increase the steam capacity of the plant by anything from 15 to 20 per cent., and in certain cases by 30 per cent. more than we were doing before. In certain cases we are also increasing the induced draught and output by applying 150-h.p. motor fans to each of a number of boilers and, by so doing, we hope to increase their steam capacity by about 40 per cent. more than the normal rating. The money has been well spent, and the boiler efficiency is higher to-day than at any time in the history of the company; we have also met the increasing loads without increasing the capacity of the boiler plant, and we anticipate no difficulty in steaming the full capacity of the new machine that is being installed at the Rosherville station.

The principles involved in the "Loffler" system, in which the whole of the transfer of heat from fuel to steam takes place in the feed heater and in the superheater, so that the boiler is not exposed to fire or to the products of combustion, is being applied on a commercial scale, and the results will be awaited with the greatest possible interest. The two most interesting features are the generation of low-pressure steam by high-temperature steam, and the very high temperatures to which steam is superheated, *viz.*, up to 930 deg. F., and sometimes to 1,110 deg. F. One must not assume that one can work for long periods at such high temperatures, as the characteristics of steel and alloys of steel are not sufficiently well known to justify confidence in working plant at these temperatures. One of the most interesting expositions of the

effect of temperature on the strengths of steels is that given in a paper presented by Professors A. L. Mellanby and W. Kerr before the North-East Coast Institution of Engineers in February last (Electrical Review, March 6, p. 383). They point out that in actual working practice the question is not of how violent may be the death of the material, but rather its length of life under the conditions of actual working.

Modern power stations are becoming complex and expensive affairs. In addition to the ordinary bleeding of the turbine to heat the condensate, steam is being returned to special boilers and re-heated; in other words, the steam is being superheated between stages to increase the average temperature through the machine. It is obvious that this ought not to be done unless it shows a financial return on the additional capital involved, but it is not unlikely that, instead of the steam being returned to special boilers, it will be passed through simple heaters utilising the high-pressure and high-temperature steam, or part of it, to re-heat the lower pressure steam on the counter-current principle, the efficiency of transfer being very high, and on the face of things it would appear that the capital cost will be very considerably less.

Naturally, a point must arise where this must end, as it becomes increasingly difficult to obtain the ultimate 1 or 2 per cent., and the cost of doing so is becoming prohibitive. The metallurgist and the steel manufacturer have played a big part in the progress that has been made, and units of 40,000 to 50,000 kW in one cylinder are in service, and there are prospects that units of 100,000 kW, or even more, may be designed.

The size of boiler units has also increased in an even more remarkable manner, but no serious or difficult engineering problems have been involved, as the output of the boiler depends only upon the extension of its heating surface.

Why should it not be practicable to have boiler units of 500,000 lb. capacity, three boilers steaming and one in reserve for a power station of three running turbines, plus one spare? Until quite recently a boiler of 70,000 lb. evaporation per hour was considered a large unit, and there are relatively few boilers in the world to-day of a capacity greater than 100,000 lb. evaporation per hour, but there is no good reason why one boiler per turbine should not be adopted, except, perhaps, that a boiler which is out of commission and cold requires a longer time to get up steam than is required to run up a turbine and its auxiliaries on to load, and should anything happen to a steaming boiler the load would be curtailed.

It is well known among engineers connected with the power industry that capital costs are the biggest factor in production on a large scale, and that the steam generating plant of a power station involves the highest capital cost and also the highest maintenance, but with the advent of large boiler units the capital cost per kWh of production will be enormously reduced not only on account of the boilers, but of the steam pipe arrangements, smaller and simpler buildings, coal bunkers and auxiliaries, and, in passing, I would remark that in the present power-station design the cost of steam, feed-water, and other pipes is becoming a very large factor. In my opinion too much money is, in many cases, being spent on refinements to obtain a high thermal efficiency.

A Novel Air-Break Switch.

Operation in Severe Weather.

According to the *Electrical World*, the Railway and Industrial Engineering Co., of Greensburg, Pa., has recently made a 220-kV air-break switch for use on overhead transmission lines. A rotating tubular blade is used, which is claimed to embody

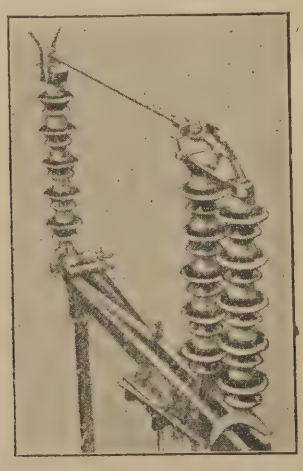

Fig. 1.—Model of Rotating Switch, Showing Constructional Details.

the essentials necessary to produce a reliable mechanism to meet severe weather conditions. An illustration of a model of this switch showing the details of construction is reproduced in fig. 1. The contact end of the blade is provided with a hollow flat end or "beaver-tail" of aluminium bronze 4 in. wide, 1¼ in. thick, and about 5 in. long, with a shank pressed into and riveted to the end of the tubular copper blade 2 in. in outside diameter. In the closed position of the switch this "beaver-tail" is jammed between the tubular copper jaws with a total contact pressure of 400 lb.

Fig. 2 shows the switch in the closed position; at open position the switch blade is perpendicular.

In opening the switch the blade is first rotated through an angle of 60 deg., thereby releasing the contact pressure and breaking out the ice before the blade is called upon to lift. This rotation of the blade is positive, being produced by the first 30 deg. rotation of the rotating insulator at the back end of the switch, the blade being subsequently opened to 7½ deg.

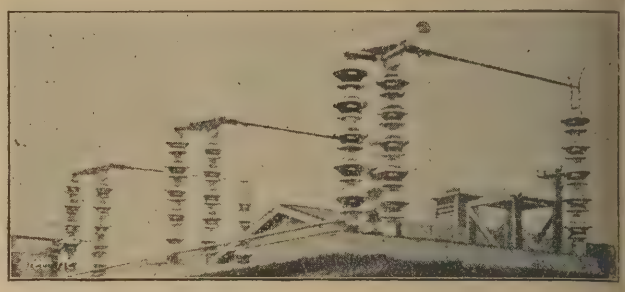

Fig. 2.—Rotating Switches with Blades in Closed Position.

beyond centre by the final 60 deg. rotation of the insulator. The advantage of releasing all pressure at the jaw is very evident when it is realised that the blade is 10 ft. 8 in. between the hinge and the centre of the jaw. If the usual jaw friction and ice locking had to be contended with, the strains on the insulators would be excessive.

The design of the jaw contact is distinctly novel and has been the subject of some speculation. It was thought that the line contact produced would cause excessive heating and wear, but tests have shown that this contact will carry from 800 to 1,000 A without exceeding a temperature rise of 30 deg. C. Wear is compensated by facing the 1¼-in. outside diameter tubular copper jaws with cast aluminium-bronze shoes having 1¼-in. faces.

All the essential mechanical parts of the switch above the insulators are of high-tensile aluminium-bronze, having also a high elongation and great resistance to shock. The blade has a double reinforcing of seamless steel, the first extending approximately 80 per cent. of the length from the hinge end and the second being within it.

In a recent test to determine the mechanical fitness of the switch for duty on 220-kV systems, it was operated continuously for 24 hours, the controls to the motor contactors being equipped with a special relay which started the switch in the opposite direction a few seconds after an operation was completed. During this period a cycle counter attached to the switch indicated 3,186 complete openings and closings and a d.c. Wh meter for the 1-h.p. motor showed a consumption of 13.5 kWh, 4.17 Wh per cycle of operation.

The prevailing temperature during the test averaged about 12 deg C. below zero. Before starting the test the switch was sprayed to form artificial sleet to a thickness of ¼ to ½ in. Before the completion of the test the motor mechanism and the auxiliary switch were sprayed from a hose nozzle and the cases were found to be tight. No part of the switch or mechanism failed, with the exception of the flexible leads to the rotating blade. The blade contacts showed a maximum wear of 0.005 in. without lubrication, and on the aluminium-bronze shoes on the tubular jaws only a slight depression was produced.

Norwegian Water Power.—A committee of French engineers made an inspection of Norwegian waterfalls and hydro-electric works in the last week in July and subsequently gave to the Oslo newspapers an account of the impressions which they had formed. In the opinion of the engineers the Norwegian water powers possess extraordinarily large possibilities of being regulated; they are capable of being utilised all the year round, whereas in France it is only possible to rely upon four months' working, at the end of which steam power has to be used. If, therefore, the Norwegian industries adopt the most modern methods it is considered that the country will have unique industrial possibilities. A beginning has already been made at the Rjukan works, where the Haber ammonia process is being introduced. At Odda it is proposed to transform the process at the cyanamide works where, among other things, liquid air is to be produced according to the Claude process. As to the future of the aluminium industry, the French engineers are reported to have stated that Norway must be considered to occupy an important position in this respect, but the prices are so high that aluminium is not used in the big industries as much as is desirable. It was added that the French import duties stand in the way of the export of manufactured of aluminium from Norway.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Lead Market Report.—Messrs. James Forster & Co. reported on August 15th: "Closing prices yesterday were £37 12s. 6d. for August and £36 6s. 3d. for November, a fall on the week of 6s. 3d. a ton for forward, with August unchanged. The expected set-back, after a continuous advance since July 27th of nearly £3 a ton, came at the beginning of this week, but a firm tone set in again and there was a recovery. The close is firm at £37 12s. 6d. for August, £37 2s. 6d. for September, £36 12s. 6d. for October, and £36 6s. 3d. for November. According to the Board of Trade returns the imports of lead during July into the U.K. created a record, no less than 27,367 tons being imported. The balance of imports over exports, *i.e.*, 25,551 tons, went straight into consumption and yet at the end of July a shortage developed, which indicates what a tremendous consumption is taking place. This month arrivals are considerably less, only about 9,000 tons being imported up to the 13th inst., and the position is getting more acute every day. Although the current price of lead is certainly very high, everything points to a further advance in values, until either consumption is checked, or production is increased to such an extent as to satisfy the world's demand and leave a surplus."

Shannon Contract Signed.—The contract between the Irish Free State Government and the Siemens-Schuckertwerke for the carrying out of the Shannon hydro-electric scheme was signed last week. A correspondent of *The Times* reports that it is intended to commence the work next month, the first stage being the construction of a canal from O'Brien's Bridge to Ardnacrusha, which is to be the head race of the power station. It is said that the contract is valued at 2½ millions sterling, but does not provide for the distribution works for which a further contract will be necessary at a later date. There is still uncertainty as to the methods which will be adopted to raise the necessary funds.

It is expected that the work will occupy three years and in the meantime the Government is to undertake an intensive educational campaign to acquaint prospective consumers with the advantages of electricity—especially in agricultural applications.

The Birmingham Building Trades Exhibition.—The Birmingham Electric Supply Department informs us that it has taken space for an exhibit of electrical appliances of all kinds at the Building and Allied Trades Exhibition which is to be held at Bingley Hall, Birmingham, from September 7th to 19th. Moreover, in conjunction with local electrical manufacturers and contractors, four lectures by well-known experts, with practical demonstrations, have been arranged. The lectures will be given by Messrs. J. W. Beauchamp and V. W. Dale, of the British Electrical Development Association, and Messrs. W. E. Bush, W. J. Jones, and R. C. Hawkins, of the E.L.M.A. Lighting Service Bureau. At the same exhibition the Yorkshire Copper Works, Ltd., will show copper tubes for hot and cold water systems.

Delagoa Bay Strike.—The employés of the Delagoa Bay Development Corporation, which provides the town's tramway, lighting, and water services, struck work last week, causing much inconvenience. The trouble was due to grievances in connection with currency. It was expected that the Government would intervene.—*Reuter* (Lourenço Marques).

Boiler Contracts. — The Stirling Boiler Co., Ltd., is at present erecting two 40,000-lb. boilers at the Bedford Corporation's electricity works. Other orders recently secured include a 30,000-lb. unit for the Kettering municipal electricity undertaking, two 50,000-lb. units for the Northampton Electric Light & Power Co., Ltd., and a 45,000-lb. boiler for the Hammersmith Borough Council.

"Exide" Battery Service.—The Chloride Electrical Storage Co., Ltd., has issued to its "Exide" service agents a chart which shows, among other things, the appropriate batteries for all makes of automobiles.

Italy's Foreign Electrical Trade.—A report upon the foreign trade of Italy during the first quarter of the current year shows that the value of electrical imports was more than double that of exports. The actual figures were: Imports 11,180 quintals, valued at 25,245,770 lire (as against 17,984,200 lire in January-March, 1924), and exports 7,407 quintals, valued at 11,103,239 lire (as against 10,743,540 lire). The principal item in both divisions was generators and motors, the exports at 6,501,738 lire being slightly higher than the imports. Electric meters to the value of 4,799,148 lire were imported; the value of imported radio apparatus is shown as 4,147,993 lire; and telegraph and telephone apparatus as 1,872,113 lire. The second largest item in the export list was magnetos, valued at 887,561 lire. In an analysis of the sources of imported electrical goods, Germany occupies the first place as in the previous year. France wrested the second place from Hungary, while Great Britain remained in the sixth position. The strong position of Germany in this market can be judged from the fact that her exports to Italy represented about 60 per cent. of the total, while the French share (the second highest) was only about 11 per cent.

Chinese Notes. — The *Chinese Economic Bulletin* reports that the Chapei Water & Electric Supply Co., Shanghai, has increased its capital by $680,000 to $2,000,000, for the erection of a new water plant.

A group of local capitalists in Kaoyu (Kiangsu province) has decided to install a telephone service in the city. A sum of $6,000 has been raised to meet preliminary expenses.

The employment of automatic telephones in China has made great headway both for public and private purposes. The largest automatic exchange is that operated by the South Manchurian Railway Co. at Dairen. This exchange, which was provided by the Automatic Telephone Mfg. Co., Ltd., is equipped for 4,800 lines, but is capable of extension to 10,000 lines. There is also a 3,000-line exchange at Harbin, and it is expected that Tientsin will be provided with automatic telephones at an early date. Although most of the work has been done by the British it is said that a small number of German automatic telephones have been installed at Tsinan.

Trade Announcements. — A firm styled the STONEHOUSE RADIO SUPPLIES has opened a radio shop at 54, Union Street, Stonehouse, Plymouth.

A new electrical department has been opened by the CLECKHEATON ENGINEERING & MOTOR CO., LTD., of Bradford Road, Cleckheaton.

Owing to the increase in their export business in the London area, MESSRS. JOHNSON & PHILLIPS, LTD., have transferred their London Export Sales Branch, under Mr. J. Horne, from their main London offices at 12, Union Court, Old Broad Street, to new and more extensive accommodation at 23-24 Wormwood Chambers, Wormwood Street, E.C.2. The telephone numbers remain the same, *i.e.*, Central 2207 and 178.

The business of the "Cantie" Switch Co., Ltd., has been purchased by BROOKHIRST SWITCHGEAR, LTD., but will continue to be carried on under the present name and from the same address—Leighton Street, Nottingham. It is being arranged that the branch offices and agents of Brookhirst Switchgear, Ltd., shall represent the "Cantie" Company.

The address of Mr. ARTHUR H. SPEARING is now 3 & 4, Clement's Inn, W.C.2. Telegrams: "Spearartha, Estrand, London"; telephone: Holborn 3136-38.

Messrs. F. W. BERK & Co., LTD., are removing, on August 24th, to larger premises at 106, Fenchurch Street, E.C.3. The firm's telephone numbers and telegraph address will remain as before.

Our Foreign Trade.—JULY FIGURES.—The Board of Trade returns for July show the following values of electrical imports and exports:—

	July, 1925. £	Inc. or dec. £	7 months, 1925. £
Imports.—			
Electrical goods and apparatus	291,087	+ 353	+ 727,566
Machinery	1,106,139	+173,004	+ 968,156
(Electrical machinery) ...	93,401	+ 13,128	+ 12,146
Exports.—			
Electrical goods and apparatus	863,952	+ 18,730	+1,456,983
Machinery	3,910,612	+ 30,904	+2,801,797
(Electrical machinery) ...	435,799	− 4,152	+ 492,681
Re-exports.—			
Electrical goods and apparatus	22,785	+ 8,117	+ 63,722

Receiver Appointed.—EGO ENGINEERING CO., LTD., Regent Street, W.—Mr. Wm. Osborne, of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C.2, informs us that he was appointed receiver on August 5th on behalf of the debenture holder in this matter. The debenture issue amounts to £800, plus interest, and, judging from the report of the directors of the company as to the value of the assets, he does not anticipate that there will be a sufficient sum realised even to meet the debenture holder's claim.

The Stinnes Concern.—According to the latest German estimates the liabilities of the Stinnes undertakings amount to no less than £9,000,000. Negotiations are proceeding for the sale of the trust's properties, including newspapers and mines. With regard to the latter it is reported that the Rhenish Westphalian Electricity Works is contemplating the purchase of the Mathias Stinnes coal mines.

French Radio Apparatus Tariff.—According to a recent decision of the French Customs authorities radio apparatus is to be classed as "Electrotechnical apparatus" for the purpose of import duty (No. 524 *bis* in the tariff list).

Patent Application.—The Automatic Telephone Manufacturing Co., Ltd., has applied for an extension of the periods of patents Nos. 1,298, 1,418, 1,420, 1,422, 7,876 and 7,877, all of 1910. The application will be heard by Mr. Justice Tomlin on October 13th in London.

Russia's Credit Requirements.—The Manchester correspondent of the *Financial Times* says that the Russian delegation which recently visited the city in connection with the projected purchase of textile machinery to the value of £5,000,000, insisted that orders could only be placed if the manufacturers were willing to allow long-term credits.

British-Dutch Valve Agreement.—An agreement has been entered into by the Mullard Radio Valve Co., Ltd., and Phillips Glowlampworks, Ltd., of Holland, whereby the former company gains the use of all the Phillips valve patents, machinery designs, and technical knowledge, with a view to manufacturing the Dutch firm's valves in this country. Messrs. Phillips have agreed to cease importing valves into Great Britain and Ireland, a matter of some magnitude as they have been by far the largest suppliers of foreign valves.

Bankruptcy Proceedings.—J. S. Yeomans, 11, Hill View Terrace, Chapel Allerton, Leeds, electrician.—The receiving order herein was made recently on debtor's own petition. The statement of affairs showed liabilities of £213, against assets of £17. The first meeting of the creditors was held on July 27th, at the Official Receiver's Office, 24, Bond Street, Leeds, when the case, being a summary one, was left in the hands of the Official Receiver as trustee. The following are creditors:—

	£		£
Churton, T. H.	33	Metcalf, —	22
Crowther, N.	23	North Electrical Co.	37
Electric Lamp Factors	23		

V. G. Baines, electrician, 2, West Street, Wellingborough.—Last day for receipt of proofs for dividend, August 25th. Trustee, Mr. D. Helliar, Official Receiver, The Parade, Northampton.

J. Isherwood, wireless and photographic dealer, 91, Lee Lane, Horwich.—Last day for receipt of proofs for dividend, August 29th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

J. S. McLeod (trading as McLeod Bros., at Bolton, and, with a partner, as McCload Bros., at Horwich), radio and electrical engineer, 189, Blackburn Road, Bolton.—Last day for receipt of proofs for dividend, August 31st. Trustee, Mr. A. T. Eaves, C.A., 47, Mosley Street, Manchester.

H. Fildes, electrical engineer's superintendent, 108, Monton Road, Eccles.—Last day for receipt of proofs for dividend, August 29th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

J. F. Lyons, electrical engineer, 25, Palmerston Street, and Front Street, Consett, Durham.—First and final dividend of 1s. 8¼d. in the £, payable August 27th, at the Official Receiver's office, Pearl Buildings, 4, Northumberland Street, Newcastle-upon-Tyne.

G. W. Tempest, 12, Sandhurst Road, Stockport, trading as the Northern Radio Co. and the General Wireless Trading Co., at Manchester, radio and telephone engineer.—Trustee, Mr. A. Yearsley, 27, Brazennose Street, Manchester, appointed August 11th.

W. R. J. White, electrical agent, 29, Great Pulteney Street, W.1.—Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C., released July 27th.

J. Benson, lately carrying on business as an electrical engineer at 2a, Wade Street, Leeds.—Receiving order made August 7th on debtor's own petition.

Roberts & Co., electrical engineers, 61, Old Town Street, Plymouth, and at East Looe, Cornwall.—Receiving order made August 10th on a creditor's petition.

Company Liquidations.—Roderick Electric Supplies Co., Ltd., Theobald's Road, W.C., and St. Mary Street, Swansea.—The creditors interested herein were called together recently at the offices of Mr. W. H. Cork, 19, Eastcheap, E.C., who occupied the chair, and reported that he had been appointed to act as the liquidator in the voluntary liquidation of the company. The statement of affairs presented showed liabilities of £1,669, of which £1,468 was due to the trade. The assets were estimated to realise £372, from which had to be deducted £179 for preferential claims, leaving net assets of £193, or a deficiency of £1,476. The company was incorporated as a private limited liability concern in July, 1923, to take over a business which was established by Mr. W. A. Roderick in 1914. The company had a nominal capital of £2,500, and there had been issued 2,272 ordinary shares of £1 each, and 1,000 deferred shares of 1s. each. The vendor was issued fully paid shares as the consideration for the assets. When the company was formed there were liabilities of £1,690, and assets valued at £3,010. A balance sheet was prepared in June, 1924, which showed liabilities to the trade of £2,302, while £137 was owing to the bank. The trading for the period showed a loss of £679, the turnover being £8,112. The deficiency as regarded the shareholders was £3,797, and that figure was accounted for by the depreciation written off the assets in the statement of affairs and the losses on the trading. It was estimated that since July, 1924, there had been a loss of £1,114. Mr. Cork stated that he had continued trading since his appointment as liquidator. He had advertised the businesses for sale, and there was a possibility of something being achieved in that direction, although no definite offers had yet been received. Failing a sale within a reasonable time the business would have to be closed down. Mr. W. A. Roderick said that the large loss had been brought about by the absolute stagnation of business. He thought that the business could be made a success, as there were good contracts which it was anticipated the company would receive. Mr. Cork said that he did not think there was very much in the contracts from the point of view of profits to be earned. The creditors might have been called together some time ago, but apart from that there was nothing to complain about. The books had been well kept. It was resolved to confirm the voluntary liquidation of the company, with Mr. Cork as liquidator, whilst an advisory committee of three of the principal creditors was also appointed. The following are among the creditors:—

	£		£
Cable Accessories Co., Ltd. ...	123	Kodak, Ltd.	77
Credenda Conduits Co., Ltd. ...	68	Morgan Bros.	96
Dorman & Smith, Ltd.	27	Napier-Kimber, Ltd.	40
S. Dawson & Co.	53	Russ, John	29
Dwyer, P. L.	30	Sloan Electrical Co.	34
Edison Swan Electric Co., Ltd.	45	Swansea Corporation	44
Electric Lamp Factors	28	Siemens & English Electric Lamp	
Aster Engineering Co.	39	Co., Ltd.	71
General Electric Co., Ltd. ...	162	Wesley Evans, J.	105
Hay, G. R.	20	West End Electric Co.	20
Jackson Electric Stove Co., Ltd.	29		

E.S. Co., Ltd., electrical and wireless dealers, 233, Tottenham Court Road, W.—A meeting of the creditors of the above was held on August 14th. The chair was occupied by Mr. B. A. Smith, receiver for the debenture holders and liquidator in the voluntary liquidation of the company. A statement of affairs had previously been circulated which showed net assets of £17,764. There were first and second debentures for £34,147. The deficiency as regarded the debenture holders was £16,382, and as regarded the creditors £37,023. The chairman stated that he was appointed as receiver for the debenture holders on June 26th last, and on July 27th the company went into voluntary liquidation. The company had been carrying on business for a good many years, it having been registered in February, 1915. It took over a going concern, but the original shares issued had changed hands. With regard to the recent trading of the company, during the half-year to June, 1921, there was a loss of about £11,000, largely due to a writing down of the stock. During the two following years there were considerable losses, but during the six months to December, 1923, there was a profit of £400, apart from debenture interest. During the half-year to June, 1924, there was a trading loss of £700, and in the next six months there was a small profit. That profit, however, was turned into a loss of £123 by the writing off of bad debts incurred in the previous half-year. There was every reason to hope that by reducing the expenses the company could carry on successfully. During the current year, however, the sales had fallen off considerably. Two creditors issued writs against the company and that precipitated the appointment of a receiver. At that time there were some hopes of a re-organisation of the company taking place, but when the accounts were prepared it was thought that any such venture was hopeless. The issued capital of the company was £5,600, of which £4,703 was issued for cash. As far as he knew £898 worth of shares were issued for a consideration other than cash. He believed those shares were allotted to the vendor in respect of the goodwill of the business taken over. In reply to a question, the chairman said that there was no limitation to the company's borrowing powers.

Mr. Houstoun said the position was that in 1921 the company lost £11,000, and shortly afterwards it was insolvent. He inquired when the second debentures were issued, and what the consideration was. The chairman replied that the first debentures and interest were for £12,397, whilst the second debentures and interest totalled £21,749. All of the debentures were issued for cash. The second debentures were issued in July, 1922. There might have been a debit balance on the profit and loss account when the second debentures were issued. Rather more than £21,000 in fresh money had been paid into the company since that date. All the money obtained was used in the ordinary course of trading.

Mr. Kinnaird, of Messrs. Stanley Evans & Co., the solicitors to the company, pointed out that if the liquidation had taken place at the end of last year the debenture holders would have received 20s. in the £. The company, however, continued, the liabilities to the trade had been reduced by £15,000, and the second debenture holders, including the two directors, could not expect to receive 10s. in the £.

The chairman stated that he was carrying on the business and disposing of the stock at market prices.

Mr. Houstoun mentioned that a petition had been presented for the compulsory liquidation of the company. He proposed a resolution to the effect that the voluntary liquidation should not be confirmed, and this was carried.

Western Engineering Co., Ltd., electrical and mechanical engineers, Liverpool. In voluntary liquidation. The following are creditors:—

	£		£
Downes & Davies	85	Johnson, Clapham & Morris,	
Ellis, W.	47	Ltd.	100
General Electric Co., Ltd. ...	930	Murray, J. A.	18[illegible]
W. T. Henley's Telegraph		Perrin, Hughes & Co., Ltd. ...	30
Works Co., Ltd.	20	Rowe Bros. & Co., Ltd.	3[illegible]
		Smith & Cookson	132

Robins Wholesale Electrical & Wireless Co., Ltd.—Winding up voluntarily. Meeting of creditors held August 19th at the offices of the liquidator, Mr. S. E. Clutterbuck, 31, Queen Street, Cardiff.

Western Wireless Telephones, Ltd.—Winding up voluntarily. Meeting, August 26th, at the office of the liquidator, Mr. W. J. Birch Kempton, 20, North John Street, Liverpool. Particulars of claims were to be sent in by August 19th.

RADIECO, LTD.—A meeting is called for September 11th at the offices of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C.2, to hear an account of the winding-up from the liquidators, Messrs. C. L. Thornton Duff and W. A. J. Osborne

MOSELEY INSTALLATIONS, LTD.—Winding up voluntarily. Liquidator, Mr. C. E. Cowney, 55, Temple Row, Birmingham. A meeting of creditors was to be held on Wednesday last.

THE WATERLOO WIRELESS CO., LTD.—A meeting of members is called for September 16th at A22, Queen Insurance Buildings, 10, Dale Street, Liverpool, to hear an account of the winding up from the liquidator, Mr. R. R. Bailey.

ASSOCIATED ELECTRIC TRADERS, LTD.—Mr. G. D. Pepys, Official Receiver and liquidator of this company, 33, Carey Street, W.C.2, states that the liabilities amount to £5,720, and the estimated assets to £200. It is proposed to pay a first and final dividend, and proofs of debts must reach the liquidator by September 2nd.

Dissolutions of Partnership.—DAFFERN & EDWARDS, electrical heating and sanitary engineers, &c., 10, High Town, Hereford:—Messrs. W. F. Edwards and H. J. Darlow have dissolved partnership. Debts will be attended to and the business carried on by Mr. Edwards.

RALPH NANCE, electrical and consulting engineers, &c., 5, Stuart Street, Bute Docks, Cardiff.—Messrs. R. V. and H. C. Nance have dissolved partnership. Mr. R. V. Nance will attend to debts.

THE NORMAN BAYNTON CO., sellers of electric lamps and accessories, 26, Rathbone Place, Oxford Street, W.—Messrs. C. N. Bradnock and L. S. B. Williams have dissolved partnership. The business will be continued by Mr. Bradnock.

RILEY, RUSSELL & CO., wireless dealers, John Street, Bradford.—Messrs. A. H. Riley and S. A. Russell have dissolved partnership. Mr. Riley will attend to debts.

Private Arrangements.—WILLIAM EDWARDS, trading as Edwards, Sons & Co., electrical and radio dealer, 492, Prescot Road, Old Swan, and 20, Prescot Road, Fairfield, Liverpool.—A meeting of the creditors of the above was held recently, at the offices of Mr. P. S. Booth, accountant and auditor, Liverpool, when a representative of Messrs. Baxendale Bros., Ltd., occupied the chair. A statement of affairs was submitted, which disclosed liabilities of £1,224, of which £1,108 was due to the trade, and there were cash creditors for £117. In addition, there were fully secured creditors for £571, who held security valued at £879, leaving a surplus of £298. The net assets were £1,547, leaving a surplus of £323. It was decided to confirm the deed of assignment already executed in favour of Mr. Booth, while a committee of inspection was also appointed, consisting of the representatives of Messrs. Baxendale Bros., Ltd., Rowe Bros. & Co., Ltd., the General Electric Co., Ltd., Pulford Bros., and Mr. John Airey. The following are creditors :—

	£		£
Baxendale Bros., Ltd.	220	Liverpool Corporation	26
Claremont, Johnson & Co., Ltd.	43	Levy, H., & Son	24
General Electric Co., Ltd. ...	78	Marshall, O. P., & Co., Ltd. ...	31
Holloway, Ltd.	20	Pulford Bros., Ltd.	100
Hamilton & Co., Ltd.	50	Roberts & Co.	20
Longford Insulating Co., Ltd. ...	35	Rowe Bros. & Co., Ltd.	85

Book Notices.—"Electrical Precipitation." By Sir Oliver Lodge, D.Sc., F.R.S. Pp. v+40; figs. 7. London: Humphrey Milford. Price 2s. 6d. net.—This work is a publication in book form of a lecture delivered by the author before the Institute of Physics at the Institution of Electrical Engineers' building, in October last. In the lecture, which was abstracted in the ELECTRICAL REVIEW of November 7th, 1924, the author puts forward a plea for the electrical control of the atmosphere, by assisting natural precipitation artificially. The book is arranged in three parts—natural precipitation, artificial precipitation, and the combination of the two. An appendix is also included, containing some most interesting and useful practical notes on commercial precipitation of dust and fumes.

"The Elimination of Interference from Radio Receiving Apparatus." Air Ministry Publication 1,136. Pp. 8. London: H.M. Stationery Office. Price 2d. net.—With a view to obtaining the best conditions for radio reception, the principles of some of the methods of avoiding interference have been set out, and a summary of 16 possible methods of obtaining relief is given.

"Primer of Costing," by R. J. H. Ryall. Pp. x + 115. London: Sir I. Pitman & Sons, Ltd. Price 5s. net.

"Mercury Arc Rectifiers and Mercury-Vapour Lamps," by J. A. Fleming, M.A., D.Sc., F.R.S. Pp. viii + 100; figs. 44. London: Sir I. Pitman & Sons, Ltd. Price 6s. net.

Catalogues and Lists.—IGRANIC ELECTRIC CO., LTD., 147, Queen Victoria Street, E.C.4.—Pamphlets advertising "Igranic" concert coils and giving reduced prices of honeycomb duolateral coils. Also a chart showing the coils required for the reception of transmissions from British and European stations.

THE HENKERBAK SYNDICATE, LTD., The Hague, Holland.—A pamphlet describing the "Henkerbak" electrical water-heating apparatus.

TOK SWITCHES, LTD., Granville House, Arundel Street, W.C.2.—A blotter bearing a calendar for August advertising "Tok" switches.

MESSRS. FALK, STADELMANN & CO., LTD., 83-87, Farringdon Road, E.C.1.—A three-fold showcard illustrating, in colour, "Efesca" radio components, including headphones, and the "Puravox" loud-speaker.

ELECTRICAL DEVICES, LTD., 18-20, Collingwood Street, Newcastle-on-Tyne.—A comprehensive trade price list of radio apparatus, including complete sets, components, and accessories.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—Catalogue Section W (2) containing illustrated details of the "Magnet" wiring system. Fully priced.

ENGINEERING SUPPLIES, LTD., 235a, Blackfriars Road, S.E.1.—An illustrated and priced catalogue of radio components, including geared coil holders, condensers, transformers, filament resistances, &c.

MESSRS. COLEY & SWINNERTON, LTD., St. John's Square, Wolverhampton.—Two illustrated and priced pamphlets dealing with electric cookers.

THE MIDLAND ELECTRIC MANUFACTURING CO., LTD., Barford Street, Birmingham.—An illustrated and priced folder containing details of "Memrex" ironclad switches designed to comply with the I.E.E. regulations for medium-pressure switchgear.

MR. GEORGE ELLISON, Perry Barr, Birmingham.—List No. 161, containing illustrations, details, and dimensions of totally-enclosed, unit type draw-out switchgear for large capacities.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from August 12th :—

Lightning. No. 459,726. Class 1.—A chemical solution for use in batteries and accumulators. Louis Frederick Ducker, 55, Worple Road, Wimbledon, S.W.19.

Tunion. No. 450,180. Class 8.—Instruments and apparatus for use in wireless telephony. George Turncock, trading as G. Turncock, 41, High Street, Aston, Birmingham.

Astra. No. 448,286. Class 8.—Instruments, apparatus, and contrivances for use in wireless telephony and telegraphy. Charles Teverill Freeman and Frank U. Weldon, trading in co-partnership, 124, Victoria Street, London, S.W.1.

Bess (lettering and design). No. 459,632. Class 8.—Electric batteries and accumulators. William Henry Osborn, trading as the Brighton Electric Supply Stores, 38, Gloucester Road, Brighton.

Radiolys (lettering and design). Class 18. Component parts for wireless receiving sets. Lionel Sidney Alexander, trading as the Wholesale Wireless Co., 103, Farringdon Road, London, E.C.1.

Annual Holidays.—The Gorton and Dukinfield depôts of the Stores Department of the London & North-Eastern Railway will be closed from August 29th to September 14th inclusive. Birkby's works, Liversedge, Yorks., will be closed from Saturday, August 29th, to Sunday, September 7th, inclusive.

Local Exhibitions.—NOTTINGHAM.—An electrical exhibition is to be held in the Drill Hall, Nottingham, from October 8th to 17th next. The arrangements are in the hands of the Electrical Contractors' Association, and the exhibition is receiving the support of the Nottingham Corporation Electricity Committee, the local branch of the E.C.A., and the largest manufacturers in the electrical industry. The exhibition will cover cooking, lighting, heating, power and welding, and its period will coincide with the opening of the Corporation's new power station. The display is being organised by Mr. W. A. Gillott, A.M.I.E.E., and full particulars can be obtained from the secretary of the local branch of the E.C.A., Mr. C. Thompson, Armitage Chambers, Victoria Street, Nottingham.

WAKEFIELD.—The city electrical engineer has been asked to prepare a scheme for an electrical exhibition during the autumn.

YORK.—The Electricity Committee has agreed to take space at the forthcoming Industrial Trades Exhibition, which is to be held in September next, for showing electrical appliances.

MEXBOROUGH.—The Urban Council arranged an electrical exhibition recently, which was opened by Mr. T. Chambers, chairman of the Electricity Committee, and proved very attractive. Well-known firms, as well as the local electrical firms, were the principal exhibitors.

A South Wales Exhibition.—An engineering exhibition organised by the South Wales Institute of Engineers was held at Swansea from August 6th to 15th. A number of leading manufacturers displayed electrical, mining, and metallurgical appliances. The Engineering Department of the University College had an interesting display.

Swiss Import Duties Removed.—It is reported from Zurich that the Swiss Government has recently withdrawn the import restrictions on electric irons and cooking stoves, insulated wires and cables, and incandescent lamps.

Canadian Radio Exhibition.—The Senior Trade Commissioner in Canada (Mr. F. W. Field) reports that the Canadian Exhibition Co., 204, King Street East, Toronto, is holding a radio exhibition at the Windsor Hotel, Montreal, from October 12th to 17th. It is understood that a few exhibit spaces are still available. A copy of the application card for space giving the rules and regulations of the exhibition is available for inspection by interested British firms on application to the Department of Overseas Trade (Room 52), 35, Old Queen Street, S.W.1.

The Moscow Radio Exhibition.—We reported in our last issue that the period of the Radio Exhibition which is being held in Moscow had been extended to September 15th. The Department of Overseas Trade now informs us that a further extension, to November 15th, will be made should the interest shown by foreign firms justify it. Foreign firms may import up to October 1st free of duty any kind of radio material, irrespective of all previous prohibition and are free to sell it after the close of the exhibition. Small articles of any one type may be imported up to the number of twelve, medium sized articles up to six, and large articles up to three. It is understood that amateur receiving sets, for instance, may be imported up to the number of twelve of every different type. The Commercial Secretary at Moscow is of opinion that this is a favourable opportunity for United Kingdom radio firms to introduce their wares to Russia. Although import on a large scale is not likely to be allowed after the exhibition, it is probable that licences will be issued for the import of specific articles, and the merits of exhibits will decide the destiny of such orders as may be placed abroad. Intending exhibitors should communicate with the Soviet Union Trade Delegation, 49, Moorgate Street, E.C.2, as soon as possible, for the duration of the exhibition depends to some extent upon the number of entrants.

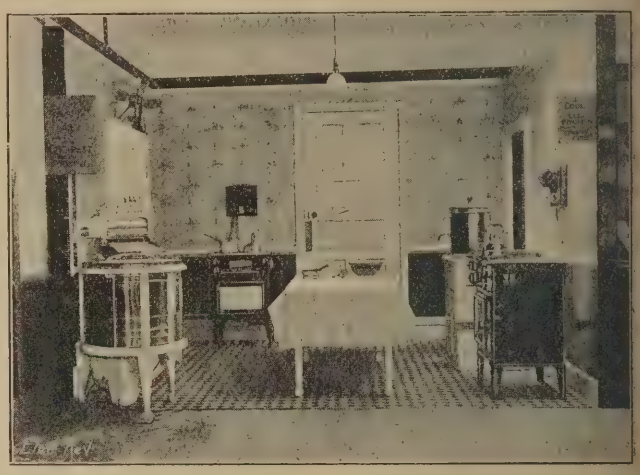
The Australian Radio Market.—A correspondent of *The Times Trade and Engineering Supplement* points out that while, in 1923, Great Britain exported radio apparatus to the value of £35,100 to Australia, the United States exported £46,000 worth, and in 1924, due to the abolition of restrictions, the value of American apparatus imported rose to £210,500. The Australian market is big and comparatively undeveloped, and the prospects are favourable, particularly as the Federal Government proposes to reduce the fee for receiving licences. There are at present broadcasting stations in Sydney, Melbourne, and Perth, while a fourth is to be opened in Brisbane.

Radio Patents in Austria.—A warning has lately been issued by the Siemens & Halske Co., of Vienna, against infringement of the "Telefunken" patents in Austria, which are claimed to cover reaction couplings, metal-sealed transformers, amplifying valves for loud-speaker reception, frame aerials, and high- and low-frequency amplifiers.

New Canadian Companies.—Among the recently-formed Canadian companies are the following: The Lighting Company of Ontario, Ltd., capital $25,000, for the manufacture of electrical machinery and appliances; the Chute-à-Caron Power Co., Ltd., to develop the power of the Chute-à-Caron Falls, Quebec; and the Portneuf Power Co., capital $1,000,000, which is to re-build a destroyed dam and supply power in the Portneuf, Quebec, district.

New Belgian Company.—La Compagnie Continentale "Trialmo" is the name of a new company which has lately been formed in Brussels with a capital of 200,000 fr., to manufacture radio apparatus.

New French Company.—A new company has lately been formed in Paris (4, Rue Cambronn) with a capital of 1,700,000 fr. and the title La Société d'Exploitation de la Téléphone Picart et Lebas, to acquire and work the Picart-Lebas telephone patents.



New Indian Companies.—Among the new companies recently formed in connection with electricity supply in India, are the Barisal Electric Industries Co., organised at Barisal, Bengal, with a capital of 500,000 rupees, and the Mangalore Electric Supply Co., at South Kanara, Madras, capital 750,000 rupees.

New Czecho-Slovakian Company.—The "Transforma" Moravian-Slovakian Electrical Construction Co. is the name of a new concern which has lately been formed at Olomoric.

A Report upon Turkey.—Col. H. Woods, O.B.E., the British Commercial Secretary at Constantinople, has recently furnished a report upon the economic and commercial conditions in Turkey (Stationery Office, 1s. 6d.), to the Department of Overseas Trade. There is little of direct electrical interest in the report, but it is stated that the position, generally, is improving and it is thought that the gradual restoration of mutual confidence between Turkey and Europe, once fairly secured, and a consequent improvement in economic legislation would promise a return to more normal conditions. The Director-General of the Customs Administration has announced that he intends to grant every possible facility to trade. In the statistics of foreign trade electrical goods are not shown separately, but under the general heading of "Machinery" it is seen that the imports for the first six months of 1924 were valued at £T2,039,064, as compared with £T1,336,478 for the whole of 1923; the exports were £T54,651, for the first half of 1924 and £T130,863 in 1923. In both the import and export lists Italy occupies the first place, and Great Britain the second. It is pointed out that although Turkey may be a small market she is now one of the few European countries which is obliged to import practically all her manufactured articles, and with a period of peace in which to develop her agricultural and mineral resources, the potential purchasing power of the country should enormously increase. Although the bulk of transactions are for cash with order or against documents, favourable credits are often extended to well-established local firms. The credit given by English and French importers is usually from 30 to 60 days, or 90 days in exceptional cases. German firms have recently commenced to grant credit, but United States firms have so far withheld them. Among the few developments which the report mentions are the construction of a powerful radio station at Angora and the refitting of the Osmanie station near Constantinople, for which tenders have been invited, and the installation of a telephone exchange at Angora, the order having been placed with a Swedish firm. An attempt has been made to introduce broadcasting into Turkey; at present receivers are subject to a Ministry of National Defence permit.

Unemployment.—The number of persons registered as wholly unemployed on August 4th was 1,260,400—an increase of 62,770 on the week, and 180,160 more than in August, 1924. The total included 817,622 men and 194,307 women, the remainder being juveniles.

New Ilford Showrooms.—The Ilford Urban District Council Electricity Supply Department (engineer, Mr. A. H. Shaw) has recently opened new showrooms at Goodmayes. One feature of the new premises is a well arranged kitchen, a view of which appears in the accompanying illustration. Here

The Ilford Council's All-Electric Kitchen.

it will be observed are two patterns of cooker, a combined washing machine and wringer, a water heater, a kettle and a number of other small appliances. The card to the left of the picture indicates that Ilford has a very favourable rate for electric cooking.

The Tokio Underground Railway.—The Tokio correspondent of the Federation of British Industries reports that the Japanese Government has refused to sanction borrowing abroad in connection with the Tokio underground railway scheme, but firms interested in the supply of equipment, &c., should keep in touch with the situation.

American Capital in Italy.—It is reported from Milan that the Banca Commerciale Italiana has sold to the New York banking firm of Blair and Company a large parcel of shares in the Società Idro-Elettrica Piemonte, the American firm in this way getting a first footing in Italy. The Italian company is a trust for the financing of water power development in Upper Italy, which a year ago had a share capital of 120 millions of lire, but has since increased this to 600 millions. It appears that the trust sought to acquire the undertaking of the Negri company of Genoa, in which the Milan Edison company has an interest, but the latter is said to have succeeded in preventing the completion of the transaction, although the shareholders in the Negri company were victorious from a monetary point of view, as they disposed of their shares at high prices to the companies competing for the majority of the shares.

Social Events.—On July 25th the employés of Messrs. A. H. Hunt, Ltd., were the guests of the managing director of the company on a trip to Brighton. The weather was excellent and lunch and tea were provided at the Pavilion, Brighton. There were present at the lunch Messrs. C. H. and A. H. Hunt, F. J. Chamberlain (general manager), and E. A. Baggaley (works manager). On the previous day the company's annual travellers' conference was held at Croydon.

The annual gala and sports of the Chloride Electrical Storage Co., Ltd., were held at Clifton Junction on August 8th. A number of interesting side-shows were arranged.

American Company's Foreign Subsidiary Sold.—An *Exchange Telegraph* message from New York says that the Western Electric Co., which has maintained many foreign branches, and is interested in some factories, particularly in Japan and China, has announced the sale of its foreign subsidiary to the International Telephone and Telegraph Co. The Western Electric had partial ownership of plants in London, Paris, Vienna, Budapest, Barcelona, Milan, Tokio, and Peking. The purchasing company will make improvements, including the extension of its system to the principal cities of Mexico.

German Commerce and Industry in July.—The Commercial Secretary at Berlin (Mr. J. W. F. Thelwall) has forwarded to the Department of Overseas Trade a review, based on the reports of the Prussian Chambers of Commerce, of the commercial and industrial situation in Germany during July. He says that there was no improvement in the general economic situation; on the contrary, the sales crisis became more acute, and affected still further branches of economic life. The reasons for the increasing sale difficulties are to be sought chiefly in the great shortage of capital, with the result that more and more delay takes place in the settlement of accounts. Further, the home market is in many cases influenced by the still deferred final settlement of the tax and Customs legislation. The position of the iron industry became more unfavourable. Scarcely any inland or foreign orders were to be had, and prices everywhere declined further. In view of the unfavourable market situation, the Raw Steel Association decided to restrict the production of raw steel for July by 25 per cent. of the participation figure. Foreign trade was very slack. Under the pressure of French and Belgian competition, export prices receded further, and for German conditions reached an intolerably low level. In the electrotechnical industry a decline in orders, in part considerable, was recorded. This applied specially to foreign orders, as the powers of competition of German firms diminished further. The renewed advance in the price of raw and half-finished products, together with the increase in wages and salaries provided for by an arbitration award, will adversely affect business also in August.

For Sale.—The London and North-Eastern Railway invites offers for the purchase of plant at the power house, Immingham Dock, Lincolnshire. (See our advertisement pages to-day.)

CORRECTION.—We regret that an error occurred in the Hull Corporation's advertisement regarding the disposal of a steam turbo-alternator, which appeared in our last issue (Supplement, p. 26). The phrase "5,500 S.V.T." should have read "550 deg. S.V.T."

Turkish Import Duty Remitted.—The Turkish Government has ordered the exemption from Customs duties of certain medical apparatus, &c. Among them are X-ray equipment and accessories (including dynamos and motors).

Tasmanian Water Power Contract.—It is reported that the Armstrong, Whitworth Pty., Ltd., has received a contract for the extension of the Great Lake hydro-electric scheme, which will increase the capacity from 63,000 to 75,000 h.p., at a cost of £114,000.

Guatemalan Street Railway Concession.—The municipal authorities of the City of Guatemala have intimated their willingness to consider new offers for a street-railway concession.

Lighting and Power Notes.

Accrington.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer, Mr. A. W. Clegg) for the year ended March 31st last, show a total income of £76,179, and working expenditure of £39,404: the gross profit was thus £36,774. The previous year's figures were: Income, £74,372; working expenses, £37,863; gross profit, £36,509. To the gross profit was added £155, dividend on war loan, making a total of £36,930. Of this amount, interest and sinking fund charges absorbed £23,263, leaving a net surplus of £13,667 (£12,839), which was carried to appropriation account. A contribution of £2,000 was made to the borough fund. The capital expenditure during the year, which included £19,052 for machinery and £13,643 for mains, amounted to £33,690. The sales of electrical energy increased from 12,192,870 kWh to 13,901,583 kWh, and the average price per kWh obtained fell from 1.459d. to 1,310d. The maximum supply demanded rose from 7,000 to 7,400 kW.

Australia.—VICTORIA.—The Victorian Electricity Commission is considering plans for providing further generating plant to deal with the increasing demand. Preparations are being made for developing hydro-electric power from the Goulburn and its tributaries in the Sugarloaf district. This scheme involves laying down seven small hydro-electric stations. It is estimated that by 1928 the demand will be such that still further power will be required. The Commission is considering three alternatives: Developing the Kiewa hydro-electric scheme in north-eastern Victoria, extending the Yallourn scheme, and extending the Newport power house.—*Electrical Engineer of Australia and New Zealand.*

Blean.—OPPOSITION TO ORDER WITHDRAWN.—With reference to the application of Messrs. Hunt & Sons, of Herne Bay, for an order to supply electricity in the district, the Rural District Council has now consented to withdraw its objection on receiving a satisfactory undertaking that the charges for electricity will not be more than those quoted at the recent inquiry.

Brazil.—ELECTRICAL DEVELOPMENT.—The Government of the State of Rio de Janeiro has signed a contract with the Rio de Janeiro Tramway, Light and Power Co., authorising the supply of electricity to the towns of Campos, Macahe and Sao Joao da Barra.—*Reuter's Trade Service* (Rio de Janeiro).

Continental. — FRANCE. — In order to meet increasing demands the Société Nantaise d'Eclairage et de Force par d'Electricité has recently commenced the erection of a new transmission line between Nantes and Cholet. The line, although designed to work at 120,000 V, will at first be worked at 60,000 V. A feature of the line is that it will cross the river Loire by a single span of 984 ft., and be supported on masts about 310 ft. in height.

STYRIA.—Work has commenced on the construction of two large hydro-electric stations between Bruck-an-der-Mur and Mixnitz, which is expected to occupy three or four years.

SWITZERLAND.—The Nordost-Schweizerischen Kraftwerke, in conjunction with the Motor Columbus Gesellschaft of Baden, has plans in hand for a new hydro-electric station at Niederschworstadt.

SPAIN.—*Commerce Reports* states that the Hydroelectrica Espanola, which furnishes Madrid with power, reports the production of energy during the year 1924 at 220,000,000 kWh, a considerable increase over the output during 1923. At the end of the year the new installation at the falls of the Jucar River was put into commission; its capacity is 3,200 kW. The new turbo-generator in the central power house of Madrid was completed in October, increasing the total capacity of the company's plants in Madrid to 22,600 kW.

Dartford.—ELECTRICITY SUPPLY.—The West Kent Electric Co., Ltd., has informed the Rural District Council that it is carrying out extensive works in connection with the laying of mains for the supply of electricity to Stone and Swanscombe at an expenditure of over £250,000, and the works are due for completion by the end of 1925. The company added that it was opposing the application for additional powers put forward by Gravesend and Dartford Town Councils, and asked for the Council's support. The Council has decided to oppose the application and to be represented at the inquiry.

Dewsbury.—LOANS SANCTIONED.—The Town Council has received sanction to loans of £2,685 for the supply of electricity in the Shaw Cross and Leeds Road areas, and £1,000 for mains for supply to Thornhill Lees.

East Ham.—YEAR'S WORKING.—The report on the working of the Borough Council's electricity undertaking (engineer, Mr. W. R. Elliott) for the year ended March 31st last, records a total revenue of £87,574, as compared with £81,527 in the preceding year. Working expenses were £61,968, as against £53,509, leaving a gross profit of £25,606 (£28,018); to this was added £8,601, brought forward, and bank interest of £183, making a total of £34,389, which was distributed as follows:—Interest on loans, £4,281; income tax, £3,154; contributions to sinking fund, £5,367; loan repayment, £2,976; contributions to capital expenditure, £9,196; rate relief, £7,918; depreciation and renewals fund, £683; balance carried forward, £815. The capital expenditure during the year amounted to £32,388, the bulk of which was expended on machinery and cables. The sales of electrical energy increased from 5,966,439 to 6,697,884 kWh, and the maximum supply demanded from 3,135 to 3,444 kW. The average price per kWh obtained fell from 3.19d. to 3.028d. During the year two new 1,000-kW motor converters were installed and one of the original 225-kW horizontal steam sets was displaced.

Edinburgh.—EXTENSION OF ELECTRICITY WORKS.—The Town Council has approved the recommendation of the Electricity Committee to extend Portobello power station to meet the increased amount of electricity which will be required in the winter of 1927. The report prepared by Mr. Edwin Seddon, engineer and manager, shows that the building extensions, required to provide for two 25,000-kW sets, are estimated to cost £200,000; one 25,000-kW set, complete with condensing plant, £100,000; pumping plant and cooling water pipework, £10,000; four boilers, complete with mechanical stokers, steel chimneys, &c., £90,000; coal and ash plant, £12,000. The total estimated cost is £434,500, and it was reported at the last Council meeting that the Electricity Commissioners were prepared to sanction the borrowing of £465,120 for the purposes of the electricity undertaking.

PURCHASE OF COOKERS.—On the recommendation of the Electricity Committee, the Town Council has agreed to purchase 100 electric cookers.

Holmfirth.—PURCHASE OF DOMESTIC APPLIANCES.—The Urban District Council is applying for sanction to borrow £1,000 for the purchase of electrical domestic appliances to be let out on hire.

Irish Free State.—CLONMEL (CO. TIPPERARY).—It is expected that the Corporation's electricity scheme will be completed and a supply available at the end of the present month.

SKIBBEREEN (CO. CORK).—At a recent meeting of the Urban District Council it was decided to write to the Skibbereen Electric Lighting Co. to arrange a conference with the Urban Council on the question of an electricity supply for the town.

Ilford.—LOAN.—The Electricity Committee is applying for sanction to borrow £6,700 for the erection and equipment of a sub-station at Gants Hill.

Japan.—TOKIO.—According to *Eastern Engineering*, the city authorities are planning an improved lighting system as a part of the reconstruction programme for Tokio. According to this plan, it is proposed to light 635 miles of thoroughfares with 40,000 lamp standards at a cost of y.2,000,000. The maintenance is estimated at y.600,000 per annum. The main streets will be lighted by 500-watt lamps and the less-frequented thoroughfares by 400- and 300-watt lamps.

London.—Joint Electricity Authority.—The Minister of Labour has given notice that after August 29th he will designate to the Electricity Commissioners, in accordance with the London and Home Counties Electricity District Order, 1925, the employés' organisations having members in the employment of authorised undertakers in the district, in order that the organisations so designated may choose two representatives of persons employed in connection with the supply of electricity in the district to be members of the Joint Authority. Any employés' organisation which is desirous of being considered under the Order should make application to the Minister not later than August 29th on the form provided for the purpose, copies of which may be obtained from the Secretary, Ministry of Labour, Montagu House, Whitehall, London, S.W.1.

Morocco.—Electrical Development.—Considerable development in electrical distribution is taking place in Morocco. The Société de l'Energie du Maroc is now operating three steam turbo-generators at its Roches Noires station in Casablanca. The station is now supplying current at 5,500 V to the Société Marocaine de Distribution, and the company has also erected a 60,000-V transmission line between Casablanca and Rabat. A similar line is being established from the first-named town to Kourrigha, while others are projected between Sidi-el-Aidi and Sidi-Machoil and between Rabat and Kenitra. It is also proposed to extend the electricity supply to the Setfat and Fedhala districts.

Northern Ireland.—Aughnacloy (Co. Tyrone).—The Town Council has considered an offer of Messrs. Curran, Belfast, to introduce electricity for public lighting and has decided to ask for details of the proposed scheme.

North-West Riding Area.—Arising out of newspaper notices of the recent conference of various local authorities in the north-western area of the West Riding (Aire and Calder) Electricity District, convened by the Keighley Corporation, to consider possibilities of joint action for the supply of electricity in the area, the Oxenhope District Council, last week, received a letter from the Yorkshire Electric Power Co., drawing attention to that company's developments in the area and offering proposals jointly with its associated company, the Electrical Distribution of Yorkshire, Ltd. After a lengthy discussion in private, the Council postponed consideration of the matter for a month, with instructions to the Clerk to ascertain from Keighley Corporation in the meantime what its intentions were with regard to Ovenhope.

Oswestry.—Electricity Supply.—The Town Council recently approved a recommendation that the North Wales Power Co. be given authority to erect in the borough a transmission line for a supply of electricity from Ruabon, providing the company satisfied the Council that it would be impracticable to lay the line underground.

Peterborough.—Electricity Extensions.—The Corporation proposes to carry out extensions at the city electricity generating station at a cost of £99,200.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Mirfield.—Lighting: From 6d. to 5½d. per kWh. Power, heating and cooking: First 1,000 kWh per quarter from 2½d. to 2d. per kWh; beyond that amount, 1½d.

Dewsbury.—Lighting: Sliding scale, varying from 5d. per kWh for the first 250 kWh per half-year to 4¼d. for over 1,250 kWh; maximum demand system, from 7½d. and 4d. per kWh to 7d. and 3½d. per kWh. Power: Maximum demand system, from 3½d. and ¾d. per kWh to 3¼d. and ⅝d. per kWh.

Maidenhead.—Power: From 2½d. to 2d. per kWh.

Tunbridge Wells.—Lighting: From 5½d. to 4½d. per kWh. Power, heating and cooking: From 1½d. to 1d. per kWh. New alternative domestic rate of 18s. per annum for each living room and hall, and 6s. per annum for other rooms, plus ¾d. per kWh for electricity consumed. Extended shop-window lighting with time switch, 1d. per kWh, plus 5s. per quarter for time switch hire.

Rochdale.—Proposed Change-over.—The Corporation has given notice of its intention to apply for consent to change its system of electricity supply from 3-wire d.c. 440 and 220 V to 4-wire a.c., 3-phase, 50 periods, 440 V between phases and 230 V between phase and neutral.

Sheffield.—Mains Extensions.—The Electric Supply Committee has approved extensions of mains for general distribution purposes, at an estimated cost of £24,961, and extensions and works at a cost of £21,667.

South Africa. — Queenstown. — According to the *South African Power Engineer*, the consulting engineer to the Municipal Council, Mr. A. E. Val Davis, has submitted a scheme for the erection of a new power station to take the place of the existing station which is not now capable of dealing with the increasing demand. It is recommended that the new station should contain two new 250-kW steam alternators, and in addition the two 75-kW sets at present in use at the existing station. Two new water-tube boilers, fitted with mechanical stokers, are also proposed. The cost of the proposed extensions is estimated at £29,330, and the remaining value of the present undertaking at £24,862.

Silsden (Yorks.).—Application for Order.—The Urban District Council is applying for an Electricity Order in respect of its area.

Stretford.—New Sub-Stations.—The Electricity Committee is to erect a new sub-station in the neighbourhood of Skerton Road, Old Trafford, to cope with the increasing demand for power in that area, at an estimated cost of £4,000, and a new sub-station in the vicinity of the junction of Warwick and King's Roads to supply the Council's new housing schemes at Gorse Hill, &c., at an estimated cost, including distribution cables and services for the housing scheme, of £5,000.

Tonbridge. — Electricity Order. — The Urban District Council has agreed, subject to obtaining a bulk supply of electricity from Tunbridge Wells, to apply for Fringe Orders to supply electricity to the parishes of Leigh and Hildenborough.

Uruguay.—Hydro-electric Development.—The possibility of developing the hydro-electric resources of the Rio Negro has again received the attention of the National Administrative Council, and it is probable that engineering companies of the world will be requested to submit estimates of charges for making a complete study of the hydro-electric resources of the river and for preparing definite plans and cost figures.—*Commerce Reports.*

Warwickshire.—Electricity Supply.—The *Birmingham Post* states that it is officially announced that the application of the Barford Electric Supply Co., Ltd., for an Order to supply electricity to a number of villages in South Warwickshire has been refused by the Electricity Commissioners. Statutory powers have been given to the Leamington and Warwick Electrical Co., which was the competing applicant.

Whitehaven.—Loans.—The Town Council has applied for sanction to loans amounting to £7,790, made up as follows:—Mains extensions, Arrowthwaite housing site, £3,790; meters, £1,500; services, £2,500.

Tramway and Railway Notes.

Continental.—Bulgaria.—The first electric railway in Bulgaria has recently been completed and put in operation between Sofia and Kniajevo.

East Ham. — Year's Working. — The accounts of the Borough Council's tramway undertaking (manager, Mr. W. R. Elliott) for the year ended March 31st last, show that the total revenue was £81,292, as compared with £78,316 in 1923-24. Operating costs increased from £89,969 to £96,061, leaving a gross deficit of £14,769 (£11,653). After meeting capital charges and special expenditure out of revenue, there was a net deficit of £42,889, as compared with a deficit of £35,673 in the preceding year. The capital expenditure during the year, which included £12,691 for permanent way, amounted to £14,814. The number of passengers carried increased from 15,342,953 to 15,987,284, and the car miles run from 1,483,256 to 1,568,102. The revenue per car mile fell from 12.46d. to 12.33d.

London.—New Oxford Circus Station.—The new booking hall below the street level at Oxford Circus station was opened to the traffic of both the Bakerloo and Central London lines on August 16th. Eight passimeters have been installed.

Manchester.—New Route.—The Corporation is to construct three miles of tramway track along Kingsway.

Rochdale.—Loan.—In connection with the Town Council's share of the purchase price of the Middleton tramways and the cost of linking up with the local system at Sudden, application is being made for sanction to the borrowing of £11,150.

South Africa.—Railway Electrification.—In connection with the electrification of the Natal main line, the position at the end of May, 1925, was as follows:—Four of the five 12,000-kW turbo-generators in the engine room of Colenso power station were in commission, and the erection of generator No. 5 was nearing completion. Five of the eight boilers were in commission, four of the five circulating-water pumps were in operation, and No. 2 station transformer had been placed in service. With the exception of connections to the transformers at Lidgetton, Cedara, and Pietermaritzburg, all work on outdoor sub-stations had been completed, and the connecting of cables in the sub-stations at Nottingham Road, Lidgetton, Cedara, and Pietermaritzburg was proceeding. All work, including the affixing of anti-climbing devices to the towers, had been completed in connection with the erection of the 88,000-V transmission lines between Pietermaritzburg and Glencoe. The erection of 72 electric locomotive units at Pietermaritzburg had been completed, and a further five were in course of erection.—*South African Railways and Harbours Magazine.*

South Shields.—Year's Working.—The report of the general manager and engineer of the Corporation tramway undertaking for the year ended March 31st last records a total income of £86,513, as compared with £82,903 in the preceding year. Working expenses were lower by £562 at £69,456, leaving a gross surplus of £17,056 (£12,884). After providing for capital charges a balance of £1,679 remained. There was, however, a deficit of £3,942 on the motor-omnibus system, the net result for the whole of the undertaking being a deficit of £2,262. The number of passengers carried increased from 18,125,830 to 18,668,095 ('buses 527,195), and the car miles run from 1,214,451 to 1,230,260 ('buses 97,794). The average traffic revenue per car mile increased from 16.08d. to 17.393d.

The Southern Railway Electrification.—III.*

High- and Low-Pressure Cable Systems and Sub-Station Equipment.

THE inauguration of various sections of the extended suburban lines electrification scheme of the Southern Railway marks a new phase in passenger transport facilities south of the River Thames. The first section embraces that portion of the former L.B. & S.C. Railway from Balham to Coulsdon North, and from Selhurst and Norwood Junction to Sutton, a total single track of 82 miles.

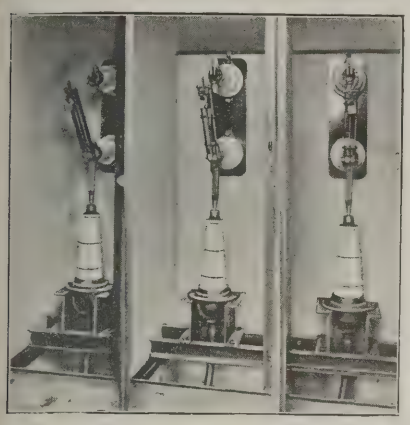


Fig. 1.—J. & P. 33,000-V Isolating Switches.

Fig. 2.—Cable Troughing along Line; 33,000 V.

Sutton and Coulsdon Extension.—Electricity is delivered by the London Electric Supply Co. at New Cross Gate at 6,700 volts, 25 cycles, single-phase, and is there stepped up to 64,000 volts by two 5,000-kVA transformers, with the centre point earthed. The power is thence transmitted by two single-phase circuits composed of four single-core, 33,000-volt, 0.25 sq. in., lead-covered cables which pass through an isolating cabin at Sydenham, containing cable potheads and isolating switches only, as shown in fig. 1, and terminating at the Gloucester Road Junction (Croydon) B.T.-H. switch cabin, where the pressure is again reduced by G.E.C. transformers to 6,700 V for distribution through an operating switch cabin, feeding the overhead conductors from which the trains collect current by pantographs.

The h.p. cables were supplied and laid by Messrs. Johnson & Phillips, Ltd., in addition to several miles of 0.5 sq. in. concentric 11,000-volt cable, running along the South London line from the Peckham Rye switch cabin, which supplies the previously electrified area, to Battersea Park. This cable at present operates at 6,700 volts and boosts the New Cross-Croydon transmission line, *via* Battersea Park and Balham Junction. Both the high- and medium-pressure cables are laid in wooden troughing, fig. 2, or earthenware ducts securely anchored, while fig. 3 indicates that each joint is bonded by means of a copper strand carried to an earth coil. Fig. 4 is a view of single-phase, 33,000-V joints in a manhole, and fig. 5 shows a van containing a 120,000-volt Delon testing outfit that derives its low-pressure from the S.R. testing car to which it is coupled; the 3-core cable to be seen in the foreground was being used as a condenser.

Fig. 5.—Delon 120,000-V Cable Testing Plant.

Fig. 6.—J. & P. Feeder Cable along Line; 11,000 V.

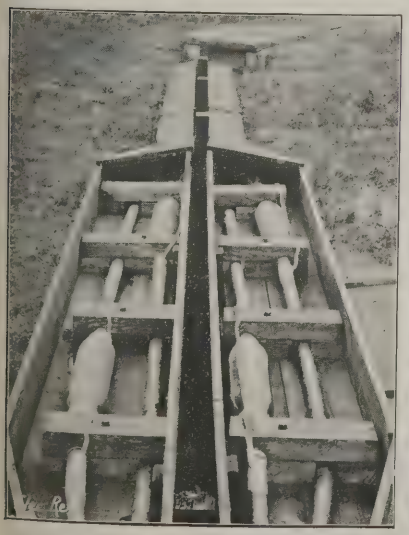

Fig. 3.—Cable Joints and Bonding.

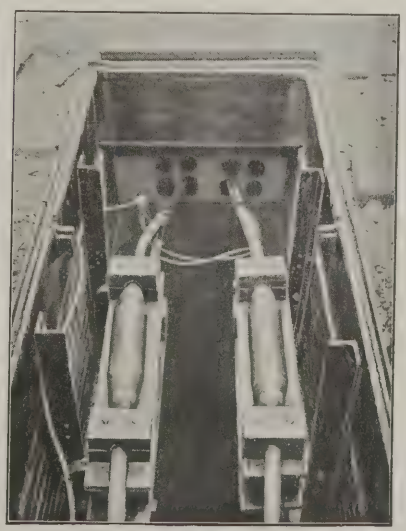

Fig. 4.—Single-phase 33,000-V Cable Joint.

The conversion of the Brighton section has involved the installation of 15 sub-stations, or switch cabins, suitably disposed along the track. The trains are fed from overhead trolley or contact lines, which are sectionalised in accordance with usual practice, each section being supplied from its switch cabin. The switchgear equipment, supplied by the British Thomson-Houston Co., Ltd., is in all instances on similar lines, with modifications depending on the number of tracks supplied, density of traffic, and consequent variation in the chance of heavy overloads or short circuits occurring, importance of section, &c.

E

*ELEC. REV., April 10th and June 5th, 1925.

In all cases switching is effected by oil-immersed circuit breakers installed in cubicles of brick and stone; oxide-film lightning arresters are provided, and the current transformers are used as through insulators between the top and bottom chambers of the cells.

The sub-stations at Peckham Junction, Tulse Hill, and Gloucester Road will usually have operators in attendance, but the remaining switch cabins will not be attended under normal conditions. The oil circuit breakers are direct hand-operated in some cases and automatically-operated in others, in the latter case transformer-operated trips being provided. All automatic breakers are arranged to ring an alarm bell when

Fig. 7.—Cable Paying-out Train at Chislehurst.

they open, and an indicator informs the attendant which switch has operated in the case of the attended stations, but in the other cases the bell is in the nearest signal cabin. Special interlocking is also provided in connection with the protective equipment to enable testing and repairs to the contact lines, &c., to be carried out in safety.

At Peckham Junction, Tulse Hill, and Gloucester Road reactors are provided; should a fault occur on the contact lines, switches in parallel with the reactors will automatically open so that the contact lines will be fed through the reactors, thus affording a chance for the fault to clear itself by the automatic reduction of the

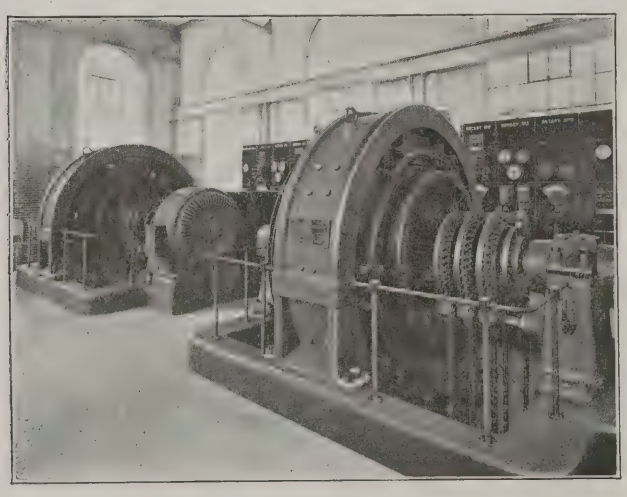

Fig. 8.—G.E.C. Barnehurst Sub-station; A.C. Side.

line voltage. Should this not take place, the oil circuit breaker will automatically open after a time interval.

In addition to various protective features, there is a main "potential block protective system"; the track is divided into sections, all the overhead trolley wires for the up and down tracks for one section being paralleled at both ends on the sub-station bus-bars through the trolley feeder equipment. Each section is fed at one end only through a group feeder equipment, but may at the other end be connected to a similar end of another section through an automatic bus-coupler. The group feeder equipments consist of two oil breakers, one of which short circuits a reactor, which at 6,700 volts will limit a fault current to 1,800 amp. maximum, and it is considered that the minimum fault current which can be dealt with as a fault would be approximately 0.6 times this, or 1,080 amperes. The maximum number of trolley lines in parallel for the purpose of considering fault isolation is four, so that the medium fault current per trolley feeder is a quarter of 1,080 amperes, namely, 270 amps.; this figure is less than the normal rating of the trolley feeders, which are provided with current transformers of 400 :5 amperes ratio. In order to prevent the overload relays from tripping the switch

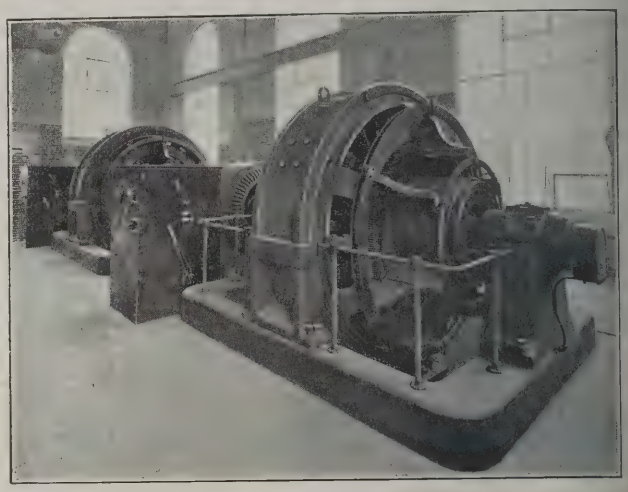

Fig. 9.—D.C. Side of G.E.C. Rotary Converters.

under normal circumstances, "potential block relays" are fitted which short circuit the automatic features of the feeder switches so long as the voltage of the system remains normal, or above, say, 3,800 volts; however, the most important point is that the contacts shall close with the voltage rising from zero to between 4,000 and 4,500 volts, the latter figure being more desirable. The relays are fitted with a dashpot time lag which operates as the contacts open, but not as they are

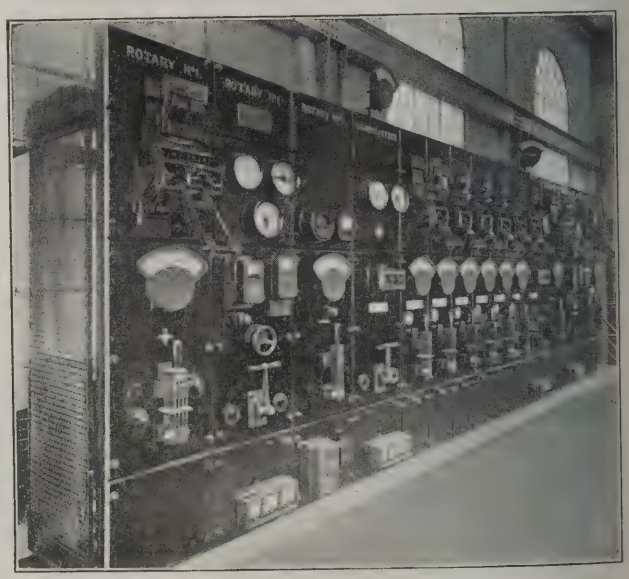

Fig. 10.—Dartford Sub-station; G.E.C. Control Board.

closing, and prevents operation due to momentary overloads opening the reactor switch, and also gives time for the automatic switches on trains to operate before restoring the automatic features of the trolley feeders.

When a fault occurs on a trolley feeder system the reactor switch supplying that section will trip, and if the section is coupled to the adjacent section through an automatic bus-coupler, the setting on this switch should be such that it will trip also. After a short interval due to the induction relay on the group series switch, the latter switch will trip, thus isolating the whole section. With all potential removed, the "potential block"

relays will open and restore the automatic features to the trolley feeder switches. When the operator in the main distributing cabin is warned that a fault has occurred by the opening of the two group feeder switches and the consequent ringing of the alarm bell, he will close the group switch, at the same time short-circuiting its automatic features by means of the pull-button switches.

Fig. 11.—G.E.C. Oil Breaker Cubicles.

The S.E. & C. Section.—For the conversion of the South-Eastern and Chatham section, Messrs. Johnson and Phillips are supplying, laying, and jointing over 25 miles of 0.25, 0.15, and 0.1 sq. in. three-core, 11,000-volt, paper-insulated, lead-covered, single wire-armoured and served feeder cable, which is carried on short concrete posts alongside the track, as indicated in fig. 6. For station lighting and signalling purposes the

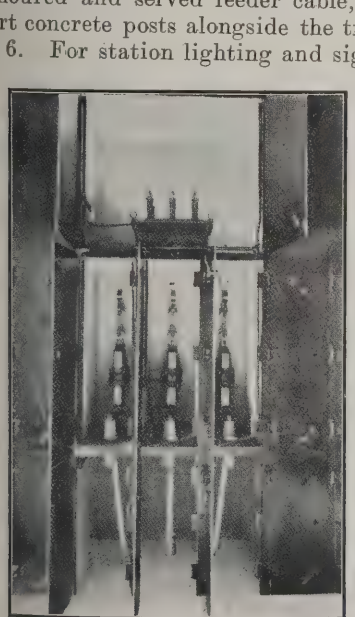

Fig. 12.—Instrument Transformers in Stonework Cells.

company is installing approximately 55 miles of 0.15, 0.1, 0.0225, and 0.06 sq. in. 3,300-volt concentric cable, paper insulated, lead covered, single wire-armoured and served. The cable contract was placed with Messrs. Johnson & Phillips, Ltd., who sublet 25 per cent. of the manufacture to each of the following firms:—Callender's Cable & Construction Co., Ltd.; the Pirelli-General Cable Works, Ltd.; and Siemens Bros. & Co., Ltd., this S.E. & C.R. cable contract as a whole being claimed to be the largest ever placed in connection with railway electrification. Fig. 7 illustrates a cable paying-out train at the entrance to Chislehurst tunnel; the 11,000-V, 3-core, 0.1 sq. in. cable is shown on two drums weighing 9½ tons gross, each drum carrying 634 yards, and the cable was laid through the tunnel without a joint. In stations, under and over bridges, &c., the cable has been laid in bitumen-filled troughing or drawn into fibre conduit, while for the Deptford Creek crossing a length of submarine cable was used.

On the three routes between Victoria, Holborn Viaduct, St. Paul's and the Crystal Palace and Orpington, *via* Catford, and also Herne Hill, electrical operation commenced on July 12th. The London Electric Supply Corporation, Ltd., delivers electricity from its Deptford generating station to the railway's main sub-station at Lewisham by seven 0.25 sq. in., 11,000-V feeders. Power is thence distributed to 19 sub-stations by duplicate 11,000-V, paper-insulated, lead-covered, and single-wire armoured cables. The switchgear and metering equipment is by the Metropolitan-Vickers Electrical Co., Ltd. The S.E. & C. section is operated on the d.c., 660-volt, third-rail system, and the Lewisham sub-station contains also rotary converters, in addition to three 400-kVA frequency changers, manufactured by the English Electric Co., Ltd., for supplying single-phase, 75-cycle energy for signalling and lighting circuits.

The twenty d.c. sub-stations contain 25-cycle, 11,000-V, 3-phase switchgear and transformers, fifty 1,500-kVA rotary converters, and the necessary 660-V d.c. switchboards. In addition, five of the outlying sub-stations contain duplicate 10-kVA frequency converters for supplying the local signalling circuits. Seven of the sub-stations have been equipped by the English Electric Co., Ltd.; they contain 19 rotary converters, each of 1,500 kW and 500 r.p.m.

The contract entrusted to the General Electric Co., Ltd., included the equipment of eight sub-stations containing 16 converter sets. Each sub-station, one of which is illustrated in figs. 8 to 12, houses two 1,500-kW rotary converters, six-phase, compound-wound, with transformers and a.c. and d.c. switchgear. The G.E.C. also supplied the cable work inside the sub-stations and batteries for the trip coils, &c., complete with rectifiers and switchgear for charging purposes. The specification required that each

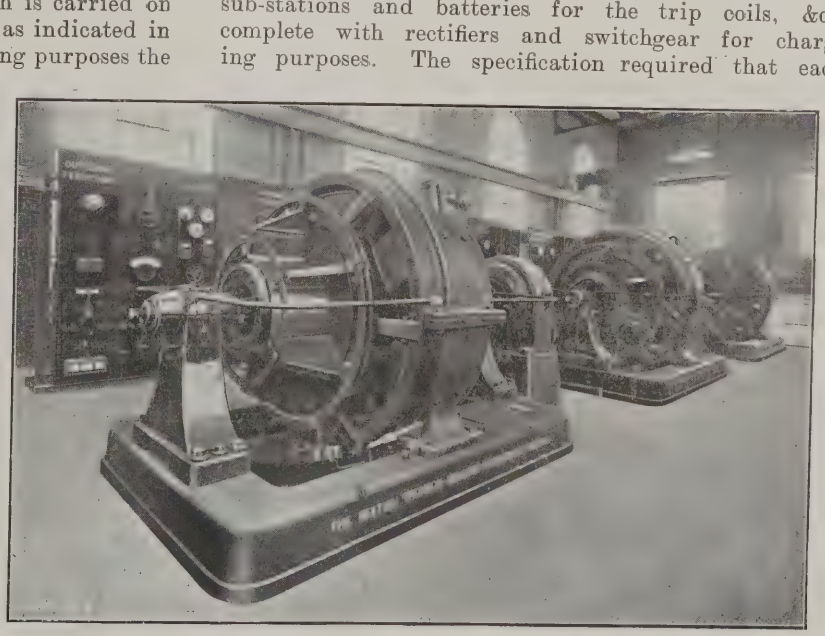

Fig. 13.—D.C. Ends of B.T.-H. Rotaries; Catford Bridge Sub-station.

should withstand a load of 4,500 kW, *i.e.*, 200 per cent. overload for 10 seconds. The machines were actually tested in the presence of the railway company's engineer for 25 seconds on this load, and during the preliminary trial the load was increased to 11,000 amperes without severe sparking, which represents an actual load of over 7,000 kW, and the following efficiency results were

obtained on test:—Efficiency at full load, 96.26 per cent., and at half load 94.65 per cent. As the load on traction rotaries necessarily varies, it is of importance that their efficiency at half load should be high. The converters operate in conjunction with self-synchronising gear.

The starting pillars (fig. 8) are mounted on the floor close to the rotaries, and in place of the usual open type of panel all the apparatus is enclosed in a black enamelled steel-plate pillar with hinged doors. The switches are provided with external handles, and the synchronising choke coils are mounted in the basement below. The e.h.p. switchgear is in moulded-stone cubicles in the basement, with operating mechanism and instruments mounted on panels to form an integral portion of the l.p. switchboard on the floor above.

Each incoming or outgoing feeder and main transformer cubicle is fitted with a mechanically remote-controlled type V.T. 3-phase oil circuit breaker, having a maximum breaking capacity of 200,000 kVA and a

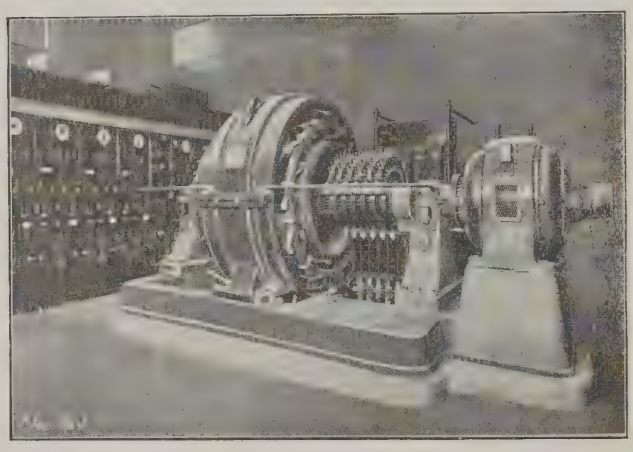

Fig. 14.—B.T.-H. Single-unit Sub-station at Dorking.

separate steel tank for each phase. The cubicles are arranged with the bus-bars in two sections, which can be separated by isolating links when desired, the various feeders and transformer circuits being divided between the two sections.

The d.c. switchgear and a.c. operating panels are on the main floor of the sub-station and arranged as one complete board. The circuit breakers on the d.c. panels are of the new G.E.C. type, whilst the d.c. watt-hour meters were made at the G.E.C. associated Chamberlain and Hookham works.

The complete equipment of the five three-unit sub-stations, one of which is illustrated in figs. 13, 15, and 16, has been provided by the British Thomson-Houston Co., Ltd., and, in addition, the order for feeder-protective apparatus and battery-charging equipment throughout the whole system was entrusted to this company. The three self-synchronising rotary converters in each sub-station have a normal rating of 1,500 kW and run at a speed of 500 r.p.m. They are designed to stands overloads of 25 per cent. for two hours and 150 per cent. for 20 seconds, being guaranteed also to stand a momentary load of four times full load without flashing-over. Induction-motor starting is used, and the rotaries are synchronised in less than 40 seconds, the starting current being approximately 30 per cent. of the full-load

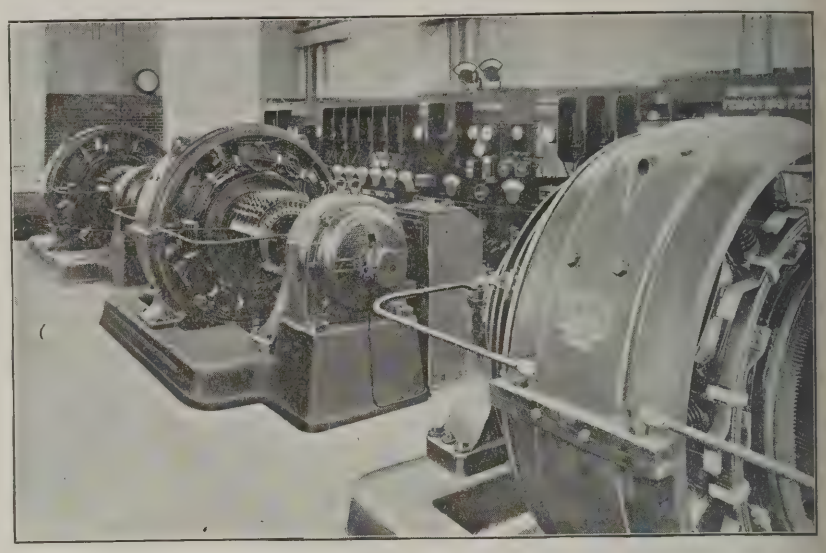

Fig. 15.—A.C. Ends of B.T.-H. Rotaries; Catford Bridge Sub-station.

current. The switchgear is of the cubicle type; except at the Holborn sub-station, the equipment is arranged on two floors, the 11,000-volt switchgear cubicles and outdoor-type oil-immersed transformers being on the ground floor, and the switchgear-operating and metering panels, rotary converters, and starting cubicles on the first floor. The h.p. cables are paper insulated, lead covered, and wire armoured, and each e.h.p. feeder equipment is provided with a set of current transformers for operating the balanced-current protective gear, these transformers being independent of those used for the overload protection and instruments.

The three-phase oil circuit breakers have a breaking capacity rated at 180,000 kVA, and the e.h.p. bus-bars are sectionalised by rotary isolating switches fitted with earth contacts, enabling the whole of one section of the switchgear to be shut down. On the d.c. side the traction feeder panels form an extension of the a.c. switchboard on the first floor, while the positive and negative rotary control panels are placed on either side of the machine transformer feeder panel. The rating of each machine d.c. circuit breaker is 3,000 amperes and of each d.c. feeder circuit breaker 2,000 amperes. The machine circuit breakers are provided with overload

Fig. 16.—B.T.-H. Switchboard; Catford Bridge Sub-station.

trips and auxiliary switches for closing the alarm bell circuit, while a shunt trip is used for cutting the

machine off the d.c. bars in the event of overspeed or reverse current conditions. Between the lightning arrester and choke coils, which are in the positive track circuit, there is an isolating switch and auxiliary switch, the latter being used to stop the alarm bell ringing after the breaker has opened; if the track should still be alive when the breaker opens, indication is given by a pilot lamp.

Auxiliary supply at the sub-stations is obtained from two oil-immersed, three-phase transformers, ratio 11,000/110 volts, connected to the incoming feeders through current-limiting resistances and controlled from an auxiliary switchboard in a corner of the sub-station; in the event of this supply failing, an automatic changeover switch will connect the lamp circuit to a battery. G.T.-H. "Tungar" rectifiers are used in all the sub-stations on the system to charge the batteries.

Protective apparatus on the system, already mentioned as a product of the British Thomson-Houston Co., is of the multi-parallel feeder type without pilot cables; greater sensibility is obtained on earth faults, as compared with phase faults, although the time setting on each is the same, while under through-fault conditions stability is maintained. Biasing transformers are used and the apparatus can be extended under certain conditions to protect any number of parallel feeders without the necessity for pilot cables. A feature of the system is that there is no necessity for the protective current transformers to be specially balanced, while a load such as that experienced by the Slades Green sub-station, which is teed off from the main line, can be protected merely by the inclusion of incoming protective apparatus in that sub-station.

Nearly 400,000 track bonds were supplied by British Insulated & Helsby Cables, Ltd., for this section of the Southern Railway, the total single-line mileage involved being 250. The rolling stock for the new electrical services consists of 124 three-car train units and 59 two-car units. The three-car units are formed of two motor cars with a trailer car coupled between them. Each motor car is equipped with two 300-h.p. motors made by the English Electric Co. and control apparatus by the Metropolitan-Vickers Electrical Co. The two-car units are not fitted with motors, and will be operated at times of heavy traffic coupled between the three-car units. Inspection of the electrical equipment of the new stock will be carried out at Orpington and Slades Green, and electrical and mechanical repairs will be effected in a new shop at Slades Green which has been built for the purpose. Fig. 14 is a view of the G.T.-H. sub-station at Dorking on the South-Western section of the railway, which will be referred to next week.

(To be concluded.)

Telegraph and Telephone Notes.

Brazil.—TELEPHONE CONCESSION.—The Municipal Council of the State of Sao Paulo has awarded to the Brazilian Telephone Co. (a Canadian corporation), a monopolistic contract for the provision of the whole of the telephone services to the capital. Considerable opposition, emanating from commercial, industrial, and agricultural interests, against the Council's action has been manifested and an appeal to cancel the concession is about to be presented to the State Congress.—*Reuter's Trade Service* (Sao Paulo).

Empire Radio Communication.—INDIA.—It is announced by the *Daily Telegraph* that the Marconi Co.'s engineers have arrived at Bombay from England for the purpose of commencing at once the construction of the "beam" wireless stations at Poona and Dhond in connection with the Empire chain of stations. The chairman of the Indian Radio Telegraph Co., which has undertaken the work, has returned to Bombay after studying systems in America, England, and France.

ENGLISH STATION SITES.—The Postmaster-General announces that a site at Winthorpe, near Skegness, for the receiving station for the "beam" services with Australia and India, was selected by him at the disposal of the contractors on August 1st. A site near Grimsby for the transmitting station was awarded to the contractors a few weeks ago; the stations were to, under the contract, to be completed by May 8th, 1926.

Holland.—SHIP-SHORE TELEPHONY.—It is reported that the Dutch Government intends to utilise one or more radio stations as links in a scheme for enabling passengers at sea to talk with people on shore by means of the ordinary telephone facilities. Tests are being carried out and the *Evening News* understands that the ultimate aim is not only to provide a local service, but to extend the facilities to other countries by means of their own land lines. Similar experiments have been made in America, England, and Germany; whereas the Germans used 100-m. waves, the Dutch will probably use a wave-length of between 800 and 900 m.

Italy.—NEW RADIO-TELEGRAPH STATION.—A radio-telegraph station is being built near Rome by Germany as part of her reparation payment to Italy. According to the *Evening News* the station is to cost nearly £780,000, and will be completed next April. It will be able to transmit and receive five messages or programmes simultaneously. The aerials are supported by seven towers, each 850 ft. in length, and covering an area of 150 acres.

International Telephony.—ANOTHER COMMITTEE.—The International Chamber of Commerce complains of the inadequacy of the present Continental telephone services and, according to the *Financial Times*, has appointed a committee, the purpose of which appears to be to develop the use of telephone service internationally and to find practical means of effecting improvements.

The whole system of telephone circuits to France from this country is to be overhauled during the next two months, says the *Morning Post*. Engineers have been sent from the General Post Office to the French coast to inspect the repeaters and cables, while others will overhaul the lines on this side of the Channel. Major J. B. Stevenson has been in charge of all the tests carried out by telephone between London and foreign cities. There are 16 circuits between London and Paris, but it is hoped to create several new "phantom" circuits. The French Post Office authorities, realising the importance of becoming the "switchboard of Europe," hope to finish the overhaul by November in time for the next International Telephone Conference.

Japan.—TELEPHONE DEVELOPMENT.—The Japanese Government has developed a plan for the improvement of the telephone system of the country. According to *Commerce Reports* over 50,000 new telephones will be installed each year during the period 1925-1930, as well as an average of 10,000 miles of new toll lines per year.

Portugal.—NEW RADIO-TELEGRAPH STATION.—On May 20th, 1925, a new radio-telegraph station was opened at Lavadores, a suburb of Oporto, by the Portuguese Government. It will be under the direction of the ministry of marine, and its official name is Posto Radio-telegrafico Naval do Porto at Lavadores, the call letters being CTP. The Marconi systems used are spark and continuous wave on 600 metres and on 2,400 metres respectively, the transmitting range by day is 300 miles, and by night 900 miles. The station has no midday signal, but repeats the meteorological reports from Monsanto (Lisbon) when requested by vessels, free of charge. A radio-goniometer will be installed shortly to give ships their position for a fee.—*Commerce Reports.*

United States.—LONG-DISTANCE TELEPHONY.—The telephone cable, 861 miles long, which links New York and Chicago and has been designed to furnish telephone and telegraph services practically immune from storm interruptions, was joined up at Swanton, Ohio, on August 11th. The cable, which is the longest in the world, the laying of which began seven years ago, is made up of 447,000 miles of wire, and involved an outlay of $25,000,000 (£5,000,000). It will handle 250 telephone and 500 telegraph messages at the same time. Of the total length 717 miles are above ground and 144 miles in underground conduits, says *The Times*.

Radio Notes.

Artists' Dispute.—NEGOTIATIONS SUSPENDED.—The negotiations with regard to artists' services which have been in progress for some time between representatives of British concert promoters and the British Broadcasting Co. have been temporarily suspended, a deadlock having been reached with regard to a continuance of professional services upon the terms hitherto in force.—*Daily Mail.*

B.B.C. Studios.—LONDON IMPROVEMENTS.—A large new studio is being equipped at 2LO, the London station. The ceiling and walls are being hung with adjustable curtains, arranged on a system of wires, swivels, and pulleys, so that the producer of a play or dramatic entertainment will be able to control the volume of sound. Hitherto only the engineers have been able to vary the volume. Folding glass doors across the middle of the studio will enable one half to be used for "effects" and "noises," and the other for the artists; the floor is of stone. The present upper studio, from which entertainments have been broadcast for the last three years, is to be abolished, but the main studio is being retained, while a new studio for talks only is being furnished.—*Daily Mail.*

Broadcast Advertising.—A Sheffield Suggestion.—The Sheffield representative of the British Broadcasting Co. has, we understand, invited the Chamber of Commerce of the city to introduce to his company representative speakers—business men interested in the city's affairs—who could advertise the city and its productions by means of broadcasting.

Canada.—New Station.—The new Vancouver broadcasting station of the Canadian National Railways was opened on August 12th at 5 a.m. British summer time, bringing the number of the C.N.R. stations up to ten. The call of the new station is CNRV and the wave-length 291 metres. The studio is in Vancouver, but transmission will take place from Lulu Island, a short distance away.

France.—Wave-length Tests.—As the result of the recent meeting at Geneva of the directors of the International Radiophone Union, wave-length tests were conducted from the Eiffel Tower, Paris, at night last week-end. The wave-lengths used were 64 and 200 metres. Similar experiments will take place next week.

New Continental Stations.—British Plant.—A further field for long-distance listeners will soon be available when the new broadcasting stations at Milan (Italy) and Brno (Czecho-Slovakia) are opened. They are being erected by Marconi's Wireless Telegraph Co., Ltd., and are of the same type and power as the new 2LO station; the power used will be 12 kW. The Peruvian broadcasting station at Lima (call letters OAX and wave-length 360 metres) which was formally opened on June 20th, is giving very satisfactory results. This station uses a standard Marconi 6-kW type "Q" transmitter.

Receiving Licences.—Proceedings Threat.—The Postmaster-General calls attention to the fact that now that the Wireless Telegraphy (Explanation) Act has been passed, the legal obligation to take out a licence for a receiving set—whether crystal or valve—has been placed beyond doubt, and he gives notice that he proposes in future to institute proceedings in cases coming to his knowledge in which sets are installed or used without licences.

Summonses Issued.—Mr. R. M. Ford, who some time ago challenged the Postmaster-General to prosecute him for not having purchased a licence, has sent a communication to the Postmaster-General, in which he says that under Section 1, sub-section 7, of the Wireless Telegraphy Act, 1904, he proposes using electrical apparatus for purposes other than the transmission and reception of messages (with which alone the Wireless Acts are concerned), and calls upon the Postmaster-General to take such steps as may be necessary to prevent Post Office messages reaching his apparatus. Mr. Ford has, it is understood, received three summonses issued at the instance of the Postmaster-General.

Short-wave Transmission.—New Station.—It is announced that the Edison Swan Electric Co., Ltd., has had the call sign 5VR allotted to it, and will shortly commence experimental transmission on wave-lengths of 23, 45, and 90 metres. Reports of reception will be appreciated and acknowledged by the company, and times of special tests will be sent to anyone on request.

The Radio Industry.—In a report issued for the benefit of the American wireless manufacturing industry by the American Government trade experts, it is declared that the development of the wireless industry in Great Britain has reached such a high state of efficiency that American wireless apparatus manufacturers cannot hope to compete in the British market.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Adwick-le-Street.—Urban District Council. September 14th. Internal wiring for electric lighting of Council houses. (See this issue.)

Australia. — Melbourne. — September 29th. Postmaster-General's Department. Telephone protective apparatus.*

October 20th. Switchboard cable. Sched. C.39, jumper wire. Sched. C.40, bells and buzzers.*

New South Wales.—November 11th. New South Wales Railways and Tramways. 5-ton 3-motor electric overhead travelling crane, 56 ft. 2 in., for iron and steel foundry, Eveleigh workshops.—*Tenders.*

September 23rd. Four feed-water meters for White Bay power house.

October 15th.—Newcastle City Council. 2,000-kW, or, alternatively, 1,500-kW turbo-alternator, complete with condensing plant.—*Tenders.*

October 7th. Victorian Government Railways. Two electric transporters complete. (AX.2303.)*

Commonwealth. October 27th. Timing clocks and calculagraphs. (See this issue.)

Bristol.—August 27th. Board of Guardians. Electrical fittings for six months for St. Peter's Hospital. (Particulars from T. S. Lamb, clerk, at the hospital.)

Egypt.—Cairo.—September 9th. Ministry of Education. One 50-h.p. Diesel engine, generator, electric motors and machine tools for the Mansurah Trades School.*

Ministry of the Interior. Supply and installation of an electric power station and distributing system for the town of Minieh.*

Edinburgh.—September 14th. Royal Infirmary. Supply of X-ray and electro-medical equipment for the new Radiological Department. (August 14th.)

Fleetwood.—August 24th. Urban District Council. Feeder cable and pillar. (August 7th.)

India. — September 15th. Madras and Southern Mahratta Railway Co., Ltd. Telegraph line materials, copper wire, &c. (See this issue.)

Leeds.—August 25th. Property Committee. Electric lighting work required for public wash-houses and slipper baths at Stocks Hill.

London.—Acton.—August 28th. Borough Council. Overhead wiring at the Council's Isolation Hospital, Wales Farm Road, Acton. (August 7th.)

Newport (Mon.).—September 7th. Electricity Department. Induced draught plant, extension of flues, &c. (See this issue.)

New Zealand.—Wellington.—September 29th. Public Works Department. 560 galvanised steel transmission line towers, complete with cross-arms, ground stubs, and accessories. (A.X. 2,250.)*

Marlborough.—Electric Power Board. September 22nd. Two 750-h.p. turbines, with generators, switchboard, &c., for Waihopai River development.—*Tenders.*

Portsmouth.—September 1st. Tramways Committee. Stores for 12 months, including insulating materials, lamps, overhead line materials, &c. (See this issue.)

Rochdale.—September 9th. Paving and Sewering Committee. Motors and electrical gear, together with the necessary wiring in connection with the electrification of sludge pressing machinery at Roch Mills sewage disposal works. (August 14th.)

South Africa.—Johannesburg.—October 1st. Railways and Harbours. Four 4-ton electrically-driven portable jib cranes complete. (A.X.2299.)*

Stockport.—September 5th. Board of Guardians. Conversion of lift at Stepping Hill Hospital from hydraulic to electric power. Particulars from the Steward at the hospital.

Stoke-on-Trent.—Stoke and Wolstanton Union. Installation of an electrically-driven pumping plant at the Turnhurst Road Institution, Chell. Specification from Mr. T. Wood, Clerk to the Guardians, Stoke-on-Trent.

Town Council. E.h.p. testing equipment. (See this issue.)

Warrington.—September 7th. Electricity Department. Twelve months' supply of earthenware conduits. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.

Closed.

Edinburgh.—Electricity Committee. Recommended:—

Soot blowers (£1,168).—Stirling Boiler Co., Ltd.

Switchgear for sub-station at Saughton (£775).—A. Reyrolle & Co., Ltd.

Transformers for Saughton sub-station (£540).—Ferranti, Ltd.

Glasgow.—Cleansing Committee. Recommended:—

Frequency changers for new refuse works (£8,197 each).—Messrs. Brush-Peebles & Co., Ltd.

Refuse power plant: Turbine, Fraser & Chalmers Engineering Works; alternator, General Electric Co., Ltd.; condensing plant, Messrs. Mirrlees, Watson & Co.; transforming plant, Messrs. Ferranti, Ltd.; cooling towers, Premier Cooling & Engineering Co.

Tramways Committee. Accepted:—

Crossings and crossovers.—Messrs. Edgar Allen & Co., Ltd.

Recommended:—

D.c.c. wire.—London Electric Wire Co. & Smith's, Ltd.

L.c. cable.—Western Electric Co., Ltd., and the Hackbridge Cable Co., Ltd.

Two steel wire haulage ropes for the Subway (£6,544 each).—Messrs. T. & W. Smith, Ltd., and Messrs. R. S. Newall & Son, Ltd., Liverpool.

In this connection the Committee reports that five tenders were received all at the same time, and it has recommended that with regard to future supplies foreign tenders be invited. The Committee has asked the Town Clerk to call the attention of the Government to the position of matters in the supply of wire rope as disclosed by the fact that the prices quoted for the contract are the same in all cases.

Haworth.—Urban District Council. Accepted:—

Erection of sub-station in connection with a supply of electricity from Keighley.—Mr. E. Metcalfe.

Irish Free State.—Dublin.—Borough Commissioners. Materials for the wiring of 180 houses on the Marino Estate:

Wire (approximately 25,000 yd. required) per 100 yd.—

	£	s.	d.

British Insulated & Helsby Cables, Ltd.	0	11	6

.eeds.—Tramways Committee. Accepted:—
50 gear wheels.—National Steel Foundry (1914), Ltd. (£443 15s.).
Special work for siding.—Titan Track Work Co., Ltd. (£300).
Special track work.—Edgar Allen & Co., Ltd. (£790 and £805); Messrs. Hadfields, Ltd. (£1,800); Titan Track Work Co., Ltd. (£870 and £700).

.ondon.—London and North-Eastern Railway Co. \epted :—
Four e.l. type welding plants for Stratford Works.—Equipment and Engineering Co.

Manchester.—Electricity Committee. Accepted :—
Adhesive tape.—L. Andrew & Co., Connolly's (Blackley), Ltd.
Batteries (dry).—Ever Ready Co. (Great Britain), Ltd.
Box compound.—British Insulated & Helsby Cables, Ltd.
Bittite tape.—Callender's Cable & Construction Co., Ltd.
Cable cover tiles.—Doulton & Co., Ltd., Hall & Rogers, G. Woolliscroft and Sons, Ltd.

Margate.—The Education Committee. Electric lighting \tallation at the Girls' Central School and Gymnasium :—
A. F. Dunkley (accepted), **£235.**
E. A. Pinto, £223.
W. J. Cannon & Co., £223.
C. Hayward & Son, £237.
E. Saunders, Ltd., £256.
H. S. Tett & Co., Ltd., £260.
Baker & Sons, £319.

Sheffield.—Electricity Committee. Accepted:—
Three 500-kVA transformers (£1,169) and one 500-kVA transformer, Scott-connected (£502).—British Electric Transformer Co., Ltd.
Twelve 8-way, 3-phase, 4-wire feeder pillars (£633).—Messrs. W. Lucy and Co., Ltd.
Erection of sub-station in Benly Lane (£1,093).—Messrs. Wellerman Bros., Ltd.

Stretford.—Electricity Committee. Accepted:—
Increasing the capacity of the ash bunker (£394).—H. Simon, Ltd.

Winchester.—City Council. Accepted:—
Extensions to the electricity works (£3,489).—Wise & Lansdell, Ltd.

Forthcoming Event.

British Association for the Advancement of Science.—At Southampton. From August 26th to September 2nd. Ninety-fifth annual meeting.

Notes.

District Apprentice Training Scheme.—We learn from *Machinery* of an interesting scheme in connection with apprenticeship training which is being developed in Milwaukee, U.S.A., where a "district apprentice system" has been inaugurated. A group of shops in a given locality, or in a certain district of a large city, co-operate in the training of apprentices, who are transferred from shop to shop to obtain diversified training. The speciality shop may take them for only a few weeks, teaching those processes that are highly developed in its plant. The small shop takes them in hand for training in the processes likely to be more highly developed in a small organisation than in a large one. In this way all the shops in a certain locality aid in developing an all-round mechanic, each one bearing its share of the burden of providing for the supply of future skilled machinists, and none can offer the excuse that the special conditions under which it operates make it impossible to carry its share of this obligation. The apprentice also profits by obtaining a more all-round training than he would be likely to get in a single shop.

The Professional Classes Aid Council.—Annual Report.—The report of the Council for the past year shows that applications for help received during the year numbered 686, and financial assistance was given to 150 families, affecting 344 individuals; 305 other applicants were advised where to obtain help. Special attention was given to education and training, as the most satisfactory branches of expenditure; 200 boys and girls were helped with school fees, outfit, and in some cases maintenance, and 41 persons were in training. In many cases help given in emergency for a short period enabled the person to regain employment, and the Council was successful in obtaining pensions from other sources in several cases. The expenditure increased from £6,645 to £8,388, resulting in a deficit of £880. The Council would welcome contributions sent to the Secretary, 251, Brompton Road, London, S.W.3.

Marine Direction-finder Improvement.—An improvement in ships' direction-finding equipment has been made by the Marconi International Marine Communication Co., Ltd. It consists of the replacement of the large double-loop aerial system by two fixed-frame aerials, which are mounted in a light wooden framework, measuring 8 ft. in height by 4 ft. wide. The two frames are fixed permanently at right angles to each other, one being parallel to the fore and aft line of the ship, and the other athwart-ships. The aerials are formed by a number of turns of stranded wire, the ends of the loops being taken through insulated connections to the direction-finding instrument. This development obviates the use of expensive fittings in the way of posts or stays to support the aerials and allows great latitude in the position of the direction-finding instrument itself, for it is not necessary to install the instrument immediately under, or even adjacent to the aerial system. The two recent additions to the Cunard fleet, the *Alaunia* and *Carinthia*, have both been equipped with this new direction-finding installation, bringing the number of Cunard ships carrying Marconi direction-finding apparatus up to 15, while 10 other ships have been or are being equipped.

A Russian Diesel-Electric Locomotive.—According to our Russian contemporary *Elektritschestwo* a new Diesel-electric locomotive has recently been put into operation on the "Oktober," formerly known as the Nicolai, railway. It has been built to the designs of Prof. Haekel, of Leningrad, and except for the engine and roller bearings is entirely of Russian construction. The motive power is supplied by a Vickers ten-cylinder engine of the four-stroke, non-reversible type, and is stated to develop 1,030 h.p. at 935 r.p.m. It is located in the centre of the locomotive and drives a generator at each end. Normally the two generators are designed to give 1,500 amp. at 380 V, but at low speeds, that is, under 19 m.p.h., they are run in parallel to give 3,000 amp. The locomotive has altogether 24 wheels—a leading and trailing pair and ten axles, arranged in groups of three, four, and three, each driven by an electric motor, the ten motors working in parallel. The engine is started by one of the generators, which can be made to run as a motor when it is supplied with current from a 600-Ah, 110-volt battery of accumulators. The locomotive can be driven from either end, the controller being adapted to give 13 parallel and 7 series working positions. The total weight of the machine is 180 tons.

New Aluminium Alloys.—The *Zeitschrift fur Metallkunde* states that the Frankfort Metal Bank, of Frankfort-am-Main, has lately introduced two new aluminium alloys known as "Seleron" and "Aeron," which are claimed to be specially useful for the manufacture of electrical apparatus. The alloys consist of 85 per cent. aluminium, the balance being made up of Cu, Ni, Zn, Mn, Si and lithium; it is the latter element which is stated to give the alloys their great elasticity and hardness. The melting point is stated to be 600 deg. C., the specific gravity between 2.8 and 3, and the limit of elasticity 10 to 20.

C.T.A.A. Dinner.—It will interest many of our readers to know that the Chief Technical Assistants' Association has arranged for a dinner in honour of two members who have recently been appointed borough electrical engineers—Messrs. John H. Parker and William Weekes. The dinner will be held in the St. Dunstan's Room, Anderton's Hotel, Fleet Street, on Saturday, August 29th, at 6.30 p.m.

A 5-ton Electric Tractor.—The latest production of Messrs. Richard Garrett & Son, Ltd., Leiston, is an electric tractor capable of hauling a trailer with a load of 5 tons. Weighing approximately 2 tons, the tractor has a normal drawbar pull of 500 lb. and a temporary maximum of 3,000 lb.; hauling a full load the vehicle can on hard level roads cover a distance of 32 miles on a single charge of the battery.

Trade Facilities Guarantees.—An official paper issued last week states that the guarantees which have been given by the Treasury under the Trade Facilities Acts, 1921-1924, up to June 30th, 1925, amount to £54,452,936. Recent guarantees include £20,000 (guaranteed as to principal and interest) to the St. Austell and District Electric Lighting and Power Co., Ltd., for the erection and equipment of power station and provision of mains; £1,250,000 to the Benguella Railway Co. (guaranteed as to principal and interest for 25 years) for the purchase of rolling stock and railway materials in Great Britain; and £50,000 to the Nottingham Coal Carbonization, Ltd. (guaranteed as to principal and interest for seven years) for the erection of plant to treat coal by a process of low-temperature carbonisation.

The Hydro-Electric Power of Tasmania.—We have received from the chief engineer and manager of the Hydro-Electric Department of Tasmania a publication under the above title. It comprises a well-illustrated and thorough description of the Great Lake hydro-electric development, and of the Tasmanian electricity supply system. Apart from the description of the works, including the constructional operations, considerable space is given to the history of the concern and to the transmission system, &c. The establishment of the plant was due to the foresight of Mr. J. H. Gillies, a Melbourne metallurgist, who in 1908 realised the developments possible by the utilisation of the great water reservoir. He formed a company to undertake the project, but owing to financial difficulties the work was taken over by the Tasmanian Government. The initial installation of 10,000 h.p. was put into operation in 1916, and the station was completed to its present capacity of 52,000 continuous h.p. in 1923. The electrolytic industries which Mr. Gillies aimed to establish, *viz.*, the production of zinc and carbide, are now established, and electrical energy is being distributed over a large area. The rates charged to the electrolytic industries are extremely low; the Electrolytic Zinc Co. has a contract of 30,000 h.p. at £2 per h.p. per annum. The work is published by the Tait Publishing Co. Pty., Ltd., Melbourne, &c., at the very reasonable price of 2s. 6d. There are 60 illustrations, many of which are detailed drawings of the plant.

Parliamentary Loud-speakers.—When the Italian Parliament reopens the Chamber and Senate will be joined by a direct telephone wire, which, by means of microphones and loud-speakers, will permit speeches made in one House to be heard in the other. The microphones will be placed on the orators' tribunes, and the loud-speakers will be at the back of the President's bench. When the two Houses sit simultaneously the device will be switched off to avoid interference

The Italian Electrical Industry.—The development of the electrical industry in Italy has so far proceeded that at the beginning of this year the total plant installed represented 2,107,000 kW, of which 545,000 kW applied to Piemont, 500,000 kW to Lombardy, 205,000 kW to Venice, and 170,000 kW to Umbria. In 1923-24 the total consumption of energy amounted to 6,200 million kWh and it is expected to exceed 7,000 million kWh this year. As to the distribution in the former year, it is reported that the mechanical industries absorbed 51.4 per cent., the textile industry 13 per cent., electro-chemistry and electrometallurgy 11.3 per cent., lighting 9 per cent., the food industries 8 per cent., and traction 7.3 per cent. The aggregate capital invested in the electricity supply industry, comprising about 170 companies, amounts to 5,000,000,000 lire, of which 4,300 million lire is held by the large groups of the S.I.P. of Turin, the Edison group of Milan, and the Adriatica group of Venice.

Versatile Electrical Contractors.—A recent note in the official organ of the E.C.A. appears to confirm a view which is held by a number of people that the day is approaching when every man will be his own electrical contractor. The note quotes two instances of the combination of contracting with other businesses very remote from it. The first presents a chimney sweep who announces on his trade card: "Chimneys swept; electrical installations." The other records a visit of a member of the E.C.A. to the Isle of Wight, where he inspected a dairy in a window of which radio apparatus was displayed for sale. The proprietor described himself as a "Cowkeeper, builder, and decorator."

The "Blackstone" Spring Injection Oil Engine.—We have been informed by Messrs. Blackstone & Co., Ltd., that the "Blackstone" spring injection heavy-fuel-oil engine, which we described in our issue of August 14th, was awarded a silver medal at each of the following agricultural shows held this season: the Royal Dublin Society's Agricultural Show in May, the Royal Lancashire and the Northumberland Agricultural Shows in July, and the Royal National Welsh Show in August. It is claimed that with oils at their present prices, the "Blackstone" engine will develop power at the rate of 50 b.h.p.-hours for 1s.

A Novel Hydro-electric Plant.—A novel type of hydro-electric plant has been set to work by an American firm in Yungan, Fukien, China. It comprises a 36-in. turbine working under a head of 10 ft. and driving a vertical shaft reaching above the dam. Bevel gearing and a belt are used to drive the 25-kVA generator, which is arranged on a lighter moored on the upstream side of the dam. This arrangement was adopted so that the electrical plant would be safe in case of flood. The set lights the native city.—*Indian Engineering.*

Fatalities.—An inquest was held at Greenwich on August 12th into the death of Charles Harwood, assistant switchboard attendant at the Stowage Wharf generating station of the London Electric Supply Corporation. From the evidence it appeared that the deceased was told to attend to an earthing device in a 10,000-V switch room. As he was absent a long time fellow workers went to the room and found Harwood lying on the floor with burns on the fingers of one hand. The inquest was adjourned.

At the City of London Coroner's Court on August 12th, Mr. F. D. Thomas held an inquest into the death of George W. Stimson, who was killed while engaged in the construction of the new Post Office tube which will connect the head office with the principal London railway termini. Major J. R. Kingston said that the deceased man, who was travelling with six others in a trolley, must have raised his head and have been caught by the top of the tunnel. Although the work had been in progress for three years, with men constantly travelling in this manner, this was the first fatality. A verdict of "Accidental death" was recorded.

Smoke Abatement Conference.—The ever-increasing interest in the problem of securing a purer atmosphere, with its resulting benefits, will receive a further impetus from the Smoke Abatement Conference to be held at the Palace Hotel, Buxton, in the autumn. This meeting, which is to take place during the week-end, October 2nd to 5th, is being arranged by the Smoke Abatement League of Great Britain, 33, Blackfriars Street, Manchester, and support is promised from many influential quarters. Certain practical proposals for reducing both domestic and industrial smoke are being prepared by the League for full consideration by those attending, and prominent individuals have agreed to open the discussions at the various sessions. It is hoped that a constructive programme of useful work will be initiated, the results of which can be reviewed at the Smoke Abatement Exhibition and Conference to be held at Birmingham in 1926.

Appointments Vacant.—Junior cable engineers to fill positions of mains clerks of works for Hackney Borough Council Electricity Department; second assistant engineer in the Electricity Department of Worthing Corporation; combustion engineer or efficiency man at the Pigeon House electricity works for the Dublin Corporation; plumber-jointer for the Radcliffe Urban District Council electricity department; draughtsman, £160 + bonus, for the Royal Aircraft Establishment, South Farnborough. (See our advertisement pages to-day.)

Educational.—The 1925-26 session of the Engineering Day College of the Northampton Polytechnic Institute, St. John Street, E.C.1, commences on September 28th. (See our advertisement pages to-day.)

Electrical Development in Alsace-Lorraine.—The *Electric World* says that the electrical industry of Alsace-Lorraine pa a much higher wage scale than prevails throughout the re of France. This is considered a handicap, and legislation regulation to remove it is sought by the producers and di tributors of electricity. The electrical companies of Alsac basing their average wage scale on the rate in vogue Strasburg in 1914, have paid an average wage since 19 which shows an increase of 270 per cent., whereas the i crease in the rest of France is but 155 per cent. In 19 346 million kWh was distributed in this province, again 291 millions in the proceding year. The Franco-Swiss agre ment with respect to the regulation of the flow of the Rhi river by a dam at Kembs will largely increase the possibilit of producing electrical energy throughout the region, whic it is asserted, will accordingly become that part of Fran where the use of electrical energy will see its highe development.

Electricity in Large Brick Field.—According to t *Electrical World*, the Brisch Brick Co., Stickney, Ill., is buil ing a plant with a capacity for eight million bricks p month, in which 1,000 h.p. of electric motors will be installe Among the motor-driven machines will be an electric dr for handling clay from the pits. The consumption is estimat at 13 kWh per thousand bricks. The supply will be taken fro the Public Service Co. of Northern Illinois by means of 33,000-V line.

Ship Electric Lighting.—The s.s. *Hildebrand*, one of t Booth Line, is fitted throughout with "Osram" electr lamps. The saloon is illuminated by 100-V, 40-W "Whi Osrams," and ventilated by "Freezor" fans.

Thin Leaf Metals.—According to the *Financial Times*, Pr fessor Mueller, of the Reich Physical and Technical Institu in Berlin, has succeeded in producing leaf metals of hither unattained thinness. He has obtained gold leaf, silver le steel leaf and copper leaf a millionth of a centimetre thick a completely transparent. The invention is regarded as being great importance for technical work.

New Guatemalan Railway.—Some further particulars a now available regarding the electric mountain railway whi is to be built between San Felipe and Quezaltenango on t Pacific Ocean side of Guatemala, the contract for whi has been secured by the A.E.G., of Berlin, Germany. T necessary power is to be supplied by a hydro-electric stati with an original capacity of 5,600 h.p., but capable of bei later extended to 14,000 h.p. The line will have a length about 28⅛ miles, in the course of which it will rise from altitude of 1,640 to about 9,840 ft. above sea level. It mainly intended for the transport of the coffee grown on t high lands in the Quezaltenango district.

A New Type of Hack-saw Blade. — Messrs. Fr (London), Ltd., inform us that, as the result of a new machi which they have recently perfected, they are putting on t market a new type of hack-saw blade, the "Exray Flex." is claimed that this blade is without any hard-defined porti liable to break off, and owing to a more uniform hardeni process, has stood tests more severe than the usual blade called upon to stand. It is further claimed that the blade c be bent in a coil of about 1 in. diameter and then uncoi without any fracture in any portion of it; also that it d not require the experience of a trained mechanic in u

Coal v. Electricity on the Swiss Railways.—Under t above title the United States Commercial Attaché at Pa recently reported that the high cost of water-power devel ment in Switzerland had rendered it questionable whet hydro-electric power was really cheaper than coal for r ning the Swiss Federal Railways. "The use of water pov is unquestionably desirable in theory, since such a devel ment would remove from the trade balance a large part of of the most important of the import items—coal—and t contribute to the economic and political independence of Sw zerland. Looked at from a commercial point of view, h ever, electrification may be bad business if, for a long peri operation costs are greater than would be involved in contin use of steam locomotives." It was shown that coal prices l fallen since electrification had been decided upon and w still decreasing. "Under these circumstances, with alre heavy fixed charges, decreasing traffic, and high freight a passenger rates, it is obvious that the demand for a revis of the electrification programme, or at least a slowing do of its execution until the economic outlook becomes clea will receive increasing popular support."

Progress of French Railway Electrification Schemes The *Electric Railway Journal* says that the electrification of Paris-Orleans-Bordeaux lines is nearing completion. The li are largely of suburban or interurban classification, the l stretches over which it was proposed to run the Fran Spanish international expresses being relegated to a m remote future. The company has erected a locomotive shop Vitry-sur-Seine in suburban Paris for the equipment and re of its electric locomotives already in service on the Austerl Juvisy and Bretigny-Dourdan lines, and a new secti Bretigny-Juvisy, is soon to have its energy from a new s station. During the past year the company has received electric locomotives, three electric motor-cars, 34 passen cars and nine freight cars, for its electric lines. Delivery expected soon of 195 electric locomotives, 77 electric mo cars and 76 trailers.

A Ceylon Hydro-Electric Scheme.—Our Indian correspondent says that an important hydro-electric scheme is being carried out in Ceylon. The necessary water is to be obtained from the Aberdeen and the Laxapana rivers, both of which rise in the central plateau of the Island, at an elevation of some 7,000 ft. They fall rapidly in gradually converging valleys, until they meet and form the upper reaches of the Kelaniganga at an elevation of about 400 ft. Advantage is to be taken of the rapid fall and proximity of these two streams to convey the water by conduits to a point on the ridge dividing the two valleys, where the combined flow can be concentrated and led down the hillside in pipes to the power-house. In the first instance a gravity section masonry dam is being built on the Kehelgamu-oya; this will impound sufficient water to deal with the daily peak load of over 40,000 kW at minimum flow. The intake to the outlet conduit is to be placed 150 yd. above the dam. The conduit will be able to carry enough water to provide for a peak load of 50,000 kW. The forebay is to consist of a tunnel driven through Morahenaganga Hill, terminating at the outlet end in a built penstock chamber or surge tank, the outer walls of which will carry the penstock sluices. This chamber will be divided into two by a wall, and each half of the chamber will have its own inlet and scour valves, so that either may be closed for cleaning, or when otherwise necessary, without interfering with the other. Steel pipes 40 inches in internal diameter will connect the surge tank with the power-house. At first only two lines of pipes are to be laid, but for the full scheme there are to be six. The length of the pipes, from the forebay to the power-house, will be 5,250 ft. and the vertical fall 2,050 ft. The spot chosen for the power-house is 50 feet above the highest recorded point reached by the river when in flood. Rock foundations are situated at a depth of 50 ft. below the surface of the ground. The initial capacity of the station will be 12,000 kW as a 24-hour load. Work for the second stage will include the construction of a reservoir at Glencairn; the extension of the penstock chamber; the laying of an additional line of 40-in. pipes; and the extension of the power-house, generating plant, &c. At the completion of the second stage the power-house will be able to supply 34,000 kW as a 24-hour load, the total capacity of the plant installed being 52,000 kW. In stage 3 the flow from the Laxapana or Maskeliya-oya Valley will be taken in, the result being that the capacity of the power-house will be more than doubled, the total capacity of the plant installed being 104,500 kW, and the total 24-hour output raised to 71,300 kW. It is expected that the first stage will be completed in from three to four years. The other two stages will be proceeded with as and when the demand for power warrants their being undertaken.

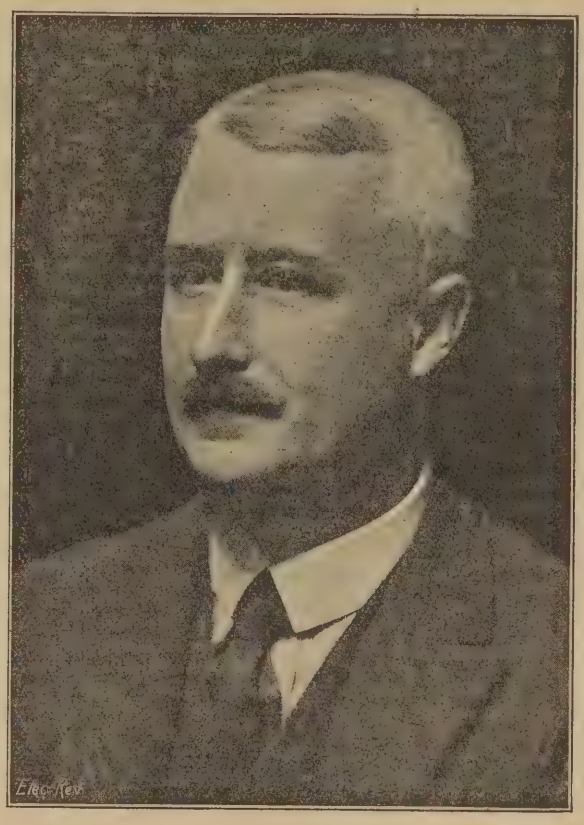
South Canadian Electrical Development.—We learn from the *Electrical World* that the Southern Canada Power Commission has completed the installation of six 5,000-h.p. units at Hemming's Falls, near Drummondville, Quebec. Several H.V. transmission lines are also nearly completed. These will supply energy to all the more important districts on the south side of the St. Lawrence by two separate lines, thereby minimising the possibility of interruption, and improving the service. The company has recently completed a sub-station at Richelieu connecting with the system of the Montreal Light, Heat & Power Co.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

The York Corporation Electricity Committee recommends that Mr. Ernest M. Pearson, of Lancaster, be appointed chief assistant technical engineer, at a salary of £450 per annum.

Colchester City Council has appointed Mr. W. H. Soulby as tramway manager, in succession to Mr. R. C. Bullough, at a salary of £350 per annum.



Mr. E. R. Briggs, who has been with the English Electric Co., Ltd., for many years and has been chief mechanical engineer, has been appointed to succeed Mr. H. F. Hemmings as works manager at the Willans Works, Rugby.

Sir Henry Maybury, Director-General of Roads, and chairman of the London Traffic Advisory Committee, left this country on Saturday last on a visit to study traffic conditions and the methods of dealing with them in the principal cities of the United States.

Mr. L. M. Jockel, A.M.I.E.E., chief assistant engineer at Willesden electricity works, is leaving the North Metropolitan Electric Power Supply Co. at the end of the current month to take up the position of station superintendent at the Nottingham Corporation's new "super station" at North Wilford. Last year Mr. Jockel was elected vice-chairman of the Junior Institution of Engineers, of which he is one of the most active members.

Mr. W. Wilde, charge engineer at the Horden "B" power station of the Newcastle-on-Tyne Electric Supply Co., Ltd., has been appointed charge engineer at the Lancaster Corporation electricity works.

The accompanying portrait is that of Mr. V. Watlington, who is acting as managing director of the English Electric Co., Ltd., during the absence on leave of Mr. P. J. Pybus. Mr. Watlington was educated at Bedford Grammar School and, later, at the City and Guilds Engineering College under Prof. W. E. Ayrton. He obtained the A.C.G.I. diploma in 1896. Upon leaving college he joined Messrs. Robert Blackwell and Co. and was engaged on the construction and equipment of tramways in all parts of the United Kingdom. In 1906 he founded the firm of Watlington & Co., which specialised in the supply of tramway materials. This firm was subsequently absorbed by the Siemens & English Electric Lamp Co., Ltd.,

Gainsborough Studio,] *[London.*

Mr. V. Watlington, M.B.E., A.C.G.I., M.I.E.E.,
Acting Managing Director of the English Electric Co., Ltd.

of which Mr. Watlington is a director. He joined Messrs. Dick Kerr & Co., Ltd., as sales manager in 1911, and when the English Electric Co., Ltd., was formed in 1919 he was appointed general sales manager. Mr. Watlington has been chairman, since its inception, of the Revising Committee of the B.E.A.M.A., which has standardised general contract conditions for the electrical industry. He is a Member of the Order of the British Empire and of the Institution of Electrical Engineers.

The Leeds Corporation Electricity Committee has made the following staff promotions: Mr. H. Topham, from shift engineer to assistant mains engineer (Grade 8a); Mr. T. Hewson, from assistant shift engineer to shift engineer (Grade 8a); and Mr. R. Rogers from assistant switchboard attendant to assistant shift engineer.

Mr. J. G. M. Hilton, who is well known in Indian electrical engineering circles, has been appointed sales engineer in the Far East for Messrs. Johnson & Phillips, Ltd. His headquarters will be in Singapore, and his address for the present is c/o the company's commercial agents, Messrs. Sime, Darby and Co., Ltd., Singapore.

Obituary.—Mr. E. P. Simpson.—The death occurred at a nursing home on August 12th of Mr. Edward Percy Simpson, a director of Worthington-Simpson, Ltd.

Mr. A. A. Kent.—The death is reported of Mr. A. A. Kent, who was for many years inspector of telephones in the Uxbridge district.

Mr. A. E. Mills.—*The Times* reported the death, on August 15th, of Mr. Alfred Ernest Mills, M.A., M.I.E.E., at North Finchley. Mr. Mills was a Fellow of the Physical Society and a consulting engineer.

Sir Adam Beck.—The death occurred at London, Ontario, on August 18th, of Sir Adam Beck, LL.D., who had been suffering from pernicious anæmia for some time. Sir Adam was a powerful figure in Canadian politics, particularly in the province of Ontario, but it was as chairman of the Hydro-Electric Power Commission that he was known to our readers. Although a Conservative in politics, he was a vigorous proponent of the public ownership of the abundant water power with which Ontario is blessed, including the Canadian side of the Niagara Falls. From his *début* as a cabinet minister in the Ontario Government, in 1905, right up to his death he directed in the ablest manner the hydro-electric affairs of the province, and the huge undertaking, whose latest

report is by a coincidence reviewed in this issue, is a lasting monument to his courage and ability. Sir Adam, although of German descent, was a native of Ontario and thoroughly Canadian in his outlook. He was knighted in 1914 in recognition of his services in connection with the treatment of tuber-

The Late Sir Adam Beck, LL.D.,
Chairman of the Hydro-Electric Power Commission of Ontario.

culosis. He was a horse breeder of note, and during the war acted as Director of Remounts to the Canadian forces.

Sir Adam contributed a special article on Canadian water power to the Jubilee Issue of the Electrical Review in November, 1922.

Mr. W. M. Milnes.—We regret to hear that Mr. W. Mayall Milnes, A.M.I.E.E., M.Inst.T., general manager and engineer of the Wigan Corporation Tramways, passed away recently while on holiday. Mr. Milnes was formerly assistant engineer and manager of the Coventry tramways.

Will.—The late Mr. R. H. Best (chairman of Messrs. Best and Lloyd, Ltd., Birmingham) left £85,280 gross and £82,746 net personalty.

New Companies Registered.

Thames Welding Co., Ltd. (207,800).—Private company. Registered August 10th. Capital £5,000, in £1 shares. Objects:—To carry on the business of electric arc and oxy-acetylene cutters and welders of metal and alloys, smiths, founders, workers, manufacturers of and dealers in all kinds of metals or electrical appliances, &c. The subscribers (each with one share) are:—A. J. Markwell, 38, Bellingham Road, Chesham, Bucks., clerk; and F. H. Davies, 39, Middleton Road, Dalston, E.8, clerk. The first directors are not named. Secretary (pro tem.): A. J. Markwell. Solicitor: Frank Budd, Devonshire Chambers, 146, Bishopsgate, E.C.2. Registered office: 146, Bishopsgate, E.C.2.

W. J. Henderson & Co., Ltd. (207,768).—Private company. Registered August 8th. Capital £3,000, in £1 shares. Objects:—To acquire the business carried on at 351, Fulham Road, S.W., as W. J. Henderson & Co., to adopt an agreement with W. J. Henderson and A. F. Phelps, and to carry on business as radio manufacturers, factors, merchants, dealers in hardware metal, and other merchants' requisites, &c. The directors are:—A. F. Phelps, 3, The Drive, Hove; W. J. Henderson, 351, Fulham Road, S.W.; R. M. Dillon, 49, Centurion Road, Brighton. Qualification: £10. Solicitors: Darling & Taylor, 7, New Square, Lincoln's Inn, W.C.2. Registered office: 351, Fulham Road, S.W.

Wheatley, Smith & Co., Ltd. (207,788). Private company. Registered August 10th. Capital £1,500, in £1 shares. Objects:—To carry on the business of motor, mechanical, wireless, and electrical engineers, founders, &c. The permanent directors are:—S. M. Wheatley, 86, Nightingale Lane, Wanstead, E.11, radio engineer; J. L. Smith, 22, Nightingale Lane, Wanstead, E.11, radio engineer. Qualification: £150. Remuneration as fixed by the company. Secretary: S. M. Wheatley. Solicitor: Arthur A. Banes, London. Registered office, 170, Strand, W.C.2.

Radio Supply Co., Ltd. (207,815).—Private company. Registered August 11th. Capital £1,000, in £1 shares. Objects:—To acquire the business of dealers in radio apparatus, components, parts, and accessories for radio transmission and reception carried on by R. L. Hazlemen, A. MacKinnon, and J. A. G. MacKinnon, at 22, Medway Street, Chatham, as the "Radio and Electrical Supply Company." The subscribers (each with one share) are:—R. L. Hazlemen, 22, The Paddock, Chatham, Kent, financier; A. MacKinnon, 66, Barnsole Road, Gillingham, marine engineer; J. A. G. MacKinnon, 66, Barnsole Road, Gillingham, electrical engineer. The permanent directors are R. L. Hazlemen and A. MacKinnon. Qualification: £100. Remuneration: £100 per annum divided between them. Secretary: R. L. Hazlemen.

Gregson & Partners, Ltd. (207,843).—Private company. Registered August 12th. Capital £10,000, in £1 shares. Objects:—To carry on business as chemical, electrical, gas, civil, constructional, and mechanical engineers, erecting and manufacturing contractors, &c. The first directors are:—E. P. Taudevin, 74, Endcliffe Edge, Sheffield, engineer; C. Gregson, Edenthorpe, Tapton Park Road, Sheffield, engineer; and J. O. Taudevin, Endcliffe Edge, Sheffield, engineer. The first two are permanent. Qualification of permanent directors, 1,000 ordinary shares; of ordinary directors, ordinary shares. Remuneration (except managing director) as fixed by company. Solicitors: Broomhead, Wightman & Reed, 14, George S Sheffield.

The Nelson Electric Co., Ltd. (207,770).—Registered a public company on August 8th with a nominal capital of £50,000 shares. Objects:—To acquire the business of a manufacturer of, and in valves and electric light bulbs carried on by the Notable Electric Ltd., with all the assets thereof (including any patents to which F. W is entitled), and to manufacture, assemble, erect, install, equip, mai repair, and deal in wireless, telegraphic, and telephonic apparatus, mag and radio-active instruments, &c. Minimum cash subscription: 7 shares. directors are:—Sir Wm. D. Henry, 60, Bickenhall Mansions, W.1, cha Anglo-Oriental and General Investment Trust, Ltd.; W. H. Edwards, tingley," Kingston Hill, Surrey, director, Tavoy Tin Dredging Corpor Ltd.; F. Warner, "The Lawn," Merton Road, S.W.19, managing di Notable Electric Co., Ltd.; A. E. Wallenburg, Berkeley Hotel, W.1, n engineer (naturalised British subject of Swedish origin). Qualification, Remuneration as fixed by the company. The directors may borrow up nominal amount of the capital for the time being. Solicitors: Mawb Barrie, 101, Salisbury House, London Wall, E.C.2. Registered office Salisbury House, E.C.2.

Benson Super Power Corporation (2,448 F).—Particu filed on August 6th pursuant to Section 274 of the Companies (Consolid Act. The capital is $55,000,000 in 5,500,000 shares of $10 each ($5,0 preferred stock and $50,000,000 common or general stock). The compan incorporated in Delaware on July 13th, 1922, to acquire the property, and privileges of the Benson Engineering Corporation of Delaware. principal place of business is at Georgetown, County of Sussex, Dela The British address is at Crosshaven, Sidcup, Kent, where W. H. T. Ga authorised to accept service of process and notices on behalf of the con The directors are:—W. H. T. Gahan; R. Rowland, "Eastwood," S C. W. Oliver, "Okanagan," Sidcup; C. H. Vickers, 274, Elgin A Maida Vale, W.; and R. F. Rubinstein, 6, Blandford Road, W.4.

Official Returns of Electrical Companies.

Folkestone Electricity Supply Co., Ltd. (51,825).—Ca £150,000 in £1 shares (100,000 ordinary and 50,000 preference). Return April 10th, 1925. All shares taken up and paid for in full. Mortgage charges, £99,100.

International Wireless Manufacturers, Ltd.—Issue February 21st, 1925, of £1,300 debentures, part of a series already regi

L. Weekes, Ltd.—B. T. Crew, C.A., of George S West, Luton, was appointed receiver and manager on August 1st, 1925, powers contained in debentures dated May 26th, 1912, and July 16t November 13th, 1919.

Ledion, Ltd.—W. C. Todd, of 3, Cannon Street, E ceased to act as receiver and manager on July 31st, 1925.

Clear Hooters, Ltd.—Particulars filed of £2,500 de tures authorised July 16th, 1925, charged on the company's undertakin property, present and future, including unpaid capital and calls and li of members, the amount of the present issue being £1,200.

Llanelly and District Electric Supply Co., Ltd.—Mort by sub-demise dated June 16th, 1925 (supplemental to trust deeds dated 3rd, 1911, November 11th, 1912, November 30th, 1916, and February 9th securing £300,000 debenture stock), charged on certain lands near North Llanelly. Trustees: Century Insurance Co., Ltd., 18, Charlotte Square, burgh.

"Ego" Engineering Co., Ltd.—W. A. J. Osborn 119, Finsbury Pavement, E.C., was appointed receiver on August 5th powers contained in debenture dated May 7th, 1925.

Pressland Electric Supplies, Ltd.—Issue on August 1925, of £1,500 debentures, part of a series already registered.

Mid-Cheshire Electricity Supply Co., Ltd.—Satisfacti full on May 14th, 1925, of letter of deposit with title deeds dated July 1925, securing all moneys due or to become due on special loan acco the Westminster Bank, Ltd.

Receptors, Ltd.—Issue on July 28th, 1925, of £500 d tures, part of a series already registered.

Oriental Telephone and Electric Co., Ltd. (40,69 Capital, £900,000 in 600,000 ordinary and 300,000 preference shares each. Return dated July 3rd, 1925. 428,941 ordinary and 188,971 pre shares taken up. £338,660 10s. paid on 149,857 ordinary and 188,791 ence, including £12 10s. paid on 50 ordinary shares forfeited. £279,08 sidered as paid on £279,084 ordinary shares. Mortgages and charges, £1

Beck & Moss, Ltd. (69,298).—Capital £2,500, i shares. Return dated March 4th (filed May 5th), 1925. All shares tak £525 paid. £1,975 considered as paid. Mortgages and charges, nil.

W. H. Allen, Sons & Co., Ltd. (66,440).—C £500,000 in £1 shares. Return dated June 8th, 1925. 408,750 shares up. £58,757 paid. £349,993 considered as paid. Mortgages and c £49,000.

Cross & Cross, Ltd. (105,754).—Capital £20,000, i shares. Return dated June 23rd, 1925. 10,000 shares taken up. £4,84 £5,155 considered as paid. Mortgages and charges, nil.

Electric Zinc Co., Ltd. (127,838).—Capital £2,000,0 400,000 preference and 1,600,000 ordinary shares of £1 each. Return December 31st, 1924 (filed June 6th, 1925). Seven ordinary shares tak Nil paid. Mortgages and charges, nil.

Hillingdon Screw & Manufacturing Co., Ltd.—Debe dated July 31st, 1925, to secure £600, charged on the company's under and property, present and future, including uncalled capital. Holder: Baker, "Hartfield," Mycenae Road, Blackheath, S.E.

W. J. Furze & Co. (121,420).—Capital £35,000, in cumulative preference and 26,000 ordinary shares of £1 each. Return May 13th, 1925. 9,000 preference and 21,029 ordinary shares take £10,735 paid on 10,735 ordinary shares. £19,294 considered as paid o preference and 10,294 ordinary shares. Mortgages and charges, nil.

West Coast of America Telegraph Co., Ltd. (52,11 Capital, £232,520 in 53,008 ordinary shares of £2 10s. and 100,000 pre shares of £1. Return dated May 26th, 1925. 45,008 ordinary and preference shares taken up. £100,020 paid on eight ordinary and preference. £112,500 considered as paid on 45,000 ordinary shares. Mo and charges, nil.

Chislehurst Electric Supply Co., Ltd. (50,980).—C £15,000 in £1 shares. Return dated April 20th, 1925. All shares tak £15,000 paid. Mortgages and charges, £7,000.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Wellman Smith Owen Engineering Corporation, Ltd.

The annual meeting was held on August 11th. Mr. F. N. Pickett, A.M.I.E.E., who presided, said that their hope of maintaining the ten per cent. dividend had been disappointed; after paying an interim dividend of 5 per cent. they were unable to recommend any final dividend. The position was due to the failure of several important and remunerative prospects, and the conditions still indicated necessity for the strictest economy. The company had acquired a controlling interest in its parent company, the Wellman-Seaver-Morgan Company, of Ohio, to prevent the latter company from entering into an amalgamation which seemed likely to prove unfavourable to the Corporation. Negotiations were proceeding for the commencement of the production of special welded tube-producing machinery and they were encouraged to hope for excellent results owing to recent developments in the manufacture of hollow steel ingots. They had manufactured for a subsidiary, the Wellman Seaver Rolling Mill Co., Ltd., a very modern tube plant which had been installed at Sheffield and was working satisfactorily, and they had also completed the work of assimilating the American designs of coke-oven machinery and gas producers. The prospects for the future depended largely upon the state of the iron and steel industry in this country.

Tyneside Tramways and Tramroads Co.

The half-yearly meeting of this company, whose report was reviewed in our last issue, was held on August 11th. Mr. G. E. C. Henderson, the chairman, said that the traffic receipts had decreased by £1,456, and the profit on the traffic account had fallen to 1,959 from £3,451 for the corresponding period of 924. The directors did not consider it advisable at present to reduce the services, they were hoping for a revival of employment. The chairman attributed the decrease in revenue to trade depression, unfavourable holiday weather, and motor-bus competition. While they had added £1,089 to the reserve and they had spent £1,216 on rolling stock. He regretted that they were unable to recommend a dividend on either preference or ordinary shares. The report was adopted.

South-Eastern Power and Light Co.—This company, which was formed in September last, and acquired certain interests in Alabama from the Alabama Traction, Light and Power Co., has published its first accounts embracing the operation of the properties acquired for the whole of last year, and of the company itself for the last three months of 1924. The gross income is given as $9,810,829 and the net income as $4,911,649. After providing for interest charges, preferred dividends, renewals, obsolescence, &c., there remains a surplus of $1,058,954.

Underground Electric Railways Co. of London, Ltd.—A return covering the period from January 1st to August 8th shows that the traffic receipts of the Common Fund companies (electric railways and motor omnibuses) were £7,863,221, an increase of £438,470 as compared with the receipts for the equivalent period of 1924. On the other hand, the London and Suburban Traction Group (tramways and 'buses) records a decrease of £24,661 in the same period—the revenue being 1,195,055 as against £1,219,716 in 1924.

Burndept Wireless, Ltd.—It is announced that this company, which was formed early this year, has organised the Burndept Wireless Corporation of America with offices in New York. This is the latest subsidiary and the company is now represented in a number of European countries and the Dominions.

East London Railway Co. — The Act transferring the company's undertaking to the Southern Railway Company has now received the Royal Assent. Accordingly steps are to be taken to issue stocks of the latter company to the debenture stockholders and to make the agreed cash payment to holders of consolidated stock. The East London Railway Co. had been in existence for 60 years.

Companies to be Struck Off the Register.—The following companies are to be struck off the register at the expiration of three months unless cause is shown to the contrary:—

Dominion Mica Corporation, Ltd.
Gibaud Magneto Co. (England), Ltd.
International Dowsing Electric Heating and Appliances Co., Ltd.
Lobita, Benguella and Catumbella Light and Power Co., Ltd.
London Electrical Trading Co., Ltd.
Northern Electrical Engineering and Plating Co., Ltd.
Romapac Tramway Construction Co., Ltd.
Tramway (Conduit) Point Syndicate, Ltd.

Fairbairn, Lawson, Combe, Barbour.—An interim dividend of 2½ per cent. has been declared on the preference shares.

Charles Clifford & Son, Ltd.—A dividend at the rate of 10 per cent. per annum, free of tax, has been declared on the ordinary shares in respect of the past half year.

Torquay Tramways Co., Ltd.—The ordinary shares are to receive an interim dividend of 4 per cent., free of tax.

Lancashire Dynamo and Motor Co., Ltd.—The interim dividend is being paid on the preference shares.

Stocks and Shares.

MONDAY EVENING.

THE effect of the recent reduction in the Bank Rate is continuing to make itself felt amongst all the investment markets in the Stock Exchange. Some people hoped, in fact, that the Rate would come down again last Thursday, and that it would be reduced to the round 4 per cent. Although this did not occur, its advent is supposed to be merely delayed, and, until further developments occur in the Money Market, there will be weekly anticipations of a 4 per cent. Bank Rate until this minimum is established. The demand for investment stocks and shares continues to be considerable. For August, the Stock Exchange is decidedly busy. The feature amongst electricity shares is the manner in which the Cable Manufacturing issues continue to forge ahead.

Home Railways are dull. The outlook seems to grow a little more depressing with every Sunday, the day upon which the rift between employers and employés inappropriately grows wider. Jobbers in the market declare that Home Railways are hopelessly unpopular, and admit that it is not surprising, in view of the incessant mutterings of the weekly orators. The rise in the price of domestic coal is a factor that does not make for hopefulness as regards the Home Railway market.

East London Railway quotations have at last disappeared from the pages of the Stock Exchange Official List. Royal Assent has been given to the Southern Railway Act, 1925, and this completes the absorption of the East London into the Southern Railway. Holders of the ordinary stock will receive terms rather better than the last-quoted value of 5¼. With the disappearance of the East London, the tale of the smaller railway lines runs practically to its conclusion. The grouping system may now be said to have attained completion.

Brazilian Tractions spurted 3½ points to 63½ upon the anticipation of an increase in the present 4 per cent. dividend. The company is doing well, as was pointed out when the recent report appeared, and, with rubber at a price which will stimulate Para production, the hope is that Brazilian Tractions may receive 5 per cent. dividend. River Plate Electricity ordinary stock has receded several points to 205. British Columbia Electric Railway deferred is 3 up at 106, upon aggressive demand in a market somewhat short of stock. Mexicans are heavy. Madras Electric Tramways drooped to 16s. 6d.; on the other hand, Madras Electric Supply 7 per cent. debenture has risen to 101½.

Anglo-Argentine Tramways preference gained ground upon the suggested acceptance, by a Buenos Aires Municipal Committee, of the company's scheme for the construction of new city subways. The Anglo-Argentine Tramways and an American company both submitted proposals. The Buenos Aires Committee favours that put forward by the British undertaking. If the Municipality agrees, the Anglo-Argentine Tramways should enter upon a lease of new life, for the long friction between company and city will be replaced by a settled agreement. Both classes of preference shares went better upon the news.

Cable manufacturing issues are an outstanding feature of strength. Rises have occurred in British Insulated, Callenders, Henley's, Metropolitan-Vickers, Siemens and Enfield Cables. Higher dividends are expected in each case. The spasm of weakness which attacked this section a fortnight ago is forgotten. Since then, prices have risen from 5s. to 7s. 6d. Nobody talks, to-day, of the raw rubber advance being likely to curtail the profits of those manufacturers. The market is in a condition of mild exuberance. The price of raw rubber has gone back a little, but rubber is no longer regarded as an element of importance in this department.

Movements amongst electricity supply shares are mostly upward. Several prices have recovered the amounts of the interim dividends deducted last week. Notting Hill preference fell 10s. to 9½ upon a few shares coming in, but other members of the London group keep very hard. County of London ordinary strengthened to 53s. 3d.: the company's new 6 per cent. preference have advanced to 1s. 6d. premium. This makes the price 22s. for the fully-paid, and the senior preference are better at 23s., the latter giving the modest yield of £5 4s. 4d. per cent. upon money invested at the current price.

Cable companies' issues are uninteresting: all the excitement centres around the shares of the construction and equipment concerns. Globe ordinary are a little better at 17½.

Marconis, now ex dividend, continue to be a heavy and neglected market. The price has sagged to 25s., and Marconi Marines drooped to 17s. 6d. Wireless shares are out of favour. Marconi 5½ per cent. debenture stock looks reasonably-priced at 103: there is a half-yearly interest payment due next month. In the iron and steel lists, changes are slight and negligible. Babcocks at 53s. retain their handsome rise of last week.

Standard Guarantees for American Accumulators.—standard ninety-day guarantee on storage batteries and a sta dard rating for radio "A" batteries were adopted at the co vention of the American National Battery Manufacture Association lately held in Chicago. At a previous meeting standard rating for radio "A" batteries was adopted whi was based on a continuous discharge of one ampere, starti with a specific gravity of 1.285 and a temperature of 85 deg. continuing the discharge until a voltage of 1.75 per cell reached. Due, however, to the fact that many batteries on t market are rated on a basis of intermittent discharge, it w decided to adopt a second rating which provides for a dischar of ¼-ampere per positive plate, the discharge to be for fo hours, followed by a rest period of twenty hours, then d charged for four more hours, and so on until the voltage p cell has fallen to 1.75. It was recommended that these ratin be placed on the name plates of all radio "A" batteries. T idea of a standard warranty includes the prospects of eve tually selling all batteries on the same basis on which mot vehicles are sold, where the manufacturer sells his mercha dise on its reputation and makes good defects in mater and workmanship only. The warranty is as follows:—

"We guarantee each new battery manufactured by us to free from defects in material or workmanship under norm use and service; our obligation under the guarantee hei limited to making good at our factory any part or parts ther of which shall, within ninety (90) days after delivery of su battery to the user, be returned to us with transportati prepaid, and which, upon examination, shall disclose to o satisfaction to have been defective. This guarantee shall n apply to any battery which shall have been repaired or open outside our factory or duly authorised service station, n which has been subject to misuse, negligence, or accident.

An Electrically Driven Stone Quarry.

The Leckhampton Quarries Co.'s Undertaking.

...r the Leckhampton Quarries Co., Ltd., is up to date is indi-...d by the fact that all the plant and machinery of this ...ucestershire undertaking is electrically operated. More-...r, the company generates its own electricity by means of a ... type of 3-phase alternator which was described in our ... 15th issue.

...he power station contains two 250-b.h.p. Premier 4-cylinder ... engines, fig. 2, each driving a Hunt 440-volt, 200-kVA, ...ycle, self-paralleling alternator, fig. 1, built by Messrs. ...dycroft, Ltd. The two sets of gas producers were supplied ... Messrs. Crossley Bros., and the auxiliary plant includes an ...compressor and receiver and furnace exhaust fans required ...starting the plant, driven by a small oil engine; a 7½-h.p. ...or drives the fan and pump of the Heenan & Froude cooler ... the main engine circulating water, while water is fortu-

Bullivant) controls the descent of ...ks loaded with limestone and the ...ng of trucks which are sometimes ...ty and sometimes loaded with fuel for the kilns. The ...gauge is standard 4 ft. 8½ in. and the loaded ...s on reaching the marshalling yard at the foot ...e incline are drawn by steam locomotives to the ...R. main line. The maximum loads for which the haulage ...was designed were two 6½-ton G.W.R. trucks, each loaded ... 10 tons of stone (33 tons) down, and either 23 or 15 tons ...according to whether fuel or another load was being raised. ...gave a general out-of-balance load of from 10 to 18 tons ...vour of the drive by gravity, but as the incline is a vary-...gradient, there are certain lengths of the track where driv-...power is necessary; for instance, when the descending load ...arly on the level and the ascending load is on the steepest ...ient (1 in 5). Also considerable torque is required to start the loaded trucks on the level before commencing the descent. The rate of travel is 5 miles per hour.

After the haulage plant had been in operation a few months it was found advantageous to load the trucks with the exact quantities of material ordered, and as such loads varied and were frequently light, the assistance by gavity was reduced and more load thrown on the motor. The motor is a single-speed cascade machine of 80 b.h.p., built by Messrs. Sandycroft, Ltd., to Mr. L. J. Hunt's design, and has proved quite capable of standing short overloads up to 50 per cent., and momentary overloads up to 100 per cent. The speed is controlled by mechanical brakes on the haulage drums and electrical regenerative braking on the motor when the speed exceeds synchronous speed. The controller regulates the resistance in the stator circuit, and when the motor is returning current to the line all controller resistance is cut out. A Heenan & Froude hydraulic brake forms part of the haulage equipment as a standby and safeguard in emergency. The heights above sea level of the hill workings and the power house are 850 ft. and 550 ft. respectively; consequently, the height through which the haulage operates is 500 ft.

On the occasion of our visit there were in operation 198 h.p. of motors of various makes connected to the stoneyard machines, and an overhead travelling cane now nearing completion will take a further 158 h.p., while hydrating plant is shortly to be installed which will require 120 h.p.

The generating plant was guaranteed to give full load at a consumption of 1.35 lb. of anthracite (of 14,500 B.th.u. per lb.) per kWh; also 1.65 lb. at ¾ load and 2.2 lb. at ½ load. We are informed by Mr. H. D. Wilkinson, consultant to the quarry proprietors, that on a full day's test run with fuel of 14,670 B.th.u. per lb., the consumption was 1.27 lb. fuel per kWh at 92 per cent. of full load and 0.98 power factor; 1.45 lb. at ¾ load and 1.53 lb. at ½ load, as against the guaranteed figures (corrected for calorific value) of 1.33, 1.63, and 2.17 respectively. These figures were obtained after deducting the power used for engine cooling (6.6 kW) from the total output, and prove that the plant has a high efficiency in respect of each of the three generating stages in producing electricity from coal.

Interesting Coal-handling Equipment.—An example of modern coal-handling equipment recently installed by Messrs. Fraser & Chalmers engineering works (General Electric Co., Ltd.), at the new power station of the West Gloucester Power Company at Lydney, possesses interesting features, inasmuch as the coal may be conveyed by it direct from the pit head to the boiler-house bunkers; provision has been also made for dealing with coal brought from adjacent collieries by rail. From the colliery screen house a 24-in. inclined Robins belt conveys the coal to a junction tower situated near the end of the boiler house; the coal here changes its direction and, still ascending, is conveyed right over the top of the boiler-house

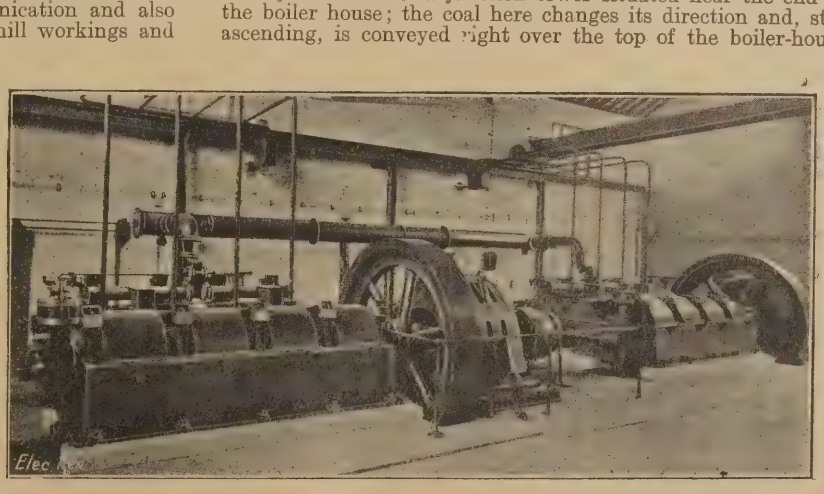

Fig. 2.—Premier 250-b.h.p. Gas Engines.

bunkers; the conveyors run at a speed of about 250 ft. per minute and have a capacity of 100 tons of coal per hour. The cast-iron rollers are mounted on hollow shafts lubricated with solid grease, whilst the "Durabelt" consists of graduated plies of cotton duck cemented together with rubber compound, or "friction" as it is called, the whole being enveloped in a rubber cover; the top cover is further reinforced by means of a special open fabric, which is used to key the top cover to the body of the belt. These belts were individually designed with regard to weight of material, plies of cotton duck, and composition of rubber, to meet the particular services for which they have been installed. The coal on reaching the boiler house is conveyed by a horizontal belt over the bunkers, into which it is distributed by a travelling tripper.

Breakdowns and Failures of Electrical Plant and Equipment.

Contained in the Technical Report for 1924 of the British Engine, Boiler and Electrical Insurance Co., Ltd., are many accounts of breakdowns and failures selected from the casualty list of the year, either because of some interesting peculiarity or as suggestive to makers and users of such plant. From the electrical and allied sections we cite the following cases.

An instance of turbine blading troubles was discovered in a 500-kVA turbo-generator running at 3,000 r.p.m. and working at a steam pressure of 125 lb. per sq. in. and a temperature of 450 deg. F. The turbine was of the Curtis type, with three wheels each containing two rows of blades. As it was noticed that the set failed to give its rated output with the normal steam supply, the turbine was opened out. It was found that the two rows of blading on the first rotating disk were indented at the steam side, the marks being in some cases $\frac{3}{8}$ in. wide, and the blading of the corresponding inlet nozzles was indented at the edge adjacent to the first row of the rotor blading; the intermediate guide blading for the first wheel also was bruised. The damage, which was not caused by distortion, and which did not bear the appearance of having been caused by water, was evidently brought about by the jamming of some foreign substance between the stationary and the revolving blades; the strainer was found in order and no loose part could be found, nor could the cause of the damage be definitely traced. It was seen, however, that there were two small blowholes at the bottom of the cylinder at the high pressure end, the holes being about $\frac{3}{4}$ in. in diameter and $\frac{3}{8}$ in. in depth. It is possible that either small portions of this porous metal or a piece of a core nail from some other part of the casting may have become detached and caused the damage. This case exemplifies the value of the recommendation that a turbine should be opened out at least once a year for examination. It is by no means uncommon, on a turbine being opened up, to find that the blading is damaged.

A case where an alloy ring, for retaining the ends of the armature conductors connected to the commutator, suddenly broke axially along its whole length and caused the wrecking of the generator of a 1,000-kW turbo-generator, is recorded. After being at work carrying half the full rated load, the machine was being shut down in the usual manner; the load had been gradually reduced, the controlling switch for the generator opened, and the steam valve tripped immediately afterwards by the engine driver, who had been awaiting the signal from the switchboard attendant; steam was then shut off. The governor was at the time in good order and no observable rise in speed took place when the switch was opened. When the speed had fallen to about 1,000 r.p.m. the trouble occurred.

The broken ring, which at first continued revolving with the shaft, opened out with the centrifugal force of the portions near the line of cleavage and of the contained windings, and, after shearing the set screws by which a ventilating fan was secured to it at one end, struck the cast-iron field frame, fracturing this also; fragments of the frame were hurled in various directions over the engine house, while the ring itself catching on the field frame was opened still wider and flung clear of the machine with only small pieces chipped off. The connections between the armature winding and the commutator, no longer held down, flew outwards and were broken; the field coils and the armature winding were damaged beyond repair. Fig. 1 shows the end of the field frame after the accident. The ring was 42 in. in diameter and $17\frac{1}{4}$ in. in width; it was pressed on to the armature core at one end, and near the other rested on lugs formed on a drum beneath the conductors. A flange, $3\frac{1}{8}$ in. deep, was cast at the end near the lugs to form one side of the fan, which was situated between the ring and the commutator, the runner of the fan being spigoted into the base of the flange, where it was further secured by fifteen $\frac{3}{8}$-in. steel set screws. Axial and circumferential movement were prevented by twenty dowel pins, screwed into the ring and sliding inside sockets cored in the lugs on the lower drum. The thickness of the body of the metal was about 1 in.; this tapered down to .55 in. near the armature core, where the thickness of the lip was .375 in. The surface speed of the ring, 13,750 ft. per minute, was by no means excessive; the stress at the inside, caused only by its own centrifugal force, would not have exceeded 2.5 tons per sq. in. and at the inside of the flange 2.75 tons per sq. in. The total running stress would have been well within the safe working limit for a sound casting.

An investigation was carried out to determine the cause of the failure, and microscopic examination showed that the material was of an excessive grain size. All the specimens examined showed a large amount of oxide inclusion and a number of small blowholes, which were distributed throughout the metal; in addition, there were, locally, cavities of appreciable dimension. Considerable difficulty was experienced in polishing the specimens owing to foreign matter, which exuded from the cavities and scratched the surface. Sections, examined both along the principal axial fracture and along a small longitudinal crack which branched off from this, showed that the fractur were in several positions inter-crystalline in character owi to the local weakness at the boundaries caused by defects. several places the cracks passed through large cavities a areas containing the gamma compound; one area of this natu is shown by a photomicrograph to possess a crack commenci at a cavity in one of the white-coloured grains, and runni into the fractured edge at a similar grain. The material prov defective owing to the metal having been cast at too high temperature and allowed to cool too slowly.

In another case, perished and brittle insulation on the arm ture coils resulted in a breakdown on a 1,500-kW, 0.8 pow factor turbo-alternator, three-phase, 11,000 volts, 50 cycl 1,500 r.p.m. The stator insulation was uniform throughou the insulation on the conductors and the partition insulati in the slots between the two rows of conductors not bei reinforced at the terminal ends. A serious burn-out occurr owing to an arc being set up in the stator end windings, t tween the top two conductors in the first slot connected to o of the terminals on the machine; the arc jumped to earth one of the clamping bolts, severing the leading-out conduct and the end turns of the conductors of the neighbouring s on the same phase, across which the former was bound. T machine caught fire and the flames, fanned by the draug were carried round the windings; all the insulation, at t exciter side, of both the stator and the rotor was burnt co

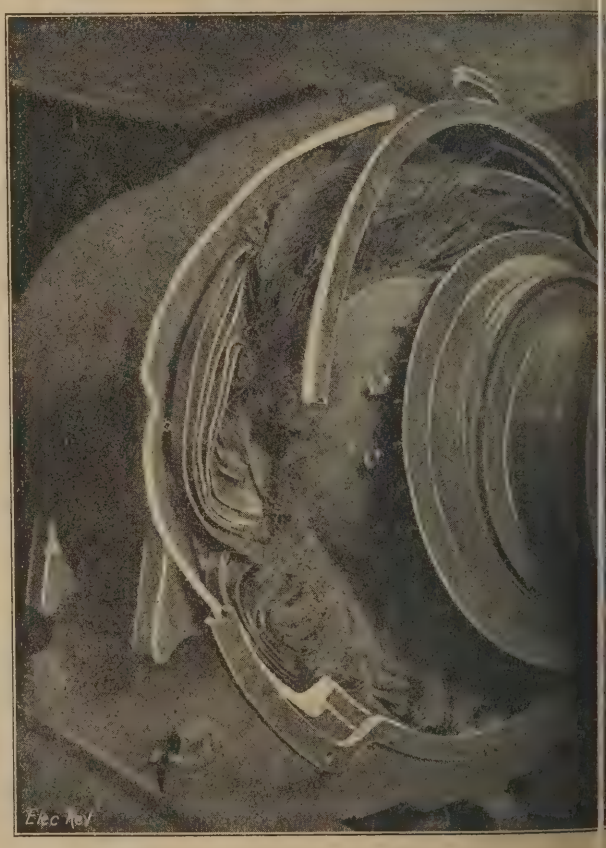

Fig. 1.—The 1,000-kW. Damaged Generator.

pletely through. The complete generator had to be retur to the makers for re-winding. The burn-out was caused the insufficiency of the partition insulation between the rows of conductors in a slot.

An accumulation of dirt in the rotor windings resulted a breakdown on a 750-kW turbo-generator, 400 V, three-ph 50 cycles, 3,000 r.p.m. It was noticed, immediately bef stopping time, that undue vibration was taking place. the following morning considerable difficulty was experien in maintaining the alternator voltage, and smoke was s issuing from the air outlet. When the end covers of the al nator were removed, it was seen that the smoke was com from the ventilating ducts in the rotor core; this contin for four hours. A test of the rotor windings, made after smoke had subsided, showed the very low insulation resista of 0.001 megohm. The rotor was returned to the mak works, where the end bells were removed, and the coils ex ined and tested. The tests this time showed perfectly nor results, but it was discovered that a short circuit had ta place between the lower turns of a group of coils and the l ing-out strip to the slip rings. The improved test had c about owing to the removal of the end bells; this had allo the faulty turns, which normally were pressed against leading-out strip, to spring outwards and create a clear

ace. All the windings of the machine had suffered from the cumulation of dirt, and the insulation of the rotor was found have perished considerably. The dirt consisted mainly of ne and iron, the latter being present, in a large measure, the form of sulphide. The air intake for the machine was the vicinity of the ash tip and the coal chute for the boilers, e opening being only protected from the dust-laden atmo-here by means of sheets of perforated metal. The rotor was mpletely stripped and re-wound, and the installation of an -filter was recommended.

A breakdown on a 400-kW turbo-generator, four-pole, com-und wound, 525 volts, 1,500 r.p.m., was attributed to shrink-e of the insulation and the resulting chafing; a short cir-it developed between a top and a bottom bar in one of the mature slots. Several bars had to be removed before the ults could be located; after the faulty bars were taken out, e insulation was tested and found to be unsatisfactory. It is decided to re-wind the armature entirely and to renew the t insulation.

A 500-kW motor converter converting to d.c. at 460/550 V, 040/910 A, from three-phase, 6,600 volts, 50 cycles, 53 amps., is subjected to a breakdown which took the form of a "short" side one of the slots between the two bottom conductors, e of which was an end conductor connected to the ter-inals; the fault occurred after the set had been in operation r three or four hours. At that time it was discovered that e charging resistances were burnt out; the resistances were placed and all the conductors, together with the insulation the faulty slot, were renewed. Two months later, while e set was being started, a humming noise was heard when e oil switch was closed; the machine was found to have oken down again. The breakdown occurred, as before, be-een two bottom conductors, one of which was an end con-ctor but on a different phase to that which had failed pre-ously. On this occasion the charging resistances were found order and, with the exception of the faulty bars, the insu-ion resistance between each conductor and the remainder, d also to earth, exceeded 100 megohms. It appears probable at the second fault developed as a result of the insulation ing strained while the charging resistances were out of mmission. The insulation of the end conductors was similar that in the remainder of the machine and not adequate. view of the high pressure between the turns, and of the essure rise which is to be expected at times of switching or the occurrence of a surge, the insulation of the end turns ould have been reinforced.

Trouble as the result of a rotary converter being worked at ow power factor in order to obtain a d.c. pressure regulation sulted in a shut down on a 300-kW, six-pole, shunt-wound terpole rotary converter, designed for converting six-phase, -cycle alternating current at 0.98 power factor to direct cur-nt at 520 volts. The machine was used for supplying at 420 lts, the transformer windings being arranged to suit.

A burn-out of this machine took place at the slip-ring end, tween the end of the core and a binder, confining the over-ng of the windings, which was $\frac{5}{8}$ in. from the end of the re. It could be seen that all the conductors of one slot and but one of the neighbouring slot had been melted through, d that nine other coils were burnt owing to the flame being rried round the periphery; molten copper, which had been rown out, had collected under the formers of the field coils; e intersegmental micas and some of the commutator bars d suffered also.

The trouble commenced with the overheating of the coils nnected to the slip rings; one of these was situated at the ntre of eight adjacent burnt-out coils and the arc evidently rted in this. Under the working conditions of this machine, hough the output on the direct-current side may be kept low the rated value, the current in the windings referred may still be excessive, as it was in this case.

The case of a 330-b.h.p., vertical, water-cooled, squirrel-cage, hase induction motor, 2,750 volts, 40 cycles, 1,180 r.p.m., which trouble was experienced owing to the rotor and stator res coming into contact is of considerable interest. The otor, which was totally enclosed, had a water-jacketed stator re. The jacket was divided into two sections, each provided ith longitudinal ducts connected so as to afford a zigzag path r the water, which was drawn from the rising main. The r in the motor was circulated by means of a fan, and the at transferred to the water by means of longitudinal ribs st on the outside of the jacket.

On the motor being dismantled after the trouble, it was und that the jacketed stator core had become loose in the ter frame on account of wear at the surfaces where the cketed core made contact with the outer frame. The fixing as effected by means of sixteen machined pads cast on the side of the outer frame, eight at each end; these bore on rresponding T-shaped lugs, 2 in. long axially, cast on the tside of the jacket; the bottom pads were secured to the wer end cover by set screws which prevented turning and ial movement. Owing no doubt to vibration, the set screws d worked loose and allowed movement of the interior por-n of the stator frame, the lugs being originally a loose fit side the pads. As a result of the cumulative movement hich occurred, both the T-shaped lugs and the machined pads re worn, in some cases by as much as 30 mils. defective joints were found in the rotor windings, is probable that uneven current distribution in the tor bars was in a large measure the cause of the vibra-n. New bars were fitted to the rotor and new end rings cast on. The stator winding, which had suffered somewhat from oil and water, was thoroughly dried, cleaned and re-varnished; after this it showed a satisfactory insulation resist-ance and withstood a pressure test of 4,000 volts for one minute. The arrangement was not considered satisfactory on account of the lightness and ill fit of the fixing lugs; it was found possible, however, to effect a satisfactory repair by locking the set screws securely and affixing additional set screws on the periphery of the outer frame and passing through the pads; these, after the jacket had been set central, were secured by locking plates to the outside of the casing. A year later, on the occurrence of a second failure, it was found that one of the stator coils was "earthed." Examination showed that the water jacket was very nearly choked with deposit, causing the motor to overheat. Considerable difficulty was experienced in cleaning out the water jacket, and finally the use of acid was resorted to. The stator winding was completely rewound and improvements were made to prevent oil being drawn into the motor through the bearings.

In another instance the shaft of a 220-b.h.p., three-phase, slip-ring type, induction motor, 400 volts, 50 cycles, 364 r.p.m., broke close to the housing at the pulley side of the inside bearing of the machine. The outer bearing was broken to fragments but the inside bearing sustained little damage. The trouble arose from the entire absence of a fillet at the change of diameter, where the journal joined on to the oil thrower; this led to a concentration of stress there. The shaft was further weakened by the presence of an area of segregated matter containing a considerable quantity of sul-phur; it could be seen clearly from the progressive markings on the fractured surface that the failure had emanated from this locality.

Several records are shown of static transformer breakdowns. In one interesting case two 1,000-kVA transformers, arranged Scott-connected, primary 6,600 V, three-phase, 50 cycles, 177 amperes, secondary 2,300 volts, two-phase, 435 amperes, were arranged with the primary windings of each transformer in two sections wound concentrically, the secondary windings being sandwiched between these; and each set of windings traversed the full length of the core. The primary and secondary of the transformers were each controlled by auto-matic oil switches set to operate with full load current. Both switches were fitted with auxiliary contacts, charging resist-ances being placed between the main and the auxiliary con-tacts. The transformers were situated at the generating end of the system close to the alternator, while the switching on or off was effected each day with the secondary on open circuit and the alternator generating full voltage. The insulation, of the transformer connected to the 86 per cent. tapping, failed half-an-hour after being switched on and while the combined load was only 200 kVA, the full-load current having at no time been exceeded. It was found that arcing had taken place be-tween the top turn of one of the inner sections and the iron core; several of the neighbouring turns were charred, the insulating cylinder, on which this coil was wound, pierced, and the core burnt locally by the arcing; the insulating cylin-der on which the secondary was wound had also collapsed at the bottom. Considerable movement of the windings had taken place owing to their lack of rigidity and in consequence the insulation of the top turn of the inner primary winding on the second limb had been bared owing to the winding hav-ing been forced against the supports; the insulation elsewhere was in good condition. The dielectric strength of the oil was, when tested, found satisfactory, the oil being free from acidity and withstanding 22,000 volts across a 0.15 in. gap. The trouble appears to have arisen from the insufficient support of the windings and to shrinkage having allowed these to move and cause a breakdown of the insulation of the end turns, the re-sultant arc causing the remaining damage. As the makers considered it possible that the insulation of the end turns was damaged during the switching operations, it was arranged that in the future the primary of the transformers should be kept permanently in circuit. The movement of the windings ne-cessitated the complete re-winding of the inside section of the primary of both limbs, and, owing to damage to the insulating cylinders on which the secondaries were wound, the replace-ment of the cylinders involved the complete re-winding of the secondaries.

Among the breakdowns recorded in the miscellaneous elec-trical equipment is the case of an oil-immersed switch, de-signed for working on a 75/125-ampere, 440-volt, three-phase, 50-cycle circuit, through a three-phase transformer, the star point on the low-pressure side being earthed. The switch was of the pillar type, the contacts being immersed in the usual manner inside a cast-iron tank; the tank was attached to a cast-iron bonnet containing the operating mechanism and elec-trical connections, an ammeter being connected to one of the outgoing phases. The tank and bonnet were separated by a three-ply wooden partition, pierced for the connections and operating bars; this would prevent any part of the upper chamber, which might become detached, from dropping into the oil tank. The switch was fitted with one no-volt and three overload trips, but was not provided with a gas vent. The oil in the tank had been replaced two months prior to the failure, which occurred at a time when there was only one 10-b.h.p. motor in operation on the circuit controlled by the switch, the motor being used for driving mechanical stokers.

An explosion occurred inside the switch, resulting in the tank bursting and the ammeter being blown out of the panel and destroyed. One of the overload coils was completely burnt

out and the aluminium bar for operating the overload trips was broken; the inside connections of the switch also bore evidence of the arcing which had taken place.

It was established that care had been taken to fill the oil tank to the correct level, but that the aluminium overload trip bars of other switches had been found broken on previous occasions at times of examination; a breakage of this nature could readily lead to a short circuit owing to the congested arrangement of the interior connections of the switch. At the time of the explosion an electric crane was working in the vicinity, but off another circuit. The evidence points to the fact that the trip bar was broken prior to the mishap and came into tact, possibly owing to vibration, with one of the amm connections. The aluminium trip bar, which was earthed once formed a short-circuit path for one of the phases thr earth, causing current to pass through the overload trip in this phase, burning it out. The current, which would passed through the overload coil, was unable to trip the sw owing to the bar being broken; the arc to earth, resul from the short circuit, evidently developed into an arc betv phases and spread across the connections inside the sw igniting accumulated gases and causing an explosion.

High-Pressure Steam Turbine Development.

Some Swiss Opinions and Achievements.

At a recent meeting of the Association Suisse des Electriciens, in Berne, M. Ad. Meyer, chief engineer of Messrs. Brown, Boveri & Co., Baden, read a paper on "Recent Installations of High-Pressure Steam Turbines," in the course of which he pointed out that at the price at which it was then being offered for delivery in large quantities at Basle, coal as fuel could successfully compete with water power in the generation of electrical energy in Switzerland. The author stated that according to various authorities the cost of fuel, including depreciation, interest, and general expenses, was estimated in the United States to amount to 75 per cent. of the total cost in the case of power stations with an output of several thousand kilowatts. Although in Switzerland coal was more costly than in America, and consequently entered more largely into the operating expenses, he based his calculations for the sake of simplicity on the American figure.

At the present time boilers were being constructed in Switzerland to deliver steam at a pressure of 35 atmospheres and a temperature of 400 deg. C. His company, in utilising steam at this pressure, was now able to supply turbines under a guarantee that, using coal yielding 7,500 calories per kilogramme and with a suitable condensing installation, the fuel consumption would not exceed 0.47 kilogramme per kilowatt-hour at the generator terminals. Estimating coal at 4 centimes per kg. (about 32s. per metric ton), the cost would be equal to only 1.88 centimes per kWh (at the present rate of exchange 100 centimes would be worth approximately 9.6d.). Figured on the 75 per cent. basis mentioned above, the total operating cost of a high-pressure, steam-operated power station would work out at approximately 2½ centimes per kWh for a co-efficient of current utilisation, that is to say, a load factor, of 60 per cent.; but if it was assumed that the load factor was 40 per cent., the production cost of a steam station would be 3.65 centimes per kWh, and with a load factor of only 20 per cent. the cost would be 5.4 centimes, figures which, in the author's opinion, could be favourably contrasted with those of a hydro-electric station. Such figures could, however, only be attained by the adoption of a much higher steam pressure than had hitherto been in general use. Although, having regard to the large quantities of coal that would need to be imported, it might be questionable whether in a country like Switzerland it would not be preferable to rely on hydro-electric stations, there were many instances in which steam at not unduly high pressures was required, in which it was undoubtedly economical to produce steam at a higher pressure than necessary for heating and other purposes, and to reduce the generated pressure by the expedient of utilising it for driving turbines. An installation of this kind had recently been completed at the Brown, Boveri works in Baden, which would shortly be heated throughout by exhaust steam. The installation comprised boilers designed to produce steam at a pressure of from 15 to 18 atmospheres and a temperature of from 350 to 380 deg. C. for power purposes and for the turbine-testing department. The steam was first used to drive a turbine, the expansion being there utilised to the condensation pressure, the latent steam heat being then transferred to the water circulating in the condenser; the water when it emerged from the latter at a higher temperature was circulated by pumps through the heating radiators, from which it returned to the condensers to repeat the cycle of operations. In order to meet heating requirements which varied in accordance with the external temperature, the water must emerge from the condenser at temperatures ranging from 50 to 90 degs. C. Taking as a typical example working live steam at a pressure of 18 atmospheres and a temperature of 350 deg. C., and an absolute back pressure of 0.5 atmosphere, the water circul for heating purposes could be heated up to about 80 deg. under such circumstances each kilogramme of steam w contain 753 calories. In the case of an ideal turbine the pansion (adiabatic) would absorb 166 calories from the ste leaving 587 calories per kg. in the exhaust steam available heating purposes. Coming down to realities, however, author pointed out that, taking turbine efficiency at 74 cent., and having regard to mechanical losses and the en lost by radiation, the calories actually converted into chanical energy by the turbine would only be 118, which w leave 635 calories per kg. (753—118) in the exhaust steam 85 per cent. of the energy of the live steam.

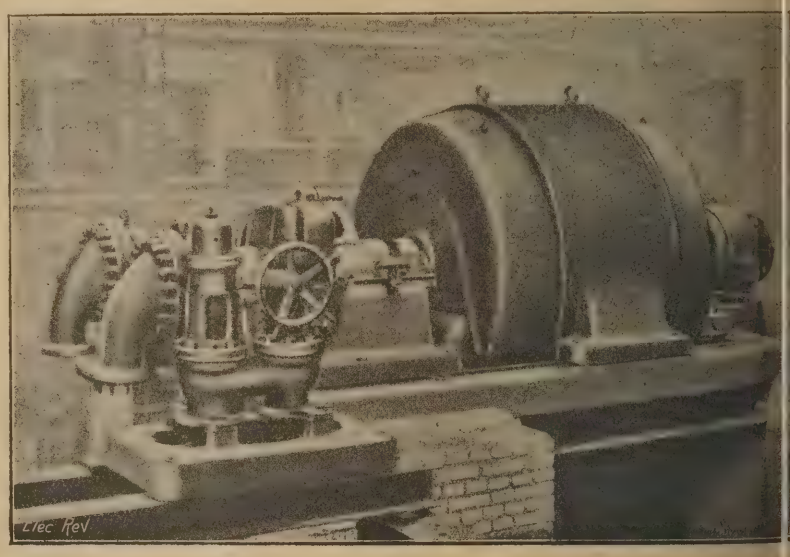

Fig. 1.—A High-pressure Brown, Boveri Steam Turbo-alternator Set.

With a turbine steam consumption of 7 kg. per kWh, a boiler having a vaporisation co-efficient of 8.75, the fuel sumption would be equal to 0.8 kg. per kWh. Owing to the latively high temperature at which the condenser water util as feed water reached the boiler, such a favourable vapo tion co-efficient could be expected without demanding too h a boiler efficiency, which under such conditions would exceed 77.5 per cent. With coal at 50 francs (£2) per m ton, the 7 kg. of steam per kWh would cost 4 centimes. only 18.5 per cent. of the useful energy would taken for power purposes, the remainder being util for heating purposes, the cost per kWh would fall to $4 \times 18.5/100$ = approximately 0.75 centime.

The double utilisation by back-pressure turbines of the en of steam would, however, be rendered difficult by reaso the fact that the demands for calorific energy and for dri power would not always be equivalent to the requisite r Whether one desired it or not, means had to be provide storing up one of the forms of steam energy. The u method being somewhat onerous and low in efficiency, plan of using a direct steam-driven turbine in place of of the back-pressure type had been tried. In this way on portion of the steam supply would be utilised in the turb to a point of expansion at which the pressure and tempera corresponded to the heating installation requirements, the o portion being allowed to expand on its way to the conden In this way it was possible during periods of excess po demands to draw steam for the turbine from the conde supply. Inversely, when a greater amount of steam was quired for heating than for power, the lower steam pres stages of the turbine could be cut out and the still live ste the pressure of which was reduced by a by-pass valve, hausted into the heating system pipes.

As a result of the high-pressure steam now available it had been made possible to replace the direct steam-driven turbine with a true back-pressure turbine in which all the exhaust steam was utilised for heating purposes. In cases where there was nothing to hinder the selection of live steam characteristics it was possible to determine the specific turbine steam consumption to ensure the requisite division of steam for power and heating purposes and the desired degree of back pressure.

Since they commenced the construction of steam turbines the Brown, Boveri Co., the author stated, had supplied normal condensing plant to the extent of, roundly, 4 million kW, an analysis of which showed the average live steam pressure to be 12 atmospheres, although in certain cases 20 atmospheres had been attained; the steam temperature had, however, never exceeded 375 deg. C. Progress was now being made in the direction of higher pressures: The North Tees (England) station* had for some years been working turbines with steam from Babcock boilers at 33 atmospheres and 370 deg. C.; a paper mill in Sweden was equipped with two "Atmos" boilers, one working at 50 atmospheres and one at 100 atmospheres, while two sets of 80-atmosphere plant were in course of construction in America. Finally, the author mentioned that the Brown, Boveri Co. had just completed a 1,750-kW turbo-alternator for the power station of the Société des Centrales Electriques des Flandres at Langerbrugge, Belgium (the machine was being submitted to test) which was designed to utilise steam at a pressure of 51 atmospheres and a temperature of 442 deg. C. The turbine ran normally at 3,000 r.p.m., but it would drive the alternator by means of gearing at 1,500 r.p.m. Fig. 1 illustrates the machine and it will be noticed that the turbine is so inconspicuous that it is hardly visible at first sight. Steam is fed to the turbine through a nest of tubes instead of the usual single pipe. The author stated that, in his opinion, there was a big future for the joint running of electric power stations and steam heating and cooking installations, which with high-pressure steam could be operated on a very economical basis.

* See Elec. Rev., July 4th, 1924, p. 19.

The Hydro-Electric Power Commission of Ontario.

Seventeenth Annual Report.

The seventeenth annual report of the Hydro-Electric Power Commission of Ontario, covering the year ended October 31st, 1924, is a record of continued and, in some cases, rapid progress. As we have said with regard to previous reports, the contents do not lend themselves to complete treatment in a small space (the report contains over 640 pages), we are only able to indicate the contents, and note the principal developments.

The consolidated accounts of the 241 municipalities (as against 224 in the preceding year) which take supplies of "Hydro" power on "cost contracts" for detail distribution, show a total revenue of $18,798,723. Against this was charged a total of $17,634,813, representing the cost of power, operation and capital charges, and depreciation, leaving a surplus of $1,163,910. Practically all the municipalities operated at a profit, there being only 16 showing deficits which in the aggregate amounted to $18,552. The net assets of the whole of the systems were valued at $72,884,271, and there were liabilities of $43,065,052, reserves amounting to $13,518,402, and surpluses totalling $16,300,817. The percentage of net debt to the total assets fell from 62.6 to 61.4; this ratio has steadily fallen from 88 per cent. in 1913. It is noteworthy that 39 municipalities were free of debt at the end of the year, while 24 others are expected to be clear by the end of 1925.

During the year the Commission operated twenty water-power generating plants with an aggregate capacity of 799,445 h.p., and a steam plant of 20,000 h.p. The total output was 5,878,576 kWh, but in addition the Commission purchased 2,922,465 kWh from outside sources, making a grand total of 8,001,801,041 kWh for the year as against 2,842,416,705 kWh in 1923.

A great deal of information is given regarding the work carried out in and the operation of the various systems into which the undertaking is divided. The principal of these is the Niagara system, whose three developments—the Queenston, "Ontario Power," and "Toronto Power" plants—produced no less than 2,526,662,700 kWh of the total output during the year. In May, 1924, the sixth unit, developing 62,000 h.p., was put on load at the Queenston plant and work proceeded on the installation of four more large generating sets. This work involved considerable rock excavation and placing of concrete, and the installation of penstocks, Johnson valves, turbines and other hydraulic equipment. The installation of the seventh set was practically completed and the eighth set was expected to be ready early in 1925, and the ninth in September next. When these sets are in operation the station will have a capacity of 500,000 h.p. The new plant has involved a great amount of new transmission line and equipment. Heavy steel-tower lines which were under construction in 1923 were completed and put into service during the early part of the year; these will deal with the power generated by the new sets. The Commission had in service at the end of the period 3,616 miles of transmission lines, including about 2,000 miles of 110,000-V conductors. The bulk of this is of plain and steel-reinforced aluminium, and the Niagara system includes the greater part of the mileage. In the Ontario Power Company generating station, the No. 15 unit was rebuilt. This was a 25,000-kW set, the generator of which burst in 1922 causing considerable damage. Two other generators were rewound during the year. The machines in the Toronto Power Company generating station were equipped with differential relay protection and the No. 11 generator was partly re-wound. In Toronto two new high-pressure sub-stations were completed and placed in operation in October last. These are of the outdoor type, each having a capacity of 30,000 kVA. Seven other sub-stations were placed in operation during the year and the equipment at eleven stations was augmented.

Since the last report the Severn, Eugenia and Wasdells systems have been combined and are now known as the Georgian Bay system. The separate plants are so interconnected that they can be loaded so as to best conserve water for the good of the whole system. In the first month of the year there was a water shortage, but the heavy demand for power was met by outside purchases. The capacity of the Eugenia plant was increased by 1,200 h.p. in May, 1924, a second pipe line and surge tank having been installed. Maintenance work only was carried out in the Severn and Wasdells divisions. A commencement was made upon the extension of the South Falls development which is to raise the output from 1,700 to 5,400 h.p.

The load on the Muskoka system was so near the limit as to preclude the shutting down of plant for overhaul during the year. Power was purchased from Bracebridge to enable the system to cope with the demand. The completion of the South Falls extension will enable both of the generating sets to be shut down and overhauled in turn.

The demand on the St. Lawrence system was lightened by the loss of a large industrial consumer, and the Rideau system load showed no material increase owing to the quiet industrial conditions prevailing in the district.

The Cameron Falls generating station in the Thunder Bay system completed its fourth year of operation with a steadily-increasing load. Two new sets, each of 12,500 h.p., were placed in commission during the year, and the new transmission line was brought into use. The development assisted the Kaministiquia Power Company by supply power during the first half of 1924. The addition of the Great Lakes Paper Company to the system gives an extra load of 10,000 h.p. and brings the total up to about 40,000 h.p. Arrangements have been made for the installation of the fifth and sixth generating units at Cameron Falls, and it was expected that they would be ready for service by the end of 1925.

In the report on the Ottawa system special mention is made of the growth of the domestic load which makes a steadily-increasing demand upon the generating plant.

Important generating stations and lines have been added to the Central Ontario and Trent system. A new automatic generating station commenced to deliver power to the system in September, 1924. This three-unit station is equipped with relays which make its operation entirely automatic if desired, but it is intended to operate normally under the control of the operator of the Ranney Falls plant, which is about four miles upstream, through the medium of remote supervisory control equipment. By pressing a button, the operator can bring a unit on the line and have it delivering power in from 15 to 20 seconds. The generator switches close, bringing the generator on the line at approximately synchronous speed, with field short-circuited, but almost instantly afterwards the short-circuit is removed, the field switch is closed and the generator pulls into step. If desired, all three units may be started or stopped simultaneously. A similar automatic plant is under construction at a lower dam, and this concentration of so much power in the neighbourhood of Campbellford has necessitated the construction of additional 44,000-V lines to ensure the delivery of power to the system, and also to ensure the uninterrupted flow of water from plant to plant, which would be seriously upset for a time if any one plant in the Campbellford chain were to be cut away from the system. A new municipal receiving station was opened at Peterboro during the year. Following a dry summer and early autumn in 1923, there was a moderately good precipitation during November and December, and this proved sufficient for the power requirements owing to the industrial depression and absence of system load growth.

The power shortage on the Nipissing system was relieved by the placing in service of the first 600-h.p. set at the Bing-

ham Chute power house in December, 1923; a second, similar, set was put into operation on March 31st, 1924. At the Nipissing plant one of the turbines was remodelled and the 450-kVA generator was replaced by one of 1,250 kVA. The inadequate wood pipe line reached the end of its useful life and was replaced by one of a larger capacity. An emergency Diesel-engine station has been erected at North Bay, but at the date of the report had not been required for service. The increase in the generating capacity of the system was accompanied by a large increase in load—an increase of 37 per cent.

During the year under review the Rural Hydro-Electric Distribution Act was amended to provide for including transformers and secondary equipment in the grant of the Provincial Government to help meet the disparity between the cost of urban and rural services, the amount of this grant to remain the same as when applied to primary lines only, *viz.*, up to 50 per cent. of the cost. The assistance thus given by the Government makes it possible to extend the service, and its beneficial influence upon agriculture and upon the general economic life of the province is already a factor of importance and worth. The minimum of three farm contracts per mile of line constructed, or the equivalent, is still the standard requested by the Commission as the basis of the application for the grant towards rural lines. During the year 285 miles of primary line was constructed, rehabilitated and absorbed, of which 38 miles was underground, and arrangements were made to construct a large number of additional rural lines during the current year. The capital cost of the latter was put at $321,103. At the date of the report 7,881 h.p. was being distributed in various rural districts, the bulk of i the Niagara system. Special propaganda work dealing v the merits of electricity in farming has been undertaken the Commission.

A great deal of testing, research, and inspection was car out in the Commission's laboratories during the year. of the special features of the work of the high-pressure general electrical testing laboratory was the making of donograph* records in the detection of over-voltage surges power lines. In the approval laboratory heating applia formed the largest group submitted, wiring devices being next largest, with motor-operated appliances very closely hind in point of numbers. A great deal of auxiliary r equipment—battery charging sets, lightning arresters, &c., submitted. The work of the photometric laboratory consi mainly of maintaining the quality of the incandescent la which are made under the auspices of the Commission.

A section of the report deals with the street railways oper by the Commission. This shows that the Essex system gressed satisfactorily, but the revenue earned by the Gu District and the Toronto and York District railways decli owing to the industrial depression in those areas.

The detailed accounts and statistics of the municipali connected to the systems occupy over 370 pages, and t are appendixes containing statistics of transmission li transforming station details, distribution lines and syste and reprints of Acts affecting the Commission passed du the year. The volume is illustrated with 36 views of var parts of the undertaking and 25 diagrams.

The Safety-in-Mines Research Board.

A Review of the Annual Report's Electrical Features.

The third annual report of the above-named Board (H.M. Stationery Office, price 1s. net) opens with an account of the scheme of co-operation which has been settled with the United States Bureau of Mines, the object of which is to co-ordinate the researches into problems of safety and health and to secure mutual assistance between the investigators of the two countries. The scheme has been worked out in official visits paid to this country by Dr. Foster Bain and Mr. G. S. Rice, director and chief mining engineer respectively of the Bureau of Mines, and to the United States by Dr. R. V. Wheeler, director of the Board's experimental stations, who was joined by Mr. H. Walker, H.M. chief inspector of mines.

The first combined publication has already appeared [Chemical Society, Trans. 125 (September, 1924), 1858], Dr. S. C. Lind, chief chemist of the Bureau of Mines at Washington, contributing an addendum to a paper by Dr. Wheeler on the electrical ignition of gases. Amongst the investigations that Dr. Wheeler saw during his visit were the X-ray examination of wire ropes and "wireless" underground signalling at the General Electric Co.'s research laboratories, while at the works of the Edison Co. at Newark the manufacture of the Edison alkaline-battery safety lamp, and the safety devices incorporated therein, was inspected.

The report shows that the funds expended by the Board during the twelve months commencing April 1st, 1924, included the following:—For general purposes, including the use of electricity in coal mines, £27,900; for research regarding the safe use of explosives and electrical shot-firing apparatus, £11,000, the total sum amounting to £48,400.

The second part of the report deals with the steps that have been taken to replace the Eskmeals experimental station. Accommodation for the large-scale experiments has been secured at a site on The Frith, by Harpurhill, two miles from Buxton, and laboratory work is now being carried out at Sheffield in temporary premises, but the University has offered a lease of an excellent site adjoining the University buildings and plans of new laboratories are being prepared.

The subject of the main part of the report is the progress of the Board's researches. A list of the programmes of research, numbering a hundred, is given in an appendix. The programmes are divided into ten groups, which include flame-proof mining electrical machinery, electrical researches, electrical shot-firing apparatus, devices for trapping dust generated by drills, and safety lamps. In the case of those programmes, numbering over 60, which have been selected as the most urgent, the investigators in charge give in brief statements of what they have done and are doing; for instance, numerous experiments with various makes of bulbs show that the whole range of explosive mixtures of firedamp and air can be ignited by heated wires (Mr. W. C. F. Shepherd). It is, therefore, essential to obtain some knowledge of the fundamental factors governing the ignition of explosive gaseous mixtures by heated filaments. To avoid complications due to oxidation of the metal filament, the research was begun with platinum wire as the source of ignition, and a number of factors which play an important part in ignition have been studied. A general conclusion to be drawn from the research, so far as it has gone, is that the same temperature of platinum wire is required to ignite all explosive mixtures of firedamp and there is no differentiation between one mixture and ano as with other sources of ignition.

As regards the propagation of flame (Mr. W. R. Chapm the effect of turbulence produced by mechanical agitation fo part of an investigation regarding the construction of ex sion-proof casings for electrical machinery. The simplest ditions under which gaseous explosions in closed vessels be produced (central ignition in a sphere) have been dealt v in paper No. 5, "Flame-proof electrical apparatus for us coal mines. First report—Flange protection," by Mes I. C. F. Statham and R. V. Wheeler (H.M. Stationery Of September, 1924, price 1s. 3d. net). The shape of the en sure, however, modifies the manner in which the flame spre and in consequence affects the development of pressure. W has therefore been continued, using cylindrical vessels different sizes, whilst the effect of turbulence in a spher vessel has also been investigated. Of a more empirical nat but of more immediate practical value, is a series of tests signed to provide flame-proof means of pressure-release f mining switchgear, alternative or supplementary to the met of release at a narrow gap between flanges. With the la enclosures the extent of flange may not be sufficient to all through the width of gap permissible, all the release of pres desired. The device which has been studied most closely bodies perforated metal plates. A specification with res to the thickness and area of the plate and the diameter spacing of the perforations has been worked out and a re on it will be published shortly.

From the records obtained (by means of a revol drum camera) in connection with the propagation of flam closed vessels (Mr. W. A. Kirkby) it has been observed the flame has a vibratory movement both in the initial final stages of inflammation. The speed of the flame va considerably during the different stages of the inflammat reaching 70 metres per second in certain experiments. appears that the time of attainment of maximum pres coincides with that of complete inflammation of the mixtur the vessel; the greatest pressure recorded in the vessel in is 70 lb. per sq. in. The explosions are more violent in tu lent mixtures, both as regards the pressure rise and the sp of the flame. In conjunction with the British Electrical Allied Industries Research Association, a considerable amo of information has been acquired bearing upon the construc of flame-proof casings for mining electrical machinery. ther investigations include a study of the effects of turbule such as might be produced in a motor casing or slip-ring co and also an inquiry into the effect of pressure piling, such might occur in a partially partitioned switch case.

Reference may also be made to a research carried out Mr. G. Lindley, the investigator appointed by the Br Electrical and Allied Industries Research Association, on construction of flame-proof plug and socket electrical conta which is nearing completion. The electrical work upon w most progress has been made is that dealing with the press produced in closed vessels when an arc is struck, a neces corollary to research upon the pressures produced by ex sions of firedamp and air in closed vessels, for in the desig mining switchgear it is necessary to take into account

*The klydonograph and its use were dealt with in our i of May 9th, 1924 (p. 770).

ssure effects. So far no pressures of any magnitude, due the arc alone, have been recorded; the experiments are ng continued, using greater power.

Regarding shot-firing apparatus (Mr. W. F. Crewdson), the rt under consideration at present is the current necessary cause ignition of firedamp-air mixtures, such as may enter switch casing, by the "break" spark produced when an luctive circuit is broken by the separation of metallic con-ts. The ease of ignition depends, among other things, on the rate of separation of the contacts, the inductance the circuit, the nature of the contacts, and the percentage firedamp in the mixture. A question has arisen as to advisability of substituting alternating for direct current en practicable, on account of its alleged greater safety. mparisons are being made of the relative igniting powers alternating and d.c. break-sparks as a check upon this claim.

The Sub-Committee for Research on Electrical Shot-firing paratus has completed its programme and its report is in paration; it is able to make suggestions for the improve-nt of the mechanical efficiency of the magneto exploders at sent in use so as to remove a fruitful cause of misfires, ich is the chief fault of these exploders. With the present es, if the handle is turned improperly a weak current may developed which will not fire the detonator, but will cause hemical change in the priming composition—the operative rt of the detonator—and this chemical change makes it more ficult to fire the detonator subsequently and may even result a misfire.

The Miners' Lamps Committee presented its final report ring 1924, thus bringing to an end five years of fruitful work wards the improvement of safety lamp design and practice. reviews in detail the official requirements with regard to testing of safety lamps and discusses possible lines of fur-r developments in design and construction.

The remainder of the Board's report is occupied by state-nts of the work done by the independent investigators, o are aided by grants made on the recommendation of the ard, and by an account contributed by Dr. J. S. Haldane of health inquiries carried on under the supervision of the alth Advisory Committee.

Mr. A. G. Gulliford, head lampman at Denaby and Cadeby lieries, Rotherham, has again been assisted with a grant £120 for the year to continue his experiments, under Dr. heeler's supervision, on firedamp detectors for electric lamps. is grant is solely for apparatus, materials and out-of-pocket penses in connection with the work, which is done at home spare time. Mr. Gulliford has completed the design of one m of firedamp indicator for attachment to an electric hand-lp, namely, one which will enable the miner to find out ether the atmosphere in which he is working contains more an 2½ per cent. of firedamp. The device is a simple one, nsisting merely of an exposed fuse-wire (suitably protected gauzes) which can be put in series with the lamp bulb by ans of a switch. If the atmosphere is clear of firedamp, the ht of the lamp-bulb is dimmed when the fuse-wire is thrown o circuit and the wire itself glows a dull red. The more edamp there is present, the dimmer does the light of the mp become and the more brightly does the fuse-wire glow til, when there is 2½ per cent. of firedamp, the fuse-wire lts and the lamp-bulb is extinguished. The miner can over his light by operating the switch.

As the result of many experiments, using different metals the fuse-wire, it is clear that platinum is the most suit-le. The small quantity of platinum used makes its cost in-finitesimal, but it can, if desired, be recovered without loss hen the fuse is renewed. Mr. Gulliford has designed the ode of attachment of the device to three different types of proved electric hand-lamps. In each instance the design is lat and the weight of the lamp is not materially increased. ture work will attempt to enable an exact measure to be ade of percentages of firedamp between 1 and 5.

Plastic Moulding.

A Recent English Manufacture.

Until recent years the art of plastic moulding was comparatively little known in this country, though the United States has for some few years taken up this class of work strongly. Under this type of moulding the materials that have made the most progress are phenolic condensation products. These products are the result of a chemical re-action between phenol (carbolic acid and formaldehyde, the result being a unique synthetic chemical product resembling the finer or natural gums during one stage of manufacture.

Mouldensite, Limited, of Derbyshire, began to manufacture a product of this nature in 1922, by which success was attained at the outset and with the growth of "wireless" the demand for the product developed rapidly. The "Mouldensite" moulding powder, which is prepared in black and brown forms of granular consistence, is now extensively used by the principal manufacturers of electrical equipment calling for a material possessing exceptionally high dielectric and mechanical strength, and as the insulation is usually in an exposed position the moulded work must present a fine polished surface which shall be unaffected by oils, water, petrol, &c. When the "Mouldensite" moulding preparation is heated it fluxes, pressure at from about 500 to 2,500 lb. per sq. in. is applied to it in this state of flux and the material is forced to every part of the mould; the pressure within the mould is hydrostatic, or nearly so. Owing to the almost liquid condition of the material when in this state of flux, a thin film of the substance is formed next to the surface of the mould, and it is in part due to this that the form of the surface of the mould is reproduced with exactness, and with a very high finish. Whilst the first effect of the heat used in moulding is to soften or flux, at the same time it induces a chemical reaction. This causes the material to harden more or less quickly according to the size of the piece being moulded and the temperature used. When this reaction has been completed by the mould having been a sufficient length of time under heat, the work is finished. The moulded article cannot again be softened or fluxed by heat.

Time and temperature play an important part in moulding "Mouldensite," and are important elements in the determination of cost of moulding and moulding equipment. Metal inserts can readily be incorporated. They are "anchored" in the mould to prevent movement whilst the charge is being pressed, during which time the charge is moving or flowing to conform to the mould.

The charge of the powder is slightly in excess of the weight of the finished piece, so that when the mould is closed and the charge is put under pressure, the excess is extruded from the mould. This excess is very small when moulds are properly made, and is easily removed in the form of a "flash." It can be moulded with a high degree of accuracy.

The moulds are made of steel and hardened, the working surfaces being highly finished and polished. Moulds made of brass or bronze quickly distort under the pressure of moulding, and are not satisfactory. The contraction usually allowed is 3 mils per lineal inch. The moulds must be strong to withstand the pressure used, but contain as little metal as is consistent with these requirements in order to ensure the rapid conduction of heat.

It is interesting to note that the "Mouldensite" materials will apparently flow up before they flow down, and in certain deep wall pieces in which difficulty is experienced in moulding, it is found that by turning the mould upside down, a perfect piece can be obtained.

It is claimed that these mouldings can be turned out with accuracy and precision of finish greater than anything possible in the way of high class machine tool work produced by the most expensive automatic machine tools. Needless to say the hydraulic presses required to produce the mouldings are a much less expensive proposition, both with regard to initial outlay and also upkeep and operation charges, than the class of machine tool which would be required to turn out similar work.

It is claimed that Mouldensite is anhydrous and non-hygroscopic, has extremely high dielectric resistance, is very hard, retaining its finish indefinitely, is unaffected by temperatures below those at which carbonisation begins, has great mechanical strength in tension, compression and shear, whilst it may be moulded with all kinds of metal inserts, which it will not discolour, even though they be of silver or similar metals, as being a stable product it cannot break down chemically setting up free gases or other substances of a corrosive nature. It is homogeneous throughout and holds its colour indefinitely. Whilst it can be readily machined, filed or sawn, and takes a high lasting polish when buffed, it is only in rare instances that these processes have to be resorted to, it being generally found that all such requirements can be provided for in the moulding process.

The specific gravity of Mouldensite being only 1.33 or approximately half that of aluminium, it will be seen that the material is extremely light, yet at the same time, it is in no way brittle and will withstand considerable shock. The moulds differ from those used for the moulding of hard rubber, celluloid, &c., and in this connection Mouldensite, Limited, has a service which includes free mould-design for the benefit of its customers. At the present time, the firm in question is making a point of the fact that its product is British and claiming that it can compete for both quality and price with any similar product manufactured abroad, and also urging buyers in this country to consider the national aspect when purchasing moulding powders or mouldings.

We have seen a number of mouldings made from this material, and the manner in which the impression of the mould has been retained with microscopic sharpness as well as the beauty of finish is very satisfactory.

Drought Curtailment of Hydro-Electric Power.—Continuing drought in the Mountain States, and especially in Colorado, says the *Electrical World*, has curtailed the production of energy at a number of municipally owned hydro-electric plants, notably Longmont and Loveland, and standby service has been required on several occasions. In the northern Colorado district the sugar-beet and vegetable crops are approximately one-third of normal, and the only farms successfully overcoming the effects of the dry spell are those with electrically operated pumps. The major portion of the privately owned power stations' daytime load is reported as being used for pumping.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A New Electrical Immersion Heater.

A new electrical immersion heater which has been placed on the market by Mr. Harold E. Trent, 259, North Lawrence Street, Philadelphia, Pa., is described in the *American Machinist*. It has been designed to meet the conditions necessary for the melting of salts such as lavite. The heating element is of the embedded type, packed in a steel tube to maintain a maximum of heat capacity. Its temperature may be

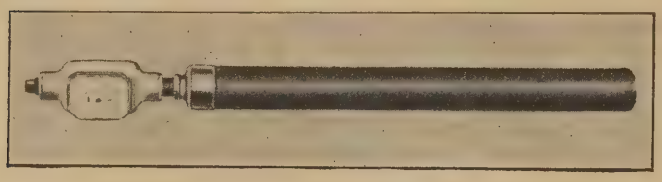

Fig. 1.—Immersion Heater.

raised to 1,600 deg. F. before the initial heating of the salt takes place. It is made in sizes up to 1,500 W capacity and 18 in. in length with a uniform diameter of 1.9 in. For the melting of other materials the loading may be increased, but care should be taken, as the salts under consideration are heat insulators and the thermo-capacity of the unit is limited. The plug connection on the end (fig. 1) can be supplied to suit.

A New Cable Connector.

Described in the *Electrical World* is a new cable connector, fig. 2, developed by M. Fauris, Lyons, France, by which it is claimed that connection may be established between cables of any cross section in making a tap on a branch feeder without cutting the feeder. The upper portion can be removed by unscrewing the lower nut, and connection and disconnection is rendered simple by means of a wrench. The device is manufactured in different sizes.

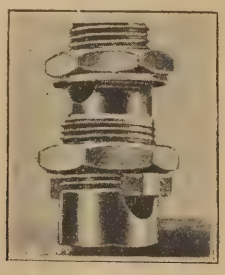

Fig. 2.—Cable Connector.

An Improved Arc-Welding Set.

The photographic reproduction herewith, fig. 3, is of a 6-kW electric arc-welding set marketed by Messrs. The Quasi-Arc Co., Ltd., 15, Grosvenor Gardens, London, S.W., who have adopted as the driving unit a 10-h.p. 4-cylinder marine-type petrol motor, made by Messrs. J. W. Brooke & Co., Ltd., Adrian Works, Lowestoft, driving direct by means of a flexible coupling. The generator is designed to give a 60/30 volt-drop characteristic, the lower pressure corresponding to a full load of 200 A, and is used in conjunction with a special reactance and field reactor; the former supplies the momentary pressure rise, whilst the latter, it is claimed, renders the pressure change of the machine exceedingly rapid. The field reactor is claimed to give the machine greater efficiency than other types of drooping characteristic welding dynamos; it consists of a static transformer, the primary winding forming part of the welding circuit, and the secondary part of the shunt field circuit; any change of current in the primary produces an e.m.f. in the secondary which is so connected as to accelerate the variation of current in the shunt field coils. A portable regulator is provided for effecting current regulation. An electromagnetic governor of the solenoid type controls the speed during the striking of the arc, after which period the duty is performed by a centrifugal type governor. The plant, including fuel tanks, radiator and cooling fan, is self-contained and the weight of the whole set does not exceed 18 cwt.

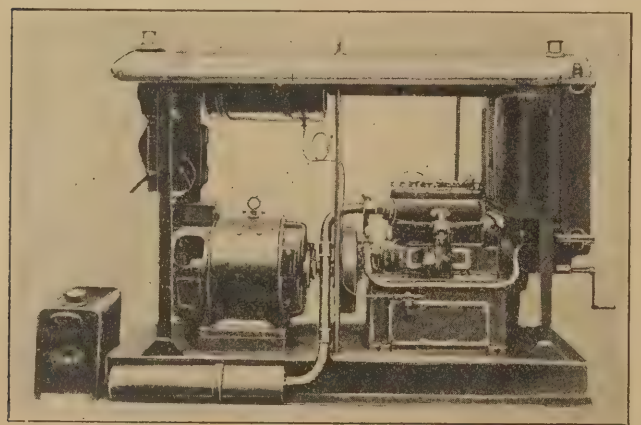

Fig. 3.—A 6-kW Arc-Welding Plant.

Electric Iron Indicator Plug.

We have received from Mr. W. T. Hughes, 74, The Downs, Altrincham, Cheshire, particulars of a unique indicator-plug for use with electric irons. The indication is given by means of an ordinary 2.5-V lamp of the flash-lamp type. This lamp is shunted across a spiral resistance which is in series with the element of the iron. The spiral resistance, which is designed to give a pressure drop of 1.8 V, also acts as a spring holder for the lamp. We understand that negotiations are at present taking place for the manufacture of this device, a section illustration of which is shown in fig. 4.

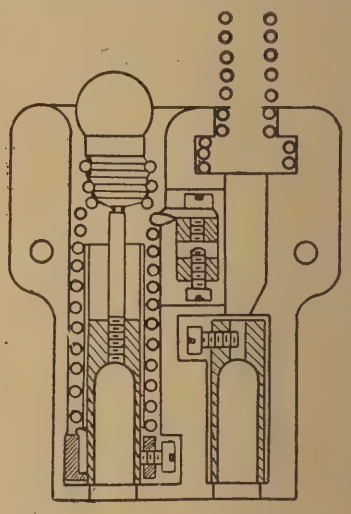

Fig. 4.—Section of Indicator-Plug.

An Improved Windmill.

We illustrate herewith, fig. 5, the "Empire" windmill which is made by Messrs. Cecil Hodges & Co., Ltd., Empire Works, Dalston, London. Its principle closely follows that of the old wooden windmills, and it consists essentially of from four to eight large wings. Each wing is divided into four panels which fit closely together and present a solid surface to the wind when it is blowing at a moderate rate, and which gradually and automatically open when the wind pressure gets beyond a certain strength, thereby maintaining a constant speed on the turbine and rendering it suitable as a means for driving electric generators. It is claimed that the mill can be operated in a wind of less than 5 m.p.h.

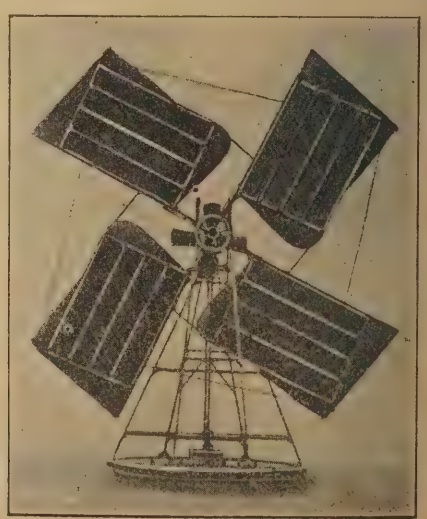

Fig. 5.—The "Empire" Patent Windmill.

The machine is fitted with ball and roller bearings throughout. It should prove a success in the lighting by electricity of country houses, farms and villages, the winds being normally strongest in those periods when the lighting demand is greatest.

A Novel Electric Cooker.

The "Quead" Cooker.

CONTRARY to many prevalent opinions on the subject of cookery an eminent London surgeon has expressed the view that "the flavour and digestibility of meat foods are impaired by prolonged cooking, owing to the coagulation by heat of the albumin which is the main constituent of all animal foods. The longer an egg is cooked, the harder it becomes and the longer it takes to digest, due to the stomach juices having to digest the coagulated albumin."

It may therefore be inferred that rapid cooking of short duration is desirable in that the external albuminous layers are thereby quickly coagulated, which allows the red internal juices to be retained in a semi-fluid and digestible condition. It is with such objects in view that the "Quead" cooker has been designed on novel lines for domestic use by Messrs. Wm. Appel & Co., who have discarded the idea of roasting in hot air or gases confined in an oven which has been the vogue for so long. Moreover, the new cooker has been arranged to improve upon the customary method of grilling, which cooks the top side only, while the juices are oozing out at the bottom. In the "Quead" cooker the source of heat is near the centre of the oven and consists of two vertically disposed elements adjustable horizontally so that they can be brought near to the joint for grilling, as shown in fig. 1, or moved apart for roasting, as indicated in fig. 2. The adjustment is made by means

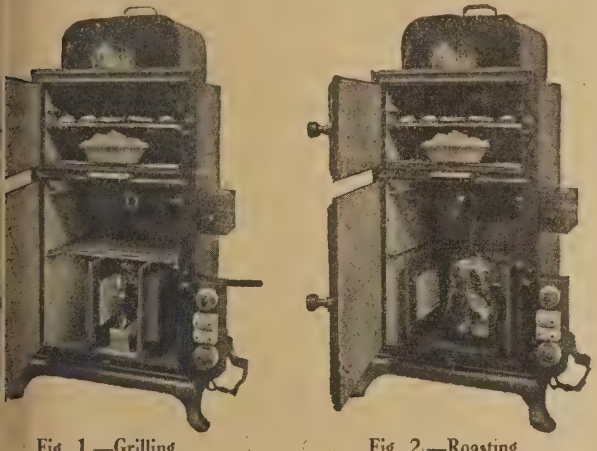

Fig. 1.—Grilling. Fig. 2.—Roasting.
Interior of the "Quead" Cooker.

of a lever at the side, and the meat to be grilled is held vertically, as illustrated in fig. 1, in a removable rack similar to that of a bread toaster.

Instead of being placed, so to speak, in a bath of radiant heat—a reversion to the old custom of roasting before an open fire—the meat is cooked remarkably quickly; the elements are thermally insulated from the metal inside of the cooker, and are consequently rapidly heated and ready for cooking in three minutes after switching them on. It is not necessary to have the walls of the cooker hot; in fact, simple grilling is sometimes commenced before they are even warm, and the energy required to maintain the necessary temperature is therefore comparatively small. The economy in this respect, coupled with the reduced time occupied in cooking, which is about one-half of that ordinarily required, it is claimed, ensures a saving of as much as 75 per cent. in electricity for roasting.

For roasting, the joint is hung on a hook which is slowly rotated by means of a clockwork motor, while means are provided for arresting the motor at any desired point. This is useful for certain shapes of joints, such as a saddle of mutton, which, if continually rotated, is apt to be cooked more at the sides than in the middle.

A device for automatic basting is provided in the form of a cup for holding the fat, with a small tap for regulating the flow of basting. The cup is supported by a socket and lever which can be swung out of the cooker for filling, &c., and it allows a joint to be roasted without any attention other than reducing the heat after the first 10 minutes.

Two patterns are exhibited at the British Empire Exhibition: One consists of two compartments, each being 16 by 12 in. and provided with separate doors; the lower compartment is 21 in. high and contains the two 1,000-watt heating elements for roasting, grilling, frying, broiling, and boiling, while it can also be used for baking. The upper compartment, which is 9 in. high, is heated by waste heat assisted by a 1,000-watt element, and can be used for baking, warming, &c., at the same time as the lower one is being used. The smaller pattern is a smaller one of similar type.

A thermometer is fitted, if required, and above the upper compartment a plate warmer is provided with a hood that entirely surrounds the plates and ensures that the top plates are as hot as those at the bottom. Boiling plates of various sizes and types are supplied, according to requirement, and the usual 3-heat control has been adopted with switches of the rocker pattern for turning up and down by moving the handle in either direction. The cooker is mounted on a cast-iron base and frame; the sides, doors, and top are lagged, while the interior is lined with enamelled plates.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Retailers and the N.A.R.M.A.T.

I note in a copy of *The Radio Trade Journal* which has been forwarded to the Wireless Retailers' Association, the statement that "each section has a voice" in the administration of the N.A.R.M.A.T. The important point, however, is that the retailers have only *one-fourth* of the voting power, and can consequently be outvoted every time. In other words, the manufacturing interests control the situation. In these circumstances the picture which is drawn of peace and progress prevailing at a round-table conference of members is suggestive of the lion lying down with the lamb, the irony of which strikes a distinctly humorous note. From this it will be seen that before he accepts the small increases of discounts offered to him, the retailer has to consider not only whether he will have "risked financial loss by promising not to sell foreign goods," but whether he will be entering into binding restrictions and rendering himself liable to other restraints in the imposition of which he has no effective voice.

In conclusion, the trade is entitled to know why the N.A.R.M. has attempted to form a Retail Section when there was already a retailers' association of some two years' standing in existence, and why the Wireless Retailers' Association was not consulted on the matter. In short, if peace and goodwill were really desired, why was not co-operation sought with the existing organisation? The multiplying of organisations, the N.A.R.M. must know, can only have the effect of weakening the section so split up.

Fredk. S. Horsey,
Chairman of the Wireless Retailers' Association.

London, *August 15th*, 1925.

Modernising Electric Tramcars.

The manager of the London combine tramways, Mr. C. J. Spencer, is to be congratulated for introducing the very fine cars described in your issue of the 7th inst. I am confident that the innovation of cushioned cross seats will be decidedly welcomed by the public, so much so that other progressive undertakings will have to adopt similar seating accommodation in the near future.

The progress of British tramcar design has been, in the past, rather disappointing, and has not compared favourably with electric train and motor omnibus development. Modern 'buses with powerful equipment, comfortable seats, bright interiors, and pneumatic tires, undoubtedly have provided a very attractive service in contrast with the generality of provincial tramways whose cars are, apparently, considered by the management to be good enough for 1925 though designed 20 or 25 years ago. It is, therefore, not difficult to understand how a large body of the public has, under the influence of a misguided and irresponsible Press, come to regard tramway transit as obsolete and has shown complete willingness to patronise any 'bus venture in preference thereto.

The service given by the L.C.C. is, very probably, the best in the country, yet its latest cars, though fast and attractively finished, still provide no better seating accommodation than formerly. Having used the London transit facilities for some years, I am very much of the opinion that the L.C.C. would, with cars having cushioned cross seats, secure a greater measure of public support. The average British tramcar does not appear to be the equal of the American street car. Why is this? Are British conditions so widely different that we cannot employ more extensively the separate entrance and one-man car with, of course, cross seats and higher speeds?

Too often is it the case that improvements in service are made only under the stress of 'bus competition, and it is at least open to question whether tramway managements have not contributed to their troubles by their ultra-conservative policy in the past. Our tramway undertakings are, perhaps, open to most serious criticism in persistently retaining the longitudinal wooden seat in spite of a marked public preference for superior comfort, such as is afforded by most progressive 'bus services. The prevailing type of tramcar seat was discarded by 'buses and American cars some years ago, and it certainly does not appear to be well suited to modern cars, with high rates of acceleration and braking. The conventional seating arrangements are supposed to facilitate the movement of passengers, but this has not prevented American systems from adopting the transverse seat.

Closely affecting the comfort of the passenger is the design of the undercarriage. On some of our largest systems the cars "jazz" and pitch in a most disagreeable and, in many cases, alarming manner. The jarring and bouncing whilst in motion, together with the din set up in negotiating crossings, suggest that a reconsideration of the conventional design would not be unprofitable. Even the illumination is often carried out on entirely incorrect principles, and reference has often been made to the extensive use of the unshaded filament by large traction systems. With low ceilings and large lighting units the result is decidedly unpleasant.

If I may venture an opinion it is that a more progressive policy is badly needed in the British tramway industry generally with regard to car design. Much improvement could be effected in the comfort and running of existing cars without appreciably increasing the operating cost. The important improvements in tramcar construction, in speed, comfort, lighting, &c., effected by Mr. C. J. Spencer are, therefore, of particular interest and value.

H. A. W.

Glasgow, *August 11th*, 1925.

A Proposed Institute of Radio Engineers.

On reading the statement of the I.E.E., in your issue of August 7th, it appears that the Wireless Section will be quite a subsidiary part of the Institution and would possibly be neglected when interests might clash.

In view of the enormous advance in wireless engineering during the past few years, and the certainty of further expansion, a separate Institute, to safeguard the interests of radio engineers, would certainly appear advisable.

With regard to the subjects for examination, these appear excellent, but there might be a tendency to set such papers chiefly from the electrical engineer's standpoint, and not from that of the purely radio engineer.

J. H. Tanton.

Halton, Bucks., *August 10th*, 1925.

Charges for Electricity Supply.

I have recently received two accounts from the Manchester Corporation for the last quarter's consumption of gas and electricity (lighting).

I was rather surprised to observe that although my consumption of "juice" for the quarter was only *twelve units* I am charged the amount of *ten shillings* (10s.). This amount is put under the heading "Minimum Charge." I presume from this that I am asked to pay £2 per annum whether I consume this amount or not. I understand that if the consumption exceeds this amount there will be a rebate. I may say that this is the second quarter's account as far as I am concerned, and it seems to me that the electricity department has the loan of my 4s. 6d. until the end of the year, notwithstanding that a deposit of £1 was paid before the installation was connected.

The gas department makes no mention of "Minimum Charge," and charges for B.th.u. consumed. Further, it offers a discount if the account is paid before a certain date, a feature which the electricity department omits. The gas department will install a cooker free of charge—the electricity department at a charge of 7s. 6d. per quarter. The rate for supply (power and lighting) under the electricity department (Norwich system) is in my case 11s. 8d. per quarter, plus ½d. per unit consumed, making a standing charge of 19s. per quarter—rather a stiff charge for the so-called convenience, cleanliness, &c., is it not?

I can well understand my non-technical friend's resentment at having to pay this minimum charge for lighting, and I myself feel it is not justified. The hire charges and rates for cookers make these articles a luxury which very few people can afford.

In view of the exhortation to use electricity and the knowledge that neighbouring towns make lower charges, it is very disappointing to find such things in Manchester. In fact one is tempted to say: "Save me from my friends."

"Stung."

Manchester, *August 17th*, 1925.

Railway Electrification in the United States.—Some particulars concerning the progress made during 1924 in railway electrification are given in abstracts in the *Railway Review* from the report of the Committee of the American Railway Association, Division V—Mechanical, on the subject of electric rolling stock. The activities in electrification were confined largely to adding rolling stock to existing projects, or the culmination of projects conceived previous to 1924. The development which is perhaps commanding the greatest interest is that wherein the sub-station plant is carried as part of the locomotive equipment. Under this heading are locomotives for the Detroit, Toledo, and Ironton and the New York, New Haven, and Hartford. The D.T. & I. project comprises a 25-cycle, 22,000-V, single-phase, a.c. distribution, with converting equipment on the locomotive to provide 600-V, d.c., for the traction motors. The transformers are so arranged that the locomotive can be operated from an 11,000-V supply. The New York, New Haven, and Hartford locomotives are designed to operate from the 25-cycle, single-phase, 11,000-V, a.c. trolley supply, which will be converted on the locomotive to d.c. An experimental oil-electrical locomotive was put into service on the New York Central, and tests indicate that it has great possibilities, particularly for switching and branch-line service. Anticipating the need for equipment to compete with the auto bus, as well as to reduce operating expense on branch lines, a considerable development has taken place during the year on gas-electric cars and small gas-electric locomotives. An experimental 3,000-V, d.c. multiple-unit car has been built primarily for terminal operation where the main line is 3,000 V d.c. trolley distribution.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the pri specification.
The numbers in parentheses are those under which the specifications wi printed and abridged, and all subsequent proceedings will be taken.

Safety First—Within Reason.

TO get an idea hammered into its consciousness and then to be obsessed by it is, we believe, a characteristic of our race; it may be seen repeatedly in our political history, not always operating to our advantage. Doubtless it enabled us to hold out through the Great War; equally in times of peace it often determines our conduct, and it may lead us beyond due bounds if not controlled by the light of reason.

To class the slogan "Safety First" as liable to become an obsession may expose us to criticism as lacking in humanity; but is it not possible to sacrifice too much for the sake of a merely hypothetical return? By all means let all reasonable precautions be adopted to ensure the safety of the citizen—it is only when the safeguards become to our mind unreasonable that we feel bound to utter a protest, in the interests of the public as a whole. A case in point was the statute which stipulated that vehicles propelled by mechanical power should be preceded by a man on foot, bearing a red flag, and should not travel at a higher speed than four miles an hour. But for that regulation British engineers, who invented steam-driven road cars over a century ago, might have led the world in the development of the automobile—but it was not relaxed until Parliament was compelled in 1896 to permit motor-cars to travel (at 12 miles an hour!) on ordinary highways. That is a typical example of precaution carried to the limit, as a result of which it took us years to catch up the rest of the world in the manufacture of automobiles.

These thoughts were prompted by a recent visit to an English village remote from civilisation, which has been supplied with electricity for many years by a small plant which, if old and apparently inadequate,

nevertheless fulfils its purpose quite well. The proprietors do not seem to have heard of the Board of Trade (or *vice versa*) or of the Electricity Commissioners, for some of the overhead wiring—in particular, the tapping of services—conforms to no rules whatever; even for bell wiring it would hardly pass inspection. Yet *it works*, and so far as we could ascertain, it works well; and the pressure is 200 volts.

Last year we made a tour of the rural distribution system installed by Mr. S. E. Britton in the neighbourhood of Chester, which has been carried out on first-class lines, presenting a striking contrast with the system mentioned above. Being a statutory undertaking, and in the public eye, it has complied with every regulation laid down by the successors of the Board of Trade for ensuring the safety of the public, at a cost which renders it almost impossible to supply electricity for lighting at a profit; consequently the Chester Corporation of necessity must do its utmost to develop a demand for cooking and heating, and other uses of electricity. That is all to the good—but it should not be a necessity, for undoubtedly electricity can be supplied for lighting by simple and inexpensive means which bring it within the reach of the poorest consumer, and yet involve no appreciable risk to the passer-by.

We advocate neither of the extremes that we have cited. That there is a middle course we are convinced, having had occasion to visit other British rural distribution systems which are entirely adequate to their purpose but, without involving any perceptible danger to the public, have been constructed on economical lines. The regulations for overhead conductors laid down by the Electricity Commissioners are in some respects more stringent than, in our opinion, is warranted by the circumstances, at any rate in the case of rural distribution; but whilst the highest standards are defined in the official regulations, it by no means follows that they will be rigidly enforced, or that their stringency cannot be mitigated by the adoption of suitable methods subject to the approval of the Commissioners. So long as hundreds of miles of 500-volt trolley wires are suspended above crowded streets, constantly in a state of vibration and subject to wear, and sometimes dependent on solder for support—and yet do not give rise to frequent accidents, it cannot reasonably be argued that overhead lines of simple construction and exposed to far less arduous conditions are liable to become "death-traps." Not only reason, but experience—here and abroad—tells us that there is no appreciable risk from overhead wires at 200 volts, and that unduly high standards of construction involve an outlay out of all proportion to the slight and problematic benefits that they confer.

We have, on previous occasions, expressed similar views with regard to the "Regulations for the electrical equipment of buildings" issued by the Institution of Electrical Engineers, and we observe that, in the report of the I.E.E. Committee on Electricity in Agriculture, which is published in the current issue of the *Journal*, the Committee suggests "that the Institution should take steps to propose rules for rural distribution networks, overhead and underground. These Rules only to apply to distribution to farms, villages, and small industries, leaving other work to be carried out under the existing Regulations as at present approved by the Electricity Commissioners." We earnestly hope that if this suggestion is adopted, the result will not be to plant further obstacles in the way of the use of electricity in rural areas. The difficulties are already sufficiently numerous without our taking steps to add to their number.

The Place of Woman in Salesmanship.

In the course of a recent speech, Sir Alfred Mond said that the antiquated methods of our salesmanship needed revision. He was discussing the many problems which face us to-day as an industrial people with a vast army of unemployed, and the remark quoted was made in considering the needs of the future with respect to organisation and administration. Every day in the newspapers the advice is given to the rising generation who wish to succeed in these difficult times, when men's jobs are so scarce and applicants for them are so numerous, that they should take a course of salesmanship. Some naturally are foredoomed to disappointment, but if we can raise the standard of business-getting efficiency it will be advantageous to this nation of shopkeepers.

Training for salesmanship is not a closed preserve for mere men nowadays; the door is open wide for the woman of business capacity. It has long been so in retail shopkeeping, and in certain departments of wholesale trade, and wonderfully successful have some women been. We in the electrical trade can recognise too that woman has an important place to fill in securing the full rate of advance in electrical development, especially in the domestic field. The more readily and generously we recognise this fact and allow the members of the fair sex to exercise their powers of conviction and persuasion to the full, the better it will be for the whole electrical industry. What is more obvious than the disposition of the mistress or housewife to admit one of her own sex into the sanctities of the household, to talk pleasantly over the uses of electricity in domestic life and the various points requiring elucidation or demonstration in connection with installed apparatus? Where a male canvasser meets with a chilling reception, or is peeped at through a door nervously opened but half-a-dozen inches, one of the opposite sex is given a cordial welcome and is invited to call again and continue the subject. Borough electrical engineers and committees, and above all boards of directors, ought to consider this aspect of local domestic electrical development far more seriously than they have done.

Of course, it is not suggested that any and every female is fitted for such a vocation. There are many qualities and qualifications required of the perfect woman in salesmanship, but happily women are devoting close and organised attention to this matter, as witness the inclusion of the subject in the programme of the Conference of Women in Science, Industry, and Commerce held in July. One of the papers contained many points of interest to those who believe, as does the author of the paper (Miss Gladys Burton, B.A.), that "selling is an occupation which is fast being raised to the rank of a profession," that "selling offers a career of absorbing interest to girls of the right temperament," and that "for the successful saleswoman there is always a market." We agree that while a "delightful personality" is not wasted anywhere, it is of first importance in selling, and we may add that in electrical salesmanship it should be particularly welcome. With a delicate womanly touch, Miss Burton said that the only law of salesmanship was "to love one's customer as oneself" (assuming, of course, we suppose, that the said customer was not too masculine), by which we judge her to lay stress upon the importance of having a satisfied consumer, by giving lasting satisfaction and avoiding the opportunity of taking temporary advantage.

Knowledge of the stock handled, some particulars of its production, its operation, its good qualities, and the performance it can render, are of course essentials, both in a man and in a woman, particularly when endeavouring to convince, win, and satisfy electrical consumers. The saleswoman must even more be able to "understand the men and women with whom she is daily confronted," though a diverting tilt is made by the author at the professors of psychology who "find ordinary tact quite beyond them" . . . . "I suppose because one cannot understand people unless one loves them." We find it difficult as mere men to tell male canvassers that in order to understand their prospective customers they must give definite evidence of affection

for them—it might at times land them in awkward situations—but there is no disputing the truth of the more common rendering that we may use, namely, that the canvasser who is acquainted with the needs and difficulties of the consumer, and seriously and good-humouredly tries to meet those needs and overcome those difficulties, is showing a regard for the said consumer and for his employers' interests at the same time. "Salesmanship" is, after all, "the ability to sell goods that won't come back to customers who will." Of course, there is a very human and practical side to all this, as some supply employés, wearied with fruitless calls, irritated beyond endurance by the petty annoyances to which they are subjected, and conscious of their own and other people's limitations, will be feeling as they read these lines. We are not out to secure the supersession of our own sex at a time when so many good men are out of employment, but we feel that the position of woman on the commercial side of the electrical supply industry calls for more exploration than it has yet had, and that there is plenty of room for the profitable employment of electrical business-getting women in many localities without dispensing with the services of any present male employé.

Electrical Accidents in Mines.

The report of H.M. Electrical Inspector of Mines for 1924, which is abstracted elsewhere in this issue, reveals the regrettable fact that during the year there were 18 deaths attributable to the use of electricity in coal mines, of which 13 were due to electric shock; this is a bad showing compared with previous years—the worst since 1913, when the same number of deaths due to shock below ground was recorded. The average for the five years previous to 1924 was happily only five, and for the ten years 1914-1923 it was 4.9. It is to be hoped that the serious increase last year will prove to be exceptional, and that future records will be at minimum values.

Most of the fatalities due to electric shock occur in connection with the operation of coal-cutting machines, and frequently they are due to some defect in the earthing conductor or its connections. The Inspector considers that there is room for radical improvement in the existing designs of plug connector, and a perusal of the report certainly supports that view. A standard specification for plugs and sockets is being prepared by the B.E.S.A., and good progress has been made with it. The delay in dealing with this detail, of literally vital importance, has probably been due to the fact that the machines continue to work satisfactorily when the earthing device is inoperative, and as all goes well until a failure of insulation of the live conductors occurs, the first indication that anything is out of order may be a fatal shock. Regular examination and testing of the earthing devices would go far to minimise the risk of accident, but the Inspector points out that in many cases this procedure is not efficiently carried out; as the use of electricity in mines is constantly increasing, the importance of adequate maintenance cannot be over-emphasised, and the work should be entrusted only to fully qualified electrical engineers who thoroughly understand the machinery that is placed in their charge. It is true that a large proportion of the accidents recorded are due to the ignorance, carelessness, or temerity of the men who pay so high a penalty for their rashness, and it is impossible to guard against such occurrences, but at least every care should be taken to make sure that the apparatus employed is not at fault. One class of defect which in the past has been responsible for the loss of many lives is the omission of a set screw, leaving an opening in a casing intended to be flame-proof, and leading to an explosion of gas. Wherever it is possible, studs should be used instead of set screws, or the screw-holes so disposed that the loss of a screw does not necessarily leave a clear channel for flame to pass through.

Standards of Quality.

Our Canadian correspondent rightly takes us to task for overlooking the constitution and achievements of the Approval Laboratories of the Hydro-Electric Power Commission of Ontario in our recent leader on this subject. The organisation, procedure, and functions of these laboratories were described in some detail in our issue of April 29th, 1921, and they have frequently been referred to in our abstracts of the annual reports of the Commission, including that which appeared in our last issue. We had not, however, appreciated the fact brought out by our correspondent, that the verdict of the Ontario Laboratories was accepted by the electrical industry in the other Provinces of the Dominion, even when the approval of the Underwriters' Laboratories had not been obtained. The matter is of some importance, and we are glad to know that the restrictive influence of the Chicago institution with regard to the sales of British products in the Dominion of Canada is less effective than we imagined.

But still, it must not be supposed that this particular obstacle is not formidable, nor may it be assumed that the Ontario Laboratories offer a wide-open door to British products. We are well aware that the quality of these goods is generally well above the standards set by either of the authorities above-mentioned, and that in most cases they would be accorded the hall-mark of approval without demur; the trouble is that, as we indicated in our leader, there are difficulties of procedure besides that of communication at long range, in the absence of direct representation on the spot, which block the way through the Laboratories to the issue of labels. Years ago an attempt was made to meet the situation by appointing representatives of the Underwriters' Laboratories in London, and for some time Messrs. Heap and Digby fulfilled that office; the arrangements that were made were fully detailed in our pages at the time. But that system was ended, we believe, by the outbreak of the Great War, and whilst there is still a measure of co-operation between the insurance offices in this country and the Underwriters' Laboratories, there is no fully-organised system in operation. We are not aware that the Ontario Laboratories have ever been represented in Britain.

Of the hearty goodwill of both these testing institutions we have no doubt whatever. It was not the fault of the Underwriters' Laboratories that direct representation on this side was abandoned; as recently as 1922 the late president, Mr. W. H. Merrill, was in this country and made arrangements with the Fire Offices Committee in London under which the latter agreed to assist in the conduct of examinations and tests in England, a service which has been utilised upon occasion in connection with Canadian business. We are assured that the Laboratories are willing to do whatever is within their power to meet any demand on the part of British manufacturers who wish to export to Canada or the United States for service similar to that performed for American industries, and the same would apply to the Approval Laboratories of Ontario—but the difficulties, partly technical and partly administrative, are admittedly serious. It has been suggested that the Laboratories should deposit their specifications with a recognised testing institution in this country, such as the National Physical Laboratory, or Faraday House, and accept certificates from that body to the effect that British products which it has tested do—or do not—comply with the specifications; but the best solution, to our mind, would be the establishment of the British Proving-House which was so warmly advocated by the late Mr. C. H. Wordingham, and which, no doubt, would act in close accord with the two transatlantic bodies.

We have in our possession a pamphlet fully describing the organisation and practice of the Underwriters' Laboratories, and the last half-yearly list of electrical appliances inspected, which may be seen by persons interested in this subject.

The "Sila" Hydro-Electric Development Scheme.

A Great Electrical Undertaking in Southern Italy.

By J. S. BARNES.

A dense network of electric high-pressure transmission lines now covers almost the whole of Italy, and forms a national system of electrical power supply. Close on 2,000,000 kW is actually installed, producing over 5½ milliards of kW-hours a year, with an average load factor of approximately 45 per cent. The great majority of the installations are hydro-electric, though, as development continues apace, and engineers are driven to consider hydro-electric schemes in new districts less adapted to the construction of large artificial lakes, a

Fig. 1.—Map of Southern Italy and Sicily, showing Electricity Supply Mains, etc.

growing demand for supplementary thermal power stations is now being experienced and is in course of being supplied. Nevertheless, it is mainly her resources in water power that are enabling Italy gradually to become, industrially, a rich country; and no other country in the world offers such a complex and interesting example of the technique of co-ordinating power supply by which various kinds of power installations, dotted all over the peninsula from the Alps to Sicily, are linked up and made to remedy each other's deficiencies.

Naturally, the greatest development has come in the north and, in a second degree, in the centre of Italy, where the presence of large towns and long-established industries provided a ready market and where opportunities for the remunerative employment of capital were much greater than in the poverty-stricken south. Moreover, the more abundant and more evenly distributed rainfall in the north made hydro-electric development less costly. Gradually, however, as the technique of power co-ordination has developed along with the ability to transmit power over long distances without too great an economic loss, the south has begun to be opened up. South of Naples, six large hydro-electric power stations, besides a number of smaller ones, are already working, as well as three in Sicily, and the famous "Tirso" plant in Sardinia, which possesses the largest artificial lake in Europe.

The regeneration of the south of Italy depends very largely on the economical utilisation of water. The best land, lying between the mountains and the sea, is often devastated by malaria, which is principally caused by the flooding of large areas during short periods of torrential rain, and the subsequent partial drying-up, thus forming ideal breeding ground for the mosquito. The precious water, in this land of long dry summers, is at the same time wasted, being no longer available for the purpose of irrigation at the seasons when it is chiefly needed. The floods, too, cause incalculable damage by erosion. Moreover, the failure up to the present to discover mineral wealth on the main land of Southern Italy, coupled with the above causes which make even the only great local industries, namely, agriculture and afforestation, barely profitable, condemns the people of this beautiful country to an existence of the direst poverty, mitigated only by the fairness of the climate and the remittances of emigrants, who leave to gain their livelihood in other parts of Europe and in America every year to the tune of over 200,000.

Since the unification of Italy, something indeed has been done by the Government, to improve the lot of these districts by the expenditure of public money on the development of the means of communication, on the supply of drinking water, on the provision of quinine and wire netting whereby to combat the malaria, and on the provision of schools. But the efforts of the Government have in the past been unco-ordinated and sporadic. Since 1922, on the other hand, the various measures in the above sense have been speeded up by the Fascist Government and large extra funds provided. Yet, only lately has it come to be realised that the regeneration of the South can only be effected by solving the water question by comprehensive schemes, that is, by utilising the water power resources of the country for the provision of power for industries (especially those industries which either feed or are fed by agriculture); by impounding the water in large artificial lakes, whereby as much as possible of the comparatively small rainfall may be utilised in power production; by thus avoiding, at one and the same stroke, both the erosion and the floods, and at the same time providing water for irrigation either by the impounded waters or by means of electrical pumping; by exterminating malaria at its origins, and by the opening up of richer land to intensive agriculture.

With all these economic objectives can be attained in a single scheme, many projects, otherwise unproductive, can be made to pay; and the Government has learnt that in encouraging and assisting such schemes, public money may be most profitably employed in harmony with individual initiative. Sardinia, the topography of which lends itself peculiarly well to the purpose, is furnishing the most typical example of development on these lines. A plan of development has been drawn up for the whole island. The presence of numerous great artificial lakes, of which two are already in existence, will soon transform the aspect of the country, and within a generation this, the poorest of Italian provinces, promises to become one of the richest.

The problem of Sicily is more difficult, because the topography of the country is not suited to the creation of large artificial lakes. What can be done in this way locally has already been done. The final solution of the problem is awaiting the completion of the great power scheme in course of construction in Calabria, known as the "Sila" project—from the name of the plateau and forest of the Sila situated in the "ball," so to speak, "of the foot of Italy," whence power is to be derived and carried, not only to the neighbouring provinces of Basilicata, Puglia, and Campania (Naples), but also across the Straits of Messina to Sicily.

During a recent visit to Southern Italy I have been given opportunities through the kindness of the chairman of the "Sila" Company, Commendatore Maurizio Capuano, and of the famous engineer, Commendatore Angelo Omodeo, who is the author of the scheme, to visit the works now well under way.

The district is one of the most remarkable in Italy, not only for its natural beauty, but for its wildness and its contrasts with what one usually associates with Southern Italy. The Sila plateau lies between the Ionian and Tyrrhenian Seas, between the Port of Cotrone and the town of Cosenza; it is over 1,000 sq. kilometres in extent and at an altitude of over 4,000 ft. above the level of the sea. It is thickly covered by an immense forest of fir and pine, poplar and beech, and is broken by the ridges of higher mountains rising to 6,000 or 7,000 feet. For four months of the year it is covered with deep snow. The chief river draining it is the Neto, fed by its main tributaries, the Arvo, the Garga, and the Ampollino, which finds its way to the Ionian Sea a few miles north of Cotrone, all at once diving down from the height of the plateau into the low, fertile, but altogether deserted, undulating plain between the sea and the great mountain wall. Geologically the district is formed of ancient impermeable oleanic rock, thus combining with the local topography to present ideal conditions for a hydro-electric scheme requiring large artificial lakes.

The scheme, when completed, will be one of the largest of its kind in Europe, producing over 140,000 continuous kW in four power stations, the largest of which, namely, that of Timpa Grande, will produce over 97,000 continuous h.p., with over 160,000 kW of plant installed.

The accompanying map and diagram, fig. 2, illustrate the scheme, which I will now endeavour to describe in detail. For clearness it will be found convenient to divide the description into three parts, as follows:—

1. The creation of three storage reservoirs by means of three dams on the upper reaches of the Rivers Neto, Garga, and Arvo—the first two having a useful capacity of four million cubic metres each, the third of 157 million cubic metres (approx. 34,540,000,000 gallons). For all intents and purposes they will form one single reservoir, as they will be connected up by pressure tunnels and have a common top water level of 1,287 metres (4,223 ft.) above the sea. By thus impounding the waters of these three rivers, the *régime* of the latter will be completely regulated.

From the Ampollino reservoir an underground flume 3⅓ miles in length will carry the mean discharge of the above lakes into a fourth reservoir, namely, that of the Ampollino, having a useful capacity of 61 million cubic metres (approximately 13,420,000,000 gallons) and a top water level 1,270 metres (4,176 ft.) above sea level. Thence the continuous discharge will be 6.5 cubic metres per second (=approx. 85,800 gallons per minute).

Taking off from the Ampollino dam at a level of 1,250 metres, a tunnel will carry this water under pressure for 4,395 metres to a point immediately above the power station, known as the "Orichella" power station, situated lower down on the River Ampollino, about 800 metres above sea level. At the outlet end of the tunnel will be constructed a surge tower, and a pressure forebay for the pipe line. The mean head will be 467 metres and, as 1 cubic metre of water falling in one second through a vertical height of 1 metre is the equivalent of a little more than 13 h.p., we thus arrive at a figure of approximately 40,000 continuous h.p., or approximately 30,000 continuous kW, representing the amount of continuous power to be obtained at this point.

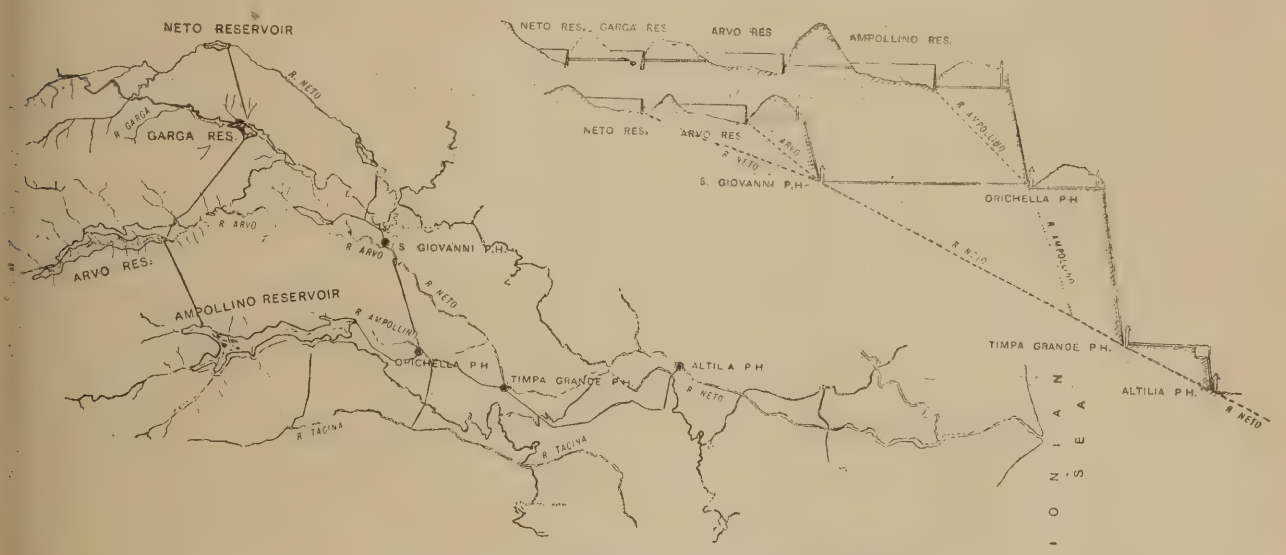

Fig. 2.—Plan and Vertical Section of the "Sila" Scheme.

The two big dams to be constructed in connection with this section of the scheme will be those impounding the waters of the Arvo and Ampollino. Both will be of the usual trapezoidal shape and built of masonry. Their respective measurements will be 40 metres (130 ft.) high and 270 metres (900 ft.) long; and 31 metres (102 ft.) high and 138 metres (450 ft.) long. The latter is already on the verge of completion.

2. The creation of two storage reservoirs of 20 million cubic metres capacity on the Neto and of four million cubic metres on the Arvo, approximately ten and eight miles respectively below the upper reservoirs, and having top water levels of 1,150 and 1,070 metres. From the latter the water will be led by tunnel under pressure to the head of the pipe line and surge tower. The water from the first reservoir will be discharged into the pressure tunnel about half way along its course of about 3½ kilometres. The total mean discharge has been calculated at 4 c.m. per second, so that with a mean head of 210 metres, another 11,000 continuous h.p. will be obtained at the second power station of S. Giovanni situated lower down in the valley of the Neto, about 850 metres above sea level. Thence the water will be carried by another tunnel and discharged into the bed of the Ampollino close to the first power station (Orichella).

3. From this point the combined discharges (amounting to 10.5 c. metres per second) will be carried by open flume and tunnel a distance of 3,665 metres to the head

of the third and greatest power station (Timpa Grande). Meanwhile the water available will have been increased to a mean of 15 c.m. per second by the addition of water derived, also by tunnel, from the upper reaches of the River Tacina, which runs parallel to and to the south of the Ampollino. The head being 467 metres, no less than 107,000 continuous h.p. will be generated at this point. Over 160,000 kW of plant will be installed. At the head of the pipe line there will be a penstock (already nearing completion), sufficient to regulate the varying requirements of the daily demand for power. There will be seven pipe lines.

4. Slightly below the discharge of the water from the turbines into the Timpa Grande (which joins the Neto a few hundred yards farther down) there is to be built an intake barrage, from which a second open flume and tunnel will carry the water into a second penstock at the head of the fourth and last of the projected power stations (the Altilia power station), situated on the lower Neto 164 metres below the mean water level of the penstock. Thus the power to be generated there will be a further 32,000 continuous h.p., making a total for the stations of over 190,000 continuous h.p., equal to approximately 140,000 continuous kW.

This will mean, including reserves, the installation of a total of over 300,000 kW of machinery in order to meet an estimated load of 50 per cent. l.f. The discharges of the last two power stations will not be entirely regulated by direct storage; but by disposing of the machinery in the right proportions between the stations and co-ordinating their operation, it will be possible to utilise the whole of the power nominally available. Thus the annual output of energy which will come actually to be sold will total approximately 1,250 million kWh or Board of Trade units.

Three main transmission lines, consisting each of two 3-phase circuits carried on lattice poles of reinforced concrete and steel structure, will start from the Timpa Grande station and will carry the current at the high pressure of 135,000 volts, the first to Taranto for Bari, Brindisi, and Lecca; the second to join up with an existing power station at Tanagro, near Potenza, whence energy is supplied to Naples; the third to Catanzaro and Reggio and across the Straits of Messina in Sicily. A fourth line at a lower voltage will serve Cosenza and Paola, and a fifth Cotrone (see fig. 1).

Only by transporting power over these very considerable distances will it be possible to secure the necessary markets. Naples and the thickly-populated Campania form a market with a continually increasing demand. The same, on a smaller scale, may be said of Taranto, now the chief naval station of Italy, and Bari, which is becoming an increasingly important commercial port and manufacturing centre. Locally it is calculated that, apart from special industries, not more than 25,000 kW will for some time be able to be absorbed. The importance of Sicily, therefore, as a market, with its teeming population, its considerable industries, its sulphur mines, and its need for water by pumping from the subsoil, cannot be overlooked. This, however, necessitates the transport of energy across the Straits of Messina. To this end the United States Steel Corporation has, through the American Bridge Co., of Pittsburg, which is controlled by it, been approached with a view to the construction of an aerial line across the Straits. No contract has as yet been signed, but the following scheme put forward by the American Bridge Co. has been accepted as the best solution :—

Two steel towers are to be constructed, one on each side of the Straits at a point slightly north of the narrowest point. Each of these towers will be 330 metres in height (a few feet higher than the Eiffel Tower), and the distance between them will be 330 metres. There will be two circuits of three cables each, running 30 ft. apart. The diameter of the cables, which will be of steel, will be .82 in., and the water in the centre will be cleared by a minimum of 70 metres. On one side of the Straits the cables will have a fixed attachment at the base of the tower, on the other an automatic movable one to allow for seasonal expansion and contraction and for wind pressure. The power will be carried at a pressure of 135,000 volts.

The United States Steel Corporation is prepared to begin the erection of the towers within eight months of receiving the order and to complete the work within two years. Further, it is prepared to guarantee the satisfactory working of the scheme for a period of five years after completion and to accept payment accordingly by instalments.

The cost, excluding that of the concrete foundations for the towers, has been estimated in the form of a firm offer at 800,000 dollars.

The capital for this great enterprise has been found by a consortium of the electrical companies chiefly interested, namely, the Società Meridionale di Elettricita, the Società Generale Elettrica della Sicilia, and the Società delle Strade Ferrate Meridionali, backed by the strongest Italian bank, the Banca Commerciale Italiana. The State is assisting, too, with a grant amounting to 200,000,000 lire (close on £2,000,000).

The Timpa Grande power station will be completed, together with the Ampollino storage reservoir, by the close of 1925, although it will not even then deal with the whole of the discharge of water described above. In other words, the extra water to be derived later from the River Tacina will not be included, while in consequence of the other power stations higher up the valleys not being in operation, together with the remaining reservoirs, the whole of the water available at the Timpa Grande will not be regulated, so that the continuous output at the beginning of 1926 will not correspond with the maximum figures given above. Nevertheless, about 30,000 continuous h.p. will be produced in this first stage of development, and progress with the remaining works will continue unchecked.

The Montecatini Co. has secured a site at Cotrone, which is a small port with a safe and deep anchorage close up to the quay side, for the erection of plant utilising the Fauser process for the production of synthetic ammonia. This plant, which will have a load factor of about 90 per cent., will employ about 20,000 kW, and thus form a useful fly-wheel, so to speak, to the total load of the whole hydro-electric system.

Before closing this summary description of this important enterprise we must not forget to mention that, in accordance with the principles enunciated at the beginning of this article, a further storage reservoir is to be constructed below the fourth power station with the object of providing water for the irrigation of the plain lying between the mountains and the sea. The complete regulation of the *régime* of the Neto will already have prevented the seasonal floods. The way will thus be paved for the gradual colonisation of this large and fertile area amounting to over 25,000 acres, hitherto practically deserted on account of lack of water and the malaria scourge, and an industrial agricultural company is being formed to exploit the new situation.

It may be of interest to British readers that the designer of this great scheme, Ing. Angelo Omodeo, is responsible for the plan of hydro-electric development in the Tay valley, known as the Grampian Electricity Supply Scheme, the construction of which, it is announced, will shortly be initiated under the auspices of the Power Securities Corporation.

Largest Synchronous Motor.—According to *Power*, a 9,000-h.p. synchronous motor, to be installed by the McKinney Steel Co. at its River Furnace Plant, will be the largest continuously rated industrial motor in the world. It will be connected to a Morgan continuous billet mill which will probably be in operation early in 1926. The motor will be of the G.E.C. design for 6,600 V, 107 r.p.m., 3-phase, 25 cycles, unity power factor. It will have shaft extensions at both ends and be coupled to a long layshaft running the length of the mill with bevel gearing to each stand of rolls. The mill will have 10 stands, six of which will be 21 in. and the remainder 19 in.

Induction Heating by Low-Frequency Currents.

The Use of the Induction Furnace for Melting Non-ferrous Metals.

By G. E. TAYLOR, A.M.I.Mech.E., A.M.I.E.E.

(*Concluded from page 287.*)

Figs. 6 and 7 show a side and front view of a 75-kVA, single-phase, 50-cycle, 440-volt furnace, having a nominal capacity of 600 lb. per hour.

Two sections of the same furnace are shown in fig. 8. It will be noted that the secondary portion consists of two arms forming an angle of 75 deg. Above them is placed a bath of molten metal, the upper part of each arm being rounded off at the point where it meets the bath.

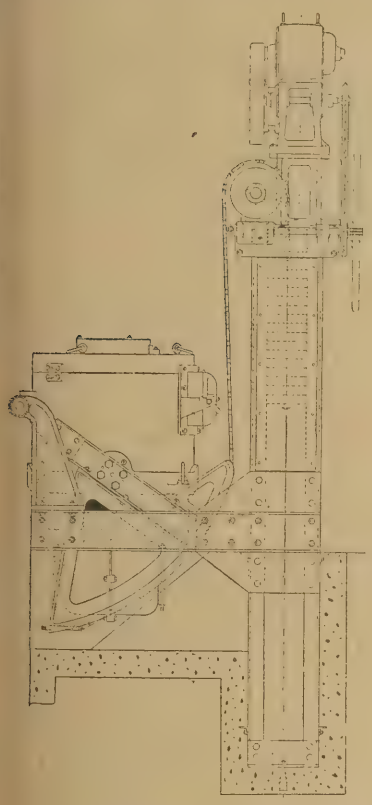

Fig. 6.—Side View of Ajax-Wyatt Furnace.

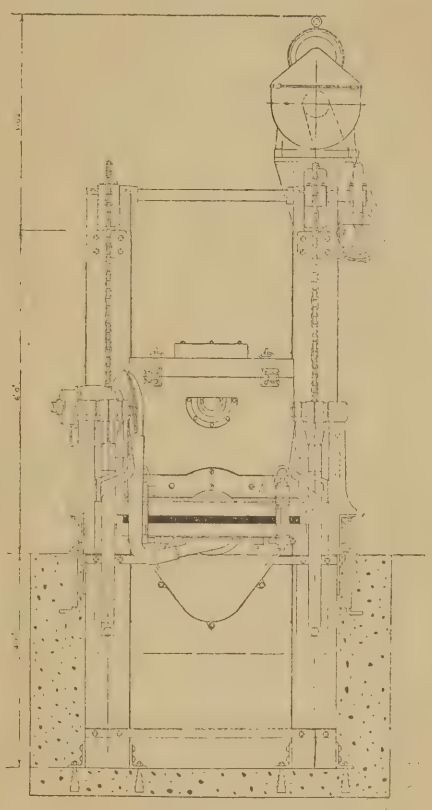

Fig. 7.—Front View.

The resistance of the lower or V-shaped part of the secondary channel is about 80 per cent. of that of the whole furnace. The V-shaped part contains about 21 lb. of metal. As the watt-hours required to raise the temperature of this amount from 950 deg. C. to 1,150 deg. C. (the temperature at which zinc volatilises in the alloy) is 285, it is evident that when the furnace is developing 74 kW, the rate of change of metal in the channel must be 3.5 times per minute to prevent the zinc volatilising. This flow of metal is obtained as described below.

To simplify construction, the furnace has been designed for single-phase working. The maximum kilowatt input of a single-phase furnace is limited, owing to the size of the secondary slot, to 80 kilowatts on 50 cycles and 90 kilowatts on 25 cycles. It may, however, be designed for polyphase working, when the maximum input will be increased in proportion to the phases used.

Conductors carrying current in opposite directions repel each other, if free to move, the magnitude of the force depending directly on the square of the current and inversely on the distance between the conductors.

When the conductors are composed of molten metal contained in rigid channels, this force will tend to bank up the metal on the outside of each channel, and where these are arranged so that a gradually diminishing force is obtained along their lengths, the metal will tend to flow from the adjacent ends. In practice it is found that when the channels form an angle of 75 deg. in relation to each other, a good metal flow is obtained.

As the channels widen out where they meet the bath, the current density at this point is much less than further down the channel; there is, therefore, an increased circulation of the metal due to the "pinch" effect.

The critical current density at which the force known as "pinch" effect will tend to reduce a rectangular conductor to half its cross section, as shown by Hering, will be given by the following formula: $C_D = 895\sqrt{G/H}$, in which C_D is the current density in amperes per sq. in.; G is the specific gravity of the molten metal, and H the depth of metal.

The current in the channel of the furnace shown in fig. 8 being many times greater than that given by the above formula, the "pinch" effect would break the circuit if it were not for the head maintained in the channel by placing the bath of molten metal above it.

The circulation of the metal in the furnace is due to various effects. As the metal becomes heated in the channels and forced to their outer sides, its place is taken by the colder metal flowing in, this flow being due to heat convection currents, or the "Joule" effect. The arrows in fig. 8 show the direction of this circulation. In making copper-zinc alloys, it is necessary that the metal should be well stirred, to ensure having a homogeneous alloy throughout the charge. Where the pit fire furnace is used, the stirring is done by the melter, using an iron bar for the purpose, just before the metal is ready to be poured. With this type of induction furnace, the stirring is automatic and continuous, being caused by the above-mentioned effects, which are of sufficient magnitude to displace the metal at the top of the bath.

The following figures give the electrical characteristics of a 50-cycle single-phase furnace:—

Nominal capacity, 600 lb. of brass per hour.

Input, 74 kW; p.f. 84 per cent.

Primary volts, 440; amperes, 200; turns, 80.

Size of primary copper, 0.125 in. × 0.75 in. (0.0937 sq. in.).

Secondary resistance, 2.9×10^{-4} ohm; amperes, 15,700.

Size of secondary copper, 3 in. × 0.75 in. (2.25 sq. in.).

Flux density in core, 12,000 lines per sq. cm.; in legs, 7,600 lines.

Copper loss (hot), 1,022 W; iron loss, 544 W.

Efficiency, 97.8 per cent.; temperature of primary, 150 deg. C.

The electrical gear external to the furnace, a wiring diagram of which is shown in fig. 9, consists of two

2-pole, change-over oil switches, interlocked with a 12-way plug board. In this case a 75-kVA auto-transformer is used to reduce the voltage from 525 to 440. The 440-volt winding is tapped up to the mid point, and is so connected to the switchgear that any voltage from 0 to 440 volts may be obtained in 20-volt steps. The ammeter and voltmeter are connected in the furnace circuit. It has been found in practice that so great a number of tappings is not required, and the switchgear and auto-transformer have therefore been simplified, as shown in fig. 10. A standard change-over 3-pole 200-A oil-switch, with two series overload trips and low-voltage release, has been substituted for the two 2-way switches, and a 220-kVA transformer with five tappings is used in place of the 75-kVA auto-transformer.

When a single-phase transformer is used to step down the voltage to that required for the furnace, provided this voltage is about 440, a tapping is generally taken out at the mid-point of the secondary winding and earthed as a precautionary measure against shock. When the furnace is connected to a 440-volt supply with unearthed neutral, an earth shield is fitted over the primary winding of the transformer. A 1-h.p. motor is provided for tilting the furnace, and a motor of $\frac{1}{2}$ h.p. is used for driving the transformer cooling fan.

Fig. 11 shows a three-legged furnace transformer on the centre leg of which is placed the winding, consisting of copper strip wound radially on an asbestos sleeve, mica or asbestos insulation being placed between the turns. The whole coil is then covered with a thin layer of special cement.

As the transformer has to be dismantled each time the furnace is lined, the laminations in the centre leg are shaped at the end and are arranged in layers of five to facilitate assembly. A small fan is used to blow air over the centre leg when in operation.

The furnace is lined with a refractory cement, which is rammed into the furnace by means of pneumatic hammers. The bottom castings are placed on a suitable stand and are lined with asbestos sheet and heat insulating bricks. The wood former, which forms the secondary channels, is placed in position and the cement is rammed round it. This is carried on until the cement is of sufficient height to place in position the former, which forms the hole to take the centre leg of the transformer. The bottom brass ring is also placed in position and the lining is rammed up to the point where the furnace shell is bolted on.

The first row of heat-insulating bricks is then placed inside the shell and the ramming is continued up to the point where the crucible form and spout forms are placed in position. Ramming is further continued until the top of the furnace is reached.

The different formers are then taken out, the furnace transformer is assembled, and the furnace is placed in its cradle, and then the channel former is burnt out. The furnace is now dried for a period of three or four days, after which about 200 lb. of molten metal is poured into it and the current is switched on.

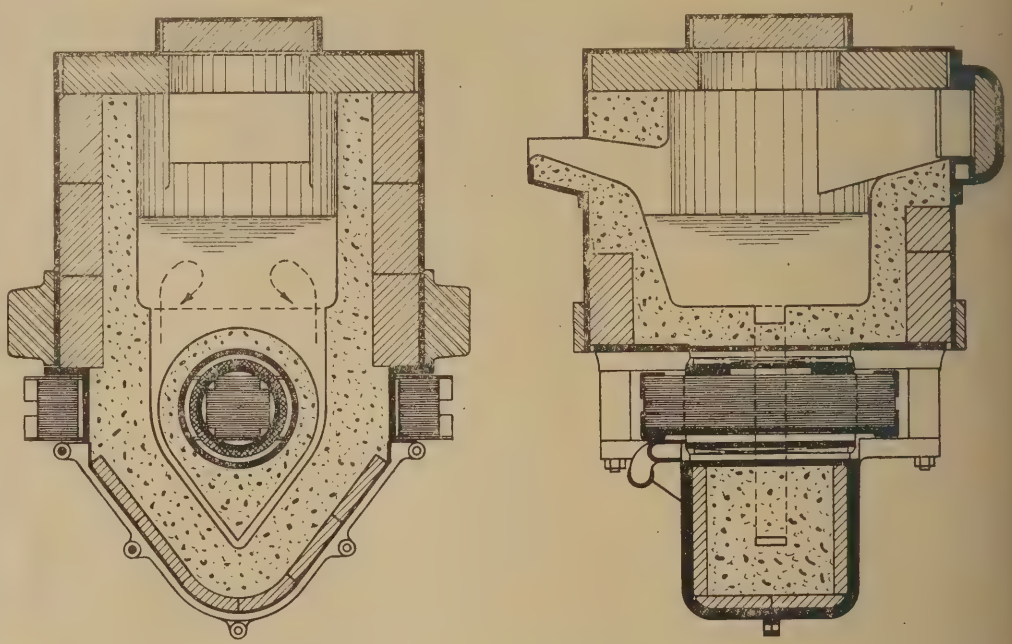

Fig. 8.—Sections of Ajax-Wyatt Furnace.

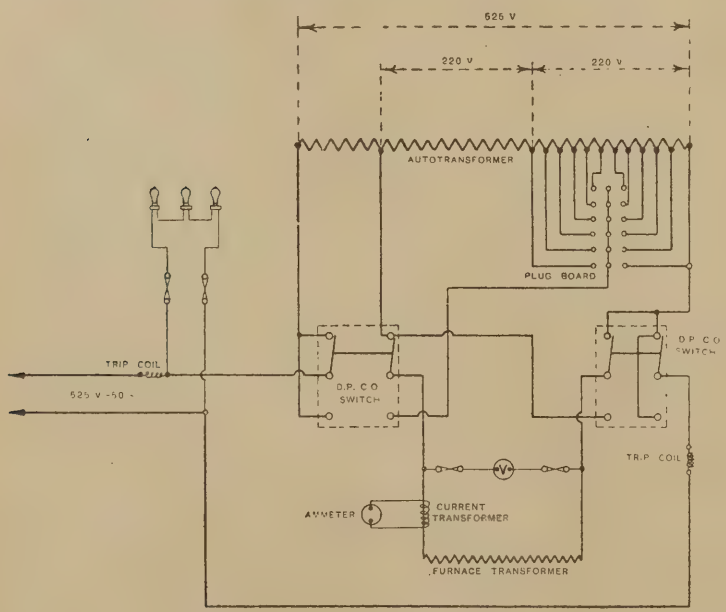

Fig. 9.—Wiring Diagram.

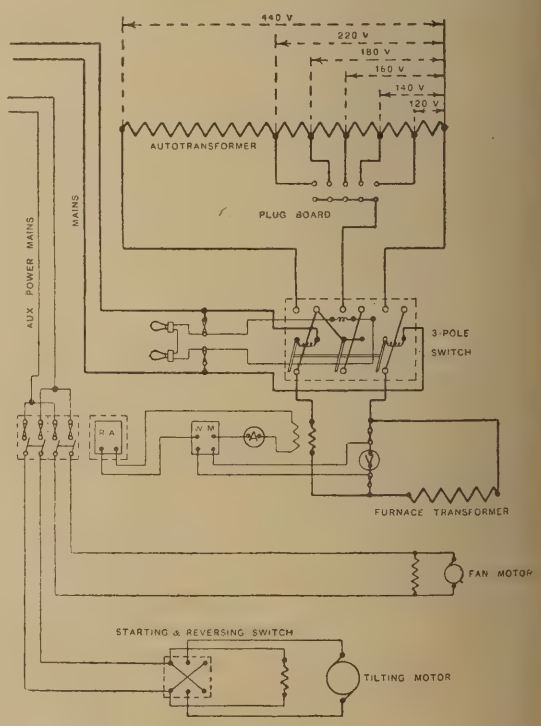

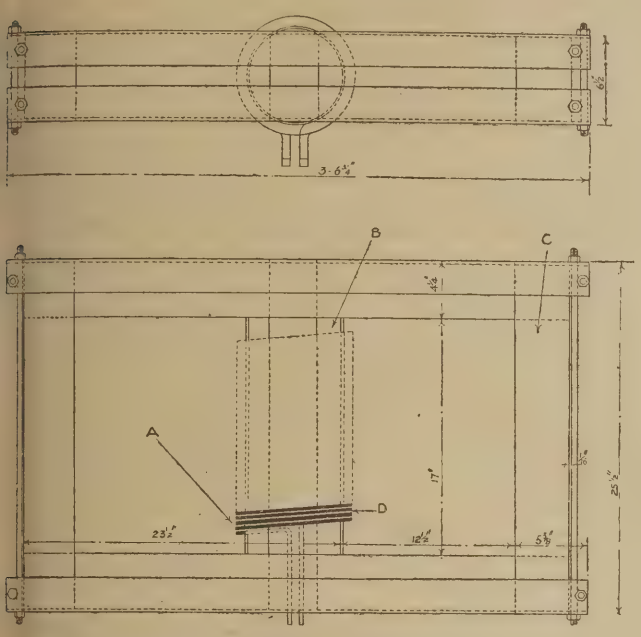

Fig. 10.—Simplified Diagram.

After the furnace is started, it may be charged with swarf, ingots, or scrap metal in any form. When the furnace has been completely charged and the whole of the metal has reached its correct pouring temperature, the needles of the instruments will begin to oscillate, owing to the varying conductivity in the channel. This is very interesting and extremely useful, for it indicates the correct pouring temperature of the metal, and so

A, primary coil; B, core; C, transformer iron; D, high-temperature insulating cement.

Fig. 11.—Three-legged Furnace Transformer.

does away with the necessity for highly skilled melters. This condition only holds good if the size of the secondary channel is made in correct proportion with regard to the power input.

The rate of flow of metal during the pouring operation is under complete control, the tilting of the furnace being carried out by means of a small electric motor. The controller is usually placed in the fixed centre about which the turn-table for the moulds revolves. The melter is therefore in the best position for observing the height of the metal in the moulds during this operation. As the lip of the spout is on the tilting axis, a constant pouring point is maintained.

The following table gives details of an actual day's run on a 65/35 brass:—

Time in hours. Melting	Melting Charging & Pouring.	Metal chgd. lb.	kWh per charge.	Lb. per unit.	kWh per ton.	Remarks.
m.	H. m.					
15	1 25	650	75·5	8·85	253	First heat —delay on moulds.
0	1 15	650	61·5	10·55	212	
55	1 5	650	67·5	9·63	233	
10	1 20	650	63·5	10·2	220	
0	1 13	650	58·5	11·1	202	
0	1 12	650	65	10	224	
0	1 9	650	58	11·2	200	
10	8 39	4,550	447·5	10·2	220	

The metal may be held at any required temperature by means of voltage regulation. As the furnace must be started up on molten metal, the usual practice is to keep it molten over week-ends, the power taken being approximately eight units per hour.

The switching operation is extremely simple, and a single change-over switch only is required, as it is found in practice that only the voltage necessary for giving the full load and that for stand-by are used.

The metal loss due to volatilisation is extremely low, and, if due precautions are taken to keep the furnace airtight, oxidisation may be practically eliminated. It is found that by adding a quantity of zinc equal to ½ of 1 per cent. of the total charge, the proportions of the mixture are maintained.

The energy consumption can be estimated from the above figures, which show that an average of 10.2 lb. of brass per kWh has been maintained throughout the shift, this including pouring time, when it is usual to reduce the load to about 8 kW.

We have, therefore, an energy consumption of 200 kWh per ton. If we take the empirical figure of 15 kW as the rate at which heat is applied to the furnace to keep the total charge at its pouring temperature, we have an efficiency of 78.5 per cent., with a furnace taking 70 kW.

The average life of the lining is approximately 500,000 lb. of brass melted, but in several cases this figure has been as high as 2,500,000, and in one case over 5,000,000 lb. The channels of the furnace do not become enlarged, as might be expected, from the violent circulation of the metal, but gradually make up, and in time the rate of melting becomes too slow for practical use.

Two men, who may be semi-skilled melters, are required to operate a 600-lb. furnace and moulds, when pouring about every hour. Four men are usually employed where banks of three furnaces are installed, and in some cases where a number of furnaces are in use, one man per furnace is found sufficient.

As practically the whole of the resistance is in the secondary channel, the kW input is independent of the quantity of charge in the crucible, and therefore the full rated load may be taken at any state of the charge.

It is usual to run the furnace for 24 hours per day, 5½ days per week. Assuming that it takes the furnace 60 minutes to melt the charge and 10 minutes for pouring time, when the load is cut down to about 8 kW, it is in operation for 108 hours at 70 kW and 18 hours at 8 kW, making a total of 8,424 kWh out of a possible 11,760 kWh, thus giving a load factor of 71½ per cent.

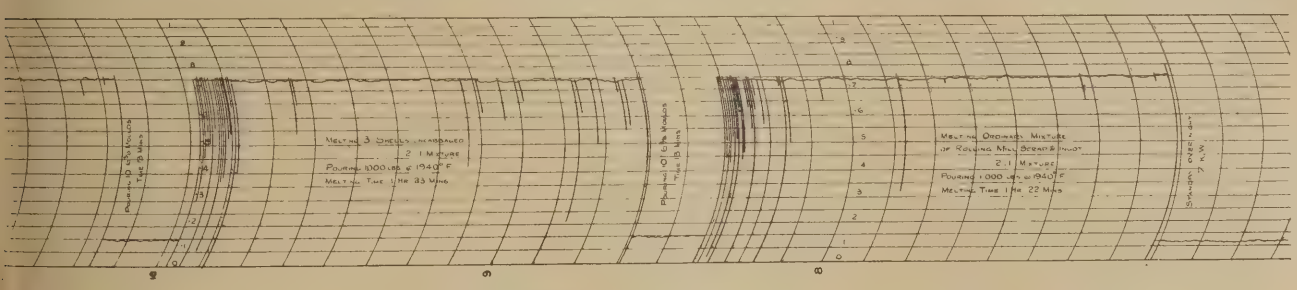

Fig. 12.—Reproduction of Kilowatt Record Chart.

Fig. 12 is a reproduction of an actual kilowatt record chart. It will be seen that the load is practically constant throughout the heat, until the charge is nearly ready for pouring. The load then begins to vary and produces the fluctuations shown on the chart. This is due to zinc volatilisation in the secondary channel. The drop in the curve at the end of the heat is caused by the load being reduced during the pouring. As soon as the metal is cast, the furnace is switched on to full load. Hence the power is practically constant during the melting period and an acceptable load is provided for the power supplier.

This form of induction furnace, which has a power factor of 85 per cent. at 50 cycles and 90 per cent. at 25 cycles, a steady and constant load with a correspondingly high load factor, a high thermal efficiency and a strong stirring action of the metal, is ideal for the making of alloys.

It is not generally realised that about two-thirds of the world's supply of yellow brass for rolling mills is now being made in this type of furnace.

The Southern Railway Electrification.—III.*

High- and Low-Pressure Cable Systems and Sub-Station Equipment.

(*Concluded from p.* 303.)

Electric traction was introduced on the suburban lines of the South-Western section of the Southern Railway in the autumn of 1915. The d.c., 600-volt, third-rail system is used, and the first section comprises 150 miles of single track, or 50 route miles. The second section, which was opened on July 12th last, covers 67 track miles and embraces the company's lines southward to Guildford and Dorking.

South-Western Extension.—For this section 61.1 miles of 11,000-volt cable was manufactured, laid, and jointed by W. T. Henley's Telegraph Works Co., Ltd., in addition to two miles of 7-core, eight miles of 15-core, and four miles of 19-core contol cable. The low-pressure cable was supplied by the Macintosh Cable Co., Ltd.

The track is supplied with d.c. at 660 volts from rotary-converter sub-stations which were equipped by the British Thomson-Houston Co., Ltd., as were the original ones. The most recent additions are four two-unit attended and three single-unit unattended sub-stations, together with extensions at two existing sub-stations and also at the Southern Railway Co.'s Durnsford Road power station, which feeds the sub-stations at 11,000 volts, 3 phase, 25 cycles.

The self-synchronising rotary converters both in the attended and unattended sub-stations have a normal rating of 1,250 kW and run at a speed of 500 r.p.m., being designed to stand overloads of 50 per cent. for two hours, 100 per cent. for five minutes, and 200 per cent. for 20 seconds, and are also guaranteed to stand a momentary load of four times full load without flashing-over. Induction-motor starting is used, and the general construction and arrangement of the switchgear in the four attended sub-stations is similar to that in the old sub-stations and to that described last week in connection with the South-Eastern section.

Special interest attaches to the unattended, or "automatic," sub-stations at Leatherhead, Clandon, and Oxshott, each of which contains a 1,250-kW rotary converter with automatically-controlled switchgear for the a.c. and d.c. ends of the set and the d.c. track feeders. The Leatherhead and Clandon single-unit stations are located at intermediate points in the run of e.h.p. feeders between adjacent two-unit sub-stations and are controlled from the two-unit attended sub-station at Effingham Junction. The Oxshott "automatic" sub-station is situated at the end of an e.h.p. feeder and is controlled from the Hampton Court sub-station.

In each case the 11,000-volt switchgear, which is constructed on similar lines to that in the attended sub-stations, is arranged on two floors at one end of the sub-station, while the 660-volt d.c. switchgear is on two floors at the opposite end of the building, the rotary converter and transformers being located in the central part of the building. The "automatic" apparatus is designed for remote control from a distant point, but provision is also made for control in the sub-station for inspection purposes when required.

To start up the rotary, the remote control switch in the distant station is closed by hand; this operation energises the master control contactor, which is so interlocked that it cannot close unless the motor-operated master controller is in the "off" position. When the master-control contactor closes, the motor-driven master-controller (which fixes the sequences of subsequent operations) closes the oil circuit breaker which connects the h.p. side of the main power transformer to the three-phase e.h.p. supply. Further rotation of the controller closes the "starting" contactor which connects the starting motor to the main transformer, and the auxiliary field winding on the rotary converter is connected to an auxiliary generator, which is driven from the rotary converter shaft. At this point the master controller stops and waits for the machine to synchronise.

As the rotary accelerates, the auxiliary generator builds up its voltage, thus energising the auxiliary field winding and fixing the polarity of the machine. When the voltage of the auxiliary generator attains approximately 80 per cent. of normal, the synchronising field contactor adjusts the resistance in the main field of the converter to the correct value for synchronising. When synchronism is reached, a synchronous-speed indicating relay re-starts the master controller, thus closing the "running" contactor which connects the rotary direct to the transformer, whilst the main field is disconnected from the synchronising tapping on the field rheostat and connected to the moving arm of the rheostat.

Further rotation of the master controller causes the auxiliary field winding to be disconnected from the auxiliary generator; the rotary will now be running in synchronism from the a.c. side, with correct adjustment of field, and will be ready for connecting to the d.c. bus-bars. The master controller, continuing its travel, closes the high-speed breaker on the "negative" side and immediately afterwards the high-speed breaker on the "positive" side closes. Thus, the machine is connected to the d.c. bus-bars. The master controller comes to rest in the "running" position, where it remains until the machine is shut down.

High-speed circuit breakers have been provided to protect against overload and short circuits; they can be set to trip at a predetermined current value and are under the control of a repeat-action relay, reclosing a predetermined number of times, but if the fault persists the rotary converter will be finally shut down and locked out. The other protective devices may be divided into two classes:—(1) Those which shut down the equipment but do not prevent automatic re-starting when conditions return to normal, and include an a.c. undervoltage relay, machine temperature delay, and d.c. reverse power relay, and (2) those which shut down the equipment either directly or indirectly and prevent automatic re-starting until the device which has operated has been re-set manually; these include an overspeed device, a.c. overload and earth-leakage relay, bearing temperature relay, a sequence-timing relay, &c.

Further, a "single-phase starting" protective relay prevents the machine from starting unless all three phases of the a.c. transmission line are energised. The high-speed circuit breakers controlling the d.c. track feeders are opened and closed by means of a control switch situated in the distant control station, but when this switch is closed by the attendant the breakers are under the control of automatic re-closing relays in the sub-station, operating in a similar manner to that described for the rotary-converter d.c. breakers. Provision has been made whereby once the breakers have been locked out, due to a persistent fault by the operation of the re-closing relays, the locking-out device can be re-set from the distant-control point after the fault has been removed. Indication at the distant-control point is given by a signal lamp to show when a feeder breaker has been locked out due to a fault.

The transformers in the attended and unattended sub-stations are of the British Electric Transformer Co.'s single-phase, oil-immersed type, arranged in banks to form three-phase units.

The new rolling stock for both the Western and Eastern areas has been built to the dsigns of Mr. R. E. L. Maunsell, chief mechanical engineer of the Southern Railway, Messrs. Herbert Jones and

* Elec. Rev., April 10th, June 5th, and August 21st, 1925.

laworth, the respective electrical engineers, having been esponsible for the electrical equipment. The motor nit formation is similar, comprising one trailer coach rranged between two motor coaches and, during the usy periods of traffic, two of these units are coupled ogether and augmented by a two-coach trailer unit. 'or the Western section, 52 motor coaches have been uilt by the Metropolitan Carriage and Wagon Co. and 6 trailer coaches by the Midland Railway Carriage and Vagon Co. The motor and trailer coaches for the astern section have been supplied by the Metropolitan arriage, Wagon and Finance Co. and the Birmingham ailway Carriage and Wagon Co. respectively. The ock for the two sections differs only in detail and imensions.

In addition, over 500 existing vehicles have been econstructed as motor and trailer coaches in the rail-ay company's works at Ashford. These vehicles are ounted on new underframes exactly similar to those f the new stock, and the passenger-carrying capacity identical; 144 existing bogie vehicles have also been dapted to act as two-coach strengthening units for ddition, when required, to the regular three-coach ectric units of both the Western and Eastern sections. For the Western section, the order for the complete ectrical equipment of 26 three-coach trains and 13 two-oach trailer units was placed with the Metropolitan-ickers Electrical Co. Each of the three-coach trains ill consist of two motor coaches, one at eac end nd one trailer coach in the centre. Each motor coach equipped with two motors, each giving an output of 75 h.p. at 600 volts on the one-hour rating, arranged in pairs on the bogies underneath the driving compartments. Each pair of motors is controlled by its own separate gear in the driver's compartments. One advantage claimed to be obtained by placing the control gear in the driver's cab directly over the motor bogies is that the weight of the apparatus is concentrated above the motors, producing more adhesive weight upon the driving wheels and reducing the possibilities of slipping under bad track conditions. Westinghouse brakes are used; the air is supplied by small compressors, directly driven by low-speed motors, one of which is placed in each motor cab. The action of all the compressors on a train is controlled by a master governor and switch producing uniform work on all the compressors, as all start and stop simultaneously.

In conclusion, the following table may convey an idea of the Southern Railway's electrification plans:—

Section.	Track miles completed.	Track miles in hand.	Total miles.
L. & S.W. ...	178	67	245
Brighton ...	70	82	152
S.E. & C. ...	—	250	250
Cost ...	£2,250,000	£5,500,000	£7,750,000

The conductor rails on the Elmer's End and Hayes line were recently charged at a d.c. pressure of 600 volts in connection with preliminary tests which will be continued at intervals till the electrified portion is ready for operation in, it is hoped, December next.

Correction.—The three 400-kVA frequency changers in the Lewisham sub-station and 15 10-kVA sets in the outlying sub-stations, mentioned last week, were manufactured by the Electric Construction Co., Ltd.

Notes from Canada.

(By our Special Correspondent.)

the issue of the Review dated July 3rd, is an itorial entitled "Standards of Quality and Perform-ice." It is rather noticeable that no mention is made of e Approval Laboratories of the Hydro-Electric Power ommission of Ontario which have now been function-g, in a manner similar to that of the Underwriters' aboratories in the United States, for over 10 years.

The following statement, quoted from the article in estion, does not apply to the Power Commission's proval for Ontario so far as the writer has been able ascertain:—

"Matters are so arranged that it is almost, if not ite, impossible for a British or other manufacturer secure the services of the Bureau."

Whether electrical materials, apparatus, or devices, ., have been approved by the Underwriters' Labora-ies or not, the Commission's approval must be ob-ned, though, usually, the Commission approves any-ng already approved by the Underwriters, whilst re-ving the right of independent action. Moreover, legal authority vested in the Commission, by the ovincial Legislature, under the provisions of the wer Commission Act, enables the Commission not only prevent the *use* of unapproved electrical apparatus, also to prevent its *sale* for use in the Province; the nmission has also power to prevent the advertising electrical apparatus (even though it be approved) such a manner as would be liable to lead to improper . For example, a manufacturer or dealer would not allowed to advertise a 1,000-watt electric heater as ng suitable for connection to an ordinary lampholder, such holders are rated at only 660 watts. There is le doubt that such restrictions will work to the benefit the community. A case that was mentioned to the ter some time ago may serve as an illustration:—

pair of electric curling tongs was purchased, and rtly afterwards a small child in the household got hold of the flexible cord, while the tongs were connected up, and bit it, with the result that his mouth was very badly burned. Investigation showed that the cord had no rubber insulation whatever, and was not fit for anything more than electric bell work; there was nothing on the device to indicate its country of origin, and its whole construction was such as to invite trouble. The device was bought at a "department store" in an Ontario city.

The Hydro-Electric Power Commission now has power to prosecute anyone found dealing in such unapproved devices for, of course, the one in question had never received its approval. Several persons have already been prosecuted and fined, and the results are said to be salutary. While the approval of the Commission is only required *by law* in the Province of Ontario, the writer is informed that its approval is usually sufficient to gain acceptance of a device in other Provinces without difficulty, even though the approval of the Underwriters' Laboratories in Chicago has not been obtained.

With regard to the work of the Underwriters' Laboratories and also to the National Electrical Code, it has always seemed to the writer to be unfortunate that it is only the fire and not the life insurance companies that are represented.

The natural tendency of the fire underwriters is to take care of the fire risk only, in connection with either electrical installations or apparatus, and though of recent years an honest attempt has been made to pay attention to the life hazard as well as the fire hazard, it is still evident that the latter gets more consideration than the former.

If there is a move in England to establish some form of approval, and to do it through the agency of the insurance companies, by all means let both the great branches of the insurance world be adequately represented, otherwise there will be a lack of proper balance.

[The constitution and working of the Approval Laboratories of the Hydro-electric Commission were described in the Electrical Review of April 29th, 1921.—Eds.]

D

The British Association.—I.

The Southampton Meeting.

On Wednesday last, the 95th annual meeting of the British Association for the Advancement of Science commenced at Southampton. In a number of respects this important sea-port is an ideal *venue* for such a congress, as within it and around are many things in wide variety to interest the scientific mind. The town is the home of the Ordnance Survey, to whose premises visits are being arranged; archæologists will find a great many matters to occupy their attentions; the New Forest provides material for the naturalist; while there are many undertakings exemplifying modern industrial and engineering progress. From our readers' point of view there are three works of outstanding interest in Southampton: the docks and harbour, the Pirelli-General Cable Works, and the Corporation electricity works. In the Engineering Section (G) papers are being read upon the first and last of these by gentlemen very competent to deal with them—Mr. H. Wauchope, the electrical engineer to the Southern Railway at the Southampton Docks, and Mr. W. G. Turner, the borough electrical engineer. The programme of visits and excursions includes visits to the docks and the Pirelli-General works, as well as to the Calshott Aerodrome, Messrs. Harland & Wolff's ship-repairing works, &c.

It is of interest to recall that the Association has previously paid two visits to Southampton—in 1846 and 1882. The programme in the latter year contained a large number of papers on electrical subjects, which was fitting when the president was Dr. C. W. (afterwards Sir Charles) Siemens. Reference to the Electrical Review of that period shows that the presidential address referred to the "new arts of applying electricity to lighting, to the transmission of power, and to metallurgical operations." A large part of the address was concerned with electrical units, and it was then suggested that the unit of electrical power should be named the "watt," and the terms "gauss" and "weber" were suggested for magnetic units. Dr. Siemens predicted that "the electric light may be worked by natural sources of power, such as waterfalls, the tidal wave, or the wind," a prophecy which has been abundantly fulfilled in two respects at least. A study of the papers presented at the meeting is very fascinating, but we cannot do more than indicate the nature of a few of them. Mr. F. J. Sprague described the Edison system of electricity distribution dealing with dynamos, lamps and meters; Mr. W. H. Preece read papers on "Recent Progress in Telephony" and "A New Arc Electric Lamp"; some "Notes on Atmospheric Electricity" were contributed by Mr. C. Michie Smith; Mr. R. Sabine dealt with electric light measurement; Lord Rayleigh presented a report of the Committee on Electrical Standards, dealing principally with the effect of temperature upon the resistance of metals; Mr. C. Vernon Boys described the principles of some electricity meters; and Dr. Siemens and Mr. A. K. Huntington presented a joint paper on the electric (arc) furnace.

This year's president is Dr. Horace Lamb, F.R.S., who was formerly professor of mathematics at Adelaide and Manchester. The president of Section G—Engineering—is Sir Archibald Denny, the well-known naval architect and marine engineer; the vice-presidents of the Section are Prof. G. W. O. Howe and Sir J. I. Thornycroft, F.R.S. Dr. G. C. Simpson and Prof. C. H. Desch are respectively presidents of Sections A—Mathematics and Physics and B—Chemistry. There is one woman president this year, Miss Lynda Grier, principal of Lady Margaret Hall, Oxford, who is presiding over Section F—Economic Science and Statistics.

The proceedings were to be opened on Wednesday evening with the inaugural general meeting at the Central Hall, at which Major-General Sir David Bruce was to relinquish the chair in favour of Prof. Lamb. The new president's address dealt with certain branches of geophysics, the structure of the earth being treated from the physical and mathematical aspects.

The real business was to begin on the following morning (Thursday), the sessions of all Sections opening at 10 a.m. The addresses of the Sectional presidents have again been spread over the programme, so that it is possible for those attending the meeting to hear more than one of the addresses if they desire, which was impossible under the old arrangement, by which they were all read at the opening session. The business of the Engineering Section was wholly marine. Sir Archibald Denny was to deliver his address, entitled "Fifty Years' Evolution in Naval Architecture and Marine Engineering," of which an abstract follows; this was to be followed by two or three papers on marine engineering subjects, and in the afternoon members of the Section were to visit the Southampton Docks.

The proceedings on the first day contained little of electrical interest, though a number of papers dealt with subjects in which the nature of electricity entered, as in a communication by Prof. L. S. Ornstein (Section A) on "Light Quantum Theory of Dispersion," while others might conceivably have electrical applications, *e.g.*, the paper on "Advances in the Treatment of Peat as a Fuel and the Production of By-products," by Dr. F. M. Perkin (Section B). Mention may also be made of a study of "The Resistance to Corrosion of Electro-Deposited Chromium," by Mr. E. A. Ollard (Section B); and a paper on metal-mining in Cornwall by Mr. E. H. Davison (Section C—Geology).

This year, as usual, "Citizens' Lectures" have been arranged for the general public. There are four of these, including one by Prof. E. V. Appleton on "The Rôle of the Atmosphere in Wireless Telegraphy" and another on "Some Technical Problems of Broadcasting," by Capt. P. P. Eckersley, chief engineer to the British Broadcasting Co. Between twelve and thirteen hundred members of the Association had, prior to the meeting, notified their intention to attend.

Fifty Years' Evolution in Naval Architecture and Marine Engineering.

(*Abstract of Presidential Address, Section G.—Engineering.*

As can be gauged from its title, this address dealt principally with the construction and propulsion of vessels during the last half-century, and only in parts was it of direct electrical interest. After dealing briefly with the types of engines in use between 1854 and 1890, the author said that the introduction of the Parsons turbine was a great advance. His first connection with the turbine was in 1890, when a small machine was used to drive a dynamo aboard the *Duchess of Hamilton* on the Clyde. It was a tiny plant, the turbine driving the dynamo direct at 10,000 r.p.m.; it was not very economical but as it was only used rarely on evening cruises, that did not matter much. It was, however, a forerunner of that great invention, permitting the economical use of the low end of the pressure curve which could not be efficiently used in the reciprocating engine, thus improving the economy of the steam engine, apart from the other advantages of freedom from vibration troubles and increased speed which could be obtained through its low weight per h.p. After briefly mentioning the first turbine-driven ships, the author said that there was no means of indicating the turbines prior to 1902. In that year the *Queen Alexandra* was put into service and an attempt to measure the torsion of the shaft was made. This was done by means of a telephone and contacts on the shaft at considerable distances apart. The system had been successfully tested on

, works shaft at about 200 r.p.m., but at the higher speed it vas not at first very successful. Thereafter an induction nethod, with permanent magnets and coils, designed by Mr. Chas. Johnson, was used for some time with success, but the tructure of torpedo boat destroyers upset the arrangement, vhich depended for its success upon a very small clearance etween the coils fixed to the hull and the sharp permanent nagnets fixed on the shaft. The Hopkinson-Thring instru- ient, using only a short length of shaft, with mirror and ght arrangement, was much used; and, also using a short ngth of shaft, Edgcombe constructed an averaging electrical ieter which had the great advantage of requiring only one eading even on the shaft of a reciprocating engine. There ere now several types of meter which could be used with onfidence. A part of the address was devoted to the develop- ient of the Diesel engine, and it was mentioned that the ton- age of motor ships had risen from 750,000 in 1919 to 2,000,000 ns five years later. The author said that mention was fre- uently made of an internal-combustion turbine; while he ad- itted that he was sceptical as to its practicability, he was ire that there could be no halt in invention and advance in ermal efficiency.

Reference was made to advances in other branches of marine ngineering, particularly boilers and condensing arrangements, nd the author said that in no direction had advance been reater than in the use of electricity on board ship. Swan nd Edison invented the carbon-filament lamp in about 1880, aking domestic and ship lighting a possibility. In 1884 the *rawa* and *Tainui* were fitted with incandescent electric light- g, but stand-by oil lamps were also provided because of the ability to failure of the electrical plant. In those days the witches were made with wooden bodies and there were no uick-break arrangements; sectional switchboards and fuse- oards were unknown; soldered joints on trunk wires insu- ted with rubber tape were made, and the wire available was ttle better than modern bell wire. The two dynamos were c. ribbon-armature Ferranti machines. That was fortunate, ecause, as the wiring was poor and the skin of the ship was ed as the return, had the current been direct there would ave been great danger from electrolysis and consequent fires. he total output was about 30 h.p. Nowadays hundreds of lowatts was used on a vessel of the same size, not only for ghting but for ventilating, local heating, cooking and for iving small machinery of all kinds, including frequently any of the important engine-room auxiliaries. There was nsiderable controversy as to whether the main dynamos ould be driven by Diesels or steam engines, and, in the case steam, whether it should be drawn at same stage from the ain engines before going to the auxiliary, or passed to the ain engine after going through the auxiliary, or the haust of the auxiliary used for heating the feed water, a combination of these arrangements. It would be teresting to watch the development of that controversy, as its proper solution further economy in full consumption ould result. Probably no one solution would suffice and in iesel motor-ships we might find the auxiliaries driven by eam—*e.g.*, when they were oil tankers requiring the steam heat the cargo oil—while in steam-driven turbine steamers might find the auxiliaries driven by electricity generated by iesel-driven dynamos. The auxiliary machinery in the engine om was now very extensive and the fuel consumed in deve- oping their power was such an important proportion of the al fuel consumed that their design and installation was be- ming, to a certain extent, a separate branch of engineering. Leaving the engineering side, Sir Archibald turned his atten- n to the design and construction of the ship itself. He owed how great had been the advance in the provisions for e comfort and convenience of the passenger. The old candle nps, swinging in gimbals at the mirror or fixed in the bulk- ads, one for each two cabins, which at best made darkness ible, had been replaced by powerful electric lights, one or re to each stateroom, with probably a reading lamp at the ad of each bed. Artificial ventilation, either with fans in h stateroom, or with trunk ventilation fed by powerful main is supplying air warmed or cooled as desired, was now fitted. t and cold water laid on to each stateroom had taken the ce of the old "goglets" and receivers. The navigating dge of a modern high-class steamer was an inspiring sight, th gyro compass probably fitted with an automatic quarter- ster, "tell-tales" from the engine room giving the revolu- ns of the engines and the direction of turning; similar ell-tales" to the rudder head showing the angle of the er; the steering gear, now fitted aft, and controlled by a elemotor," invented by A. B. Brown, of Edinburgh; there re radio rooms and radio direction finders, and, probably, derwater microphones for finding the position from under- ter land bells; probably a telephone system linking up the dge with the various chiefs of departments; automatic icators showing the water in all holds and ballast tanks; l means for closing all watertight doors below deck in the nt of fog or collision.

Light Quantum Theory of Dispersion.

By Prof. L. S. Ornstein.

bstract of a Paper read before Section A.—Mathematical and Physical Science.)

f we want to discuss the equilibrium of electrons and radia- n from the point of view of light quantum hypothesis, it is essary to put the probability of collision of an electron l a light quantum proportional to the square of its "wave gth." This result leads us to the hypothesis that a light quantum is a spherical volume of electromagnetic energy with dimensions of the order of wave length. This hypothesis may be used in order to find the refractive order. If a light quantum strikes over an atom a force will be exercised on the quantum which is proportional to the volume of the atom and to the gradient of the field in the quantum. The order of magnitude of this gradient may be estimated from the hypothesis mentioned. During the interaction the momentum of the quantum is put proportional to $hc/\lambda v$ (h Planck constant, c velocity of light in ether, v velocity in the quantum and λ wave length). From the above the retardation of a quantum by an atom can be calculated; and taking into account the probability of collision with the atoms the ordinary formula for the refractive index for long waves can be obtained. On the same base the Rayleigh formula for the scattering of light can be found.

In the light quantum theory, dispersion can be obtained by taking into account—just as in the old theory—the inertia of the electric masses in the atom. The influence of damping by radiation, which plays a part in the old theory, also finds its counterpart in our light quantum considerations.

The History of Cornish Mining.

By E. H. Davison.

(*Abstract of a Paper read before Section C.—Geology.*)

The history of Cornish mining is a record of progress in mechanical invention making it possible to work new types of ore deposits. The ore bodies of Cornwall consist of alluvial gravels and deep lodes. In the beginning, mining in Cornwall was restricted to the working of alluvial gravels and of lodes at their outcrops. The impossibility of raising water from any depth prevented deep mining all through the Middle Ages. The use of adits to drain away the water was, however, developed along the coast in the sixteenth and seventeenth centuries, and to some extent made use of in the inland mines. Till the middle of the eighteenth century mines seldom worked below 100 feet. The invention of pumping engines by Savory, Newcomen, Watt, Trevithick and others during the eighteenth century rapidly extended the depth to which mines could be worked. After that the chief factor which determined the type of ore deposit worked was the value of the metal. At first, copper was the more valuable metal, and the lodes were worked in the copper zones, tin being considered a by-product; then, when foreign copper ores reduced the price of that metal, the copper mines were either abandoned or carried down into the tin zone, thus becoming tin mines. Of late years, the older mines in the Camborne-Redruth area have become more or less exhausted, and deep development to the north has been carried out on the basis of geological forecast. This development is now in process, but has been successful already in one instance. The available mineral wealth of Cornwall, so far as tin is concerned, is of two types:—(1) The unworked tin zones below abandoned copper mines; and (2) Lodes some distance from the granite outcrop, which carry tin at depths which were too great for profitable mining in the past.

Legal.

Colwyn Bay U.D.C. v. Llandudno and Colwyn Bay Electric Railway, Ltd.

This action was mentioned to Mr. Justice Finlay in the Vacation Court on August 19th, on a motion for an interim injunction restraining the defendant company, until the trial of the action, from running tramcars on Sundays in alleged breach of an agreement of 1906.

Mr. E. W. Cave, K.C., on behalf of the Council, stated that the agreement had been observed by the company until within the last few weeks, when it began to run Sunday cars.

Mr. G. B. Hurst, K.C., for the company, said that he desired time in which to answer the affidavits. It was a matter of the greatest importance to his clients as they had been running the cars every Sunday since June 21st, and they wanted the matter disposed of quickly.

Mr. Justice Finlay said it was obviously a case which should be disposed of promptly; he allowed the motion to stand over until August 26th.

Dublin and Lucan Electric Railway.

Mr. Justice Hanna, in the Free State High Court, Dublin, recently appointed Mr. P. McDowall Grosart provisional liquidator in the matter of the Dublin and Lucan Electric Railway, with power to negotiate for the sale of the undertaking as a going concern, and to protect the assets and property of the company. A petition for the winding-up of the company was allowed to stand over.

Tempering of Bronze.—According to the *Mining Journal*, it is reported from Stockholm that after many years' experiments, M. O. Gustafsson, an Oskarshamn foundry foreman, has invented a method of tempering bronze to the hardness of steel.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Employment During July.—The review of labour conditions during July which appears in the August *Ministry of Labour Gazette* states that employment in the engineering industry generally remained bad and showed a slight decline in practically all sections. Conditions remained fairly good in electrical engineering, however. The percentage of unemployed in the whole of the engineering industry was 11.4. In marine engineering it was as high as 20.3 per cent. and in general engineering and engineers' iron and steel founding the figure was 12.4 per cent. On the other hand, the electrical branch had a percentage of 6.0 unemployed, as compared with 5.6 in June, and 6.0 in July, 1924. There was an increase of 0.6 to 8.6 per cent. in the proportion of unemployed in the wiring and contracting industry, but in the electrical cable, wire, and lamp manufacturing group, there was a fall of 0.5 to 7.2 per cent.

A Report Upon Hungary.—The Department of Overseas Trade has received a report upon the commercial and industrial situation in Hungary (Stationery Office, 1s. 6d. net) from Mr. E. C. D. Rawlins, the British Commercial Secretary at Budapest. In an introduction it is said that, although at the beginning of 1924 the general economic condition of the country was far from good, the end of the year brought hope and promise for the future. This is attributed to the programme of reconstruction, assisted by an international loan, and the appointment of the Commissioner-General of the League of Nations. Another favourable feature of the year was the abolition of a mass of trade prohibitions and restrictions and licences, which had led to retaliatory tariffs and proved a hindrance to trade. It has been stated that taxation has reached its highest point and cannot be further increased. The Budget for 1924-25 included an allocation for the laying of a telephone cable between Budapest and Vienna, which is expected ultimately to cost 10 million kr. (gold). An appendix to the report contains particulars of foreign trade during 1924. It is seen from this that 11,018 quintals of electrical machinery and apparatus was imported during the year. The bulk of this came from Germany (46 per cent.) and Austria (40 per cent.); Great Britain's share was only 0.29 per cent. of the total. The exports of electrical machinery totalled 3,951 metric tons, valued at 17,400,000 kr. (gold). It is stated that the Austrian machine industry has good prospects, as stocks are beginning to be exhausted, and all those household articles which were previously supplied by Bohemia and Austria, or by other foreign countries, can now be manufactured by local factories. The industry appears to be able to compete with foreign products, and especially is this true in the case of agricultural machinery, electrical machinery, and equipment, internal-combustion engines and steam engines. Among other details of development, it is mentioned that three automatic telephone exchanges are under construction for Budapest.

The Leipzig Fair.—The German Customs authorities are making special arrangements for inspecting the baggage of visitors to the Leipzig International Fair (August 30th to September 9th) on the trains instead of at the usual bureaux. The Fair embodies a section devoted to the display of small electric power plant for country house and institution lighting, including water-turbine installations.

Local Exhibitions.—Stockport.—An Ideal Homes and National Trades Exhibition is being organised by Mr. L. Batley, Gorsey Works, Stockport, for the period from September 16th to 26th.

Hanley and Oxford.—Modern Housekeeping Exhibitions are being organised in these towns by Messrs. Gibson, Life and Co., St. John's House, 3, Fulwood Place, Holborn, W.C.1, in the first case from November 11th to 24th, and in the case of Oxford from December 11th to 22nd.

E.D.A. Activities.—The British Electrical Development Association has sent us a copy of a coloured poster (E.D.A. 571) which it has recently produced to encourage the use of electricity for cooking. This bears a picture of a lady using an electric cooker, and informing the reader that "I cook my food the electric way for a unit a day." If the charge per kWh is one penny, the Association will substitute "a penny" for "a unit" in the "slogan."

Contribution to E.D.A. Funds.—The Radcliffe District Council, at its meeting last week, decided that the Electricity Committee should contribute £35 (one-tenth of 1 per cent. of the total income of the undertaking for the year ended March 31st, 1925) towards the publicity campaign promoted by the British Electrical Development Association, subject to the sanction of the Electricity Commissioners.

Buenos Aires Subways.—A message from Mr. G. Ward Price which appeared in the *Daily Telegraph* last week, stated that if the contract between the Intendente of Buenos Aires and the Anglo-Argentine Tramways Co., Ltd., for the construction of two underground railways at a cost of £10,000,000 was ratified by the Municipal Council, the whole of the material needed for the works would be bought in England.

Book Notices.—"*Journal* of the American Institute of Electrical Engineers," Vol. XLIV, No. 8, August, 1925. New York: The Institute. Price $1.

"*Journal* of the Institution of Electrical Engineers," Vol. LXIII, August, 1925. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

"The Theory of Electric Cables and Networks," by Dr. A. Russell. Third Edition. Pp. xii + 356; figs. 88. London: Constable & Co., Ltd. Price 24s. net.

The Technology Reports of the Tôhoku Imperial University, Sendai, Japan. Vol. V, No. 2, 1925. Maruzen Co., Ltd.: Tokio and Sendai.

Scientific Papers of the Institute of Physical and Chemical Research, Tokio, Japan.—Nos. 32 and 33, June, 1925; Nos. 34, 35, and 36, July, 1925. The Institute.

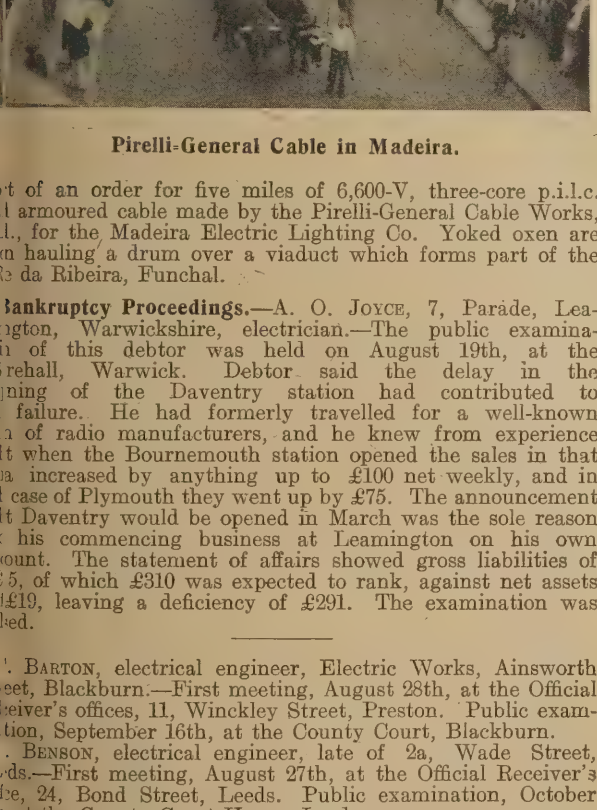
"Japanese *Journal of Engineering*." Abstracts of the National Research Council of Japan, Tokio. Vol. I, 1921; Vol. II, 1922. The Council.

The Oxford University Press has issued a list of books on science and technology, which includes a number of works on electrical and radio matters.

Lead Market Report.—Messrs. James Forster & Co., in their letter dated August 22nd, say:—"Closing prices yesterday were £39 for August, and £37 1s. 3d. for November against £37 12s. 6d. and £36 6s. 3d., respectively, at the end of last week. The feature of the market this week has been the daily widening of the backwardation, which accurately registers the shortage of early arrival lead. The Mexican lead has at last arrived in London, totalling about 2,500 tons, but this, as we anticipated, had not the slightest effect on the market, as it was all sold to consumers long ago. The American price was advanced another 25s. a ton this week, and it is reported that, owing to the recent heavy sales to Germany, there is no more American lead available before November delivery. If this proves to be the case, we must anticipate an even more stringent position than at present during the next two months, with the prompt price going to a still higher premium over forward. There seems nothing to prevent the price going over £40 a ton again."

Electrical Development at Greenock.—The chief engineer and manager of the Greenock Corporation electricity undertaking (Mr. F. H. Whysall) has sent us a copy of a booklet which has been sent to all domestic consumers. This sets out in an attractive manner the methods of charging adopted, which, it is seen, are very reasonable. The principal system is based on the normal consumption for lighting in houses of various sizes; this is charged for at the lighting rate, and all energy consumed in excess of the stated quantity is subject to the heating rate. Another system employs a fixed weekly charge, again based on the size of the house (number of apartments), and a secondary charge of ½d. per kWh. Energy for water-heating between the hours of 10 p.m. and 6 a.m. is charged for at the rate of ½d. per kWh.

Mannesmann Interests in Morocco.—Prior to the war the German Mannesmann seamless tube concern obtained concessions in Morocco by which it was hoped to obtain sufficient copper, zinc, and lead to make Germany independent of other foreign supplies of these metals. By the Versailles Treaty, the firm lost its concessions in French Morocco, and the subsequent disturbances in the Spanish zone have rendered development impossible. According to the *Financial Times*, efforts were made to sell the concessions first to French and then to Spanish interests, but these proved unsuccessful. The Mannesmann concern is now in negotiation with an Anglo-American group whose identity has not been divulged.



The United States and the British Radio Market.—In a review of the radio situation in Great Britain, *Commerce Reports* says that the restriction of the use of foreign apparatus under the original broadcasting regulations enabled British manufacturers to develop and "dig themselves in," and they thus gained an effective control of the market. The position of the industry is so strong that only in the cases of loud speakers and headphones is competition seriously felt. "It should be apparent to American manufacturers desiring to sell radio goods in the British market that there is no opportunity to sell any appreciable quantity of goods of ordinary manufacture. Imported sets or parts must make an exceptionally strong appeal, either on the basis of their efficiency or uniqueness or because of unusually low prices for unquestionable value." "Next to the United States and Canada, Great Britain is probably the most highly developed radio market in the world."

Domestic Appliances for British Columbia.—The Department of Overseas Trade announces that Mr. L. B. Beale, Trade Commissioner at Vancouver, is at present in this country and will attend at the Department, 35, Old Queen Street, S.W.1, from August 31st to September 4th. He is desirous of meeting manufacturers of goods of a number of classes among which are household electrical fittings and utensils. Interviews can only be given by appointment and applications should quote reference 5832/T.G.

Fires.—There was an outbreak of fire at the premises of Messrs. William Geipel & Co., The Borough, S.E., on August 4st, the third floor of the building being destroyed. The situation of the building made the work of the fire brigade very difficult, but the flames were subdued in a comparatively short time.

On the previous day considerable damage was caused by fire at the works of Messrs. Pratt Bros. (Edinburgh), Ltd., electrical contractors, West Park Place, Dalry Road, Edinburgh. In this case the firemen were hampered by dense fumes from burning celluloid in a battery-charging room in which the fire is believed to have originated.

British Cable in Madeira.—In all parts of the world British cables are known and respected, and even where transport methods are of a primitive nature they can be found, for instance, in Madeira. The accompanying illustration shows a

Pirelli-General Cable in Madeira.

part of an order for five miles of 6,600-V, three-core p.i.l.c. armoured cable made by the Pirelli-General Cable Works, Ltd., for the Madeira Electric Lighting Co. Yoked oxen are seen hauling a drum over a viaduct which forms part of the Ribeira da Ribeira, Funchal.

Bankruptcy Proceedings.—A. O. Joyce, 7, Parade, Leamington, Warwickshire, electrician.—The public examination of this debtor was held on August 19th, at the Shirehall, Warwick. Debtor said the delay in the opening of the Daventry station had contributed to his failure. He had formerly travelled for a well-known firm of radio manufacturers, and he knew from experience that when the Bournemouth station opened the sales in that area increased by anything up to £100 net weekly, and in the case of Plymouth they went up by £75. The announcement that Daventry would be opened in March was the sole reason for his commencing business at Leamington on his own account. The statement of affairs showed gross liabilities of £345, of which £310 was expected to rank, against net assets of £19, leaving a deficiency of £291. The examination was closed.

T. Barton, electrical engineer, Electric Works, Ainsworth Street, Blackburn.—First meeting, August 28th, at the Official Receiver's offices, 11, Winckley Street, Preston. Public examination, September 16th, at the County Court, Blackburn.

J. Benson, electrical engineer, late of 2a, Wade Street, Leeds.—First meeting, August 27th, at the Official Receiver's office, 24, Bond Street, Leeds. Public examination, October 5 at the County Court House, Leeds.

H. P. Galt, electrical engineer, 56, Norbury Road, Thornton Heath. Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released, July 23rd.

J. Cowan (Cowan & Cox), merchant of electrical appliances, 7, Dickenson Street, Manchester.—Last day for proofs for dividend, August 27th. Trustee, Mr. J. Sykes, 30, Belgrave Terrace, Stalybridge.

H. E. Dixon (Creswick Dixon Electric Co.), Bodega Buildings, High Street, 101a, Albert Road, 451, London Road, and 63, Chesterfield Road, Sheffield, and Electric House, Knifesmith Gate, Chesterfield.—Last day for proofs for dividend, September 2nd. Trustee, Mr. C. Turner, 155, Norfolk Street, Sheffield.

Roberts & Co., electrical engineers, 61, Old Town Street, Plymouth, and Fore Street, East Looe.—First meeting, September 3rd, at 5, Princess Square, Plymouth. Public examination, October 16th, at the Western Law Courts, Plymouth.

Private Arrangement.—R. C. & A. H. Yeldon, dealers in electrical and radio goods, 20, New Road, Portsmouth.—A meeting of the creditors of the above was held on August 19th, at Portsmouth, when the chair was occupied by Mr. M. P. Winstoun, of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C. It was reported that the liabilities amounted to £384 and the assets totalled £572. The debtors started business about three years ago in partnership, the elder brother having put capital of £200. They carried on the business successfully until the beginning of this year, when, owing to the slump in the radio trade, it was found difficult to carry on. The turnover had been about £50 weekly, but latterly it had fallen considerably. The expenses, including drawings, amounted to about £10 per week. The chairman stated that the debtors had executed a deed of assignment to Mr. W. A. J. Osborne, of Messrs. Corfield & Cripwell, as trustee for the protection of the assets. The debtors stated, however, that they would be able to carry on the business and discharge their liabilities in full. It was decided that the debtors should execute a composition deed to Mr. Osborne as trustee with a committee of inspection, the deed to provide for payment by the debtors of the sum of £30 a month by weekly instalments of £7 10s. until the whole of the liabilities were discharged in full. The following are creditors :—

	£		£
General Electric Co., Ltd.	101	S.D.H. Mfg. Co.	23
Brown Bros., Ltd.	29	Silvertown Co., Ltd.	47
Webber, J. M., & Co.	36	Hobday Bros.	33

Company Liquidations.—Chase Electrical Manufacturing Co., Ltd., 195, Archway Road, Highgate, N.19, and at Hornsey.—A meeting of creditors was held recently at the offices of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C., when the chair was occupied by Mr. W. A. J. Osborne, who stated that the shareholders had passed the necessary resolutions for voluntary liquidation and had appointed him to act as the liquidator. The statement of affairs presented disclosed liabilities of £1,765; £1,040 was due to trade creditors, there were sundry creditors in respect of salaries, &c., £562, and cash deposits amounted to £163. The net assets were estimated at £671, leaving a deficiency of £1,093. Mr. Osborne stated that the cash deposits were money sent by small traders in different parts of the country for articles which they had never received. The company was incorporated in February, 1920, with a nominal capital of £6,000, divided into 5,000 ordinary shares and 1,000 employés' shares of £1 each; no employés' shares had been issued. The company took over certain plant and machinery from Mr. Chase for £858. In 1920 the company took premises in Potters Bar and spent a large sum of money in alterations, but after some 18 months it was found that serious losses had been incurred and the company was compelled to vacate the premises. In September, 1924, the company took over Mr. Hooydonk's business in Hornsey. It was decided to confirm the voluntary liquidation of the company with Mr. Osborne as liquidator, and a committee of inspection was also nominated. The following are creditors :—

	£		£
Aldenham Bros.	85	Spencer & Sons	36
Hart Mfg. Co.	31	Sankey & Sons, Ltd.	54
Lawerell Mfg. Co.	64	Standard Screw Co., Ltd.	20
Morgan Crucible Co., Ltd.	42	Smith & Co. (Clerkenwell), Ltd.	31
London Electric Wire Co. and Smiths, Ltd.	28	Walsall Mfg. Co.	144
Pethick Advertising Co.	252	Chase, F.	345
		Pethick, —	150

F. W. Smith & Co. (1907), Ltd., Manchester, electrical engineers and contractors.—A meeting of creditors was held recently at Southport. The liquidator of the company, Mr. C. Leigh, I.A., of Southport, presented a statement of affairs which showed liabilities of £2,568, of which £2,054 was due to the trade; there was a bank overdraft of £109, and the managing director's salary amounted to £405. There were net assets of £1,874, leaving a deficiency of £694. The bank overdraft was guaranteed by the managing director, and the bank also held as collateral security debenture stock amounting to £272. The company was incorporated in 1907 with a nominal capital of £5,000. The issued capital was £4,286. It was stated that the managing director's salary for the past three years had been £500, £350, and £234. The turnover in 1921 amounted to £10,081 and there was a loss of £373. From 1922 to the date of liquidation the turnover had never been more than £8,000, and no profits had been made. It was decided to confirm the appointment of the present liquidator and to appoint a committee of inspection. The following are the principal creditors :—

	£		£
General Electric Co., Ltd.	798	Walsall Hardware Mfg. Co., Ltd.	101
Brown Bros., Ltd.	222	Beardsall, W. E., & Co., Ltd.	69
Chloride Electrical Storage Co., Ltd.	148	Marconiphone Co., Ltd.	67
		Leigh, C.	67

W. A. Saxby & Co., Ltd., battery manufacturers, 3, Gayford Road, S.W.12.—A meeting of the creditors in this matter was held on August 20th, when Mr. Saxby stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company and receiver for the debenture holders. No statement of affairs was presented, but Mr. Saxby reported that the liabilities to trade creditors amounted to £311. In addition there were debentures for £450. Mr. Saxby stated that the debenture holders had agreed to accept 15s. in the £ in respect of their claim. The assets, after allowing for debentures and preferential claims, amounted to £119. It was stated that included in the assets was an amount of £250 representing goodwill, and although negotiations were pending for its sale, it was very doubtful whether it would fetch that amount. The company was formed in November, 1923, taking over the business previously carried on by Mr. Saxby, for £100. The nominal capital of the company was £1,000, of which £600 had been issued as fully paid. Accounts for the period of 12 months to November 15th, 1924, showed that the sales were £2,514, and there was a gross profit of £560. The expenses amounted to £849, and there was a net trading loss of £282. Mr. Saxby stated that the liquidation had been forced by the execution of a writ by one of the largest creditors. After some discussion the meeting broke up without any resolutions being passed. The voluntary liquidation of the company will, therefore, be continued with Mr. Saxby as liquidator.

Associated Electric Traders, Ltd.—Last day for proofs for dividend, September 2nd. Liquidator, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C.

Northumberland and Durham Radio Engineering Co., Ltd.—A meeting of creditors is called for September 4th, at Atlas Chambers, 88, Westgate Road, Newcastle-on-Tyne. Liquidator, Mr. J. Mitchell.

Dissolutions of Partnership.—Luminaux Electrical Supplies, factors of electrical supplies, 553, Mansion House Chambers, E.C.—Mr. S. G. Wallis Norton and Mr. W. Sanders have dissolved partnership.

H. Derricott, general brassfounders and manufacturers of electrical fittings, Reliance Works, Penn Street, Birmingham.—Messrs. E. H. and P. W. Derricott have dissolved partnership. Mr. P. W. Derricott will attend to debts and continue the business under the same style.

Daradio Wireless and Service Depot, London Road, St. Leonards-on-Sea.—Mr. S. W. Davies and Mr. J. E. Radermacher have dissolved partnership. Mr. Radermacher will attend to debts.

Deeds of Assignment.—T. H. Joyce (T. & H. Joyce), electrical and wireless factors, 210B, Shaftesbury Avenue, W.C.—Particulars of claims to be sent by September 4th to the trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C.2.

B. E. Crow (Crow, Toogood & Co.), electrical engineer, London, Bournemouth and Eastbourne.—Particulars of claims to be sent to the trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., by September 4th.

Catalogues and Lists.—Messrs. Farrow & Sons, Ltd., Spalding, Lincs.—A stock list of new and second-hand electrical and mechanical equipment. Priced.

The Benjamin Electric, Ltd., Brantwood Works, Tariff Road, Tottenham, N.17.—A folder, illustrating the illumination of various departments of a clothing factory.

Messrs. S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.C.—List No. 2E, illustrating and describing the "Sbik" lightning arrester.

The Electric Furnace Co., Ltd., 17, Victoria Street, S.W.1. Pamphlet D, illustrating and describing electric resistance furnaces.

Mr. Walter Balmford, "Electric House," Steelhouse Lane, Birmingham.—Two illustrated pamphlets, dealing respectively with radio valves and insulating staples.

The Cox-Cavendish Electrical Co. (1924), Ltd., 105, Great Portland Street, W.1.—A pamphlet, dealing with actinotherapy or the use of artificial sunlight in healing. Illustrations and prices of apparatus are given.

The Stonebridge Electrical Co., Ltd., Victoria Road, North Acton, W.3.—List 91/1, containing an illustrated description of electrical apparatus for measuring the velocity of water.

Messrs. George Green & Co., 40, Aybrook Street, W.1.—An illustrated and priced booklet containing particulars of "Gee Gee" electric water-heating apparatus of various patterns.

Sir William Arrol & Co. (Swansea), Ltd., King's Dock Works, Swansea.—A profusely-illustrated brochure describing the company's works and some contracts which have been carried out.

Messrs. Cole, Marchent & Morley, Ltd., Bradford.—A pamphlet advertising central-exhaust steam engines.

Messrs. Landis & Gyr, Ltd., Elgee Works, Windmill Road, Hampton Hill.—An illustrated leaflet advertising the firm's switchboard meters.

Superlamp, Ltd., 92 and 94, Paul Street, E.C.2.—A fully-illustrated price list of electric lighting pendants, lanterns, bowls, shades, and other fittings; domestic appliances; and signs.

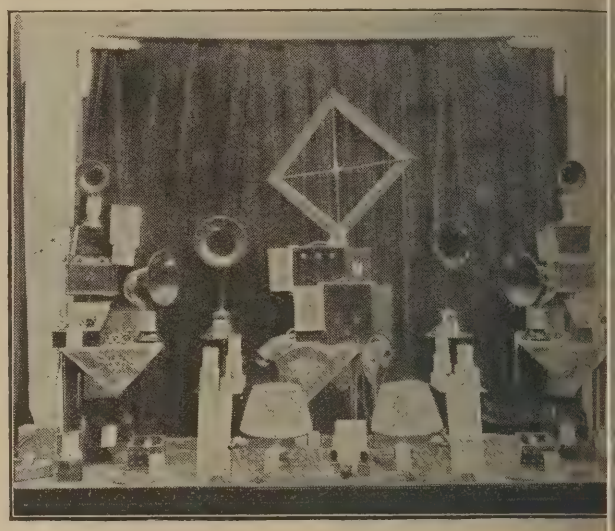
Trade Announcements.—Messrs. Brewer & Phillips have opened premises as electrical engineers at 66, Regent Street, Plymouth.

British Brown-Boveri, Ltd., states that as the result of a friendly arrangement its interest in and control of the firm of Scintilla, Ltd., completely ceased as from April 1st, 1925.

The new address of Merchants & Agencies, Ltd., is 38, Great Russell Street, W.C.1. Telephone Nos.: Museum 6634-5.

Automatic & Electric Furnaces, Ltd., informs us that in order to cope with the increasing demand for "Wild-Barfield" furnaces in Birmingham it has opened branch offices in that city at 21, 22 & 40, Guildhall Buildings, Navigation Street. Mr. A. Vincent, who has been representing the company's interests abroad, is taking charge of the branch. The company is carrying out demonstrations at the Birmingham Corporation's Summer Lane generating station; the first period was from August 24th until to-day (Friday), and another is from August 31st to September 4th.

Messrs. Philips Lamps, Ltd., have opened a branch at 27, Womanby Street, Cardiff, under the management of Mr. A. H. Smith.



The works of Messrs. Belling & Co. have been transferred from Edmonton to Enfield. The new address is Bridge Works, Southbury Road, Enfield, and the telephone no. "Enfield 1123" (3 lines).

Mr. E. M. Parsons, 38a, Brook Street, Hull, electrical and radio engineer and contractor, wishes to receive catalogues of electrical and radio goods.

The Electrical Imports of Paraguay.—The *Board of Trade Journal* states that the value of electrical goods imported by Uruguay during 1924 was £18,185. Of this amount £10,078 is attributed to Argentina, £400 to the United Kingdom, £4,24 to the United States, £2,603 to Germany, and £13 to Italy.

Large American Electricity Merger.—The *Electrical Worl* announces that the Pennsylvania Electric Corporation is t be purchased by the Pacific Gas & Electric Co., operated b the J. G. White Management Corporation. By this transaction which, it is reported, involves a cash payment of $20,000,00 public utility companies with combined assets exceedin $175,000,000 will be brought together, the consumers number ing about 300,000 in an area stretching from western New Yor through Pennsylvania and Maryland. The Associated Ga and Electric Co. controls the Manila Electric Corporation.

A B.T.-H. Display at Selfridge's.—The art of window dressing is seen at its best at the Oxford Street premises o Messrs. Selfridge's, the outstanding feature of the window being the specialist nature of each display. Radio apparatu made by the British Thomson-Houston Co., Ltd., has recentl been dealt with by the company and the result is seen in th

A B.T.-H. Window at Selfridge's.

accompanying illustration. A few examples show the wid range of the products—frame aerial, loud speakers, receivin sets, valves, &c.—a veritable *multum in parvo*.

British Trade Mark Applications.—The following ar among the recent applications for British trade marks. Objec tions against any of the proposed marks may be entered withi one month from August 19th :—

R.W. (lettering and design). No. 457,744. Class 6. Carbon brushes part of metal, graphitic and bronze brushes, copper and brass gauze brushes, &c.-Ringdorffwerke Gesellschaft, 1, Bahnhofstrasse, Mehlen-am-Rhein, German (British representatives: Haseltine, Lake & Co., 28, Southampton Building W.C.2.)

Venner. No. 455,457. Class 8. Electrical time switches.—Venner Tim Switches, Ltd.

Peter Pan. No. 458,434. Class 8. Instruments and apparatus for use i radio-telephony and telegraphy.—Radio Accessories, Ltd.

Bullphone. No. 459,824. Class 8. Instruments and apparatus for use i radio-telephony and telegraphy.—W. Bullen, 38, Holywell Lane, E.C.2.

Rotala. No. 459,414. Class 8. Instruments and apparatus for use i telephony and telegraphy.—Rotax (Motor Accessories), Ltd.

Design of Polar Bear. No. 460,152. Class 8. Apparatus and instrumen for use in connection with radio-telegraphy and telephony.—Radio Commun cation Co., Ltd.

Indigraph. No. 460,297. Class 8. Variable condensers and variable i ductances, being parts of radio instruments.—Igranic Electric Co., Ltd.

Vacularm. No. 460,421. Class 8. Measuring and indicating instruments.-Cecil Gordon Vokes, trading as C. G. Vokes & Co., 38, Conduit Street, W.

Trulov. No. 460,600. Class 8. Apparatus and instruments for use in co nection with radio-telegraphy and telephony.—Radio Communication Co., Lt

Fabrolite. No. 460,563. Class 50. Electrical insulating materials.—Th British Thomson-Houston Co., Ltd.

Glasgow and the Joint Industrial Council.—The Glasgo Corporation recently received a communication from the Secr tary of the Scottish District Joint Industrial Council asking the Corporation would accept the findings of the Council an contribute to its expenses. The Corporation's Conditions Service Committee recommends that no action be taken.

For Sale.—British Insulated & Helsby Cables, Ltd., in vite offers for surplus generating plant. The Paignton Ele tric Light & Power Co., Ltd., will shortly be taking a bul supply of electricity, and is therefore inviting offers for th purchase of plant at its electricity works. Plymouth Co poration Electricity Department has for disposal one 500-k direct-coupled engine and d.c. dynamo. (See our advertis ment pages to-day.)

Meter Approved.—The Electricity Commissioners hav approved of the construction and pattern also the means pr vided for fixing and connecting meter known as the Ferran Type "F.H." d.c. mercury motor ampere-hour meter, rat from and including 20 amp. to 100 amp., fitted with t terminals.

Social Event.—The employés of Messrs. Ferguson, Pailin Ltd., held a sports meeting at their new ground at Bel Vue, Manchester, on August 15th. This was the first of wh is hoped to be an annual series, and the abundance of athlet talent and excellent weather made the occasion a very enjoyab one.

The German Electrical Industry.—Dealing with the situation of the German electrical industry, a Frankfort newspaper states that despite the financial difficulties it has been possible for considerable progress to be made recently in the direction of the extension of the electricity supply works, which has naturally brought orders to the manufacturing industry. In individual cases (the Saxony works, the Mark works, &c.), the financing of the developments has been effected by the raising of loans, but in most cases the cost of the expansion has been defrayed out of the current income of the municipal and State works resulting from the present high charges for the supply of energy. This development has caused the manufacturing industry on the whole to have a good turnover and in most cases has ensured full activity. On the other hand, the foreign trade has considerably declined because German export prices are higher than those of foreign competitors, although there are certain articles in which individual works are claimed to surpass foreign firms, and technical developments will soon, it is said, again result in these articles coming on the export market. After these general observations the Frankfort newspaper proceeds to discuss the situation of the electrical manufacturing industry in the Frankfort district. Among the branches mentioned are the production of switchgear and switchboards, installation material, measuring instruments, heating installations and appliances, electromedical apparatus, telephones, telegraphs, clocks, &c. Summarising the situation it is submitted that the Frankfort electrical branches are not badly occupied, but in part are well employed, although the export trade leaves much to be desired. The financial position is not easy, but is said to be certainly better in many cases than in other branches of business.

South American Rubber.—According to the *Board of Trade Journal* the exports of Para rubber from Para, Manaos, and Iquitos during the first half of the current year, amounted to 3,345,000 kg., of which 7,753,000 kg. went to the United States and 5,449,000 kg. to Europe. The British Consul at Iquitos informs the Department of Overseas Trade that the improved prices for rubber have led to merchants in the district taking a renewed interest in the extraction of the latex. Most of the rubber trees have not been tapped for seven years, and it is anticipated that they will give an exceptional yield.

Australian Preference Conditions.—In the Australian House of Representatives, on August 21st, Mr. Pratten, Minister of Trade and Customs, introduced the Customs Act Amendment legalising the imposition of a condition that goods, in order to enjoy full preference, must be 75 per cent. of British manufacture.—*Reuter* (Melbourne).

Irish Free State Electrical Imports.—The value of the imports of electrical goods into the Irish Free State during May last is officially returned at £35,647—a decrease of £8,336, as compared with May, 1924, bringing the total for the first five months of the year to only £134,836, as compared with £189,776 in the corresponding period of 1924.

Copper, Lead and Rubber Prices.—Messrs. F. Smith & Co. report August 25th:—Copper (electrolytic) bars, £69 15s., £2 increase; do. do. sheets, no change; do. do. wire rods, £78 10s., 5s. increase; do. do. h.c. wire, 9⅞d., ⅛d. increase.

Messrs. James & Shakespeare report August 25th:—No change in the prices for copper bars (best selected), sheet and rod; English pig lead, £40 10s., 30s. increase.

Messrs. Edward Till & Co. report August 25th:—India-rubber, Para, fine, 3s. 1d., 1d. decrease.

New Municipal Showrooms.—The Warrington Corporation is to establish separate municipal showrooms for the Electricity and the Gas Departments, both of which will be situated in Horsemarket Street. There was some criticism of these proposals at the last meeting of the Town Council, one of the main arguments being that there should be a combined showroom for both departments. The chairman of the Electricity Committee (Sir Peter Peacock) said that the Electricity Committee had been looking out for premises for the last four years.

Chinese Tariff Conference.—The Chinese Government has forwarded to the Powers an invitation to attend a special tariff conference in Peking in accordance with the Nine Power Washington Treaty. The date of the Conference is to be October 26th. The invitation expresses China's desire to confine a conference in accordance with the provisions of the Treaty, at the same time reminding the Powers that her right to bring up the question of tariff autonomy at an opportune moment was reserved by the Chinese delegates at the Washington Conference.—*Reuter* (Peking).

Lighting and Power Notes.

Ampthill. — Electricity Supply. — The Urban District Council has given its consent to the application of the Bedford Town Council for a Special Order to supply electricity to the town.

Barnsley.—Mains Extensions.—The Electricity Committee is to carry out mains extensions at a cost of £5,230.

Bristol.—Year's Working.—We have received from Mr. H. Braday Proctor, city electrical engineer, his annual report and the statement of accounts of the electricity undertaking for the year ended March 31st last. The total revenue was £421,011, as compared with £370,906 in the preceding year. Working expenditure increased from £216,886 to £252,014, leaving a gross profit of £168,997, as against £154,020, to which was added a sum of £14,059, being adjustment of income tax, and £262 from the obsolescence reserve fund, making a total of £183,317. Capital charges absorbed £112,633, leaving a net surplus of £70,685, as compared with £67,809 in the preceding year. Of the surplus £16,000 was contributed to the district rate, and the remainder transferred to reserve. The net capital expenditure during the year amounted to £121,115, and included £72,295 for mains. The sales of electrical energy amounted to 56,082,891 kWh, an increase of 5,957,411 kWh, and the average price per kWh obtained fell from 1.67d. to 1.64d. The maximum supply demand rose from 23,107 to 26,345 kVA. The number of electric cookers connected during the year increased from 112 to 451, and an additional 41 miles of cable was laid. The change-over of the system of supply in the Fishponds and Brislington districts was completed, and good progress was made in the Clifton, Horfield, and Knowle districts.

Burnley.—Year's Working.—The report on the working of the Corporation electricity undertaking (engineer: Mr. J. E. Starkie) for the year ended March 31st last shows a total income of £87,426, as compared with £85,708 in 1923-24. The working expenditure was £41,222, as against £40,118, and expenditure incurred in respect of plans for a new station—which have been rejected by the Electricity Commissioners—charged to revenue, amounted to £801, leaving a gross profit of £45,401 (£45,590). Capital charges absorbed £25,544, leaving a net surplus of £19,857, as compared with £19,895 in the preceding year. Of this amount £6,000 was transferred to depreciation and meters extension account, and the remainder to reserve. The capital expenditure during the year amounted to £24,773, the chief item being £17,514 for mains and services. The electrical energy sold increased from 8,068,242 to 8,223,508 kWh, and the maximum supply demanded from 3,770 to 3,900 kW. During the year application was made to the Commissioners for sanction to install two 5,000-kW turbo-alternators to meet the estimated increased demand during the winter of 1926-27.

Canada.—Hydro-Electric Development.—According to the *Electrical News*, work is to commence on the erection of a hydro-electric power station, on a site at Grand Falls, recently acquired by the province of New Brunswick. Plant with a capacity of from 50,000 to 60,000 h.p. will be installed at first, and additional plant of 25,000 h.p. added later. The ultimate development of the site is placed at 150,000 h.p. The Premier of the province has announced that already the Government has received demands aggregating 71,000 h.p. from paper mills in the province.

Cannock.—Extension of Supply.—In connection with the proposal to supply electricity to Cheslyn Hay and Great Wyrley, the U.D.C. proposes to extend the mains and provide the necessary sub-stations at an estimated cost of £20,785, and is applying for assistance to the Unemployment Grants Committee.

Chester.—Special Order.—The Corporation has applied for a Special Order, for the supply of electricity in the urban district of Tarporley, and in certain parishes in the rural district of Tarvin.

Continental.—Italy.—The Società Elettrica del Valdarno and the Società Ligure Toscana di Elettricita are erecting a new 120,000-V transmission line between Florence and Leghorn, a distance of about 47 miles. The line will be carried on ferro-concrete masts 69 ft. high.

Jugo-Slavia.—According to a recent official report the water-power resources of Jugo-Slavia represent a total of 2,982,922 h.p., divided as follows:—Serbia, 1,265,568 h.p., Bosnia-Herzegovina, 621,141 h.p., Slovenia, 260,308 h.p., Montenegro 280,098 h.p., Croatia and Slavonia 365,836 h.p., Dalmatia 59,700 h.p., and Woimoden 159,280 h.p. The foregoing figures refer to the power available at low water level, the power being on the average three to four times greater. So far only 7,529 h.p. is being utilised in Serbia, 11,330 h.p. in Bosnia-Herzegovina, 70,836 h.p. in Slovenia, and 60,600 h.p. in Dalmatia. Among the new plants at present under consideration are one of 24,000 h.p. on the River Sare, one of 100,000 h.p. in the Velebite Mountains in Croatia, and one of 100,000 h.p. on the Dwina in Bosnia.

Czecho-Slovakia.—A recent issue of the *Journal* of the Czecho-Slovakian Ministry of Public Works states that there are now four hydro-electric stations of a total of 7,270 h.p. in operation in the country, *viz.*, on the Elbe, near Konighof (2,100 h.p.), on the Morava, near Kromeric (2,130 h.p.), on the Elbe, near Podebrad (1,300 h.p.), and one on the same river near Nimburg (1,740 h.p.). Five additional plants of a total of 10,740 h.p. are in course of construction, and ten other hydro-electric power stations of a total of 101,070 h.p. are projected. The bulk of the electrical energy will be utilised in the Ostrau coal-mining area.

Eastbourne.—Inquiry.—An inquiry was held at the Town Hall on August 14th by Sir William Marwood, on behalf of the Ministry of Transport, into the application of the Corporation for sanction to supply electricity to Willingdon. Mr. H. Caldwell, for the Rural District Council, raised objection to the use of overhead lines. Mr. Brydges, borough electrical engineer, stated that the only way to provide electricity at a reasonable price in that neighbourhood was by means of overhead wires. Sir William Marwood will submit his report to the Ministry in due course.

Glasgow.—Year's Working.—We have received a copy of the 33rd annual report of the Corporation electricity undertaking (engineer: Mr. R. B. Mitchell) covering the year ended May 31st last. The revenue account shows an increase of income from all sources of £88,925, and working expenditure an increase of £80,315, the former from £1,153,194 to £1,242,119, and the latter from £571,119 to £651,434. The gross profit was thus £590,685, as against £582,075. Interest on loans amounted to £244,361, sinking fund charges to £235,961, and depreciation £98,590, leaving a net surplus on the year's operations of £11,772, as compared with £5,975 in the preceding year. This was transferred to the reserve fund, which now amounts to £88,349. The increase in the working costs is attributed to a large increase in respect of rates and taxes, and to the general increase in the repairs, and maintenance of buildings, plant, &c. The capital expenditure during the year amounted to £416,867, bringing the total expended on the undertaking up to £7,386,749. The chief items of expenditure were £78,554 for additions to Dalmarnock station and £141,826 for mains and cables. The electrical energy sold increased from 166,087,836 to 179,263,199 kWh, of which 8,181,500 kWh was generated at Port Dundas and the remainder at Dalmarnock. The average gross income per kWh sold was 1.663d., as compared with 1.666d. in 1923-24, and the cost per kWh sold 1.647d., as against 1.657d. The maximum supply demanded rose from 193,214 to 211,003 kW.

In connection with the Dalmarnock station, the report states that the building extensions to the turbine room, boiler-house, and switch house are nearing completion. The erection of the first of two 25,000-kW sets on order from Messrs. C. A. Parsons and Co. will commence early in September, and the set is expected to be in commission by December this year. The switchgear on order from Messrs. A. Reyrolle & Co., Ltd., is well advanced, and will, in all probability, be ready to take load by the end of November. During the year five additional substations were put into commission, and construction was commenced on three others.

Lymm.—Inauguration of Supply.—The new sub-station at Eagle Brow was opened on August 12th by the chairman of the Urban District Council. In December, 1923, the Council approached Warrington Corporation for a supply of electricity, and satisfactory terms were arranged. Electricity is generated at the Warrington Corporation electricity works and transmitted to the Lymm sub-station through duplicate feeders at 6,600 V, 3-phase, 50 cycles, where it is reduced for distribution. Two oil-cooled transformers of 150 kW each are at present installed. The h.p. switchgear was supplied by the British Thomson-Houston Co., Ltd., and the transformers by the Fuller Electrical & Manufacturing Co. British Insulated and Helsby Cables, Ltd., supplied the h.p. cables, and W. T. Glover & Co., Ltd., the l.p. cables. The scheme was designed and carried out under the supervision of the borough electrical engineer, Mr. F. V. L. Matthias.

Market Drayton.—Street Lighting.—The Urban District Council has accepted the offer of the Market Drayton Electric Light & Power Co., Ltd., for public lighting, from September 13th next to April 17th, 1926, at £3 10s. per lamp.

Northallerton. — Street Lighting. — The Urban District Council has accepted the tender of the Northallerton Electric Light & Power Co., Ltd., for public lighting for a period of two years.

Perth.—Electricity Charges.—A reduction of 5 per cent. in the lighting and power rates for electricity was sanctioned at the last meeting of the Town Council.

Pontypool.—Electricity Charges.—The Pontypool Electric Light & Power Co., Ltd., has applied to the Electricity Commissioners for a Special Order authorising it to revise the maximum electricity charges in the district.

Presteign.—Street Lighting.—The Urban District Council has accepted the offer of the Presteign Electric Co., Ltd., for street lighting during the period September 29th to March 31st next, at £2 per lamp.

Shelf.—Electricity Supply.—The Urban District Council is to support the application of the Electrical Distribution of Yorkshire, Ltd., for a Special Order authorising it to supply electricity within the urban district.

Southend-on-Sea.—Loans.—The Town Council is applying for sanction to the following loans:—£4,041, balance for the installation of one 750-kW Diesel engine at London Road station, and two similar engines at Leigh station; £3,059 for three waste-heat boilers, with piping, valves, &c., and the extension of the cooler room at Leigh station.

Southwell.—Electricity for Villages.—The Rural District Council has decided to ask the Derbyshire and Nottinghamshire Electric Power Co., which is about to carry overhead cables through a portion of the rural district from Farnsfield to Aversham, whether it will be willing to supply the various villages *en route* with electricity.

Spalding.—Electricity Scheme Delayed.—The electricity scheme is being held up by the Electricity Commissioners, who are urging the Urban District Council to take a supply in bulk from either Boston or Peterborough. The Council maintains that it will be cheaper to have its own generating station.

Taunton.—Loans.—The Town Council has applied for sanction to loans amounting to £7,000 for the following purposes:—Mains, £5,000; meters, £1,500; motors, £500.

United States.—Electrical Development.—According to *Power*, the Public Service Company of Northern Illinois has recently ordered a 50,000-kW steam-turbine for the Waukegan Station. This is the third set, the first being one of 25,000 kW, which was installed two or three years ago, and the second of 35,000 kW, installed last winter.

The *Electrical World* states that the Buffalo General Electric Co. has received a contract from the city of Buffalo to replace with electric lamps all the existing gas lamps of that municipality. The new contract runs for two years from the beginning of 1926 with the option of a renewal for another year. Equipment for the business streets will consist of 4-amp. and 6.6-amp. inverted magnetite lamps, and residential street illumination will be by incandescent lamps of from 100 c.p. to 150 c.p., with underground conduits. These will be of the same type as those which have already been installed in residential streets by the company to the number of about 2,000.

Wick.—Electricity Scheme.—The Town Council has decided to proceed with an electric lighting scheme for the borough.

Wimborne. — Electricity Supply. — The Urban District Council proposes to consent to the application of Torr, Dunnford & Co. for a Special Order to supply electricity to the town, subject to the maximum price of 1s. per kWh being reduced when the shareholders have received a dividend of 8 per cent.

Wirral.—Electricity Scheme.—At a recent special meeting of the Rural District Council it was decided to ask for tenders for the laying of cables for the first two sections of the work from the boundary of Ellesmere Port to the parish of Heswall, *via* Neston, and the second section from Wallasey to Moreton. Powers to borrow £110,000 for the work have been applied for by the Council.

Tramway and Railway Notes.

Argentina.—Buenos Aires.—The Anglo-Argentine Tramways Co.'s scheme has been accepted by the Municipal Executive. The company's proposals provide for the taking up of surface lines in a small congested area, but the rights to run traffic over these roads are to be retained. In addition, subways are to be constructed and omnibus services to be established in the suburban areas. The 'buses will run in connection with the tramways and subways. The whole programme will probably require 120,000,000 dol. paper, and will take a number of years to complete.—*The Electric Railway and Tramway Journal.*

Birkenhead.—Motor Omnibuses.—The Tramways Committee has decided to substitute motor omnibuses for tramcars on one of the routes.

Bury-Salford. — Through-Running.—A scheme for a through-running tramway service between the two towns is under consideration.

Dover.—Loan.—The Corporation is applying for sanction to a loan of £7,184 for track renewals.

Ipswich.—Railless Cars.—According to *Modern Transport*, the Corporation has now been granted powers to run railless cars over the whole of its existing tramway system. The application for Parliamentary powers to effect this alteration was made on the recommendation of Mr. A. Baker, general manager, Birmingham Corporation Tramways, who undertook the examination of the matter at the request of the Corporation, and decided that the existing tramways were worn out.

Lochgelly.—Tramway Scheme.—According to the *Electric Railway and Tramway Journal*, the Town Council has finally agreed to withdraw its opposition to the Provisional Order for the extension of the Fife electric tramway through Lochgelly eastwards. The proposed new line branches off the present line at the Cross, and continues eastward along East Main Street, across the foot of High Street, and through the Public Park on the south side of the Lochgelly Iron and Coal Co.'s Jenny Gray colliery.

London.—Old Street Station Improvements.—Escalators were put into service at Old Street underground station on August 19th. A basement booking hall, with passimeters, is being formed, whilst the station building will be replaced by one of modern Underground design, shops being a feature.

Progress of "Underground" Extensions.—According to *The Times*, excellent progress is being made with the work of extending the City and South London Railway to Morden. The tunnelling is now completed, and the engineers who will lay the track are about to take charge of the operations. The new rolling stock is being delivered. It is not expected, however, that the line will be open for traffic until early next year. The two-mile extension of the Kennington loop, which runs from Charing Cross to Kennington, via Waterloo, is making progress. Work is being carried out from four working shafts, with service headings. From the Charing Cross shaft the south-bound station tunnel is under construction, and two-thirds is now complete. On the north-bound line, tunnelling is going on under the river bed, over 50 yards having already been completed. This tunnel will make a junction with the north-bound station tunnel at Kennington, and in the south-bound tunnel a junction will be effected midway between Bethlem Hospital and Kennington station.

Breakdown.—A temporary breakdown of the electric train services between Broad Street and Richmond on the London, Midland and Scottish Railway occurred on August 19th. Steam trains to Richmond were put into operation at Broad Street, and these enabled the passengers to travel to their destinations with only about half an hour's delay.

A Large Electric Cable and Accessories Works.

A Visit to the Prescot Works of The British Insulated & Helsby Cables, Ltd.

The extensive works at Prescot of The British Insulated and Helsby Cables, Ltd., to which we recently paid a visit, and which at present occupy a factory space of some thirty acres, excluding extensions which are at present being carried out, were established originally by the British Insulated Wire Co. about 1888, the works then covering about two acres. The first products were small single wires and cables for lighting work, paper insulated and lead covered, and multiple twin conductors for telephone work. In 1902 an amalgamation was effected with the Telegraph Manufacturing Co., Ltd., of Helsby, resulting in the formation of The British Insulated and Helsby Cables, Ltd., of which Mr. James Taylor is the chairman and Mr. Dane Sinclair the general manager.

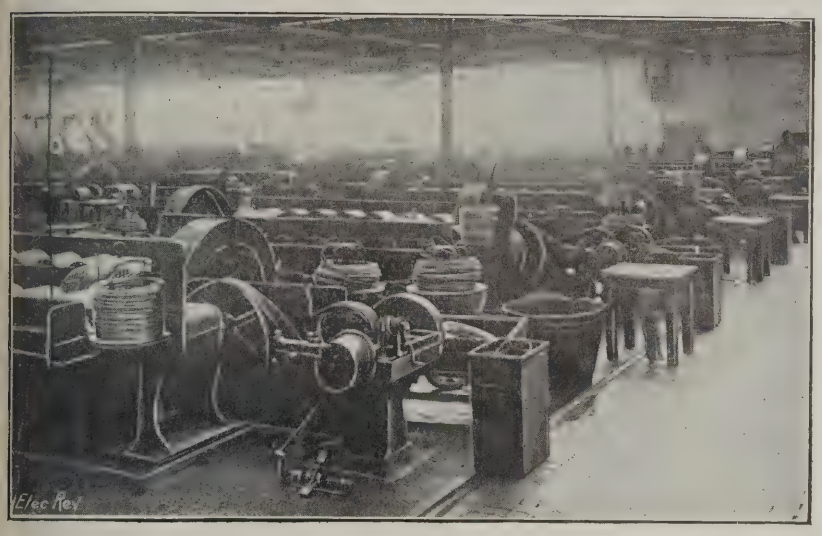


Fig. 1.—Automatic Wire Drawing Machines.

The works are favourably situated, with the main Liverpool to Warrington Road bordering them on the north side and the extensive sidings of the L.M.S. Railway on the east. A double track connects these sidings and the works, running through a central avenue of loading and unloading yards and sheds from which the various departments radiate. The principal manufactures of the works are, of course, copper wire and rod, &c., and paper-insulated cables of every description; but the accessories branch is by no means a small one, covering an area of about 12 acres; cable boxes, pillars, switches, fuses, and bonds are but a few of the products.

In a tour of the works, which is no light task in limited time, the first place of interest, taking the cable-making departments in the order of manufacturing process, is, curiously enough, also the last, being the copper refinery, where the scrap metal collected from the various departments is dealt with. The copper is melted down in oil furnaces and moulded into billets about 2 ft. long by $3\frac{1}{2}$ in. in diameter. These, with bulk supplies from outside sources, are dispatched to the rolling mills, where they are reduced to $\frac{1}{4}$-in. rod. There are at present three rolling mills, two being used for aluminium rod and sheet; but a fourth mill is being equipped for copper rod rolling, this being 210 ft. long by 70 ft. wide. Each copper-rod mill is equipped with a reheating furnace and three sets of rolls. After rolling, the copper rod carries a black oxide scale which is removed by immersion in weak acid. This is done in long pickling tanks. The next process of importance is the wire drawing, the bulk of which is effected in a new and well-equipped shop, 240 ft. by 156 ft., but the very fine wires are dealt with in two smaller rooms after being reduced to about No. 16 gauge in the first-mentioned shop. Two methods of drawing are carried out, on automatic and single block machines; wires for special uses and contracts are dealt with on the latter. Fig. 1 is a view of some of the automatic machines, and fig. 2 shows the single block drawers. The rod is first reduced through nine dies to No. 16 gauge and then through a further ten dies to No. 25 gauge. These dies are of chilled cast iron and are made at the B.I. & H. works. From No. 25 gauge the wire is drawn on the fine-wire drawing machines in the smaller shops through 16 or more diamond dies to reduce it to the smallest size, one mil diameter. In the final stage of drawing, the wires are hard. For the process of cable making it is necessary to anneal the wires; this is done in the annealing department, fig. 3, where the wires are passed through Bates & Peard bright annealing furnaces. In the chambers of these furnaces is a steam pressure slightly above that of atmosphere. Each chamber is air-tight, and the openings through which the wires enter and leave are water-sealed. Most of the machines in the

Fig. 2.—Wire Drawing Blocks.

wire mills are driven singly by electric motors, 4,100 h.p. of which are installed in the rolling and wire mills.

The extruding department is one of particular interest and importance. Here the metal, instead of being rolled, is extruded through dies in a semi-molten condition. Fig. 5 is a view of the extruding department; the heavy wire-drawing machines are shown in the foreground, and it is on these machines that grooved contact wire for traction work is drawn, forged steel dies being used. Much heavier work, such as bus-bars, &c., is dealt with on draw benches, on which the bars, &c., are carried along after extrusion on chain travellers. Some American metal presses, which also play an important part, were installed for munition-making purposes during the war. Aluminium sections, angle channels, beading, &c., are also products of the extruding department, which is served by a 5-ton Heywood crane.

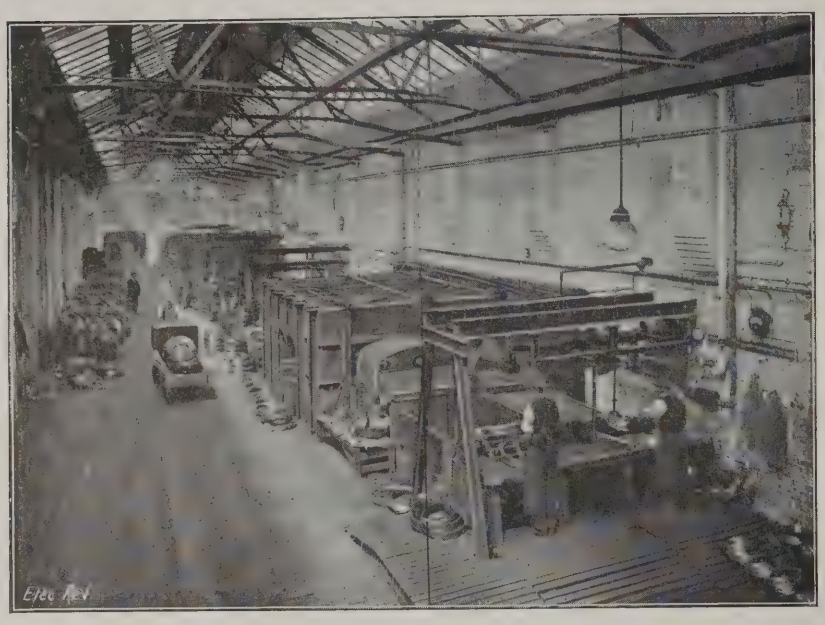

Fig. 3.—The Annealing Department.

At this stage of the cable-making process it is interesting to note that the output of copper exceeds 100 tons per day. All the wire for the B.I. & H. rubber-covered cable works at Helsby is manufactured at Prescot. This wire, in order to prevent action on the copper by the sulphur in the rubber, is tinned by passing it through baths of flux and molten metal. To comply with the B.E.S.A. specifications, all hard-drawn wires are subjected to the usual wrap and twist tests in the shops, and tests for elongation, conductivity, &c., in a fully-equipped testing laboratory.

It is necessary in many cases to produce longer lengths of wire than are turned out by the machines, and to meet these requirements electrical butt-welding machines of the firm's own design and make are installed in the wire-drawing shops.

The extensive rooms of the wire-stranding department make the next call on the metal. Stranding machines for all sizes of cable are installed, including those of the rotating-bobbin type, and others of more modern design in which the bobbins float in line with the cable. The stranded cores are now dealt with in the paper-covering rooms. Here, the paper, which is received in rolls 24 in. wide, is cut into strips of about 1 in. in width and wound on reels on paper-cutting machines, each machine dealing with a complete roll in one operation. The wound reels are installed on the paper-covering machines, which transfer the paper to the cable cores. These machines are of the tandem type, and some of the larger machines wind 40 layers of paper in one operation. The paper used for the insulation of the "outers" of concentric cables, not the overall insulation of other cables, is impregnated before application—in all other cases the cores are covered with dry paper. The cores are papered separately, after which they are built up on very large covering machines which twist the cores, run the spun yarn into the spaces between them, and apply the outer or overall insulation.

Samples of the paper received are analysed in the chemical laboratory to ensure that they contain no matter which will prove injurious to the metal, or to the paper itself in the course of time; also to ensure that it is of sufficient strength to run on the machinery. It is of importance that the paper should be able to withstand the temperatures to which it is subjected in the drying ovens, where it is treated after being applied to the cable, and again in the process of impregnation. The paper must have a certain limit of porosity sufficient to allow the impregnating oils to penetrate, but not sufficient to permit them to flow away. It is interesting to note that one function of the paper is to hold the oils in thin layers, it being a peculiar property of oil that it is stronger (electrically) in films than in bulk. The main insulating room is served by two cranes of 15- and 5-ton capacities. Insulating is also effected in two other rooms, one of which is mostly devoted to stranding. These departments, with the two long lead rooms and the general office block, occupy the south-east corner of the works. The impregnating plant is part of the equipment of the lead rooms, thus enabling the lead covering to be applied directly the cables leave the ovens, and cranes are provided for the quick transportation of the cables, the large room being spanned by a 15-ton and a 10-ton cranes, and the small room by a 15-ton and a 5-ton cranes.

Fig. 4.—The Braiding Shop.

When ready for lead covering, the cables are suspended (on the factory drums) in oil tanks; they are then unwound and passed through the lead-covering machines. These are of the usual type, in which the moulds receive the molten lead from overhead furnaces,

and apply it to the cable running horizontally through the centres; it might be more accurate to say that the lead is formed round the cable as, of course, any consideration of forcing the lead on to the cable is out of the question. Unless an alloy sheath is specified, pure virgin lead is used for sheathing.

The process, after testing, takes us to the armouring shop. This is a large room, 520 ft. long by 100 ft. wide, at the west extremity of the existing works, covered by a 15-ton crane. Two types of machines are installed, those for wire armouring and those for tape armouring. The former are similar in design and principle to those used for the core stranding, and the latter operate on similar lines to the paper-covering machines. A heavy machine arranged along the centre of the department is the outstanding feature; at the time of our visit it was dealing with a 0.25-sq. in., 3-core, 3,000-V cable for the City of London. A view of this shop is shown in fig. 6. A new building of steel and glass construction throughout is at present being erected for this department.

On this machine and other smaller ones the whole operation in connection with the armouring of the cables is effected. The lead is compounded at one end, and the cable is finally whitewashed at the other extremity, the covering of jute, cotton, or hessian tape, &c., over the lead, the winding-on of the armouring, and the final covering of jute, being done in order along the machine between these points. Welding machines serve a very useful purpose in this branch of the works for joining the lengths of wire and tape used for armouring. The railway track runs past the south end of this building, and across the lines is the drumyard, from whence the drums are transported to a distributing field on the opposite side of a by-road. A 5-ton "Goliath" crane, which runs on rails 80 ft. apart and has an effective span of 100 ft., serves the yard and field; it is electrically driven, the supply being collected from overhead wires run out on wooden poles. This crane is a recent addition, and its usefulness can be gauged by the large distributing area over which it operates.

All finished cables are dealt with in a fully-equipped cable-testing department adjacent to the armouring shop. This building, 240 ft. by 100 ft., is served by a 15-ton crane and is provided with three large immersion tanks in the centre. The actual testing operations are carried out at the sides. Three testing bays for pressure testing are arranged on one side of the test house, and a gallery above the bays is equipped with the necessary measuring apparatus. Each bay is used and equipped for testing up to a given pressure, the maximum pressures being 10,000, 50,000, and 200,000 V; the bay for the last-named is used also for h.p. experimental work. Included in the testing plant are two Mordey-Victoria 2,000-V alternators, relics of the original Prescot lighting scheme, still rendering good service. A 600-kVA G.E.C. (America) machine supplies the pressure-raising transformers at 1,000 V. For applying some of the lower pressures, an adjustable double coil is used in which the pressure is raised by balancing inductance against the capacitance of the circuit. All pressure tests are applied for 15 minutes or more.

The manufacture of telephone cables is carried out in its entirety as a separate branch in two buildings to the south of the works, one being 400 ft. long by 100 ft. wide, and the other about two-thirds of this size.

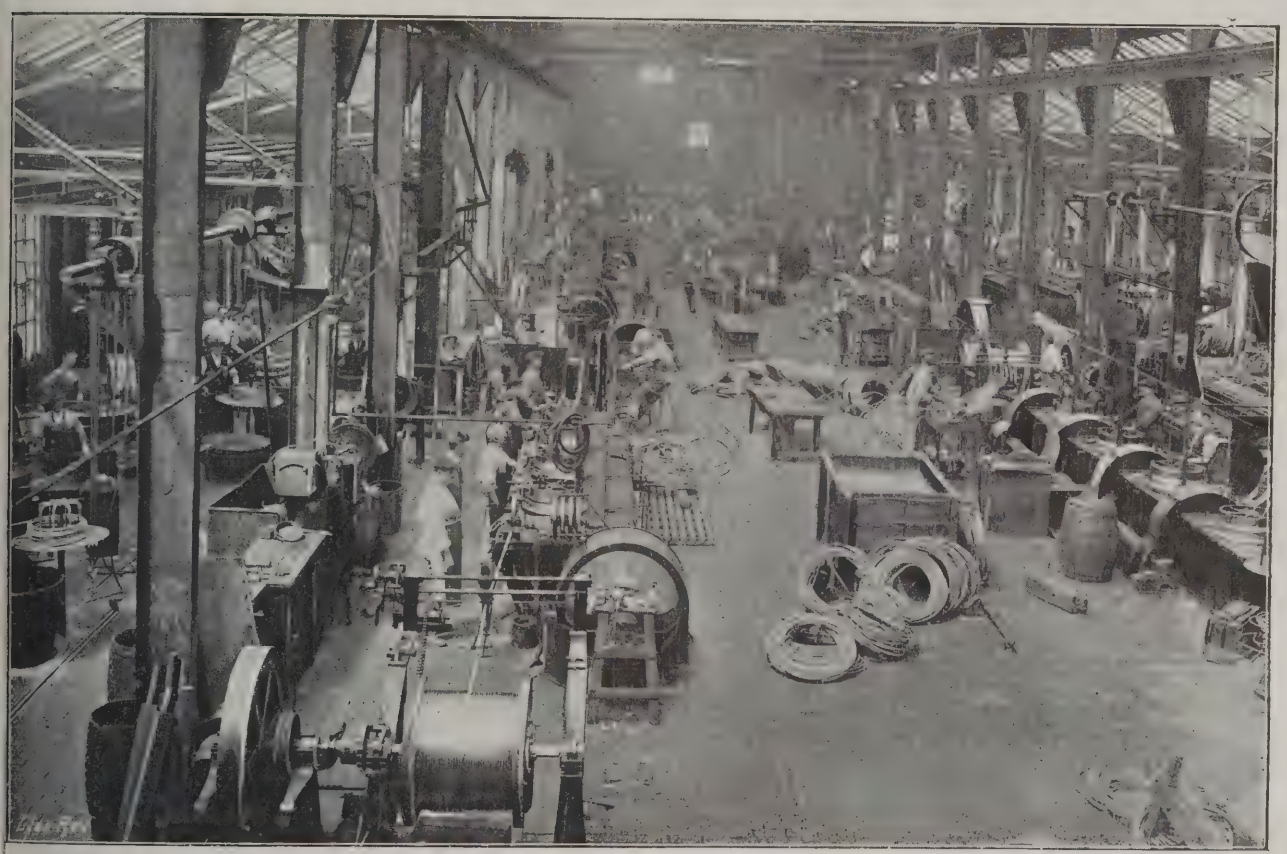

Fig. 5.—The Extruding Department.

The former is served by a 5-ton crane, and deals with the manufacture up to the lead-covering process which is carried out in the smaller house, also equipped for testing the cables; two cranes—10-ton and 7-ton—span this shop. Paper-lapping machines for covering the bare copper strands are of the revolving-bobbin type. The twinning of the paper-wound strands is carried out on horizontal and vertical machines. For multiple cables the process is carried out on special-precision twinning machines designed to ensure that the lengths being twinned are exactly equal in order to obtain the balance of capacities vital in telephone work. A most interesting feature of this department is a long cabling machine which will build up 165 pairs of wire in one operation. This machine is of the revolving bobbin type, and is made up of 10 fliers, each of which deals with one layer of wires or pairs of wires, each successive flier holding the larger number of bobbins required for the increased size of the concentric layer. Several machines of this type are installed in the department, and cables built up to certain sizes on some of the machines are transferred to others to be further increased. Cables consisting of 1,350 pairs of 6½-lb. wire have been built on these machines. All cables are tested for con-

tinuity before transportation to the lead-covering rooms. The braiding of aerial cable is effected on 24-bobbin machines. Fig. 4 is a view of the braiding shop; it will be seen that the cables are unwound and rewound, before and after braiding, on drums under the platform on which the machines are mounted. Special cables for hot and dry climates are dealt with on these machines. The cotton-covering shop is situated adjacent to the braiding room, and is equipped with cotton-whipping machines of several types, including some of the high-speed central bobbin type. The production of enamelled wire is carried out extensively, and it is interesting to note that 270,000 miles of this material were sold last year in sizes up to 0.052 sq. in.

The accessories department is by no means a small branch of the works, and occupies an area of about 12 acres at the N.E. corner. It is a factory within a factory, and employs something like 1,200 hands. Electrical equipment of every description is manufactured, including cable boxes and pillars, insulators, bonds, meters, fans, welders, &c. Two large foundries form a considerable part of this department, and turn out castings for the various products. The machine shop is of particular interest; here electrical welders are made for butt, seam, and resistance welding in many varieties of work. These machines are of B.I. & H. production, including some of the firm's own design. The company has been making electric welders for the last 23 years, and at present it is turning out over 80 different types.

Fig. 6.—The Armouring Shop.

Fig. 7 shows a seam welder, one of the latest productions of the firm. Bond making is carried out on a large scale, the output being somewhere in the region of 10,000 bonds per week. A special bond of the firm's own design, of the protected type, is of particular interest; it is intended for railway work, and is constructed on an oval frame; it consists of a continuous strip of copper, making several layers. The terminals are cold pressed on to the ends of the strip to remove any air which may be locked in before being forged. Twenty-one fires used for casting the heads for bonding are installed in the bond-making shop; also four new compressed-air moulding machines, besides numerous presses of every description.

The machinery of the meter-manufacturing shops presents a contrast to that of the cable-making and accessories departments. Tiny lathes are at work on the very delicate parts for electric meters, and modern American automatic pinion cutters and wheel-cutting machines are among the latest additions to the equipment. The production of electric fans is a further interesting engagement of this part of the works, and special fans for use in hot climates are turned out by mass production.

A fleet of 21 electric battery trucks is engaged on transportation duties in and between the various shops and departments throughout the works. These are mostly of the elevating-platform type, and are each of 2-ton capacity. The batteries for these vehicles are charged at a special station equipped with three panels each capable of dealing with five trucks at a time. A supply is received at 120 V d.c., and is equalised out at 40 V to each panel by a balancing set. One of the trucks is shown in fig. 8, which also gives a view of an electric 1-ton runway. This serves all the shops

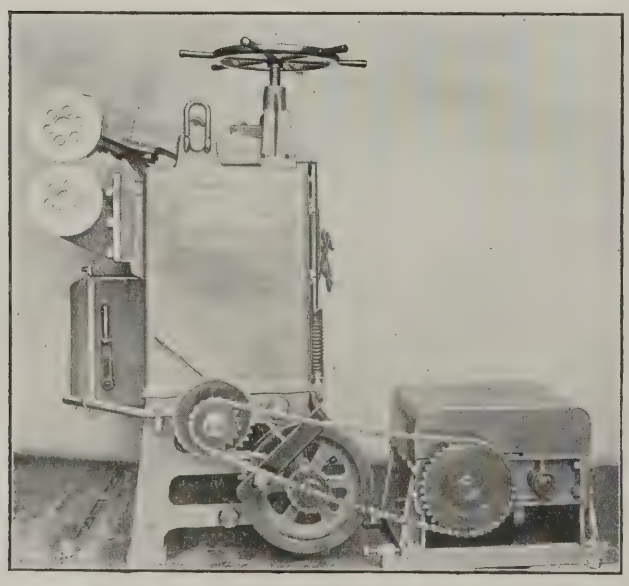

Fig. 7.—An Electric Seam Welder.

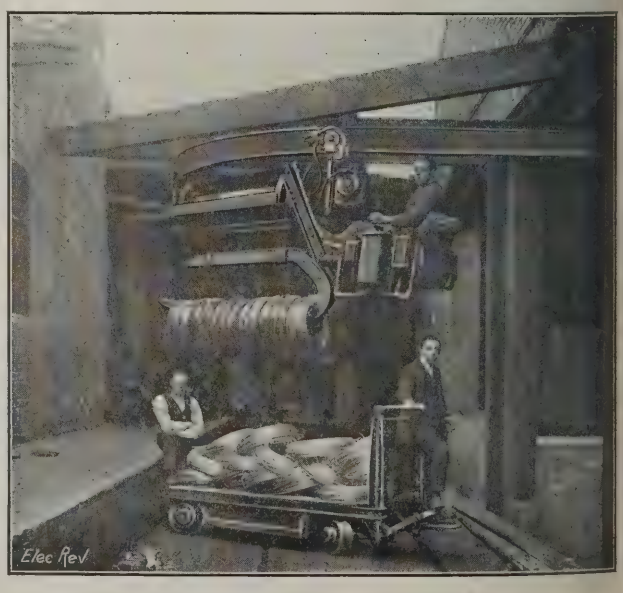

Fig. 8.—Electric Truck and Runway.

of the wire-mill department, except the extruding room. It will be seen that with the coils of wire placed together in a vertical plane the horizontal carrying arm can thread several in a single operation.

Practically the whole of the machinery throughout the factory is electrically driven, and the supply is received from the firm's own 5,500-kW capacity generating station situated on the site, supplemented by a supply in bulk from the Liverpool Corporation. The demand of the factory is in the neighbourhood

f 9,000 h.p., but the station also supplies the town f Prescot. The generation is 3-phase a.c., but most f the factory is equipped with d.c. motors, the neces- ary conversion being done in a rotary station put own by the company. The general offices face the ailway at the front of the works; they occupy a floor rea of 25,000 sq. ft. The departmental offices are rranged on the sites of the departments.

The welfare of the staff and workpeople is by no eans neglected. A large and well-equipped canteen, uilt in 1915, affords accommodation for those of the aff and workpeople who live at a distance from the orks. Four dining rooms are provided for the use f the male and female staffs and factory workers. eals are supplied at very reasonable prices, and those orkers who bring their own meals can have them armed up; gas, steam, and electricity are used im- artially for the cooking and heating apparatus. Rest ooms are provided for the female employés, and tached to these is a sewing room where overalls are rned out for use in the works. A trained ambulance aff is constantly in attendance at the ambulance ooms; these are situated in the centre of the works. djoining the ambulance station is a room fitted with -ray apparatus to deal with any casualties requiring ch attention. The latest development is a dental inic where employés can obtain first-class treatment reduced charges.

Telegraph and Telephone Notes.

Czecho-Slovakia.—Telegraph Service.—According to the nual report for 1924 of the Czecho-Slovakian Post and Tele- aph Department, there are now 3,631 telegraph offices and ,830 miles of telegraph wire in use in that country, the mber of messages handled last year having been 15,800,000.

Faroe Islands.—Radio-telephony.—New facilities for inter- mmunication between islands in the Faroe group have been ovided by the installation of two small duplex wireless ephone sets on the islands of Thorshaven and Nolso. The paratus, which is of the Marconi XP1a type, does not need attention of a skilled operator, being used in the same y as an ordinary house telephone. The set comprises a all power valve transmitter and a valve receiver, worked tirely from batteries, and with the aerial supported by sts 70 ft. in height, communication over a distance of 20 les can be maintained. The adaptability of this Marconi uipment to a variety of circumstances is shown by the fact at apparatus of the XP1 type has been supplied to the State lways of Siam for use in connection with that service.

France.—Call Disk Competition.—The French Post and legraph authorities are organising a competition for the most itable pattern of official call disk for subscribers of automatic ephones. Subscribers must submit their designs before tober 15th next. Full particulars of the competition can be tained from the Direction de l'Exploitation Telephonique, he Bureau, 103, Rue de Grenelle, Paris.

Germany.—New Atlantic Cable.—The submarine telegraph ble which the Deutsch Atlantische Telegraphengesellschaft to lay from Emden to the Azores, to connect with the Com- rcial Cable Co.'s and the Western Union's systems, has been ered from the Norddeutschen Seekabelwerken A.G. Nordeeham, says the *Financial Times*, and is to be ready the autumn of 1926.

Japan.—New Radio Company.—A Japanese wireless tele- aph company, managed jointly by the private interests con- ned and the Government, has come into being with Viscount ibusawa and Baron K. Nakashima as members of the com- ttee. The company is to be organised with the Government tion at Iwaki as its principal asset, reports the *Daily Tele- aph*. Supplementary subscriptions in shares will be made by minent business interests in Japan.

New Radio Service.—A new wireless telegraph service to pan has been inaugurated by Marconi's Wireless Telegraph ., Ltd., and is now available to the public. The rate is 4d. per word, and messages, which should bear the routing truction "*via* Marconi," may be handed in at the Marconi ices in London, Liverpool, or Manchester, or at any postal railway telegraph office in the United Kingdom.

Sierra Leone.—Telegraph and Telephone Services.—The nual report for 1924 on the Sierra Leone (West Africa) rail- y includes an account of the operation during the year of the egraph system of the country and the telephone exchange Freetown, both of which are under the management of the lway. The total mileage of telegraph and telephone lines the end of the year was 1,204, four miles less than in 1923, luding 156 miles of telephone lines in Freetown. The num- of electric train-staff instruments was 78, the number of egraph instruments was 40, and the number of telephone cuits on the Freetown exchange was 88, or six less than 1923. The double military line from Port Lokko to Mabanta was bought from the Army and dismantled, and the best of the material was used for the construction of a new line from Port Lokko in a northerly direction through Mange to the trading centre of Kambia. There is now a through line from Songo to Kambia, while a branch line of about three miles was constructed from Loawa, in the Northern Province, to Mattru. Since the departure in January, 1922, prior to retirement, of the European telegraph superintendent, the section has been in charge of an African telegraph inspector. Mr. Bennett, assistant engineer-in-chief of the Nigerian Posts and Telegraphs Department, following an inspection, reported that the section was in an unsatisfactory state. However, at the date of the report under review, May 1st, 1925, Mr. G. Cresswell, of the Nigerian Posts and Telegraphs Department, had just arrived to take up the appointment with the title of assistant telegraph engineer. He is responsible to the chief engineer of the railway and has a very large amount of work in front of him. Excluding messages on railway service, the number of telegrams dispatched during the year by the public increased by 1,682 to 45,206, and Government messages increased by 5,852 to 18,299. The number of subscribers, excluding the railway, connected to the Freetown telephone exchange was 34 public and 15 Government. Telegraph revenue increased by £773 to £5,500, and telephone income increased by £71 to £1,334.

Switzerland.—Automatic Telephony.—The Bollwerk central telephone exchange in Berne is to be converted into an automatic station. The installation will provide for 4,400 connections, with an eventual capacity of 9,000; extensions are also to be made at the various sub-exchanges. The contract for the work has been placed with the Siemens & Halske Co., of Berlin.

The Telephone Service.—New Exchange.—A new telephone exchange was opened on August 20th in specially-designed premises in Coolfinn Road, Victoria Docks, E.16, to meet the increased demand for telephone service in the neighbourhood of the Albert Dock. Equipment of the central battery type has been fitted, and accommodation for 1,500 subscribers' lines has been provided, with capacity for extension to 4,000 lines. The new exchange will serve an area of about six square miles now served by the East and East Ham exchanges, from which 900 lines were transferred, says the *Morning Post*, at the time of opening. To carry the traffic between the Albert Dock and other London exchanges 195 outgoing and 180 incoming junction lines have been provided. An estimated daily traffic at the time of opening of 22,000 outgoing and incoming calls will be handled by a staff of 31 telephonists.

Radio Notes.

Interference Elimination.—Wave-length Tests.—The night of August 31st—September 1st has been chosen for the all-Europe test in connection with the scheme to allocate every station such a wavelength as will prevent interference between one country and another. Practically every broadcast station throughout Europe will alter its wavelength, and nearly all the British stations will do likewise. The test will last for two hours, and will begin at midnight. Every station will transmit its own programme, and announce its identity every few minutes, so that any interference can be detected by listeners in every country in Europe except Russia; the National Physical Laboratory is acting for the B.B.C., and the success of the scheme depends on the accuracy of transmitting on the allocated wavelengths. Never before have fractions of a metre been used by B.B.C. stations. Representatives of the various countries will afterwards meet at Geneva to compare notes before the final scheme is put before their respective Governments for approval.

Long-distance Relaying.—A "Central" Receiver.—A season of international entertainment will be available to listeners this coming winter, for it is hoped to complete the new "central" receiving station which the B.B.C. is building at Hayes, near Bromley, in Kent, early next month. In October this plant will pick up American and Continental programes and relay them to Daventry, whence they will be re-radiated. The B.B. Co. has been developing proposals for the exchange of programmes in this manner, and the new station will have a 300—500-metre receiver, and another for shorter bands for long-distance reception. Direction-finding apparatus will be provided for locating sources of interference and for assisting in calibrating B.B.C. stations.

Russia. — Soviet Broadcasting. — The Soviet authorities evidently regard radio-broadcasting as an excellent means of propaganda, for the *Daily Mail* reports that over 6,000 workers' clubs have been fitted with receiving sets, and 12,000 reading rooms for the public have now been similarly equipped. When the British Broadcasting Co.'s experimental station at Hayes is ready, listeners in this country will have an opportunity of judging the quality of the Soviet broadcast programmes, as relayed by 5XX.

United States.—Range Tests.—Between 12.30 and 5.30 a.m. B.s.t. on August 25th and 26th, the General Electric Co.'s station at Schenectady, W.G.Y., was to broadcast test programmes on a wave-length of 380 metres as part of the experiments announced a fortnight ago. The power was to be changed every 15 minutes from 2½ kW (its normal output) to 50 kW, and more power will be used in future if necessary, the object being to ascertain the extent to which the range of the station can be extended.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Adwick-le-Street.—Urban District Council. September 14th. Internal wiring for electric lighting of Council houses. (August 21st.)

Australia. — Melbourne.—September 29th. Postmaster-General's Department. Telephone protective apparatus.*

October 20th. Switchboard cable. Sched. C.39, jumper wire. Sched. C.40, bells and buzzers.*

October 7th. Victorian Government Railways. Two electric transporters complete. (AX.2303.)*

Commonwealth. October 27th. Timing clocks and calculagraphs. (August 21st.)

Telephone transmitters. (See this issue.)

New South Wales.—November 11th. New South Wales Railways and Tramways. 5-ton 3-motor electric overhead travelling crane, 56 ft. 2 in., for iron and steel foundry, Eveleigh workshops.

September 23rd. Four feed-water meters for White Bay power house.

October 15th. Newcastle City Council. 2,000-kW, or, alternatively, 1,500-kW turbo-alternator, complete with condensing plant.—*Tenders.*

Belgium.—September 23rd. Ministry of War. 4,500 km. of field telephone cable.*

Edinburgh.—September 14th. Royal Infirmary. Supply of X-ray and electro-medical equipment for the new Radiological Department. (August 14th.)

September 7th. Electricity Supply Dept. Electric lighting installations at 288 houses under the Gorgie housing scheme. Specifications from engineer's office.

Egypt.—Cairo.—September 15th. Director-General, Mechanical Department, P.W.M., Cairo. Six generating sets for steamers for the Government workshops, Bulag.

Ministry of the Interior. Supply and installation of an electric power station and distributing system for the town of Minieh.*

India. — September 15th. Madras and Southern Mahratta Railway Co., Ltd. Telegraph line materials, copper wire, &c. (August 21st.)

London.—H.M. Office of Works.—September 15th. Supply of electrical and mechanical engineering labour in daywork in Cardiff. (See this issue.)

Bermondsey.—September 9th. Board of Guardians. Six months' supplies of electric lamps. Forms of tender from Mr. H. H. Reeve, Clerk to the Guardians, 283, Tooley Street, S.E.1.

Westminster.—September 9th. Board of Guardians. Electrical lamps, fitting, &c. Forms of tender from Mr. W. J. Leckley, Clerk to the Guardians, Guardians Offices, Princes Row, S.W.1.

Newport (Mon.).—September 7th. Electricity Department. Induced draught plant, extension of flues, &c. (August 21st.)

New Zealand.—Marlborough.—Electric Power Board. September 22nd. Two 750-h.p. turbines, with generators, switchboard, &c., for Waihopai River development.

Northampton.—September 4th. Town Hall and Markets Committee. Installation of new electrical fittings, lamps, switches, and winches, &c., in the Guildhall, Northampton. (See this issue.)

Portsmouth.—September 1st. Tramways Committee. Stores for 12 months, including insulating materials, lamps, overhead line materials, &c. (August 21st.)

Rochdale.—September 9th. Paving and Sewering Committee. Motors and electrical gear, together with the necessary wiring in connection with the electrification of sludge pressing machinery at Roch Mills sewage disposal works. (August 14th.)

South Africa.—Johannesburg.—October 1st. Railways and Harbours. Four 4-ton electrically-driven portable jib cranes, complete. (A.X.2299.)*

Stoke-on-Trent.—Stoke and Wolstanton Union. Installation of an electrically-driven pumping plant at the Turnhurst Road Institution, Chell. Specification from Mr. T. Wood, Clerk to the Guardians, Stoke-on-Trent.

Town Council. E.h.p. testing equipment. (August 21st.)

Warrington.—September 7th. Electricity Department. Twelve months' supply of earthenware conduits. (August 21st.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Glasgow.—Corporation. Accepted:—

100 time switches for hiring purposes.—Venner Time Switches, Ltd.

Government Contracts.—The following Government contracts were placed during August, 1925 :—

Admiralty (Civil Engineer-in-Chief's Department).

Electric cable.—British Insulated & Helsby Cables, Ltd.

Admiralty (Contract and Purchase Department).

Batteries.—Chloride Electrical Storage Co., Ltd.; D.P. Battery Co., Ltd.; Tudor Accumulator Co., Ltd.
Distributing boards.—Dorman & Smith, Ltd.
Conduits.—Talbot Stead Tube Co., Ltd
Air coolers.—Reavell & Co., Ltd.
Cooling tower.—Davenport Engineering Co., Ltd.
Copper tubes.—J. Wilkes, Son & Mapplebeck, Ltd.
Morse keys.—Baird & Tatlock, Ltd.
Electric lift.—W. Wadsworth & Sons, Ltd.
Motors, control gear, and spares.—Laurence Scott & Co., Ltd.
Transmitting panels.—H. W. Sullivan, Ltd.
Radiogoniometers.—Gambrell Bros., Ltd.
D.p. switches (5 and 15 amp.).—Hawkers, Ltd.; Barr & Stroud.
2-ton and 3-ton electric overhead travelling cranes.—T. Smith & Sons (Rodley), Ltd.

War Office.

Electric cable.—W. T. Henley's Telegraph Works Co., Ltd.; Pirelli-General Cable Works, Ltd.; Western Electric Co., Ltd.
Aerial frame windings.—Fuller's United Electric Works, Ltd.
Generators.—Small Electric Motors, Ltd.
Rotary transformers.—W. Mackie & Co., Ltd.

Air Ministry.

Push buttons.—Pinnacle Switchgear, Ltd.
Motor generators.—Small Electric Motors, Ltd.
Generators and spares.—W. Mackie & Co., Ltd.
Magnetos and spares.—British Thomson-Houston Co., Ltd.
W./t. valves.—Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.; Mullard Radio Valve Co., Ltd.; British Thomson-Houston Co., Ltd.
Voltmeters, thermo-ammeters, and milliammeters.—E. Turner.

Post Office.

Telephone apparatus.—Bonnella Bros., Ltd.; British Insulated & Helsby Cables, Ltd.; British L. M. Ericsson Mfg. Co., Ltd.; General Electric Co., Ltd.; Houghton Butcher Mfg. Co., Ltd.; B. W. Johnson; London Electric Wire Co. & Smiths, Ltd.; Phœnix Telephone and Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Sterling Telephone and Electric Co., Ltd.; Telephone Mfg. Co., Ltd.; T. Watson; Western Electric Co., Ltd.

Telephone materials.—British L. M. Ericsson Mfg. Co., Ltd.
Bronze wire.—Shropshire Iron Co., Ltd.
Copper wire, &c.—R. Johnson, Clapham & Morris, Ltd.
G.i. wire.—R. Johnson & Nephew, Ltd.
Wireless apparatus.—Marconi's Wireless Telegraph Co., Ltd.

Irish Free State.—DUBLIN.—Contracts placed by the Controller of Stores, Department of Posts and Telegraphs during July, 1925 :—

Battery plates.—D. P. Battery Co., Ltd.
Cells.—Edison Swan Electric Co., Ltd.
Copper wire.—British Insulated & Helsby Cables, Ltd.
Insulators.—Wm. J. Kellie.
Spindles for insulators.—W. F. Dennis & Co.
Telephone accessories.—Hall Telephone Accessories Co.
Bronze wire.—W. F. Dennis & Co.; F. Routledge.

Polmont.—Nobel Industries, Ltd. Accepted:—

One 21,550-sq. ft. air preheater.—Howden-Ljungström Preheaters (Land), Ltd.

South Africa.—UNION TENDER BOARD.—Among recent contracts placed by the Board (reported in the *S.A. Mining and Engineering Journal*) are the following :—

Underground cable.—Eugene Phillips Electrical Works (Canada).
Telegraph material.—Telegraph Manufacturing Co.; Rogers, Jenkins and Co.; Hubert Davies & Co. (Johannesburg); and Stewarts and Lloyds (Pretoria).
Accumulator battery for Slangkop radio station (£1,550).—Hubert Davies and Co.

Southend-on-Sea.—Town Council. Accepted:—

Reconditioning of 750-kW Diesel engine, time and line basis (£2,650, maximum), and erection of exhaust boiler, staging and ladder (£40).—Belliss & Morcom, Ltd.
Waste heat boiler (£435).—Spencer Bonecourt, Ltd.
Coresill (£189 3s.).—Christie & Gray, Ltd.
Motor (£214).—British Thomson-Houston Co., Ltd.

Stirling.—Town Council. Accepted:—

Electrical work at new houses in Bannockburn Road.—Mr. Alexander Brewster.

Thirsk (Yorks.).—The tender of Mr. Eric Thompson has been accepted for installing electric light at the new Thirsk and Sowerby Institute.

Worksop.—Electricity Committee. Accepted:—

Two 510-b.h.p. crude-oil engines and two 320-kW generators.—Vickers-Petters, Ltd.
10-ton overhead travelling crane.—Herbert Morris, Ltd.

Notes.

An Alleged Impostor.—WARNING TO ELECTRICAL ENGINEERS.—We have received from the Town Clerk of Lancaster Corporation the following statement :—For the past year or two it appears that a man named R. C. Milner (*alias* Rollo Milton), who gives as his address 4, Rockley Street, Pendleton, Manchester, has been making applications to electrical engineers for posts as assistant engineer, mains superintendent, station superintendent, charge engineer, &c., and enclosing testimonials, all of which are fictitious. An effort has been recently made by the Lancaster Corporation to make an example of him, but their efforts have met with no greater success than those of others. It may, however, be of some service to record the facts. The Lancaster Electrical Engineer (Major G. C. Milnes, M.C.) last month advertised for a shift charge engineer at a salary in accordance with the N.J.B. Scale, Grade 8, Class B, applicants to have had experience with water-tube boilers and turbo-alternators in an e.h.p. power station. About 40 applications were received, including one from Milner. From a perusal of the application it appeared excellent. The man called to see the Engineer on August 5th, and as the applicant was one, having regard to the excellent application, whom the Engineer would in due course have put in a selected list, he interviewed him. When the Engineer looked at him, his face appeared familiar. The Engineer suggested that he had met him on some previous occasion, but Milner was unable to recollect previous acquaintance. The latter, however, suggested it might have been at the Engineers' Club, either at Manchester or London. As the Engineer is not a member of either club, he said this could not be the case. The matter was then dropped. At the interview Milner impressed the Engineer, and afterwards the Engineer referred to some applications he had received in October, 1923, for the appointment of mains superintendent. He found an application from a Mr. Rollo Milton. This was in many respects similar to that now received from Milner. The Engineer was convinced that Rollo Milton and R. C. Milner were the same person. Milner (or Milton) was interviewed by the Engineer in October 9th, 1923, along with other candidates—that was where he had seen him previously. In 1923 Milner gave his age as 38. His recent application gave 34. The Engineer then doubted the veracity of the present application. He made inquiries from the gentlemen who were purported to have given Milner testimonials—the Electrical Engineers of Bolton, Eccles, and Salford. The result of inquiries revealed that the statements with regard to service at those undertakings were fictitious. It was found that he had never been in the service of those undertakings at all. Milner also stated that he had been with the Leicestershire and Warwickshire Electric Power Company as senior engineer-in-charge for three years. The result of inquiries showed that he was there only a few weeks. The company doubted his competence, and called for his original testimonials. He said he would go to Manchester to get them, but he never returned. The Lancaster Corporation issued a summons charging him with an offence under the Servants' Characters Act, 1792, but the summons could not be served, as the address is apparently only an accommodation address, and the Salford police in whose area he was supposed to reside intimate that Milner is evidently a "bird of passage." Possibly he may be heard of again.

A High-Sensitivity Oscillograph.—Some particulars are given by the *Revue Générale de l'Electricité* of a new form of oscillograph, which is to be especially adapted for use in the plate and bridge circuits of vacuum tubes. It is sentitive within the range below one milliampere, and suitable for frequencies up to 3,000 cycles. In principle it consists of a thin, flat strip of silicon-steel alloy placed in an air gap with is surface perpendicular to the field due to a permanent magnet. The strip is suspended at its centre, and light springs at either end hold it in position. One of these springs is geared to a concave mirror. The coil carrying the current the variation of which is to be indicated, is sunk into the poles of the permanent magnet. The current causes the strip to rock to and fro on its pivot, communicating this motion to the mirror. The use of the silicon alloy suppresses the distortion due to Foucalt currents and to hysteresis. Examples are said to have been given of its application to the recording of noise, both aerial and submarine, the registration of wireless signals, and the measurement of small intervals of time.

Electric Steel Furnaces in Germany.—There are in operation in Germany approximately 100 electric furnaces, compared with 360 in the United States, 150 in Great Britain, 70 in France, 50 each in Italy and Sweden, and 40 in Canada. Germany's participation in the entire electric steel production of the world was 56 per cent. before the war and 21 per cent. in 1918, whereas the United States rose from a participation of 17 per cent. in pre-war years to 45 per cent. in 1918. In 1908 the production of steel in electric furnaces amounted to 0.2 per cent. of the total German steel output, growing to 4.7 per cent. in 1913 and to 16 per cent. in 1918, but declining to 7.6 per cent. in 1920. The electric furnace in steel foundries has largely replaced the crucible furnace, and the Martin furnace to some extent. It is not expected, however, that converters, crucibles, and Martin furnaces will be completely replaced by electric furnaces in the near future. The size of furnaces has been growing in Germany as in other countries, although the largest German furnace in operation has only a capacity of 30 tons. Three types of furnaces are extensively used, the Héroult, Nathusius, and Roechling...-Rodenhauser being the most numerous. A number of steel foundries in Germany are also operating induction furnaces, especially of the Roechling-Rodenhauser type. They are generally two-phase furnaces, and their general electrical and heat efficiency amounts to 60 per cent., compared with 86 per cent. generally assumed for arc furnaces. This is not very satisfactory, but it is stated by German foundries that, with due consideration of the cost of the graphite electrodes, initial expense, maintenance, &c., their operation is not more expensive than that of an arc furnace, so that the cost of one ton of steel produced by either the arc or the induction process is almost the same. —*Commerce Reports.*

A Tracing Cloth Substitute.—According to *Electrical World* a transparent celluloid, to be used as a substitute for tracing cloth where permanent drawings are subject to frequent and minor alterations, has been developed and is being used by several large operating companies. It is claimed to be particularly useful where records, maps, connection diagrams, and similar information must be kept up to date continuously, and where periodic reproduction is necessary. The material is about 0.015 in. thick; one side has a smooth finish, and the other a matt surface upon which the tracing is made. Tracings made in this way are said to be almost indestructible, since the ink lines may be easily removed with a sharp scratcher with no injury to the celluloid surface.

Bay of Fundy Tidal Scheme.—The New York correspondent of *The Times* states that by a referendum which is to be submitted to the State of Maine on September 14th next, the approval of the people is being sought for a project to harness the tides of the Bay of Fundy. A scheme has been prepared by Mr. D. P. Cooper, hydraulic engineer, who has selected two inlets on the boundary of Maine and New Brunswick—Passamaquoddy Bay, for the upper pool and Cobscook Bay, in Maine, for the lower pool. He proposes to build locks and dams across the narrow passages between the islands at the entrances to the pools, whilst between the two pools there will be a separating wall 3,600 ft. long, on which power houses will be placed. By opening the gates of the upper pool only during a rising tide and the gates of the lower pool only at low tide, there will be maintained a continuous difference in level between the two pools. The water pouring down from the upper to the lower pool should then yield a minimum of 500,000 h.p. throughout the year, Mr. Cooper asserts, with a possible maximum of 700,000 h.p. if required. It is estimated that the cost of construction will be about £15,000,000, and that the work will occupy 5,000 men for five years. If the Maine referendum is favourable, Mr. Cooper will approach the Canadian and United States Governments for sanction to the scheme. The Governor of Maine has endorsed the proposal.

Shannon Power Scheme. — Preliminary work on the Siemens-Schuckert Shannon scheme has begun in Co. Limerick. The Berlin office of the firm has completed its arrangements for the shipment of plant, and the first consignment will reach the Shannon in about four weeks. Railway connections must be built between the harbour and Limerick Railway Station and also from Long Pavement to Ardnacrusha, where the power station is to be erected. The railway work is expected to be finished by December, and it will employ some 600 men. The actual work of canal excavation will begin in the spring.—*The Times.*

A Wooden Pole Support.—A pole support, the "Malone," has, according to the *Electric Railway Journal*, been placed on the market by the Blaw-Knox Co., Pittsburgh, Pa. It is designed to reinforce wooden poles that have rotted at the ground line, but are otherwise in good condition. The support consists of three galvanised pressed and flanged steel plates adjustable to poles from 10- to 14-in. diameters at the ground level. These plates are arranged to clamp around the pole by means of bolts and washers, and are fastened to three "Malone" concrete anchors.

Canadian Mica Discovery.—What is claimed to be the largest "show" of mica unearthed in Ontario has been discovered at North Hastings, a short distance from Bancroft, by Sorser & Co., who have shipped three cars (120 tons) to the United States market. Crystals weighing as much as two tons have been taken from the show. The company proposes starting a factory there in the near future for the purpose of cutting mica to size. Experts who have visited the property assert that it is the largest yet found in Ontario.

An Acid-proof Apron.—In order to meet the demands of the new Home Office Accumulator Regulations (para. 14), that protective clothing for use in accumulator charging shall consist of "an apron made of material impervious to water, &c.," the Ray Manufacturing Co., Bristol, has placed on the market the "Raymac" acid-proof apron. This overall apron is claimed to be impervious to water and to be unaffected by sulphuric acid. It is made of a specially selected rubber composition, and is of three-ply construction to enable it to withstand hard wear. It forms a one-piece neatly fitting garment giving full flexibility to the body under working conditions; it is reversible, and made to fit any normal size. The buttons for the cross straps are of lead and no seams exist in the article, ensuring that no part is subject to acid attack.

Electric Sign Ban.—Flashing electric signs are not to be allowed in the city of Oxford under a town-planning scheme now under consideration, says the *Daily Mail*. It is felt that night signs having the appearance of intermittent illumination and roof signs are out of place in the University city, and it is proposed under the preliminary scheme to prohibit them.

New Power Development in Canada.—The purchase by the Kingdon Mining, Smelting, and Manufacturing Co. of power rights and property in the vicinity of Chats Falls, on the Ottawa River, is announced. The James Robertson Co., of Montreal, controlling the Kingdon Co., intends to start work shortly on a lead and zinc manufacturing plant which will cost in the neighbourhood of $2,000,000, as well as a large water project. The power development will probably be a joint enterprise between the company and the Ontario Hydro-Electric Power Commission, which expects to erect a power plant on the Ontario side of the river.

Accident. — Walter Hazelhurst (29), electrician, of Firwood, was admitted to Bolton Infirmary on August 20th suffering from burns to the hands received while cutting a cable.

The Institution of Electrical Engineers.—At the invitation of the Salford Corporation Electricity Committee, an afternoon inspection of the new Agecroft power station will be made by the members of the North-Western Centre on Thursday, September 24th. Arrangements have been made for lunch at the Engineers' Club, and transport in covered motor coaches will be provided.

Appointments Vacant.—Plumber-jointer for the Peterborough Corporation electricity department. Combustion engineer for the North Metropolitan Electric Power Supply Co. Electrical engineer for the Mains Department of the Calcutta Electricity Supply Corporation. (See our advertisement pages to-day.)

The Natal Railway Electrification.—A Durban correspondent of *The Times Trade and Engineering Supplement* states that in a number of instances the actual cost of equipment in connection with the electrification of the Natal railways has been considerably in excess of the estimates. Referring to the actual working, he says that very little trouble has been experienced, and it is considered that when further experience has been gained in the operation of the system and initial difficulties have been overcome, the advantages of the scheme as a means of improving and cheapening the working of traffic will be apparent, and also that in due course the anticipated benefit to the community from the provision and distribution of electric power at low rates will be fully realised.

Electricity in Mining.—The extent to which the use of electricity has developed in the South Wales mines is indicated by a recent statement by Mr. Theodore Stretton, president of the Association of Mining Electrical Engineers, that in that area the Powell Duffryn Co. alone uses about 160 million kWh per annum.

Electrolytic Method of Accelerating Corrosion.—In a paper by Messrs. Robert J. Anderson and Samuel H. Brooks, reprinted from *Mechanical Engineering*, dealing with a series of tests made on the accelerated electrolytic corrosion of brass, it is interesting to note the method of acceleration employed. The material to be tested is made the anode in the corroding medium (an electrolyte), and platinum wire is used as the cathode. A small current density is imposed through suitable connections, properly regulated, and the anode is rotated in the electrolyte. After a suitable time the sample is removed, washed, dried and weighed, and the actual loss in weight determined. In the particular tests referred to in the paper the brass employed was in the form of condenser tubing, ¾ in. outside diameter and .005 wall thickness. The test pieces were rotated at 140 r.p.m. by a constant-speed motor.

United States Electrical Statistics.—Reports submitted to the *Electrical World* by 77 per cent. of the generator rating of the electricity supply industry indicate the gross revenue from the sale of energy during May was $110,900,000, an increase of 9 per cent. over May, 1924. During the month the gross revenue was 5.3 per cent. below the estimated normal for that month, this normal being based on the operations for the past five years. The operating expenses during May totalled $51,250,000, a gain of 7.3 per cent. over the corresponding month of last year.

A Lightning Discharge.—During a thunderstorm on Sunday (23rd inst.) a block of two Council houses in Dene Avenue, Lemington-on-Tyne, was struck by lightning with rather interesting results. A correspondent (W. E. P.) informs us that the house was the lowest in the immediate vicinity; it had no wireless aerial, but neighbouring houses had.

The lightning struck the middle chimney stack, dislodging the three top courses of bricks and several tiles. It then spread throughout the fabric of the house by means of the gas pipes embedded in the walls, bursting off patches of cement plaster and burning the pipes at damp spots and at sharp bends, and blowing out staples where these were used to secure the pipes. It finally earthed through the water pipes, dislodging a bracket holding a cistern in the bathroom.

It is interesting to note that the damage occurred where contact resistance between fabric and metal was lowest, at points of high inductance (bends in pipes), and at points of high discharge density (staples).

Charges for Electricity Supply.—The following letter arrived too late for inclusion in our "Correspondence" columns:—

I note the remarks of your correspondent "Stung," and beg to explain a few of his statements which are inclined to be misleading.

With regard to the statement that the Manchester Electricity Department installs cookers at 7s. 6d. per quarter, the impression is given that this is the only price, which is not so, as cookers are hired in three sizes at quarterly rentals of 5s., 7s. 6d., and 12s. 6d., the 5s. cooker being of ample size for the requirements of a household up to four persons. While admitting that the Gas Department will install a certain type of gas cooker free, a decent type with an enamel finish is, I believe, 5s. per quarter.

"Stung" is correct in his assumption that he has to pay 10s. per quarter "minimum charge," or £2 per annum, but should his consumption exceed this amount the following quarter, he would receive a rebate. Does a consumer expect the Manchester Corporation to fix meters, cut-outs, and service (6 yards) free without any guarantee for the expenditure involved? It must be remembered that the Manchester consumer is not burdened with meter rents as a large proportion of other consumers are, and with regard to the £1 deposit, this is in the nature of a guarantee, and as long as this sum is in the keeping of the Corporation, interest is paid on it.

Lastly, I should be interested to hear of the towns in the neighbourhood of Manchester which, to use the words of "Stung," "make lower charges." I am under the impression that Manchester supplies the cheapest electricity for domestic use in South Lancashire, while the undertakings bordering the city—Salford, Eccles, Stretford, Sale, Cheadle, Stockport, Altrincham, &c.—do not hire-out electric cookers at all, and their rates of charge are certainly not under those of Manchester.

In view of the fact that the number of cookers ordered from the Manchester Corporation runs into four figures, and that they are installed in municipal houses, at the back of shops in small streets, &c., one can hardly call them luxuries, and is tempted to say, not: "Save me from my friends," but "What a friend we have in the Corporation."—F. C. Dain, Stretford, Manchester, August 24th, 1925.

Completion of Canadian Electrification Project.—The electrification of the main line of the Canadian National Railways between Lazard and St. Eustache was, says the *Electric Railway Journal*, completed on June 29th, giving the company a direct electric line from the Tunnel Terminal to St. Eustache, and permitting the removal from service of the storage-battery car which has been operating between Montreal and St. Eustache. The concern will put two new multiple-unit electric cars on this line in place of the storage battery line. The new cars were constructed in the Point St. Charles shops; they have an overall length of 80 ft., and accommodate 88 passengers, 72 of whom can be seated in the main body of the car.

Anthracite Coal in Devon.—According to the *Colliery Guardian*, operations carried out in the Bideford district since October, 1924, under the direction of Mr. Thomas Thornton, mining prospector, have resulted in the discovery, within a mile and a half of Bideford, of anthracite coal in large quantities. There are three proved seams running parallel at a distance of about 500 ft., and extending a mile and a half on the "strike," which runs 12 miles from the shores of Bideford Bay to Chapelton, in the valley of the River Taw.

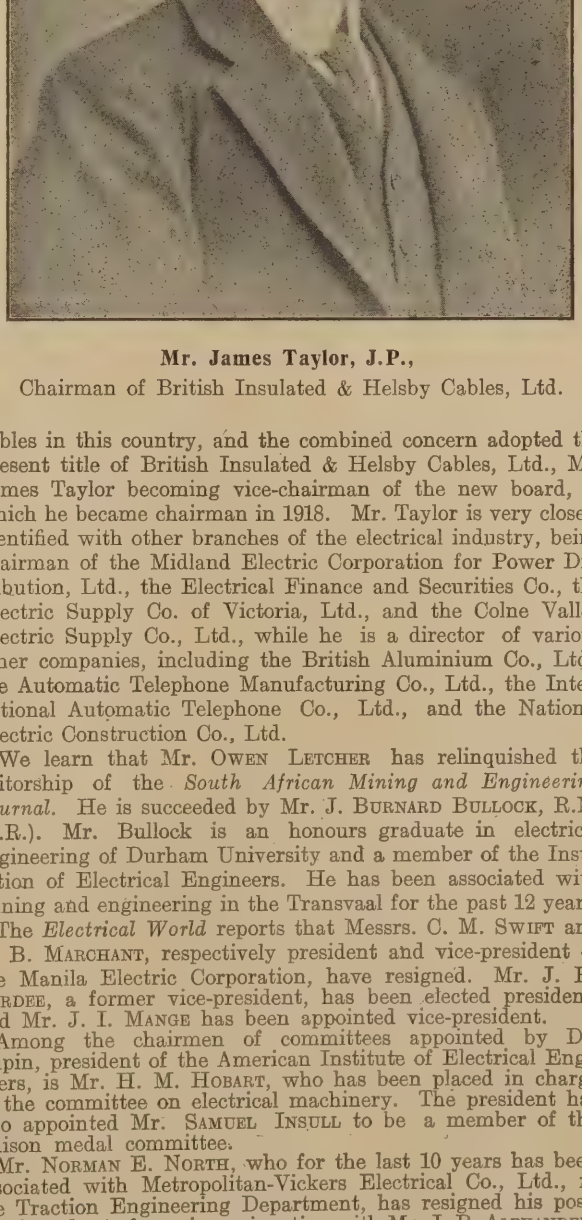
Encouraging the Use of Electric Vehicles.—We learn that he New York Edison Co. has recently taken a step which hould further encourage the use of electric motor trucks and ans in the United States. It has arranged to supply charging oards and other battery-charging requisites on the deferred ayment plan, that is, by a first deposit followed by monthly ayments spread over twelve months.

"Non-Sulphatable" Lead Accumulators. — At a recent neeting of the Académie des Sciences in Paris, M. Ch. Féry ontributed a note on accumulators, in which he stated that the ulphation of lead batteries could be prevented by protecting he negative electrodes from the action of the oxygen in the ir and from the positive plates. By applying to an accumula- or the same arrangement as adopted in his air depolarisation attery, M. Féry stated that he had been able to produce a econdary battery which, after four months, retained 83 per ent. of its charge capacity, and that after being discharged nd put aside for two years it was recharged under normal onditions. The author considered that the new accumulator ossessed all the advantages of a dry battery and was destined o have many important uses in telegraph and industrial work.

Educational.—The new session for courses in electrical ngineering at the Polytechnic, 307-311, Regent Street, ommences on September 28th, the dates for enrolment being eptember 16th to 25th (19th excepted). The prospectus pro- ides for the first to sixth years' National Certificate and alter- ative courses.

Tramway Accidents.—In a recent issue of *Verkehrstechnik*, Herr A. Wolf deals at some length with the subject of acci- ents in tramway operation and the means of securing their eduction. The author considers that there is a "co-efficient f rolling-stock utilisation" above which the risk of accident o passengers increases rapidly. Taking as a basis the latest fficial figures available of the traffic accidents in Germany be- ween 1899 and 1919, those relating to tramways show that 3.77 per cent. of the accidents affected passengers and 56.23 er cent. pedestrians; of the total only 8.38 per cent. was due o tramway operation, a figure which, in Herr Wolf's opinion, ndicates that tramcars are not in themselves particularly angerous vehicles. The majority of passenger accidents were aused by attempts to board and alight while the cars were unning, too sudden application of the brakes, and collisions. he author considers that the number of accidents in the first lass can be reduced by the use of folding steps and gates on he rear platform; as regards pedestrian accidents, 34 per cent. re sustained by children, and it is suggested that urban uthorities should provide more playing grounds so that chil- ren should not have to play in the streets. Although less than 0 per cent. of accidents are due to the rolling stock and the perating staff, Herr Wolf considers that steps should be taken o secure a reduction. He is sceptical as to the value of life rotectors or guards, the bulk of them in use in Germany eing, in his opinion, too high from the ground, so that while hey may prevent a victim from being run over, they are bound o cause him serious injury. He considers it preferable that ore attention should be paid to the improvement of brakes, hat stopping places should be selected with greater care, and hat when they are located in the middle of the road, refuges hould be provided. The best solution is to run the tramcars long their own track separated from the public highway, lthough this can only be done in the case of new roadways of fficient width. Herr Wolf concludes by recommending that reater attention be paid to overhead conductors and to more areful selection and training of the tramway staff. Experi- nce has shown, he considers, that while it is wise to educate hildren to traffic dangers, rules and regulations for the public's enefit are of little avail, and that consequently it is the ehicles themselves that must be arranged, equipped, and con- olled so as to reduce the number of accidents to the minimum.

Inquest.—Mr. S. Brighouse, coroner, recently held an nquest on the body of Wm. Matthew Hendry (7), who was illed by a "live" wire on the railway at Bootle. The oroner found that Hendry was killed accidentally and ex- ressed the opinion that extra safeguards, such as barbed wire, ould be placed on fences as a deterrent.



French Electrical Industries.—Some interesting statistics oncerning the electrical industries of France are given in the *lectrical World*. The capital invested in these industries in 924 exceeded 1,000 million francs, including new enterprises nd new capital for existing ones. The total capital now em- loyed in the production and distribution of electrical energy over 4,500 million francs. The number of employés ex- eeds 25,000. A recent census of the resources lists 109 central tations of capacities of 10,000 kW and over, the total reaching ,000,000 kW. The smaller stations are rated at 500,000 kW n all. The consumption per head of the population increased y 20 per cent. during the year and is now double that of five ears ago. The electrical manufacturing industry has an in- ested capital of 2,000 million francs against 300 million francs n 1913. Before the war the industry employed 25,000 hands; o-day the figure has increased to 70,000.

N.A.S.E. Scholarships. — The third annual award of cholarships under the auspices of the National Associa- on of Supervising Electricians has just been made. The xamining Board, composed of Messrs. F. Gill, A. Kirk, and V. J. Revell, reports a large increase of entrants and the nswers to questions as being very good. The winners of the cholarships are: Supervisors, Mr. E. North (London); Fore- en and Associates, Mr. G. Kirk (London), and Mr. A. Olding London).

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. James Taylor, J.P., chairman of British Insulated and Helsby Cables, Ltd. (whose portrait appears herewith), has been intimately concerned with the cable-making industry since 1884, when he joined his brother, the late G. Crosland Taylor, who in the previous year had commenced the manufacture of cables at the Deeside Electric Works, Neston. About the beginning of 1886 the business was converted into a limited company, and the well-known Telegraph Manufacturing Co., Ltd., came into existence. This company played an important part in the manufacture of v.i.r. cables under that style until 1902, when, in order to increase the scope of the business, an amalgamation was effected with the British Insulated Wire Co., Prescot, the original manufacturers of paper-insulated

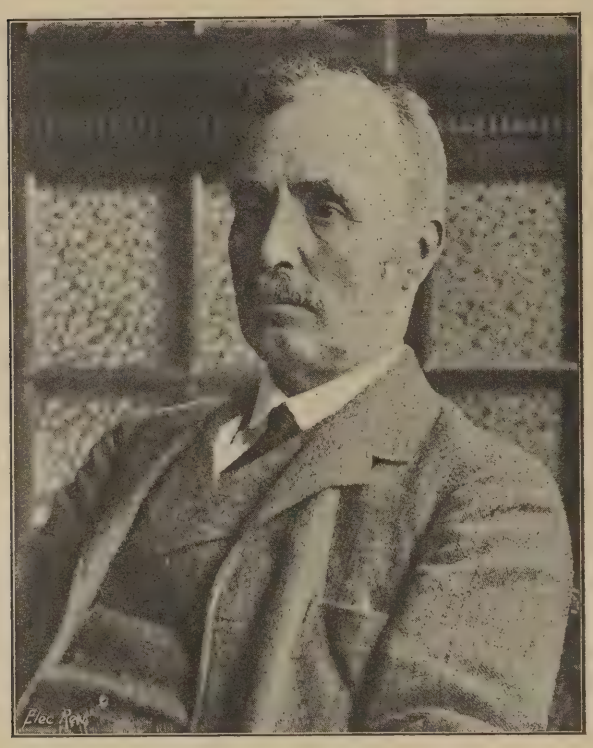
Mr. James Taylor, J.P.,
Chairman of British Insulated & Helsby Cables, Ltd.

cables in this country, and the combined concern adopted the present title of British Insulated & Helsby Cables, Ltd., Mr. James Taylor becoming vice-chairman of the new board, of which he became chairman in 1918. Mr. Taylor is very closely identified with other branches of the electrical industry, being chairman of the Midland Electric Corporation for Power Distribution, Ltd., the Electrical Finance and Securities Co., the Electric Supply Co. of Victoria, Ltd., and the Colne Valley Electric Supply Co., Ltd., while he is a director of various other companies, including the British Aluminium Co., Ltd., the Automatic Telephone Manufacturing Co., Ltd., the International Automatic Telephone Co., Ltd., and the National Electric Construction Co., Ltd.

We learn that Mr. Owen Letcher has relinquished the editorship of the *South African Mining and Engineering Journal*. He is succeeded by Mr. J. Burnard Bullock, R.N. (S.R.). Mr. Bullock is an honours graduate in electrical engineering of Durham University and a member of the Institution of Electrical Engineers. He has been associated with mining and engineering in the Transvaal for the past 12 years.

The *Electrical World* reports that Messrs. C. M. Swift and R. B. Marchant, respectively president and vice-president of the Manila Electric Corporation, have resigned. Mr. J. H. Pardee, a former vice-president, has been elected president, and Mr. J. I. Mange has been appointed vice-president.

Among the chairmen of committees appointed by Dr. Pupin, president of the American Institute of Electrical Engineers, is Mr. H. M. Hobart, who has been placed in charge of the committee on electrical machinery. The president has also appointed Mr. Samuel Insull to be a member of the Edison medal committee.



Mr. Norman E. North, who for the last 10 years has been associated with Metropolitan-Vickers Electrical Co., Ltd., in the Traction Engineering Department, has resigned his position in order to form, in conjunction with Mr. J. B. Alexander, late director of Ebonestos Insulators, Ltd., the Traction Equipment Co., Ltd., with offices at 36, King Street, Manchester,

and Windsor House, Victoria Street, S.W.1, to handle all forms of electrical apparatus for rolling stock, permanent way, and overhead equipment.

Mr. R. B. Hungerford, managing director of the Western Electric Co. (Australia), Ltd., is at present on a visit to this country. Later he is proceeding to the United States.

Mr. J. A. Partridge, a pioneer of short-wave radio transmission and one of the first to communicate by this means with the United States, has been appointed chief resident engineer at the B.B.C.'s new "picking-up" station at Hayes.

Mr. Dane Sinclair, director and general manager of British Insulated & Helsby Cables, Ltd., whose Prescot works are described elsewhere in this issue, started his electrical career in 1872, when he joined the Telegraph Department of the North British Railway. In 1875 he was one of those selected to go to Japan in connection with the erection of telegraph lines by the Japanese Government, and he remained as inspector for five years. For his services there he was subsequently awarded the Order of the Rising Sun of the Third Class, which at the time was the highest honour that the Japanese Government could confer on a foreigner. Shortly after his return,

Mr. Dane Sinclair,

General Manager of British Insulated & Helsby Cables, Ltd.

Mr. Sinclair was appointed engineer to the National Telephone Co. for the Glasgow district, and subsequently, after the amalgamation of the three principal telephone companies, he became London manager of the new National Telephone Co., and in 1892 he was appointed to the position of engineer-in-chief. He held this position until 1902, when he accepted the invitation of the directors of British Insulated & Helsby Cables, Ltd., to take the position of general manager of that company—an appointment which he still holds—and in 1923 he accepted a seat on the board of directors. During his service with the National Telephone Co. Mr. Sinclair was responsible for many inventions, some of which are in general use to-day. Mr. Sinclair is also a director of the Automatic Telephone Manufacturing Co., Ltd., the International Automatic Telephone Co., Ltd., the Constantinople Telephone Co., the Midland Electric Corporation for Power Distribution, Ltd., the St. Helens Cable & Rubber Co., Ltd., and the Enfield Cable Works, Ltd.

Obituary.—Senor Zuluetia.—The death recently occurred at Neguiri, Bilbao, Spain, of Don Juan Urrutia y Zuluetia, the president of the Spanish Associacion de Productores y Distribuidores de Electricidad. The deceased had played an important part in hydro-electric development work in Spain, and was a director of both the Sociedad Hidro-Electrica Española and the Sociedad Hidro-Electrica Iberica.

Mr. A. T. Hobbs.—The death occurred suddenly on August 17th of Mr. Alfred Thomas Hobbs. Mr. Hobbs had been engaged in home and foreign cable contracts for a number of the large cable companies. During the last three years he was mains engineer with the Northwood Electric Light & Power Co., Ltd.

Wills.—Mr. Hugh L. Williams, electrical engineer, of Worcester Park, Surrey, left £59,383 gross and £49,012 net personalty.

Mr. Joseph Furze, Tavistock, who was superintendent of the Commercial Cable Co., Liverpool, for 40 years, left £17,260 gross and £15,649 net.

The late Mr. Donald Barns Morison, J.P., who was chairman and managing director of Richardsons, Westgarth & Co., Ltd., left £81,735 gross (net personalty £76,014).

New Companies Registered.

Lee De Forest, Ltd. (207,976).—Private company. Registered August 20th. Capital, £500 in 1s. shares. Objects:—To acquire the benefit of inventions connected with radio-telephony and telegraphy and other methods of intercommunication, and apparatus, instruments, and appliances connected therewith, and to develop and work these, &c. The directors are:—Dr. Lee de Forest, Spayten, Dayvil, New York City, U.S.A.; C. F. Elwell, 60, Great Russell Street, W.C.1; H. G. Couchman, 91, St. Julians Farm Road, West Norwood, S.E.27; and Grace Gwyther, 46, Cavendish Avenue, Church End, Finchley, N.W.12. Qualification, 1 share. Remuneration as fixed by the company. Solicitors: Bartlett & Gluckstein, 199, Piccadilly, W. Registered office: 12, Craven House, Kingsway, W.C.2.

Radiophones (1925), Ltd. (207,881).—Private company. Registered August 14th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of manufacturers, merchants, commission agents, &c. The directors are:—N. Miller, 278, Kingsland Road, E.8, stock-keeper; and F. Padgham, 581, Barking Road, Plaistow, E., company secretary. Qualification (except original directors) as fixed by the board. Solicitors: C. Butcher and Simon Burns, 32, Gresham Street, E.C.2.

Anglo-Polish Chemical Syndicate, Ltd. (207,889).—Private company. Registered August 15th. Capital, £10,000 in £1 shares. Objects:—To manufacture in Poland and other countries synthetic ammonia, nitrogenous fertilisers and other chemical, agricultural, and industrial products, to acquire from the Polish and other Governments and public bodies and persons, concessions, licences, and rights for the construction and working of hydro-electric and other forms of power stations, &c. The subscribers (each with one share) are:—R. H. Palmer, Grove Hill House, Grove Park, S.E.5, clerk; L. E. Holt, 19, Addison Road, Walthamstow, E.17, clerk. The first directors are to be appointed by the subscribers. Qualification, 100 shares. Remuneration (except managing director), if any, £50 per annum, divided between them. Solicitors: Lewis & Yglesias, 6, Old Jewry, E.C.2.

Beardmore (Paisley), Ltd. (207,943).—Private company. Registered on August 17th with a nominal capital of £250,000 in £1 shares. Objects:—To adopt an agreement with Wm. Beardmore & Co., Ltd., and to carry on the business of manufacturers of, and dealers in motor-cars, vehicles and boats, aero engines, aeroplanes, motor launches and motor conveyances of every description, and parts, fittings, and accessories for the same; electricians, electrical and mechanical engineers, machinists, fitters, millwrights, founders, wire drawers, tube makers, saddlers, japanners, enamellers, electro-platers, &c. The subscribers (each with one share) are:—W. J. Newbert, 123, First Avenue, E.12, clerk; and W. C. Gibbs, 214, Victoria Road, Southend, clerk. The first directors (to number not fewer than three nor more than five) are:—Lord Invernairn of Strathnairn (chairman), V. Beardmore Stewart, and J. G. Girdwood. No share qualification required. Remuneration (except nominee of H.M. Treasury), £250 each per annum; of such nominee, such sum as may be approved by the Treasury. Solicitors: Nicholson, Graham & Jones, 19-21, Moorgate, E.C. Registered office: 36, Victoria Street, S.W.1.

Peerless Productions, Ltd. (207,879).—Private company. Registered August 14th. Capital, £500 in £1 shares. Objects:—To carry on the business of manufacturers of electrical and medical apparatus, specialities, &c. The directors are:—C. H. Rapinet, 148, Queen's Road, Bayswater, W.2, clerk; and R. J. Phillips, "San Marino," Upper Tooting Park, S.W.17. Remuneration, £225 each per annum (except managing director). Registered office: Peerless Works, Cowthorpe Road, Wandsworth Road, S.W.8.

Wenham Lighting Corporation, Ltd. (207,913).—Private company. Registered August 15th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of an electrical and gas engineer and factor hitherto carried on by W. R. Grigsby at 184, Gray's Inn Road, W.C.1. The directors are:—W. H. Lovatt, 21, Ironmonger Lane, E.C.2; and W. R. Grigsby, 1, Observatory Road, East Sheen, S.W.14. Qualification, 5 shares. Solicitors: Stone, Morris & Stone, 41, Moorgate, E.C.2. Registered office: 21, Ironmonger Lane, E.C.

Walbar Engineering Co., Ltd. (207,912).—Private company. Registered August 15th. Capital, £1,000 in £1 shares (250 preference and 750 ordinary). Objects:—To carry on the business of motor and electrical engineers, merchants and brokers, &c. The permanent directors are:—J. Gratrix, 93, Birch Road, Berry Brow, Huddersfield; W. A. Lord, 162, Woodside Road, Lockwood, Huddersfield; J. B. Littlewood, 1, Park Gate, Berry Brow, Huddersfield; and H. Langley, address not stated. Qualification, 50 shares.

Stuart Electrical Co., Ltd. (207,910).—Private company. Registered August 15th. Capital, £4,000 in £1 shares. Objects:—To carry on the business of electrical engineers and contractors, manufacturers of, and dealers in electrical, magnetic, galvanic, and other apparatus, mechanical engineers, &c. The subscribers (each with one share) are:—G. W. Wood, 45, Newman Road, Erdington, Birmingham, electrical contractor and engineer; Mrs. E. L. Wood, 45, Newman Road, Erdington, Birmingham. G. W. Wood shall be permanent governing director, so long as he holds 500 ordinary shares, at a salary of £300 per annum. Solicitors: C. F. Monk, 37, Waterloo Street, Birmingham. Registered office: Union Chambers, Temple Row, Birmingham.

Official Returns of Electrical Companies.

Madras Electric Tramways (1904), Ltd. (80,361).—Capital, £200,000 in £1 shares (125,000 preference and 75,000 ordinary). Return dated May 26th, 1925. 100,000 preference and 75,000 ordinary shares taken up. £85,240 paid on 67,500 preference and 17,740 ordinary shares. £89,760 considered as paid on 32,500 preference and 57,260 ordinary shares. Mortgages and charges, £130,000

Orford Electric Light and Power Co., Ltd.—Issue on July 20th, 1925, of £100 debentures, part of a series already registered.

W. H. A. Robertson & Co., Ltd. (95,906).—Return dated July 13th, 1925. Capital, £36,000 in 600 ordinary and 3,000 preference shares of £10 each. 600 ordinary and 2,180 preference shares taken up. £5 per share called up on 430 preference and £10 per share on 1,750 preference and 600 ordinary shares. £25,650 paid. Mortgages and charges, nil.

A. Hirst & Son, Ltd. (57,889).—Return dated May 28th, 1925. Capital, £20,000 in 100 preference and 1,900 ordinary shares of £10 each. 100 preference and 1,220 ordinary shares taken up. £2,200 paid on 100 preference and 120 ordinary shares. £11,000 considered as paid on the remainder. Mortgages and charges, nil.

British Electric Transformer Co., Ltd. (76,351).—Return dated April 21st, 1925. Capital, £1,000,000 in 300,000 preference and 700,000 ordinary shares of £1 each. 300,000 preference and 325,000 ordinary shares taken up. £539,821 paid on 290,776 preference and 249,045 ordinary shares. £85,179 considered as paid on the remainder. Mortgages and charges, £20,000.

United Electric Tramways of Montevideo, Ltd. (80,456).—Return dated July 2nd, 1925. Capital, £1,000,000 in 100,000 preference and 100,000 ordinary shares of £5 each. All shares taken up. £295,105 paid on 26,221 preference and 32,800 ordinary shares. £704,895 considered as paid on 73,779 preference and 67,200 ordinary shares. Mortgages and charges, £901,621.

Ever-Ready Co. (Great Britain), Ltd. (167,171).—pital, £500,000 in £1 shares (200,000 preference and 300,000 ordinary). nual return dated June 11th, 1925. 165,892 preference and 249,000 ordinary res taken up. £75,892 paid on 63,892 preference and 12,000 ordinary res. £339,000 considered as paid on the remainder. Mortgages and arges, nil. A further 34,108 preference shares were allotted, payable in sh and fully called up on June 16th, 1925.

Tingey Wireless, Ltd.—F. W. Lord, 37, Walbrook, E.C.4, sed to act as receiver or manager on April 21st, 1925. (Notice filed gust 15th, 1925.)

Allen West & Co., Ltd. (108,870).—Return dated March h, 1925. Capital, £150,000 in £1 shares. 141,724 shares taken up. 41,724 paid. Mortgages and charges, £60,000.

Cawnpore Electric Supply Corporation, Ltd. (84,233).—pital, £547,986 in £1 shares (160,000 preference and 387,986 ordinary). turn dated June 8th, 1925. 160,000 preference and 160,000 ordinary shares en up. £245,000 paid on 160,000 preference and 85,000 ordinary shares. ,000 considered as paid on 75,000 ordinary shares. Mortgages and charges, 0,580.

Llangollen and District Electric Light and Power Co., d. (75,384).—Capital, £6,000 in 3,500 ordinary and 2,500 ference shares of £1 each. Return dated July 16th, 1925. 1,754 ordinary 360 preference shares taken up. £2,110 15s. paid, leaving £3 5s. in ears. Mortgages and charges, £3,500.

Melton Mowbray Electric Light Co., Ltd. (53,018).—Re-n dated April 9th, 1925. Capital at date of return, £40,000 in £5 shares, issued and fully paid. Mortgages and charges, £19,100. (On April 30th, 5, the company increased its nominal capital to £60,000 in £1 shares.)

Indo-European Telegraph Co., Ltd. (3,953).—Capital, 0,000 in £25 shares. Return dated May 7th, 1925. 17,000 shares taken £425,000 paid. Mortgages and charges, nil.

Eastern Extension, Australasia and China Telegraph ., Ltd. (7,224).—Capital, £4,000,000 in £10 shares. Re-n dated June 25th, 1925. All shares taken up. £4,000,000 paid. Mort-ges and charges, £752,400.

Pritchett & Gold & E.P.S. Co., Ltd. (166,503).—Capital, 0,000 in £1 shares (100,000 preference and 100,000 ordinary). Return ed April 16th, 1925. 87,267 preference and 84,846 ordinary shares taken £2,507 paid on 2,500 preference and 7 ordinary shares. £169,606 con-red as paid on 84,767 preference and 84,839 ordinary shares. Mortgages l charges, nil.

Standard Electric Co., Ltd. (68,643).—Return dated June h, 1925. Capital, £10,000 in 5,000 preference and 5,000 ordinary shares £1 each. 3,077 preference and 5,000 ordinary shares taken up. £1 per re called up on 4,177 shares and 10s. per share on 400 shares. £3,700 sidered as paid, being £1 per share on 3,500 and 10s. per share on 400 res. Mortgages and charges, £300.

Hooper's Telegraph and India Rubber Works, Ltd. 947).—Return dated June 29th, 1925. Capital, £50,000 in 1,000 preference 4,000 ordinary shares of £10 each. All shares taken up. £40,000 paid the ordinary; £10,000 considered as paid on the preference shares. rtgages and charges, nil.

Dynamic Electrical Co., Ltd. (104,436).—Capital, £10,000 £1 shares. Return dated December 31st, 1924 (filed March 17th, 1925). hares taken up. £7 paid. Mortgages and charges, nil.

Jacqueline, Ltd.—Particulars filed of £2,000 debentures norised July 20th, 1925, charged on the company's undertaking and pro-y, present and future, including uncalled capital, the amount of the ent issue being £1,200.

W. A. Saxby & Co., Ltd.—W. A. Saxby, The Greenway, itton Road, Hounslow, was appointed receiver and manager on August , 1925, under powers contained in debentures dated April 17th, 1925.

Edward Deane & Beal, Ltd. (92,885).—Capital, £60,000 £1 shares (20,000 preference and 40,000 ordinary). Return dated December , 1924 (filed June 11th, 1925). 20,000 preference and 20,009 ordinary es taken up. £9 paid. £40,000 considered as paid. Mortgages and ges, £7,500.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Scarborough Electric Supply Co., Ltd.

The report for 1924, which is to be presented at next Monday's meeting, says that the directors have been in negotiation with the Scarborough Corporation for the purchase by the latter of the whole of the undertaking, which purchase, in any case, the Corporation has power to effect compulsorily in February next year. The directors have, subject to the shareholders' approval, entered into an agreement for the sale of the undertaking to the Corporation at a price to be fixed by arbitration. The shareholders are to be asked to confirm this agreement. The total profit for the past year was £22,878, and to this are added £240 brought forward, and £50 bank interest, making a total of £31,169. Out of this sum the directors have written off £3,619, the balance of the expenses of the debenture issue, and £190 from the apparatus on hire account; debenture interest absorbs £3,600; and £3,000 is placed to reserve, leaving £20,760. A dividend of 6 per cent., free of tax, was paid during the year; it is not proposed to pay a final dividend but to carry forward a balance of £13,018.

Mexico Tramways Co.—The gross earnings for 1924 amounted to $11,692,370 (Mex.), as compared with $1,226,830 in 1923, and the net earnings fell by $991,469 to $154,580. The continued decline in the earnings is attributed to the growing competition of omnibuses and other forms of transport. After meeting general expenses, bond interest and sinking fund allocations, there was a deficit of $543,368, as against $2,950 in 1923, and the 6 per cent. mortgage bonds again receive no interest.

Adelaide Electric Supply Co., Ltd.—The dividend for the half-year ending August 31st has been declared on the 6 per cent. cumulative preference shares.

Mexican Light & Power Co.—The report for 1924 records gross earnings of $15,864,260 (Mex.), as against $14,827,943 in the preceding year. The net earnings fell from $8,309,162 to $7,941,787, due to the larger provision for depreciation. After providing for general expenses and bond interest there is a balance of $2,593,070, which has been contributed to capital expenditure. There is thus again no surplus for the payment of interest on the 6 per cent. income bonds.

Sevenoaks and District Electricity Co., Ltd.—Last week the company published particulars, for public information only, of its capital and undertaking. The authorised capital is £54,948, divided into 89,792 8 per cent. cumulative preference shares and 20,104 ordinary shares of 10s. each, and there are debentures amounting to £49,850, which are convertible at par into preference or ordinary shares. It is proposed to recommend that the shares be converted into £1 shares, the holders receiving one new share for each two old shares.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Sevenoaks and District Electricity Co.—20,104 ordinary shares of 10s. each, fully paid, Nos. 1 to 20,104; 38,200 8 per cent. cumulative preference shares of 10s. each, fully paid, Nos. 1,593 to 39,792; 1,592 new 8 per cent. cumulative preference shares of 10s. each, fully paid, Nos. 1 to 1,592; 29,000 new 8 per cent. cumulative preference shares of 10s. each, 2s. 6d. paid, Nos. 39,793 to 68,792.

Aberdeen Suburban Tramways Co.—There was a profit of £1,937 on working during the six months ended July 31st, and the balance at credit of the profit and loss account is £6,917. It is proposed to transfer £1,500 to the renewal and depreciation account, to pay a dividend at the rate of 7 per cent. for the past year, and, after paying directors' fees, to carry forward a balance of £3,130.

International Telephone & Telegraph Co., Ltd.—It was announced in our last issue that this company had acquired the foreign subsidiary of the Western Electric Co. (U.S.A.). To enable this to be carried out the company is issuing 5½ per cent. convertible debentures, maturing in 1945, at 99 per cent., to the extent of $25 million.

Calgary Power Co.—The accounts for the last financial year show a net profit of $158,342, an increase of $38,632 as compared with the previous year's profit. The increase is attributed to the operation of the new contract with the City of Calgary.

Pinchin, Johnson & Co., Ltd.—The directors report that the results of the past half-year (to June 30th) were so satisfactory that they are able to pay a dividend of 10 per cent. (actual) on the ordinary shares as compared with 8 per cent. for the first half of 1924.

General Electric Co. (U.S.A.).—It is announced that the whole of the issue of 5 per cent. gold debentures maturing normally in September, 1952, are to be redeemed on September 1st, at 107½ per cent., together with accrued interest.

Tilling-Stevens Motors, Ltd.—The directors have given notice that all outstanding 5 per cent. 5-year notes are to be redeemed on August 31st in accordance with the terms of issue.

German Company.—The *Continental Company for Electrical Undertakings*, Nuremberg, reports a net profit of 319,573 marks for the year 1924-25, but no ordinary dividend is to be paid.

Southern Brazil Electric Co., Ltd.—The interest coupon due on January 1st, 1925, of the 6 per cent. mortgage debentures is being paid.

Canadian General Electric Co.—A dividend at the rate of 7 per cent. per annum has been declared on the preference stock for the quarter ending September 30th.

Victoria Falls & Transvaal Power Co., Ltd.—The company reports that the net earnings for the second quarter of the year amounted to £242,785 before providing for taxation.

Melbourne Electric Supply Co., Ltd.—The dividend for the six months ending August 31st has been declared on the 8 per cent. first cumulative preference shares.

Crossley Bros., Ltd.—An interim dividend of 3½ per cent. has been declared on the preference shares.

Stocks and Shares.

Monday Evening.

Until the Bank rate comes down—as it may do on the Thursday in this week—to 4 per cent., the Stock Exchange markets will keep in mind the probable reduction as a bull point for all the investment markets. Prices of sound securities are firm, and the tendency is for values to advance. In such ordinary shares as those, for example, of the cable equipment group, prices continue to make headway. Amongst electricity supply shares, a sudden spurt in County of London ordinary served to enliven the list. In foreign issues, Anglo-Argentine Tramways and Brazilian Tractions stand out with noticeable improvement.

The rise in County of London shares carried the price to 61s. before a setback occurred to 58s. 9d., the latter being

6s. 6d. higher on the week. Rumours of a possible bonus distribution of shares led to the jump in the price. Readers of this column have understood for some time past that the London undertakings are likely to capitalise their reserves and to pay these over to their proprietors, in the shape of shares. Study of the companies' balance-sheets will demonstrate the probability of such a distribution being made, but any conclusions drawn from such examination need to be salted with caution. They may easily prove misleading if handled with too airy optimism. County new preference are 1s. 7½d. premium.

Charing Cross ordinary are 1/16th higher at 48s. 9d. There is an impression that the "City" portion of the Charing Cross Company may be treated a little differently, for the time being, from other members of the London group in the matter of its capital reorganisation. City of London shares at 47s. are also 1/16th up. Newcastle-on-Tyne ordinary and first preference gained sixpence apiece. Bournemouth and Poole, at 3, have put on half-a-crown. Electric Supply Corporation went back to 31s. 3d.; London Electrics are 1s. higher at 34s. 6d.

Shares in the provincial power companies are being watched by people who think that industrial prospects point to early extensions of power developments, and that, in any new issues of capital made to cope with these, the existing shareholders will be given the opportunity for subscribing to shares at bonus prices; that is, at prices lower than those which rule in the market for the present shares. This is the reason why the latter stand at figures which seem hardly justified by the dividends now being paid.

Looking well ahead, some people anticipate the time when there will be a broad and an active market in the shares of the two big concerns that may spring from the amalgamation of to-day's electricity supply concerns into two comprehensive and important undertakings that will control the supply of current and power to London and the Home Counties. Dealings, it may be re-affirmed, have recently started in the new 7 per cent. preference shares of the Shropshire, Worcestershire, and Staffordshire Electricity Co., these shares being obtainable at 21s. 4½d., free of stamp and fee. A full dividend is due next month, and the yield on the money comes to £5 12s. 6d. per cent. On the basis of last year's profits, the dividend is covered 5½ times over.

The investor may be interested to know that a modest amount is available of the Yorkshire (West Riding) Electric Tramways 4½ per cent. first debenture stock at 78¾, January and July interest. The return is £5 14s. 6d. per cent. at this price. Redemption may be effected any time at the company's option at 105, and the interest-service is well covered.

Anglo-Argentine Tramways preference are both higher at the common price of 3¼. The 5 per cent. debenture gained 2, at 73½. If the Municipality of Buenos Aires accepts its own Committee's recommendation to adopt the Anglo-Argentine Tramways scheme for subway construction, in preference to that submitted by an American firm, this would put an end to the friction which has existed so long between the company and the Buenos Aires Council. Hopes of this materialising are responsible for the better prices now established in the company's issues. Brazilian Tractions at 66 are 2½ up since a week ago, and stand a little higher than the price of the shares on the eve of the war. Expectation looks, here, for a rise to 5 per cent. in the dividend, as already indicated.

The annual reports of the Mexico Tramways and the Mexican Light and Power Companies have now come from Toronto. From these it is evident that settlement in Mexico is still to seek. Both companies are making moderate progress in the face of considerable difficulty. Reluctance to meet their obligations on the part of municipal debtors is still manifest. Labour claims constitute a handicap upon profitable working. Nevertheless, the companies "keep on keepin' on" with a courage and determination that can hardly fail of reward in the future. The only alteration in the prices is a loss of ½, to 62, in Mexico Tramways 5 per cent. bonds. Para Electric Railway first debenture stock has risen to 44½ in sympathy with the rise in Brazilian Tractions, whose preferred shares are also higher at 68.

Home Railway stocks show little change. Metropolitans rose a point to 68½. Underground £10 shares eased off to 2⅜. British Electric Traction ordinary and preference are better at 113 and 105, respectively.

Indo-Europeans at 42½ have gained 20s., and Great Northerns at 31½ are a fraction up. The Eastern Division has not moved. Wireless shares are equally tranquil. Construction and manufacturing shares are again stronger. The feature is a 3s. rise in India Rubber shares to 22s. 6d., upon prophecies of a 7½ per cent. dividend. The company is at present paying 5 per cent. General Electrics gained a florin at 26s. Siemens are better at 30s., so are British Aluminiums at 3⅓. Callenders, Henleys, and British Insulated maintain their previously advanced prices, and the market, throughout, is a good one. Iron, steel, and engineering shares are dull; Babcocks eased off to 2 9/16ths. For this, the labour situation at home affords the explanation. People are growing weary of their shares; they are selling them to put the money into more popular areas, such, for example, as the rubber market, where prices are better upon the persistent buying of the good-class shares. Automatic Telephones keep steady at 2 1/16th. International Telephones put on several dollars upon the acquisition from the Western Electric Co. of its subsidiary, the International Western Electric Co.

Electrical Accidents in Mines.

The Report of H.M. Electrical Inspector of Mines for the Year 1924.

As was the case for the year 1923, the report of H.M. Electrical Inspector of Mines for 1924* has been issued as a separate publication. An abstract of its contents is given below.

During the year the British Engineering Standards Association was requested by the Mining Association to undertake the preparation of specifications for such colliery requisites as were amenable to standardisation. A representative Sectional Committee was set up accordingly to organise and direct the work, and Regional Committees were formed with a common and definite programme for consideration. This preliminary investigation did not embrace electrical equipment, but one of the Regional Committees has already detailed a sub-committee to consider and report what components of the electrical installation may be standardised with advantage. Further progress in this direction may be expected during 1925.

During the past year the use of electrical energy increased by 117,758 h.p., making a total of 1,481,932 h.p. It is regrettable that there were again no fewer than 14 fatal accidents due directly or indirectly to the use of electricity. In 12 instances one life was lost in each case; there was one double fatality from electric shock, and in one of the two instances where gas was ignited four lives were lost, making in all a total of 18 deaths. With one exception all these accidents occurred below ground. Thirteen lives were lost by electric shock and five deaths were due to ignitions of gas. All occurred at coal mines.

Summarised Account of Electrical Accidents Resulting in Loss of Life during 1924.

1. *New London Colliery, Notts.* January 24th.—Deceased, a coal-cutter machine man, received a fatal shock from the plug of the trailing cable. It was found that the earthing conductor in the cable had been pulled out of its terminal, while one of the live conductors was also detached from its terminal and was touching the metal plug case so that this was "alive." The system was 3-phase at 500 volts, and the neutral point was earthed.

2. *Bowhill Colliery, No. 1 Pit, Fife.* April 17th.—Deceased, a miner, received an electric shock during an attempt to free an electric coal-cutting machine which had become wedged between roof and floor at the face where a 19-in. seam was being worked. Subsequent examination of the machine failed to disclose a point at which the insulation had broken down, but discovered that it was not possible to screw the "earthing pin" up properly so as to make a reliable electrical connection for the earthing circuit. The plug box on the machine had been repaired at some time, and a home-made "earthing pin" had been fashioned in such wise that the shoulder of his pin would not pass through the hole in the cover plate of the plug box, with the result that it was not possible to screw this pin sufficiently far in to apply pressure to the face of the plug casing, in accordance with the original purpose of the device. The system was 3-phase, 500 V, with free neutral.

3. *Cowdenbeath Colliery, No. 7 Pit.* April 17th.—Deceased was in charge of a coal-cutting machine and received a shock during an attempt against orders to repair a trailing cable and plug. His death was due to his ignorance, and followed an attempt to remove a similar plug without turning off the machine switch with which it was mechanically interlocked. The system was 3-phase at 500 V, with free neutral.

4. *Newton Cap Colliery, Durham.* May 13th.—Deceased was working a coal-cutting machine as chargeman when he received an electric shock from the machine. It was found that the earthing conductor in the trailing cable had been pulled out of its terminal, and that there was another defect, with regard to one of the live conductors, so that the machine frame ceased to be earthed and became charged electrically. The system was 650 V, 3-phase, with free neutral.

5. *Bridgewater No. 3 Pit, Lancashire.* May 30th.—Deceased was employed as a haulage attendant and was found unconscious near an open-type liquid controller. He had failed to turn off the main switch in the stator circuit when shutting down the motor, so that, although the motor was not running, the rotor circuit was energised inductively. A test with a voltmeter showed that the open-circuit rotor pressure was 400 volts. One slip ring was connected to the frame of the liquid controller and the other two slip rings to two insulated contact plates mounted on the two sides of the controller drum.

6. *Hartley Bank Colliery, Yorks.* May 23rd.—Six men working with, or in the vicinity of, an electrical coal-cutting machine, suffered serious burns, to which four of them succumbed, as a result of the ignition of firedamp attributable to open sparking at the reversing switch of the machine. It was found that one set screw was missing out of four intended for securing the base of the plug box to the side of the reversing switch box, so that a circular opening about 7/16 in. in diameter was left in the switch box permitting the entry of gas and the emission of flame.

*Stationery Office. Price 6d.

7. *Newbiggin Colliery, Northumberland.* July 23rd.—Deceased, employed as a pony driver, while waiting at the bottom of a dilly, raised his arms and took hold with both hands of a steel roof girder which was "alive" at the moment, owing to a defect of insulation in an electric light fitting. Investigation showed that joints had been made in the wiring of the lamp fitting and had been insulated with black tape, and that there had been a leakage of current between one of the conductors and the metal frame of the lamp fitting, which had burned a hole through the tape.

8. *Penrhiwceiber Navigation Colliery, No. 1 Pit, Glamorgan.* August 2nd.—Deceased, employed as an electrician, had been engaged during the preceding day in making a joint in a 3-core wire-armoured high-pressure cable. The following morning deceased, with three other electrical workmen, returned to the place to complete his work, and while they were otherwise engaged in the vicinity he opened the box and began to remove the temporary insulating tape without first seeing that the pressure had been cut off from the cable, with the result that he received a shock which proved fatal immediately. The system was 3-phase at 2,200 volts, with free neutral.

9. *Gwaunclawdd Colliery, Brecon.* August 18th.—Two men, a fireman and a haulier, were burned as the result of an ignition of methane attributable to open sparking at the commutator of a direct-current motor used for driving a pump, and the haulier died. Another fireman, who entered the district to investigate after the occurrence, was overcome by afterdamp, but was rescued and revived. The motor was of the totally-enclosed type, *i.e.*, the enclosure was intended to be such as to prevent free circulation of air between the inside and outside of the case, but not such as to be termed airtight.

10. *Lady Helen Colliery, Fife.* October 2nd.—Two coal-cutting machine men were killed by electric shock in a place which was 2 ft. 6 in. high while removing a sheet of corrugated iron, 8 ft. long by 2 ft. 3 in. wide, by sliding it on one long edge over the live trailing cable, between the machine and the props, in order to bring it into the road head. The electrical system was 3-phase at 500 V, the neutral point being earthed through a limiting resistance of 10 ohms. The accident was due to the ignorance or recklessness of the men, who should have switched off at the gate-end box and moved the trailing cable out of harm's way before withdrawing the iron sheet.

11. *Risehow Colliery, Cumberland.* October 29th.—Deceased, employed as a "trailer," was endeavouring, with the assistance of another, to replace a derailed full tub, and took hold of a trailing cable that was suspended by the side of the road. The insulation of the cable was defective, and he received a severe shock. The system was 3-phase at 500-550 V, the neutral point being free.

12. *Milfraen Pit, Monmouth.* November 27th.—Deceased, employed as a pump attendant, was found unconscious with one hand on the control switch of the pump motor and the other on the covering of the outgoing cable, as if he had been about to start or stop the pump. It transpired that the electrical staff had recently been at work upon this pump motor and had removed the slip ring control and had substituted direct switching of the stator circuit on to the line. The system was 3-phase at 500 V, the neutral point being insulated.

13. *Black Boy Mine, Durham.* December 3rd.—Two linesmen were set to work changing connections on the top of a 35-ft. "H"-type timber pole which carried two sets of 3-phase high-pressure lines. The insulators carrying the bare conductors comprising these lines were attached to three lengths of channel iron bolted horizontally to the two wooden poles. The linesmen had been cautioned and knew that these conductors were "alive," but one of them, while changing his position on the pole, attempted to pass between the line he was working upon and the live conductors, by way of the channel iron girders. It appears that he slipped and fell upon, or took hold of, one of the live conductors.

14. *Tudhoe Colliery, Durham.* December 18th.—Deceased was employed as a pump attendant below ground, and he appears to have opened the locked door of a high-pressure electric switch of the cubicle type in order to point out to a lad the live bus-bars at the top of the switch where mice used to be found dead prior to the fitting of a covering plate. Unfortunately, inserting a flame safety lamp which he took from the boy the better to illuminate the place, he touched a terminal at a pressure of some 1,600 V above earth. The system was 3-phase at 2,750-3,000 V, the neutral point being earthed.

Non-fatal Electrical Accidents and Dangerous Occurrences.

During the year, 47 notices were received of non-fatal electrical accidents at the time of their occurrence and 10 further notices were received later, making a total of 57 accidents of this class. Thirty-seven of these accidents occurred below ground and 19 above ground at mines under the Coal Mines Acts and one on the surface works at a quarry. In 53 instances some personal injury was caused affecting in all 57 persons.

Included in these totals are two cases of fire below ground due to electrical causes, and three instances of explosions of switchgear, one upon the surface and two below ground. It should be observed that outbreaks of fire above ground are not included unless personal injury directly results therefrom, and that explosions of switchgear are not compulsorily reportable as such.

One case of fire underground, that at Dodworth Colliery on November 23rd, was attributed to the insulation of one of the unarmoured direct-current cables becoming defective at the point where it touched the armouring of the 3-phase cable near the shaft bottom; arcing brought about a fault in the 3-phase armoured cable which caused the 3-phase circuit-breaker to trip. The failure of insulation on one pole of the direct-current system increased the stress on the insulation of the other pole with the result that the insulation of the unarmoured cables broke down and originated the fire.

Of the fires above ground, the destruction of the generating station at Ferndale on May 29th, is of interest, it being attributed to a defect in a large oil-cooled transformer

Maintenance of Electrical Equipment.

That there is room for improvement on this score must be admitted. There would be less difficulty in meeting the demand if all mine owners and managers realised, to quote from the preface of a recently-published text-book on colliery electrical engineering, 'that the electrical engineer has developed from a mere workman into a man upon whose knowledge of his work and conscientious execution of his duties they must depend to a greater and greater extent for maintaining and increasing the output of coal under economical conditions.' Systematic thorough examination and testing, with a convenient record and ready comparison of the results together form a necessary part of organised maintenance, and it is in this respect that many collieries, especially amongst the smaller ones, are deficient.

Revision of Official Memorandum on Electricity Regulations.

When the Electricity Regulations which were made under the Coal Mines Act, 1911, were established in 1913, a Memorandum was prepared by the Departmental Committee concerned, and was issued in the early part of 1914 to explain some of the practical points arising thereon. That publication served a necessary and useful purpose, both educative and administrative, but in 1920, when the Electricity Regulations applicable above ground came into force, it was decided that the time had come to enlarge the scope and revise the text of the memorandum. The original was therefore withdrawn and the new issue substituted in April, 1921. Certain paragraphs in that issue touching the matter of open sparking, or, as it is called to-day, flame-proof enclosure, opened new horizons and gave rise to considerable discussion, especially as to the degree of responsibility for suitability of design that could reasonably be assumed by the manufacturer. In the result, attention was usefully directed to the problems of flame-proof design, and the British Engineering Standards Association proceeded with the preparation of specifications for electrical apparatus with flame-proof enclosure. Arising therefrom, the British Electrical and Allied Industries Research Association explored the ground, and an investigation was undertaken at Sheffield University under the direction of Dr. R. V. Wheeler to determine or verify the factors governing the propagation of flame within closed and partially closed vessels, so that sure means of rendering them safe for use in coal mines might be devised. The results of the research into the problem of flange protection then undertaken have been published by the Safety in Mines Research Board, as Paper No. 5, by I. C. F. Statham and R. V. Wheeler.

Plug Connections for Trailing Cables.

In his report last year the Inspector referred to the preparation of a standard specification for plugs and sockets for mining use by the British Engineering Standards Association. That specification has not yet been issued, the delay being due to the difficulty of meeting all requirements as to space limitations, but such progress has been made that he hopes to be able to report publication next year. Although the primary object of that particular specification was to secure interchangeability, advantage was taken of the opportunity thus afforded to improve the design, in the direction of greater reliability, of the contact device which is intended to secure the continuity of the earthing circuit between plug and socket. That a radical improvement in this respect was desirable and indeed long overdue must have been obvious to anyone who had opportunities of seeing the condition of unreliability to which this earthing contact is frequently reduced, in the case of many existing designs, under working conditions. There have been a number of accidents due to the unreliability of the existing type of earthing contact, and the Inspector has, in the course of his routine inspections, come across many similar instances which, fortuitously, did not result in an accident. Systematic testing of the conductivity of these earthing devices would doubtless have disclosed the weakness of design and should have resulted in improvements both in design and in maintenance. Such testing, however, has been the exception rather than the rule. Defects in the earthing circuit do not interrupt the working of the plant and do not result in an accident unless there is also a failure of insulation, so that the testing of the earthing system is too often neglected for work that is more obviously pressing.

Automatic Protection of Circuits.

Although it is still probably true that in the majority of mines overload protection alone is used, that is to say, fuses or their equivalent in circuit-breakers are relied upon as the means provided to cut off all pressure automatically from the circuit affected by a fault, yet it is encouraging to note that in an increasing number of installations it is now recognised that something more is required to reduce the danger from fire consequent upon a failure of insulation in a cable or apparatus. Fuses are inherently incapable of preventing a sustained overload unless the setting is so close to the normal current as to result in tiresome and unnecessary interruption of service. Overload trip coils in circuit-breakers are preferable because the setting is more accurate and is less open to unauthorised interference, but without the addition of controllable time-lags so as to permit of close setting, overload trips are but little better than fuses for the prevention of fire due to an electrical breakdown. The solution of this problem will probably be found in the addition of leakage-protection, implying means to ensure the automatic isolation of a faulty circuit immediately the current leaks or flows in an abnormal path. Colliery engineers are now more generally adopting leakage protection, usually in the form of core-balance with current transformers, for 3-phase systems, and it is interesting to observe that in several direct-current installations the Cousen Rosebourn system of discriminative leakage protection has been adopted with satisfactory results.

Coal-Cutting Machines.

According to the annual returns, over 30 million tons of coal were got last year by electrical coal-cutting machines, and there were in use at the end of the year 3,046 electrical coal-cutting machines of the bar, chain, and disc types, with a few rotary drills. The relatively large number of accidents that are noticed elsewhere in the report as having occurred in connection with trailing cables and plugs is in some measure an indication of the need for improvement in existing designs of plug connector. If comparison is made between the number of machines driven respectively by electricity and compressed air, but excluding from the latter the percussive machines, it will be seen that the number of electrical machines, which was 66.3 per cent. of the reduced total in 1915, represented 68.8 per cent. in 1924. Referring to the total numbers of machines of all types while bar machines have increased 67½ per cent., chain machines have increased nearly six times, and percussive drills with a few rotary heading machines, rather more than two and a-half times in number.

Metalliferous Mines and Quarries.

The history of electricity in these mines is uneventful, and there have been very few reported accidents. The chief user of electric power are tin mines in Cornwall, followed, as to the horse-power of motors installed, by the iron-ore mines of Cumberland and the slate mines of North Wales.

There are no data available as to the use of electricity at quarries, but there are some considerable installations at work in particular those of the Buxton lime firms in Derbyshire. The Inspector also visited installations of some importance in connection with the Welsh granite quarries and the whinstone quarries in Ayrshire.

Conditions in the Netherlands.

Electric Lamp Works Prosperous.

Mr. R. V. Laming, O.B.E., the British Commercial Secretary at The Hague, has forwarded to the Department of Overseas Trade a report,* dated February, 1925, on the economic, financial, and industrial conditions of the Netherlands. It is stated at the beginning of the report that the worst of the effects of the war have been got over, and the general situation if not brilliant, is steadily improving, although slight relapses are sometimes felt in particular trades. The public financial situation is better than it has been for the last few years and the currency has steadily improved. About 133 million florins of fresh capital was issued during 1924. It is stated that there was a general disinclination on the part of the public to participate in purely industrial concerns without a wide margin of security, and in consequence higher premiums became necessary. Nevertheless, among the principal private issues was that of the Philips Incandescent Lamp Co. of ordinary shares of 3½ million florins at 150, and preference shares for 1,113,000 florins at 110. The incandescent electric lamp works reported a prosperous period, and at the end of the year they entered into a European combine.

Foreign Trade.

While actual figures of the electrical exports of the Netherlands during 1924 are not given, the report says that there was a larger demand for dynamos, transformers, &c., the principal

*Stationery Office, 2s. 6d. net.

rkets being Belgium and the Dutch East Indies, the latter taking increased supplies of steam boilers, steam engines, turbines. Machinery generally was exported in slightly ger quantities, chiefly to Germany and the Dutch East ies. More details are given with regard to electric lamp orts. A lowering of prices is apparent from the fact that, le the quantities were increased, the value was lower. The res were as follows:—1924: 5,013 metric tons, valued at 76,000 guilders; 1923: 4,678 tons (25,816,000 guilders). principal consumers were France, Russia, Italy, and Aus-ia.

urning to the imports of electrical goods, it is seen that many remained the principal supplier of motors, machinery apparatus, although supplies from this source were re-d during the year under review. The value of boilers im-ed increased by 1.1 million fl., Great Britain being second to Germany in importance. Larger quantities of Ger-steam engines and turbines were imported. The importa-of internal-combustion engines increased by 1,500 tons and value by 3.5 million fl., the greatest quantity coming from many and the greatest value from England. Imports of pressors, ventilators, pumps, cranes, &c., also increased. imports of insulated copper wire were practically entirely nan, and the same applied to lamps and lighting fittings. number of electric vehicles imported showed an increase, it is worthy of note that Hungary was the principal sup-r with 27, as compared with 18 from Germany.

Railways, Tramways, and Telephones.

he electrification of the railway between Leiden and The ue has been completed, but it has recently been stated electric traction on this section will not be put into ation for passenger and other traffic until the whole line rified. A number of steam tramways have been converted rified. A number of steam tramways have been converted ectric traction and others are said to be following. In the ntime, in order to compete with motor omnibuses and lorries, petrol-driven tramcars are being used on some systems. The railways and tramways have lost a certain amount of traffic to motor transport, but, although a reduction of tariffs again increased the traffic, no increase of revenue resulted. A Royal Commission on transport systems has reported that although at present motor omnibuses may be competing with, they will finally prove to be useful feeders for railways and tramways, and it has suggested legislation conducive to this end.

With the exception of Amsterdam, Rotterdam, The Hague, Arnhem, Maastricht and Enschede, the telephone system is in the hands of the postal authorities. According to the latest available figures, on January 1st, 1923, the number of instruments in use numbered 185,122, or 2.6 per 100 inhabitants, and the length of the lines to 600,000 km. or 8.5 km. per 100 inhabitants. The submarine telephone cable between England and Holland was duplicated during the year owing to the pressure of traffic. The new cable is of greater capacity and is also intended for international calls between England and Germany.

General.

At the end of 1924 a Revised Customs Duties Act became law. The original Act was introduced in 1862, but under modern conditions of trade many difficulties were experienced in working the tariff, and a complete revision in respect of technical classifications and definitions had become necessary. Speaking broadly, the general effect of the new tariff is to increase the import duty from 5 to 8 per cent. *ad valorem*.

As regards British trade, the most obvious fact is that the quality of British goods is still recognised, but prices in many cases are too high. At one time when deliveries from other countries were bad the British supplier scored, but when improvements in deliveries set in considerations of prices again weighed heaviest. Any diminution in the quality of British products would counteract the slight advantage which they hold owing to their good reputation.

Exports and Imports of Electrical Goods and Machinery in July, 1925.

Board of Trade returns for July show that there was little ge from the previous month in electrical exports and rts, so far as the totals were concerned, although there large fluctuations among the items. The export total slightly higher and the rises and falls in the items were t balanced. Submarine telegraph and telephone cable showed a big change, exports being trebled, while the st rise in value occurred in the case of telegraph and one instruments and apparatus. A large proportional ase is apparent in the figure for railway and tramway rs, and "other motors and generators" also experienced able rise. The greatest fall was one of about 25 per cent. e case of unenumerated electrical machinery, which more counterbalanced the rises in the other three items of the inery section. There were also serious decreases in the ts of batteries and accumulators, meters and instruments, ns, telegraph and telephone wires and cables (not sub-ne), and insulated wires and cables. A comparison with tatistics for July, 1924, reveals much the same position e comparison with June, 1925.

There were also a number of violent fluctuations in the import list, an outstanding example being insulated wires and cables, the imports of which were halved in value. Other notable decreases occurred in telegraph and telephone wires and cables (not submarine) and glow lamps. A number of important increases also occurred, particularly in the case of batteries and accumulators, which reached about twice the value recorded in June. An even larger proportional increase is shown against the item meters and instruments, and the unenumerated machinery and goods both reached enhanced values. The rise in the total as compared with July, 1924, is of important dimensions, and attention may be drawn to the large advance in the case of glow lamps.

The increase of £8,183 in the re-export total was mainly due to the greater values recorded for telegraph and telephone instruments, and unenumerated goods and apparatus.

The gradual augmentation of all three sections is shown in the seven-month figures which appear at the bottom of the table.

	Exports.			Imports.			Re-Exports.

The Automatic Disposal of Boiler-House Ash.

The Blackburn Meadows, Sheffield, Aerial Ropeway.

The aerial ropeway that was installed for the automatic disposal of the ashes from the boiler house of the Sheffield Corporation's Neepsend electricity generating station was described in our issue of April 9th, 1915. We are now able to illustrate a much more ambitious ropeway scheme, designed for the removal of the ashes from the Blackburn Meadows station.

In this case Mr. S. E. Fedden, chief electrical engineer and general manager of the Sheffield Corporation electricity undertaking, was faced with the difficulty of the disposal of the ash

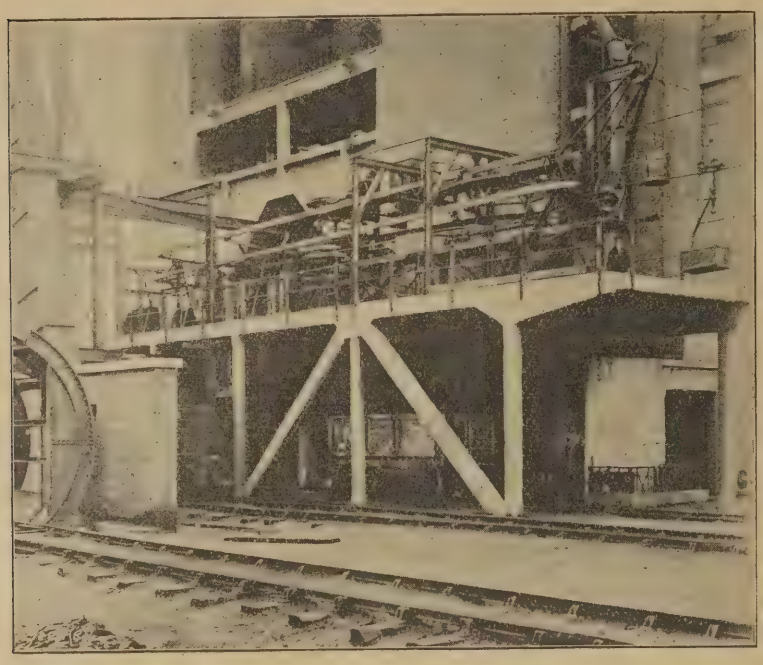

Fig. 1.—Side View of Loading, Driving, and Tension Terminal.

Fig .2—End. View of Terminal.

owing to the fact that there was no dumping room available in the immediate vicinity of the power station itself. The most convenient place was at a point about 3,000 ft. away, where a large valley offered a suitable dumping ground, but to get to this point it was necessary to cross the main line of the L.M. and S. Railway and also two highways; also in order to provide ample tipping accommodation, so as to eventually fill up the whole valley, it was found necessary to run the ropeway in a kind of circular tour at the discharging end, so as to envelop an area of about 12 acres, the whole of which would be available for tipping, giving a dumping capacity of approximately 30,000,000 cu. ft.

An aerial ropeway seemed to be the only possible form of conveyor that would meet the situation, and eventually the contract was again placed with Messrs. R. White & Sons, of Widnes. This ropeway is 7,127 ft. long overall and the capacity of the plant is 20 tons per hour in 5-cwt. net loads, with a dispatch of 80 loads per hour, or one load every three-quarter minute. The average gradient against the load is 1 12.8, whilst the steepest gradient against the load is 1 in 4.

There are a number of angle stations along the line and t whole of them are specially designed for absolute automa working, so that the carriers, whether loaded or empty, w pass through them both on the concave and convex sic without being released from the hauling rope, stopped, handled in any way. This, of course, is of great importan as it would have added very materially to the cost of t working of the plant if it had been necessary to have a m

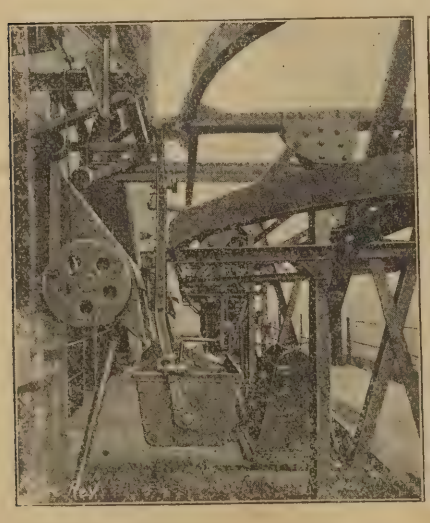

Fig. 3.—Carrier Box and Loading Shoot.

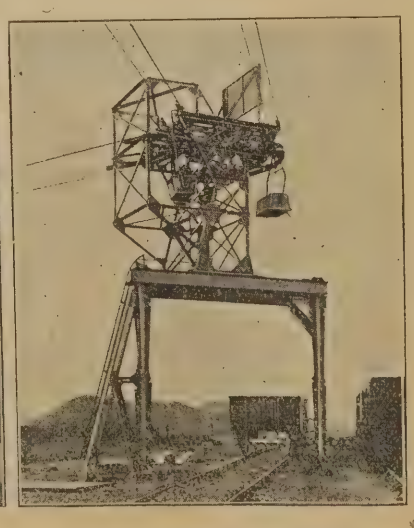

Fig. 4.—Automatic Angle Station.

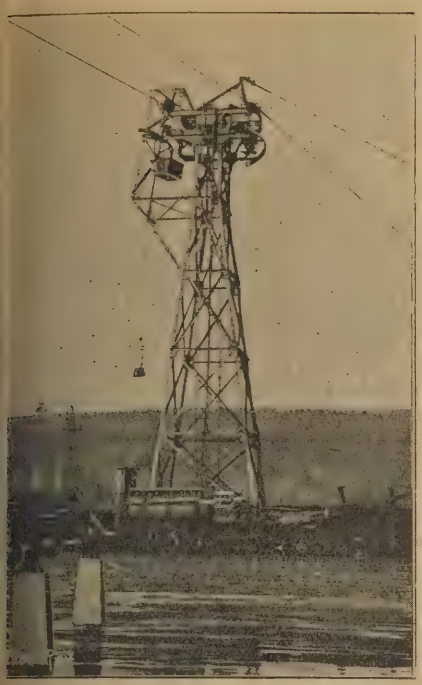
in attendance at each of the five angle stations. As it is, man at the loading station is all that is required for ordinary working of the ropeway, for by means of Mes White's special system the incoming empty carriers, a being automatically released from the hauling rope on en ing the loading terminal, are run by gravity along the inclined fixed loading rail up to any particular loading point required, where each empty carrier is stopped automatic by means of special buffer gear in the right position loading. In the present case the ashes clinker are conveyed from the furnaces the boiler-house floor by means of suct plant into two overhead loading hopper about 1,730 cu. ft. total capacity, with loading shoots and valves of Messrs. Whi special construction. In addition an elec hoist takes tip wagons loaded with ashes clinker from the boiler-house floor automatically tips their contents into overhead loading hopper.

After the man in charge has filled ropeway carrier box with ashes by gra from the overhead loading bunker refe to above, simply by pulling a lever operates the loading valve, he pulls ano lever in order to release the buffer g when the loaded carrier is free to tr onwards along the inclined loading rail to the outgoing end of the terminal, wh it is automatically connected to the hau rope and starts on its forward journey the tipping ground. Each loaded carrie also tipped automatically at any requ point by means of a device which is n of a portable nature and can be move any point along the carrying rope whe is desired to discharge the loaded ca boxes on the tipping section of the rope This tipping gear is entirely self-contained, and does require any guy ropes to keep it in position.

It will be realised that a large saving is effected by suc plant in the cost of labour and attendance generally.

The carriers have all been fitted with an improved typ automatic gravity rope gripper, with a positive fric locking device which ensures a safe grip on the hau rope when the carriers are going up steep gradients, pas automatic horizontal angle stations, and also when pas

y sharp vertical angle stations at the intermediate towers. carrier sheaves, the hauling rope supporting rollers on intermediate standards, and the rope sheaves at the auto- ic angle stations, are all fitted with ball bearings, whilst shoot to form a continuous shoot right to the openings in the top of the platform, in order that whenever necessary, ashes may be loaded directly into railway wagons standing below.



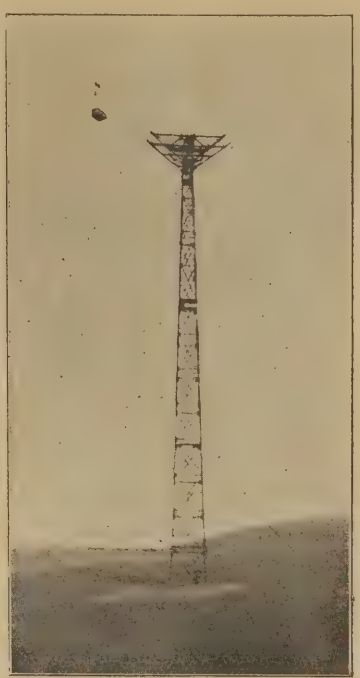


Fig. 5.—Automatic Angle Station.

Figs. 6 and 7.—Tipping Ground Angle Stations.

-coil carrying ropes are used in order to reduce the work- friction and give specially smooth and easy running. t the loading and driving station a 27-b.h.p. patent 2-speed ade induction electric motor has been installed, running

Fig. 4 illustrates the first automatic angle station from the loading terminal; it is self-contained in order to span the railway line without any guy ropes being required; it has an angle of 114 deg. and is 30 ft. high from the railway level.

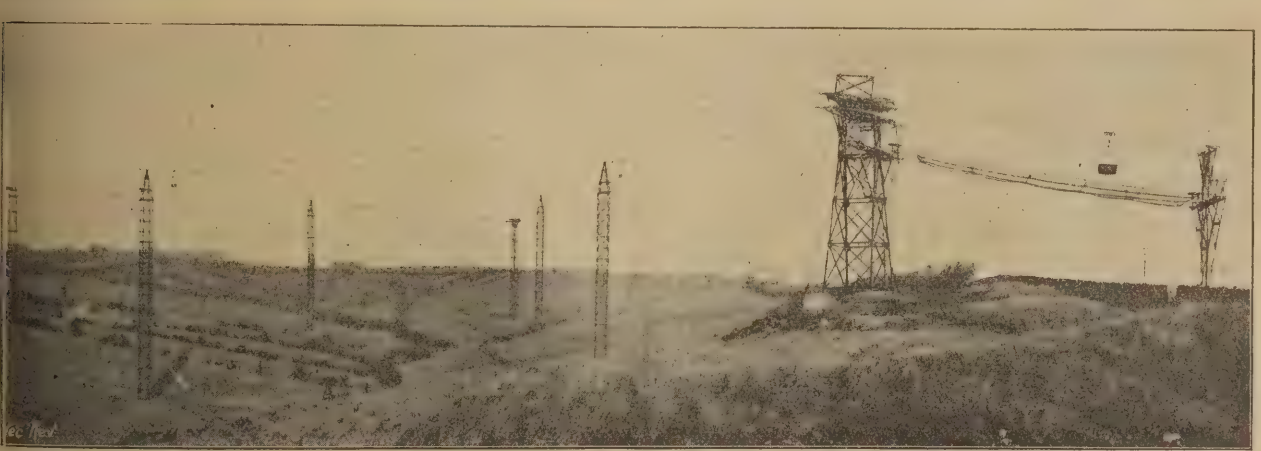

Fig. 8.—Triangular Tipping Section and Roadway Protective Netting.

ually at 720 r.p.m. with a hauling rope speed of 200 ft. per ute under ordinary working conditions but this speed can reduced to 480 r.p.m. with a hauling rope speed of 133 ft. minute when required occasionally for inspection pur- es. On the main horizontal shaft of the ring gear an automatic brake arrange- nt is fitted, so arranged that immediately ropeway is stopped the brake will come action automatically, in order to pre- t the ropeway running backwards in the of loaded carriers being left on the oing side, with only empty carrier boxes the return side.

eferring to the illustrations, fig. 1 is a eral side view of the loading, driving, tension terminal, built on the top of einforced concrete staging in order to the necessary clearance above the rail- w. Fig. 2 is an end view of the same minal with a loaded bucket just leaving loading station, and an empty bucket rning on the incoming side; this view shows the live weight arrangement pro- d to keep a constant tension on the ling rope. Fig. 3 shows a carrier and just after being loaded by gravity from shoot valve, and also the buffer gear stopping each carrier in the exact posi- required for loading. In this connection ay be mentioned that special trap doors e been provided at the top of the ferro-concrete staging, one end hinged, so that as the trap doors are lifted up free end will fit up against the lip of each fixed loading

Fig. 5 shows another automatic angle station, 40 ft. high, with an angle of 146 deg.

Fig. 9 is a side view of the protective bridge across the main line of the L.M. & S. Railway, with a clear span of 181 ft. 6 in.

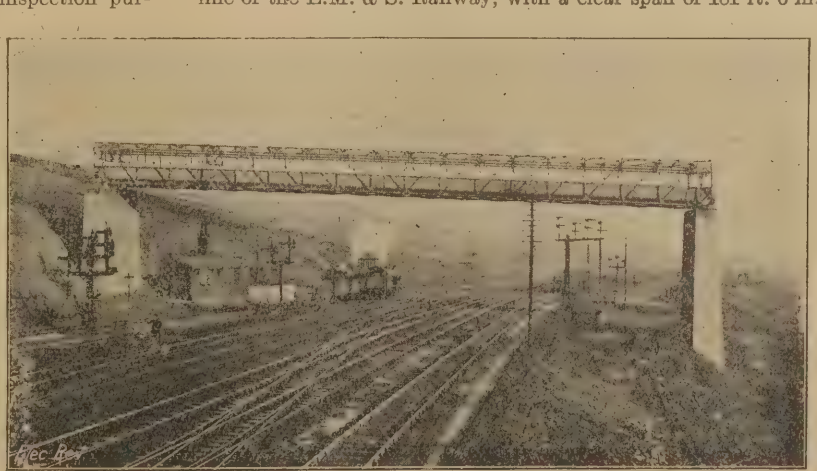

Fig. 9.—Protective Railway Bridge.

between the centres of the piers at each end. The bridge is made of steel with a wood platform and tongued and grooved boarding each side, the clear width of the bridge being 16 ft.

The two end piers are built up of bricks and are massive with heavy coping stones at the top, on which the ends of the bridge rest; the brick pier on the lower side of the railway is 59 ft. high whilst the one on the top side is 52 ft. high, measured from the top of the concrete foundations at the base. The clearance from the rail level to the underside of the bridge is about 45 ft. in the centre.

The protective netting across the new road to Rotherham has a span of 116 ft. with 20 ft. headroom from the road to the underside of the netting. The net itself is 16 ft. wide, with side nets 2 ft. 6 in. deep, reinforced with supporting wire ropes and cross spreader bars. The netting across Meadow Hall Lane has a span of 60 ft., with 20 ft. headroom, the net being 16 ft. wide with side nets. Fig. 8 is a general view of the triangular tipping section of the ropeway, and it also shows the protective netting over Meadow Hall Lane, together with the automatic angle station at the commencement of the tipping ground, which is 35 ft. high and has a divergent double angle, one of 119 deg. and the other of 155 deg., in order that each ropeway line may branch out in a different direction so as to meet the two further automat angle stations shown on this figure on the tipping groun One of them is indicated at the extreme right-hand side fig. 8 and is 100 ft. high with an agle of 86½ deg.; the oth can be seen in the far corner about the centre of fig. 8, ju beyond the two main supporting standards indicated; it 105 ft. high with an angle of 57 deg. As will be seen fr the illustration, the tipping section of the ropeway is of a t angular form with a valley in the centre, and the ordina supporting standards of square construction shown vary height from 100 to 120 ft. Fig. 6 is a near view of one of t automatic angle stations on the tipping ground, which al shows a carrier box in the act of automatically dischargi its contents, while fig. 7 is a front view of the ang station.

We understand that although this ropeway has to wo under very special and difficult conditions, owing to the nu ber of horizontal, as well as vertical, angle stations involve it has given every satisfaction in actual working and is ful up to the duty for which it was designed.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

A New Crystal Set.

The new "Cosmos" crystal receiving set to which METRO-VICK SUPPLIES, LTD., has drawn our attention has several distinctive features. Apart from its neat workmanship and appearance, the provision of an arrangement, to be seen on the left of fig. 1, for tapping off various amounts of the tuning inductance across the detector circuit is, we believe, unique and not only conduces to sensitivity, but also allows the user to vary the selectivity of the set. Fig. 1 indicates that the coils are concealed in the base of the receiver, while tuning is effected by a variable condenser. The set is fitted with terminals enabling either one or two pairs of head-telephones to be used, and two types of detector can be supplied: a dust-proof glass-covered cats'-whisker detector with split ball and socket adjustment for the contact arm, or a "permanent" detector, the former being fitted with a screw cap which allows

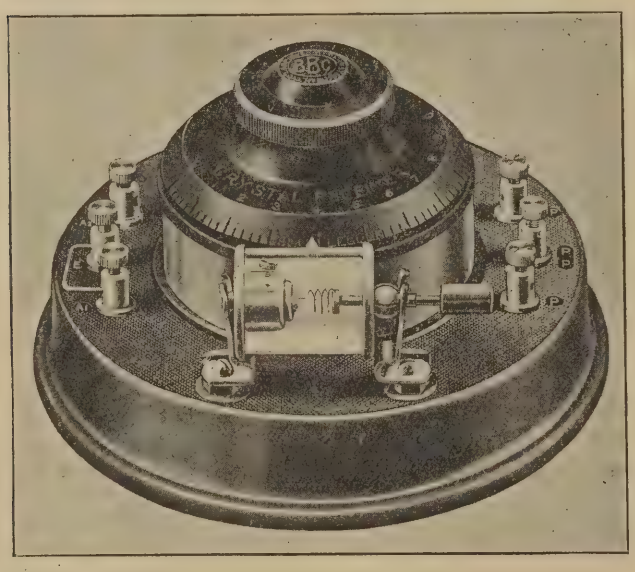

Fig. 1.—New Metro-Vick Receiver.

for any type of crystal to be used. The set may be hung on the wall if required, and a loop is provided for this purpose; when not in use the telephone can be hung on the tuning knob, thus making a neat and compact arrangement. It is claimed that good results can be obtained with this set at a distance of 75 miles or more from the Daventry high-power station, and 15 miles and over from a main station. The B.B.C. coil covers a wave-length from about 300 to 650 metres, and the long-wave coil from about 1,200 to 3,000 metres, depending upon size and height of aerial.

A Jacobean Cabinet Receiver.

A handsome product of the EDISON SWAN ELECTRIC CO., LTD., takes the form of a Jacobean cabinet radiophone loud-speaker set, which makes an excellent piece of furniture in oak with "old" brass fittings. Fig. 2 shows the arrangement as viewed from the front, the cabinet being 5 ft. high, 2 ft. 3 in. wide, and 1 ft. 7½ in. deep; the upper portion contains the receiver panel and wiring, while the lower portion is divided into three: First, there is an accessory drawer in which the tuning headphones may be kept; then there is compartment to accommodate an Ediswan "Televox" loud speaker that is adjusted by means of the usual modulat which is extended through the louvre front, which is shown i fig. 2. The loud-speaker leads are connected to the receiver b a plug and socket, an arrangement which enables the use to remove the loud-speaker for the purpose of extending th leads into an adjoining room. A recess is provided for a 6-vo filament accumulator in the loud-speaker compartment, belo which is a cupboard to house the h.p. accumulator or dry ba teries, as the case may be. The receiving circuit is of th dual type, embodying four valves and five stages: The firs valve functions as both a high- and low-frequency amplifier the second is the detector; and the third and fourth are bot

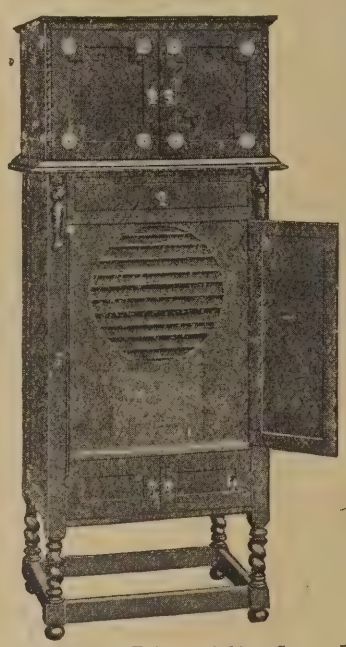

Fig. 2.—An Ediswan Cabinet Set.

Fig. 3.—A "Round" Crystal.

Fig. 4.—An Ediswan Loading Coil

l.f. amplifiers, the last being resistance-capacity coupled Capacity reaction is obtained by means of a variable condenser the plate voltage of the l.f. valves is 120 V, and a fixed bia potential is applied to the grid of the first valves and a variabl bias to the last two. Range "blocks" are provided with th instrument to cover wave-lengths of from 300 to 500 metres additional blocks for longer waves being obtainable if re quired.

A "Round" Crystal.

The varying sizes and irregularity of form in which crystals are sold often necessitate the exercise of much patience wher attempting to fit a crystal into its cup, but "standardisation" is the universal cry nowadays, and it is accordingly interest ing to note that a crystal is now being manufactured in a regular cylindrical form adaptable to practically all crystal cup in common use. The new product, a sample of which we ha received from TUNGSTALITE, LTD., is strong mechanically, and is, so far as we are aware, the only one of its kind that is made in a uniform size and shape. Fig. 3 indicates that

fit into ordinary-sized cups snugly without splintering; sensitive over its entire rounded, as well as over its cut es, and each specimen has a useful surface equal to a of three square centimetres.

A Plug-in Loading Coil.

have received from the EDISON SWAN ELECTRIC CO., LTD., ple WL 324 inductance coil of the plug-in pattern, which een designed so that existing sets can be easily converted, terposing the loading coil in the circuit, to receive broad- from the new Daventry high-power station on a wave- h of 1,600 metres. The coil sent us, fig. 4, is rigid and well ; it performed its function without trouble.

Modified "Amplion" Construction.

at is said to be an improved method of assembling plion" loud-speaker horns which are being fitted to their 4, AR19, and AR22 models, is announced by Messrs. Alfred am & Co.; these models became available to the public ily 15th. It will be observed from fig. 5 that the flare is

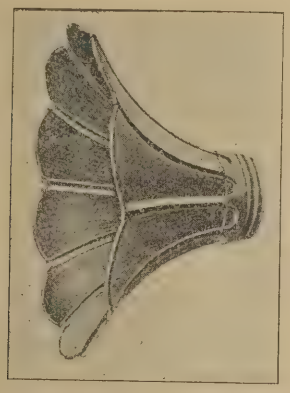

Fig. 5.—Modified "Amplion" Flare.

with a threaded metal screw which is firmly held to the conduit by a heavy rubber bush; by this means assembly ck and rigid. Also it will be noticed that the leaves of orn are united by crystalline finished metal ribs and that are similarly bound at the flare. The new method of ucting oak and mahogany horns is claimed to have d advantageous, but it will not affect the price of the ments.

The "Anvil" Coil Former.

t amateur radio-telephonists prefer to construct every- they possibly can for their sets; they will find the il" coil former, one of which has been sent us by Messrs. OOD CONCESSIONAIRES, LTD., a useful gadget that will their desire to wind coils cheaply. The ring is made of sand is fitted with a neat wooden handle, the 30 pin holes screwed; "Honeycomb," "Duolateral," and other pat- of coil may be wound on this former, which has been ionally patented.

Short-Wave Radio-Telephone Communication.

Messrs. Autoveyors' New High-frequency Relay.

the utilisation of short waves instead of waves l hundreds and thousands of metres in length hich we have been accustomed, will have a pro- effect on the art of radio communication cannot enied. Recent work with waves less than 100 in length has indicated clearly that conceptions ethods hitherto in vogue will have to be drastically l, facts which Messrs. Autoveyors, Ltd., have not been to appreciate. Under the guidance of their technical or, Mr. A. E. Chapman, they have tackled the subject fresh point of view, and attempted to take into account which seem to have been somewhat neglected, if not oked, in the past.

have announced that within the last few weeks they uccessfully completed the design of several novel devices together form what has been termed "compound apparatus. This gear is intended to be employed as a of short-wave radio-communication over long range, and mpany has applied, we understand, to the secretary of neral Post Office in London, and to the district radio isor in New York, for a concession authorising it to an ordinary commercial radio-telegraph service to traffic between this country and America. The com- main object in asking for such a concession was to by demonstration and "practical working," its claim that it is able to establish and maintain efficiently with the aid of its new apparatus constant long-range communication with extremely low power.

The term "compound focus" is used to indicate that the radiations from the transmitter will be emitted in the form of a "ray"; that is to say, the focusing will be in both the vertical and horizontal planes, not in the latter only as in the Marconi "beam" system. In order to allow for the variation in the plane of polarisation of the electromagnetic waves radiated from the transmitter during the day, we understand the receiver is to be a simple oscillator pivoted about its centre and capable of being rotated in any direction, so that its position may be changed from time to time throughout the day.

While awaiting the necessary authority to enable it to substantiate its claims in this manner, the company has partially changed its policy in that it has decided to license thermionic valve manufacturers to produce and market one of the new components embodied in the "compound focus" apparatus, *viz.*, the high-frequency relay, and thereby, through the medium of the many successful dx. experimenters in this country, if possible, to secure evidence that radio communication between any two points in the British Empire may be effected and maintained at such a low cost as to establish the claim that a charge of 2d. or 3d. per word will present adequate recompense for the provision of such a service.

Several other entirely new components are embodied in the "compound focus" apparatus, which will be placed at the disposal of the public in due course, and one of the h.f. relay models that Messrs. Autoveyors propose to market will be suitable for broadcast reception on the B.B.C. wave band, it is claimed, in conjunction with suitable loading inductance.

The three electrodes of the new h.f. relay, of which we have samples, are assembled in a small glass cylinder which is provided with an ebonite cap at each end, the caps each having three terminals; the relays are robust and their overall dimensions are 1 in. diameter and $2\frac{3}{4}$ in. in length. An unusual feature is that the relays are made positive and negative, one of each type being used in place of the common single-valve receiver. One of the several receiving circuits that may be used is reproduced in fig. 1, A and E being the aerial and earth, while the values of the coils used are marked on the diagram; B_1 and B_2 are the low- and high-pressure batteries respectively, the filament rheostats being marked R; the short straight tungsten filament F is surrounded by two concentric coils of thick wire (marked D) which are termed the "helix" and "rack" (*i.e.*, plate and grid), V+ and V− being joined as indicated in the diagram through two 0.00025 μF variable condensers C.

The filament voltage is from 1.8 to 2 V and its current 0.3 A; the helix voltage may be from 30 to 50 V, the emission at the lower voltage being stated to be 10 mA. When designing the h.f. relay an attempt was made to maintain magnetic symmetry, for it is maintained that the device functions electromagnetically in addition to electrostatically and that use has been made of phenomena differing considerably from those employed in the ordinary valve; the lengths of the arrows in the diagram are intended to represent, roughly, the augmented output that is obtainable by the use of the new component.

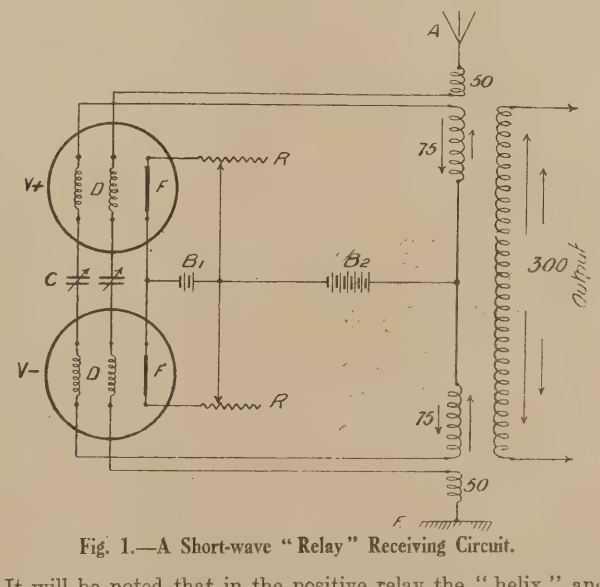

Fig. 1.—A Short-wave "Relay" Receiving Circuit.

It will be noted that in the positive relay the "helix" and "rack" are wound anti-clockwise, while in the other they are clockwise, and it is claimed that the high-frequency oscillating aerial currents which flow round the "racks" of the relays exercise an electromagnetic control on the filament emission and minimise interelectrode capacity, which is one of the chief difficulties encountered in short-wave work. Due to the reversal of the spirals in the negative relay, it is said that an increase of current in the positive relay is accompanied by a decrease in the negative one, and *vice versa*, so producing a push and pull action as indicated by the above-mentioned arrows.

Patents are pending, we understand, throughout the world, and in view of the somewhat bold claims of its inventor, it may perhaps be advisable to refrain from detailing and commenting upon the theoretical explanation of the action of the new "relay" until the specifications become available.

Reviews.

The Metallurgy of Aluminium and Aluminium Alloys. By Robert J. Anderson, B.Sc. Pp. xxxi+891. New York. Henry Carey Baird & Co., Inc. Price, 10 dollars net.

Since J. W. Richards's treatise of many years ago, little of a systematic nature has been published on aluminium from the metallurgical standpoint. The work under review enters in detail into the varied aspects of the metal and its alloys in industry, and the perusal of the volume impresses one with the advances which have taken place within recent years in this branch of metallurgical science. The whole volume bears the stamp of having been written by one who is not only fully conversant with the subject, but also possesses first-hand knowledge of the difficulties which beset the metallurgist of aluminium and its alloys.

The magnitude of the aluminium industry is shown by the fact that the world's production of the metal in 1923 amounted to 179,000 tons, 50 per cent. of which was consumed in the production of sheets, wire, and fabricated aluminium, the remainder being utilised in the manufacture of light aluminium alloys. In tonnage produced, aluminium now stands fourth among the non-ferrous metals, and it is exceeded only by copper, lead, and zinc. In nature aluminium is the most abundant of the industrial metals, being third in abundance of the elements in the earth's crusts, but in the commercial production of aluminium only two minerals are utilised, *viz.*, bauxite and cryolite; the process involves two stages, *viz.* (1) the preparation of alumina of high purity from bauxite, and (2) the electrolysis of the alumina produced in a liquid bath of cryolite and other added salts.

One of the chief difficulties in the metallurgy of aluminum lies in the fact that the metal, after being produced, cannot be refined as can copper and other of the common metals, and the purity of the metal secured by the electrolytic dissociation of alumina depends upon the purity both of the alumina and of the electrolytic bath; hence, it is necessary in the Hall and Héroult processes to use alumina as pure as possible. Aluminium electrolytic processes need essentially a source of cheap electrical energy, since an enormous amount of electricity is consumed, and all aluminium reduction plants in the world, with the exception of a few in Germany, consume energy derived from hydro-electric power plants. It is for this reason that aluminium reduction plants are normally situated within easy reach of waterfalls, steam-generated electric power being totally out of the question as a source of energy for economical aluminium production.

In view of the relative scarcity of bauxite the future growth of the aluminium industry, so far as greatly increased output of metal is concerned, depends upon two requisites, *viz.* (1) the discovery of new ores of aluminium, *i.e.*, ore that can be used as a basis for the production of aluminium by the processes at present employed; and (2) the development of methods for the treatment of ores that are not amenable to the Hall and Héroult processes, or similar reduction methods. A commercially feasible process for the production of aluminium from aluminium silicates and the common aluminium minerals is the desideratum at the present time, but while considerable experimental work has been done on this problem, no process other than the one covered by the Hall-Héroult patents is being employed to-day.

The book is divided into 19 chapters dealing with bauxite mining, the production, properties, and uses of aluminium and its alloys, melting practice, losses and defects in aluminium castings, mechanical and heat treatment, and the micrography and electroplating of aluminium. The author deals in considerable detail with the preparation of aluminium alloys, together with their rolling and other mechanical treatment. The soldering and welding of aluminium and aluminium alloys is discussed from the metallurgical standpoint. Aluminium parts can be soldered together, but not with any degree of permanence, due to the metals in the soldering alloy being electronegative to aluminium, and on contact with water, galvanic cells are set up so that the joint disintegrates by auto-corrosion. Autogenous welding by oxy-gas methods is employed extensively in the aluminium industry, for making joints of substantially pure aluminium and of aluminium alloys, and for making repairs and in salvaging castings.

An important part of the volume is the summarised statement of the aluminium productions of the various countries, markets, trade statistics and tariffs, which is remarkably comprehensive and of the greater value in that mere statistics are relieved by comments. A large amount of information is also given on the various patent aluminium alloys; this together with a most complete bibliography renders the compilation of special value.

The author being a practical metallurgist draws considerably from his own practical experience, and gives the manufacturer much valuable advice. Bearing in mind the extent and character of the literature to be dealt with, the author has been remarkably successful in bringing the subject matter up to date and compressing it into reasonable compass, and he has undoubtedly filled a hiatus in the list of books available for the technologist. The book has been edited with great care, is profusely illustrated, and is remarkably free from misprints.

A Text Book of Wireless Telegraphy and Telephony. By W. Greenwood, B.Sc.(Eng.), A.M.I.E.E., A.C.G.I. vii + 265; figs. 201. London: W. B. Clive, University Tutorial Press, Limited. Price, 5s. 6d. net.

In this book the subject is treated as a branch of electrical engineering, in much the same way as other branches of electrical technology are usually dealt with, and it is necessary therefore for the reader to be conversant with the fundamental principles of electricity. The author is careful, however, to avoid any advanced mathematical explanations in the body of the book, but includes at the end a chapter on "A few mathematical investigations," with proofs which the mathematical student is referred to in the appropriate places in the text.

This is a good arrangement, but we are in full agreement with Mr. Greenwood when he says "students of physics, whether pure or applied, cannot realise too early, that a knowledge of the rudiments of the differential and integral calculus and the methods of solution of the simpler differential equations is an essential part of their mental equipment."

The book covers the whole subject of the transmission and reception of wireless messages, the first third of the book dealing mainly with theoretical principles, and the remaining two-thirds with practical applications.

In a book of this sort, where the field is so extensive, the difficulty is to know how little can be said without omitting important matter, and the author has got over this difficulty very well by the avoidance of details combined with a free use of diagrams. The general arrangement, printing, diagrams and index are excellent, and add materially to the ease with which the subject can be studied.

The matter is well up to date, though indeed the allusion to the Imperial Wireless Chain on pages 126 and 140 might well have been omitted, as the scheme of high-power stations alluded to was abandoned a year ago. Some of the information given on important new arrangements such as that on "Mixed Valves" and the "Beam System" is very short and sketchy, but it is impossible in the limits of space available to do more than outline with many aspects of the subject, although they promise great development in the near future, in such special cases the author is always careful to refer the reader to published papers where full details can be obtained.

This is a text book which can be especially recommended to electrical engineers, potential electrical engineers, and students of physics who wish to understand the principles, and the up-to-date practice, of wireless telegraphy and telephony.

Electricity and the Structure of Matter. By L. Southerns, M.A., B.Sc. Pp. iv + 128; figs. 34. London: University Press, Humphrey Milford. Price, 2s. 6d.

The non-scientific person cannot complain of any lack of willingness on the part of physicists to interpret for him the advance of modern theories of the constitution of matter, and the volume before us, Mr. Southerns has attempted to cover a good deal of ground in a small compass, and in spite of the fact that literary excellence is sometimes sacrificed for colloquialism, the book is thoroughly readable, and should assist the non-technical reader to a general idea as to the trend of modern discoveries in molecular physics. The book commences with a historical sketch, followed by a chapter on the rudimentary principles of electricity and magnetism. The author then deals very ably with the subject of radio-activity and the structure of the atom. In this section we find a good account of some of the brilliant experimental work which has been carried out by modern physicists. Electromagnetic waves are next considered, the treatment including an account of wireless telephony that is so brief that we cannot think there are many people at all interested in physical science who will derive much instruction from it. A short chapter on the structure of crystals concludes the book. There is also an index, and a glossary of technical terms.

Intending purchasers of this book, who are electrical engineers, should be warned that a considerable portion is devoted to descriptions of simple electrical apparatus that have no particular bearing on modern theories of the constitution of matter, and on general grounds we think that this might have been somewhat curtailed.

Memorandum on Electric Arc Welding. Second Edition. Issued by Factory Department, Home Office. London: H.M. Stationery Office. Price, 3d. net.

Much practical information and many useful hints are contained in this little book, which should prove of value to operators of electric arc welding equipment. The information is chiefly on precautionary measures which should be taken to safeguard the operator.

The general principle of electric arc welding is dealt with in the introductory chapter. The merits, or otherwise, of both a.c. and d.c. currents are compared, and an outline of the regulations applying to the installation in each case is given.

Work entailing special risks, such as welding on steel and boiler work, is dealt with at length. The concluding chapters deal with injurious effects to the operator, and the cautionary measures, and a special chapter is given to the injurious effects of radiations.

earchlights and Wireless for Motor Lifeboats.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Charges for Electricity Supply.

I notice a letter from "Stung" in last week's REVIEW, which is rather involved.

The writer complains that he has to pay £2 per annum minimum charge for "juice" of which he only uses 12 units a quarter. If that is the actual load he finds for the supply people, he should pay one shilling per unit, and even then he is not a profitable customer to them. There are several pounds' worth of copper, meter, labour, &c., lying idle, or nearly so, and the best thing for him is to try "Trylites" and cut out electricity.

Next, he refers to his fixed charge as 11s. 8d. per quarter, and immediately afterwards says it is a standing charge of 19s. per quarter.

If "Stung" would cut out coal and gas, and use electricity properly, *i.e.*, for radiators and cooking, he should use at least 2,000 units per annum; his cost would then be 46s. 8d. fixed charge, plus 83s. 4d. for "juice," or a total cost of about ¾d. per unit. He can then cut out any question of cleanliness and convenience and come right down to brass tacks, because he is getting exceedingly good value for his money. In fact, he is buying energy at about cost price and at a price which will compare favourably with gas and coal.

I should like to know of neighbouring towns which sell energy cheaper than Manchester on the Norwich rate.

If "Stung" will *use* electricity, not play at it, he will find it the cheapest thing he ever bought. If he will compare a joint of meat cooked electrically and a similar joint cooked in a poisonous gas, he will find that he gets his electricity for nothing.

E. O. Walker.

Manchester, *August 24th*, 1925.

[The charge of 19s. per quarter was obviously, in round figures, the sum of the fixed charge of 11s. 8d. and the rent of the cooker, 7s. 6d.—EDS. ELEC. REV.]

Is There an Age Limit?

As the original query of the 10th ult. seems to have missed its mark, I venture to offer the following comments:—

To withhold one's true age is folly.

To believe that employers of labour would prefer a man of thirty against a man of forty-five provided each man has gathered equal knowledge day for day seems devoid of method in the madness. For Major Porter to cast back at us, who remained behind, that played-out theory that we were cowards shows truly weakness. Let's stick to age limits.

The difficulty seems to be that somehow or other many employers have got it into their heads that young bloods will succeed where knowledge and the hard knocks of time may fail.

In their over-anxiety to recover trade they forget that De Lesseps was 64 at the time of the building of the Suez Canal; Morse was 40 when he demonstrated the practicability of the telegraph; Stephenson was, I believe, 43, Herschel ditto, Volta 44, and many others could be cited.

Engineering is not imagination, the composition of poems or essays. It is time *v.* intellect plus possibilities. As one of 45 and out I shall not flinch from offering my past experience and fear no man of 30 if given a fair hearing. I know as a late advertiser that much of both answers to and advertisements of those 30 years old and under is false and misleading, as a careful perusal of advertisements and answers will show that the man who has been through the mill of 56 hours' work per week, plus three nights a week at evening technical classes, the rest of his spare time being spent in preparing his lessons, can easily be backed against the modern youth, to whom Sir John Foster Fraser has just appealed in his article, "A Talk to Workshy Youths."

It is not the masters that are to blame. But on the contrary, let us sink this influence, aim at investigation, cause and comparisons, remember that science is measurement. Then and then only will England and the world see, and know, that men of 40 years are not less worthy of engagement than the man of 30, nor short of intellect.

Let those of 40 be true to their colours, remember the war period and keep on trying: "It's for Britain and the British."

"All Ages Need Apply."

The Motor Repair Shop.

We have read with some interest the article on the above subject in your last issue, and the impression left on our minds is that your correspondent has succeeded in filling more than a column (exclusive of photographs) by describing two attempts at carrying out what is quite an ordinary and every-day repair. It is well known that carbonised mica leads to breakdowns, and that when the destruction of the mica segments has gone to such a depth as the author describes, the only remedy is to replace them.

We were surprised to read that an attempt was made to repair a job by filling in with cement to such a depth as half-an-inch. The result inevitably is the formation of air pockets, with obvious results. Such filling to a very small depth is quite permissible. It is the practice of most first-class repair shops to examine all armatures for shorted commutators before proceeding to any other repairs, and to replace all faulty micas. This can be done in most cases without taking the commutator adrift. Turning up or grinding a commutator with the armature in its own bearing has been considered good practice, where possible, for over a quarter of a century.

We entirely agree with the remarks about the grooving of bearing bushes (referred to as "brushes" in error in the text), and have found by experience that a very large percentage of breakdowns on d.c. armatures is due to commutator trouble arising from oil creepage.

The Development of Short-wave Radio-communication.

In an article which appeared in your issue of July 31st, I notice the following remarkable statement:—

"That attention has in recent times been redirected to short waves, *i.e.*, under 100 metres, is due to amateur experimenters having obtained surprising results over long distances with very small power, and the investigation of the new effects which have been recorded may influence future developments profoundly."

It appears to me that the writer of the article is not quite fair to other and earlier workers in stating that the attention which has been redirected to short waves is due to the work of amateurs, unless indeed he classifies myself, Mr. C. S. Franklin, and other engineers of the principal radiotelegraphic companies of the world as "amateurs."

As far back as June 20th, 1922, in a paper which I read in New York before a joint meeting of the American Institute of Electrical Engineers and the Institute of Radio Engineers, in describing the results which had shortly before been obtained by Mr. Franklin and myself with waves a few metres long, I stated that:—

"The study of short electrical waves, although sadly neglected all through the history of wireless, is still likely to develop in many unexpected directions and open up new fields of profitable research,"

stating also in the same paper how:—

"Some years ago, during the war, I could not help feeling that we had perhaps got into a rut by confining practically all our researches and tests to what I may term long waves or waves of some thousands of feet in length."

This paper was duly printed in the *Journal* of the A.I.E.E., and an extract from it appears in the issue of your REVIEW of August 25th, 1922.

In a paper read before the Royal Society of Arts on July 21st, 1924, I described a great number of tests carried out over world-wide distances by myself and my assistants with waves under 100 metres in length, and I particularly referred to the first radio communications ever established between England, Australia, and South America, by means of such short waves; and in a further address delivered before the same Society on December 11th, 1924, I described how, by means of a 32-metre wave, communication had been maintained with Australia for 23½ hours out of the 24.

Extensive reference to both these papers was made by the ELECTRICAL REVIEW in its issues of July 25th, 1924, and December 19th, 1924, and in one of your Editorial Notes of your issue of December 19th, 1924, you stated:—

"Senatore Marconi took up the systematic study of short waves in 1916, and investigations were carried out on a large scale in 1920-21, but the most important experiments have taken place during the past twelvemonth."

I do not wish in any way to belittle the results obtained by amateurs in this and other countries, whose work of patient research I have always acknowledged, as I also stated in my last lecture before the Royal Society of Arts.

I might add, in conclusion, that all the contracts of over a year ago entered into with the Post Office for the erection of "beam" stations for Imperial Communications contemplated the use of short waves only.

G. Marconi.

London, *August 19th*, 1925.

Fire at Grenoble Exhibition.—According to a *Reuter* message from Grenoble, in the course of a storm on the evening of August 19th, lightning struck one of the buildings at the Hydro-Electric Exhibition. Fire broke out and completely destroyed the building, which contained aeroplanes, motor-cars, small electrical apparatus, &c. The damage is estimated at about ten million francs. The fire was extinguished at midnight. No other building was damaged. An inquiry has established that the lightning struck an electric transformer, set fire to an awning above the roof, and thus caused the flames to spread with extraordinary rapidity.

The Development of Short-wave Radio Communication.

THE recent decision of the U.S. Navy Department to supply all naval vessels and shore stations with short-wave radio equipment, if its use proves reliable under all conditions, is an event of some significance. The increasing number of tests which are being carried out with waves of a length below the limit of 100 metres points more and more to their superiority over the longer waves for long-distance communication, and there is more than this one merit of greater penetrative power that suggests the desirability of their being utilised. The frequency of the impulses received in the antenna of the receiver increases proportionately as the wavelength decreases, hence much sharper tuning is possible and a greater degree of selectivity is obtained. Then, too, there is the considerable economy of power which can be effected by the use of short waves.

If the short-wave method of transmission were commonly adopted in the shipping services and the coast stations of this country, there would soon be an appreciable smoothing-out of the present chaotic state of affairs which prevails around 600 metres, which is the wavelength most frequently used by ship and coast stations. No one denies now that the 600-metre spark transmitting sets on ships are out of date. The coarse note which they transmit is almost invariably loosely tuned, and its accompanying harmonics are often strong enough to cause interference on the neighbouring wavelengths. It is said that a ship's operator can pick out and follow the particular note which he desires to read only by virtue of his intimate acquaintance with its distinctive pitch or "musical" quality, but such practice as this places too hazardous a reliance upon the skill of the operator, and renders his task unnecessarily difficult.

The objection to the wholesale replacement of ships'

spark transmitters by up-to-date equipment is, of course, the expense which would be involved, and apparently the most that can be hoped for is the gradual replacement of these sets, as they become worn out, by modern c.w. installations, probably designed for operation on short waves. In many of the French coastal stations, the expense has not been allowed to stand in the way of the complete substitution of efficient c.w. transmitters, and it seems to be the intention of the U.S .Navy Department to follow this example, but in the American case, closer attention is to be given to the utilisation of short waves.

It is worthy of note that, just as the very short waves have remarkable power for covering long distances, the long waves, especially those in the neighbourhood of 20,000 metres, have a particular utility in signalling over relatively short distances, a characteristic which probably accounts for the earlier development of the long-wave system, for it is only within comparatively recent years that serious attempts have been made to communicate by means of radio-telegraphy and telephony over really long distances. Last week we were taken to task for being "not quite fair to other and earlier" workers, in stating that the attention which has been re-directed to short waves is due to the work of amateurs. Our use of the word *re*-directed, however, indicated that we were not unmindful of previous professional investigations, but it does seem that either the deductions which followed therefrom must have been faulty, or the long-wave system was deliberately developed in preference; moreover, it is not so long ago since short waves were relegated to the use of amateur operators because they were considered to be of no particular value to anyone else.

Not quite nine months ago, we drew attention to the fact that Senatore G. Marconi "took up the systematic study of short waves in 1916, and investigations were carried out on a large scale in 1920-21, but the most important experiments have taken place during the past twelve months," *i.e.*, in 1924. It will be noted that four years elapsed between the subject being taken up and the carrying-out of large-scale experiments, and that the most important of them took place three years later still, resulting in the comparatively short-wave "beam" station proposal. Amateur workers must therefore be congratulated, not only for boldly utilising very short waves, but also on the success with which their efforts to produce results quickly have been crowned.

The British Association.

The annual "Parliament of Science" has concluded its session at Southampton, one of the most successful in its history from the point of view of the numbers attending. As we stated in our last issue, the meeting compared badly with the Southampton meeting of 1882, so far as electrical matters were concerned, but it has to be remembered that electricity in those days was an infant science with a wide future, presenting a number of problems which have now become history. To-day, although the outlook is still a broad one, electricity is established and the main business is not so much investigation and research (although these are still of the greatest importance), as development and extension. In other words, the business aspect predominates. Consequently, what little there was relating to electricity as a science was mainly concerned with wireless work, *e.g.*, the papers on "The Study of Wireless Wave Fronts by Directional Methods," by Dr. R. L. Smith-Rose and "Some Thermionic Valve Problems," by Prof. E. V. Appleton. The Engineering Section expended a great deal of its time in discussing the question of road transport; one or two mornings, however, were devoted to marine engineering matters with which the president of the Section, Sir Archibald Denny, has had a life-long acquaintance. The only strictly electrical papers were those by Mr. W. G. Turner and Mr. H. Wauchope dealing respectively with the Southampton Corporation electricity undertaking, and the electrical equipment of the docks—both of an eminently practical nature.

The popular Press has again been provided with the usual number of startling headlines—usually mere "asides" in the papers—but it cannot be said that the bulk of the matter was to be comprehended by the layman. It was one of the first principles of the Associ tion that its annual meetings should enlighten the pu lic as to what had been going on in the scientific wor during the preceding year, but there has been a regre able tendency for the past few years to forget thi Many papers are couched in language that can only grasped by experts in the particular branch of scien which is being treated—those who may be considered know all about the subject already. We cannot expe every scientist to have the gift of Sir Oliver Lodge ar other well-known teachers, of imparting abstruse info mation in simple terms, but we think that a greater effo might be made in this direction.

The Lessons of the Japanese Earthquake.

Every trade report which reaches has something to say regarding t necessity for British manufacturers make a close study of, and adapt the methods to, conditions in each partic lar market. Although this general applies merely to normal conditions, there are sever countries in which the probability of the occurrence the abnormal has to be taken into consideration. Jap is an example of this; the severe earthquake of Se tember, 1923, and the slighter subsequent disturban have brought forcibly before the Japanese the fact th all possible measures must be taken to render buildin and plant immune from the effects of these unforese able disasters.

We review in this issue a report prepared by t Japanese Electrotechnical Committee, and presente at the recent Extra-high-pressure Conference in Pari dealing with the effects of the 1923 earthquake up electrical installations, and containing suggestions f meeting the conditions to which Japan stands expose

The stations principally affected by the disturban were hydro-electric undertakings; the steam plants the area, although damaged, were not in use at t time, as most of them act as stand-by stations to t water-power plant. The Hakone system suffered t most, some stations being totally destroyed, whi others took a long time to recover. A considerable pa of the transmission systems was damaged and su stations were put out of action, but these required shorter time for repair. The report deals in son detail with the nature of the damage caused to each cla of building or apparatus, and an outstanding featu is the fact that rotating machinery generally remain undamaged, although in many cases its foundatio were cracked.

The report presents a number of conclusions an suggestions for mitigating the effects of future eart quakes. It is stated that if proper precautions a always taken in interior wiring there is little risk fire, and the service should be resumed immediate after the cessation of the principal vibrations. T transmission systems should be efficiently inte connected to enable the unharmed stations to take ov the supply to consumers connected with destroyed st tions. It has been proved that it is possible to co struct sub-stations and transmission lines almost eart quake-proof; new ones should be built in this wa and steps should be taken to reconstruct existing buil ings and lines to make them earthquake-proof. Speci attention should be paid to the communication circui between generating stations and sub-stations, &c. It thought advisable to construct a loop transmission li around a large city capable of being connected to a incoming transmission lines, so that a source supply will always be available. For public servi buildings, such as water-supply stations, fire station telephone and telegraph buildings, &c., it is recon mended that special, independent earthquake-pro lines should be installed, and emergency communicatio measures should be adopted.

We think that a study of some of the details of t report, particularly those relating to sub-statio

pparatus, transmission equipment, and domestic in-allations, will be of interest and profit to British anufacturers who have business relations with Japan.

Buying a Washer.

Engineers buy many kinds of washers, without thinking it necessary to keep a diary of events, or enlisting the assistance of their wives; but the urchase of an electric washer, of the sort that washes othes, and costs from £45 to £60, is so exceptional a ansaction for an engineer to be engaged in, that a com-ete record of the proceedings, such as that commenced this issue over a well-known pseudonym will be found ell worth perusal. Our contributor's foresight is com-endable; as he points out, once an appliance has been urchased and put into use, one can never regain the oint of view from which the question was originally proached. So he records his investigations and im-ressions from the very start, and they will be found not ly interesting, but useful and suggestive to the maker d the seller, as well as the purchaser of an electric asher.

Many readers will endorse the author's remarks on the gh price of the electric washer; it is certainly difficult believe that the cost of production, even in small mbers, can be more than half the price at which the achines are offered to the public. We are not told hether the washers referred to were of British or reign manufacture, but in view of the enormous mbers in use across the Atlantic, it would seem that e American machines are produced in bulk, and, erefore, should be cheap in comparison with those ade in small numbers in this country—yet we have ver met with a low-priced electric washer. It cannot alleged that the cost of marketing the machines forms large proportion of the price, for no one will contend at they are extensively advertised here—and our con-ibutor's experience strongly suggests that little effort made to induce the public to take an interest in them. pparently the selling staff, in some of the cases he met th, cared little about the matter.

There must, however, be a very large body of poten-al purchasers, who only need convincing of the merits the electric washer to make the plunge, like our con-ibutor, in spite of the high initial cost; and the con-uding portion of his article, in which he demonstrates e remarkable economy effected by the washer, which ys for itself within twelve months, should go far wards that end. It is true that the washer load is of tle value to the supply authority in itself, but the me might be said of the electric iron and the electric ttle, which are well-known to be most effective pro-oters of the domestic load in the aggregate. Similarly, e electric washer, which is emphatically a labour-saver, uld strengthen the case for the electric way in the ouse where it was used, whilst it would also form so uitful a topic for conversation that it would become invaluable advertising medium in the neighbourhood, pecially in view of its rarity in British households at esent. We therefore commend the article to the ttice of our central-station readers who, if they are t interested in the promotion of the domestic load, ght to be.

London Goods Railway.

According to reports in the Press, proposals are under consideration for the construction of a network of underground goods railways, connecting the ndon termini with the docks and with the principal stributing centres. The project is estimated to cost 2,000,000, and a promotion company has been formed obtain the necessary statutory powers.

It can hardly be doubted that such a railway would be immense benefit to the metropolis, in which an enor-ous amount of goods traffic is carried on; not everyone ows that the Port of London is the principal seaport this country, its annual aggregate tonnage entered d cleared exceeding 20,000,000 tons. There is also a st amount of goods traffic between London and the ovinces by land, as well as internal traffic between the rious members of that overgrown agglomerate of cities, which might be most conveniently handled underground, relieving the congested streets of much of their present burden. The scheme includes the construction of a huge central underground station, to serve as a clearing house, which reminds us of the ingenious project put forward by Mr. Gattie years ago; impracticable as a surface proposition, the Gattie scheme might be worthy of consideration in connection with underground goods railways.

If the proposals are carried into effect, the railways will, of course, be operated electrically, and will also offer a considerable demand for electricity for lighting and power. It is interesting to recall that a similar network of railways has for many years been in operation in—or rather under—Chicago; in that case, we believe, the tunnels were already in existence, and thus a considerable economy was effected. The Post Office has also led the way by constructing a tube railway from east to west for its own purposes, which is approaching completion. The scheme certainly appears to be worthy of close examination, and we trust that it may prove capable of solving, at least in part, the perennial problem of London's traffic congestion.

Service and Advice.

We may be excused for turning once more to this subject if we point out that according to the best authorities the success of electricity in the United States, which is constantly held up to us as a model, is mainly due to the way in which the various branches of the electrical industry have hastened to serve consumers' interests and advise upon the best methods to adopt. New phases of the matter are constantly coming to light in the United States, and it may be of interest to mention two of the latest. The first is the cost of electrical service, with particular reference to cookers. The National Electric Light Association recently collected data from a typical central-station company with 4,000 cookers on its system with a view to ascertaining the cost to the company and the benefit to the consumer. This company makes no charge for "servicing" cookers, no matter how old they are, and the approximate cost of this arrangement is about $20,000 per year. In 1923 there were 2,348 cookers in use, and 6,059 complaints (2.5 per cooker) were received and disposed of at the cost of $2.57 per complaint. In 1924 the number of cookers rose to 8,956, and the number of complaints to 3,972; the cost per complaint, however, fell slightly to $2.45. There is a fear that this form of service will ultimately prove very expensive to the company as the appliances in use grow older; unless some sort of charge is made, consumers are apt to be careless in handling their cookers and call in the company's men for the most trifling things.

Another matter which has recently been discussed at considerable length in the United States is the providing of illumination advice to the consumer. In this country a great deal is being done by the Electric Lamp Manufacturers' Association. (It will be understood that free advice is meant, as apart from the engagement of professional consultants.) The view adopted in the United States, however, is that as the supply companies gain most from electric lighting, they should provide most of the free advice to consumers.

The *Electrical World* says that a survey has indicated that less than 10 per cent. of the users of light who actually seek advice go to the electricity supply company for it, although, it is said, 90 per cent. of the cost of lighting is due to the electrical energy consumed. The supply companies should, therefore, supply a similar percentage of the advisory service, but in spite of this, few American companies have lighting departments and fewer still are able to take care of 90 per cent. of those who now seek advice. We would not like to say how far American conditions are on all fours with conditions in this country, but we think that our own supply authorities could do a great deal to improve illumination, and, incidentally, benefit themselves, by advising consumers as to the best methods to adopt. No doubt E.L.M.A. would render assistance to this end.

The Wynau Power Station.

Some Particulars of a New Propeller-Type Turbine.

The capacity of the old power station at Wynau, Switzerland, having become insufficient to meet the electricity requirements of the district, the directors of the Société des Entreprises Electriques de Wynau some time ago decided on the construction on the left bank of the river of an entirely new hydro-electric station of 10,000 h.p. capacity, the power being obtained from the same barrage as the station on the right bank.

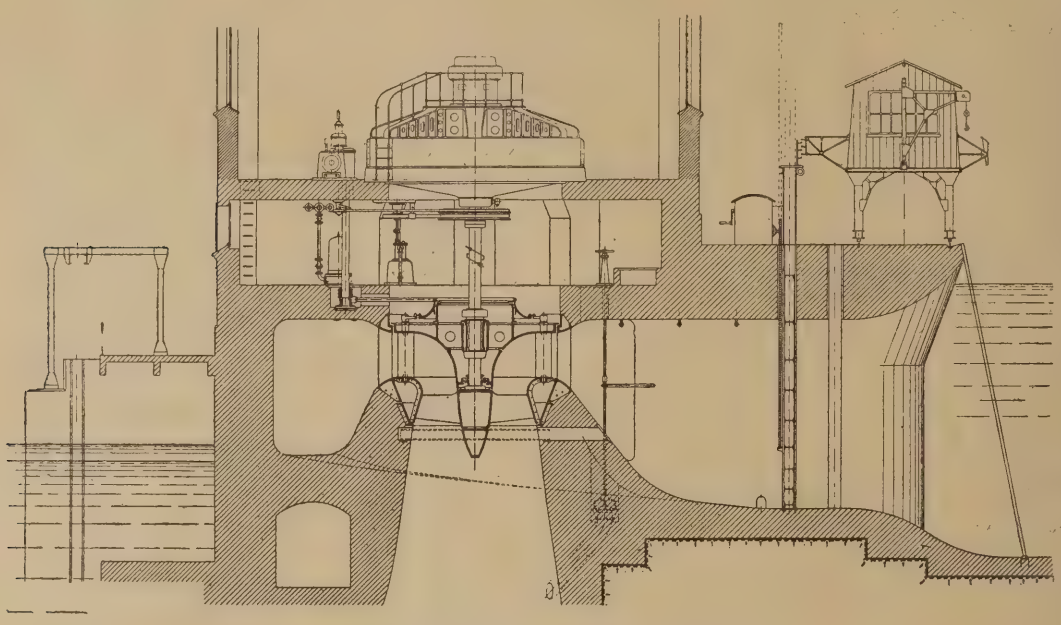

Fig. 1.—Sectional Elevation of one of the Wynau Turbines.

The turbines of the original plant, which develop 860 h.p., drive the alternators through the medium of somewhat large conical bevel gearing. To overcome the drawbacks of this method of driving, it was decided, for the new plant, to take full advantage of the latest turbine practice and to equip it with turbines having wheels in the form of ships' propellers.

The principle of this type of turbine is an old one; the early Jonval turbines, for example, were fitted with impelling wheels, on the periphery of the inner rim of which a series of blades was mounted. The curvature of the blades was mounted somewhat acute, on account of the relatively low peripheral speed possible at that time; not only so, but the water was conveyed to the rotor by an axial distributor not well suited to vane adjustment. As far back as 1860 an American inventor of the name of Traux patented a turbine with a four-blade propeller without an external rim, the water being led to it by a spiral-shaped chamber. Horton, in 1877, and Williams, in 1893, also both designed turbines with impellers of very much the shape of ships' propellers, but provided with subsidiary blades shorter than the circumferential space between two consecutive main blades.

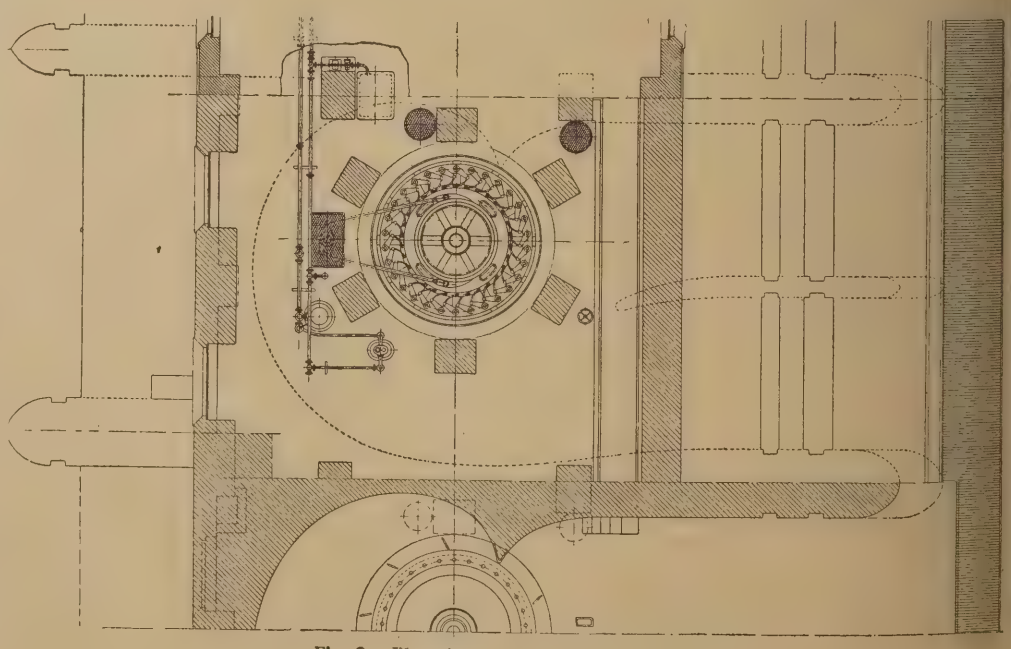

Fig. 2.—Plan of one of the Wynau Turbines.

The development of the Francis turbine with centripet admission and axial outlet led, however, to the abando ment for a time of the propeller turbine.

The object of all propeller-type turbine designers h been to increase the speed in order to permit of t direct coupling of electric generators and so effect reduction of installation costs. In order to dimini the friction due to the higher speeds, the number a length of the blades have been reduced, and to preve any eddies a mo simple and less curve shape was given them. Due, finall to the progressive r duction in the di meter of the disk hu to which the blad are fixed, a retur has been made step b step to the shape ind cated, as mentione above, by Willian and Horton. It mainly to the effor of the American eng neer Nagler, of Mi waukee, and of Pro Dr. Kaplan,* Brunn, that t modern improvemer of this type of turbi is due. Followin the excellent resul secured, and pul lished by Kapla most turbine manufacturers recommenced the constru tion of screw-type turbines. The Société des Ateliers d Constructions Mecaniques, of Vevey, Switzerland, whic for a long period has experimented with high-spee turbines, made some trials in its experimental depar ment with one of these screw wheels of a diameter 380 mm. (practically 15 in.), and it was as an outcom of the results of these tests that the Wynau Co. place an initial contract with the Vevey Co. for two screw-typ turbines designed to work with water at heads varyin

* *See* World Power Conference Paper No. 64, "Historical No on the Kaplan Turbine," by Dr. Ing. S. Kneidl.

om 7¾ to 17 ft., and to develop a maximum of 2,700 p. each at a speed of 107 r.p.m.

Figs. 1 and 2 represent the elevation and plan, and f. 3, is a general view, of one of the Wynau turbines. ch turbo-alternator set is provided with three main arings, of which two are embodied in the alternator. e thrust bearing of the turbine, mounted on the cover the distributor, is of white metal lubricated with circulated by a small pump driven by gearing the turbine shaft. The water is conveyed to the distributor by means of a cement spiral chamber, the inlet which is symmetrically arranged in order to facilitate, the elimination of eddies, the regulation of the ter delivery by means of the usual vane wheel. The me-work of the turbine, which is of heavy construction and consists of two cast-iron rings held together 10 columns cast with them, supports the turbine, the ernator, part of the flooring, and also the load of pivot. The shape to be given to the outlet pipe was subject of much special study by son of the considerable speed possed by the water on emerging m the driving wheel, which corresnds to one-fourth, and even one-rd, of the total energy. A special fuser was finally adopted to enable greater portion of this residual rgy to be recuperated. The driving eel is a single steel casting, and is nposed of a hub with four blades hout a peripheral rim, the shape ng, as indicated in fig. 3, roughly t of a ship's propeller. The diater is, however, slightly greater at exit edge of the blades than at the ry edge; they are relatively long to ilitate the guiding of the liquid eam and to prevent eddies. The eel, which is bolted up to a coupling lk, forged in one with the turbine ft, rotates in a readily dismounte cast-iron casing. When it becomes essary to dis-assemble the alter-or, the wheel, together with the ft, can be supported in channels med in the walls of the cement outlet pipe. The or of the alternator can be supported on a bottom ssbar by means of jacks provided for the purpose.

The water distributor, which is of a type similar to t of the Francis turbine, consists of a bottom ring rying the conical casing of the impelling wheel, a cover and 30 pivoted cast-steel vanes. The turbine mework and distributor are divided axially. The rnals are in one piece with the vanes and work in nze guides. The upper journals pass through the tributor cover and carry at their extremities adjust- levers connected with the sluice-control rings by all bronze connecting rods, the latter being made ible in order to prevent undue wear of the vanes uld any foreign body penetrate between them at the ment they are closed. The pivot of the main shaft unted on the cross member of the alternator supports only the weight of the rotating portion of the turbine alternator, but also the axial thrust of the water on driving wheel, it being possible for the load to reach otal of 82 metric tons. It is of a type patented by Vevey Co., the object being to ensure a uniform divin of the load on all the segments and over their entire lth.

With regard to the control of the turbine, the regula-, mounted in the alternator room, comprises a frame-k which forms an oil reservoir, a servo-motor, and ernal control apparatus. The servo-motor, which has differential piston, acts, on the one hand, on the dery to the pivoted vanes of the distributor, and, on other, by means of a cataract and a system of rods the compensating orifice (pressure regulator) in the mber below the turbine. The servo-motor is conlled by a governor connected with the distribution ve; a small auxiliary servo-motor is also provided so t all that the governor—which is enclosed and driven by belt off the turbine—does, is to move a small adjusting needle. The regulator is also provided with two special fittings, one of which allows the turbine speed to be controlled from the switchboard, while the other enables the speed to be reduced while the turbine is running. Each of the two turbines is provided with a couple of safety devices; one effects the automatic closing of the turbine should the governor of the regulator cease to function owing to seizing or belt troubles; the other consists of a centrifugal regulator fixed on the turbine shaft and so set that should the speed exceed 120 r.p.m. a catch, which is connected with the oil distributor of the regulator, is released, so causing the stoppage of the turbine. The two initial screw turbines at Wynau were put in operation in October, 1923, and were run by the Vevey Co. until the reception tests were carried out in January, 1924, under the direction of the Hydrometrical Bureau of the Swiss State Water Service, the power developed by the alternators being measured by officers of the Testing and Standards Station of the Association Suisse des Electriciens. The tests showed that with a head of 17 ft. a maximum efficieney of 89 per cent. was attained. At a specific speed of 728 r.p.m., and at a specific speed of 862 revolutions with a head of 4 metres (13 ft. 1½ in.) the efficiency was 86 per cent. Although the available head at Wynau ranges between 7¾ and 17 ft., the variations in delivery are only about 8 per cent. With a 16½-ft. head and working at full load, the turbines develop 2,730 h.p. at 86 per cent. efficiency, while at seven-eighths load an efficiency of 87.7 per cent. is attaned.

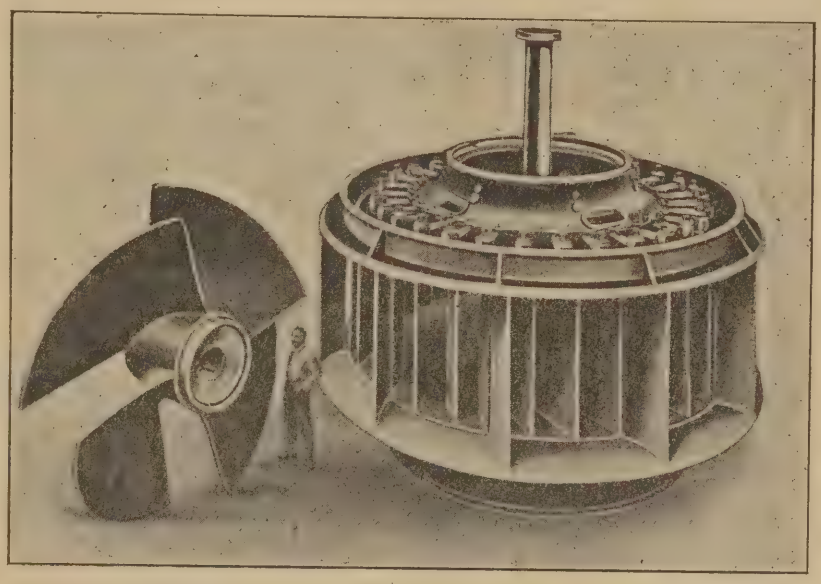

Fig. 3.—General View of one of the Wynau Turbines.

As a result of their satisfactory operation an order for two additional turbines for the Wynau station has recently been placed with the Vevey Company, which summarises the advantages of the propeller turbines as follows: They are particularly well adapted to utilise at a minimum cost the power of rivers in plains, furnishing large volumes under low heads, and also in cases where there is much variation in the head of available water. As compared with the Francis type, higher speeds are possible, reducing the cost and size of the alternators, and also the size of the power station buildings. Not only is the efficiency, when working at from three-quarters to full load, high, but the higher angular speed of the alternators also increases the efficiency of the latter. Finally, owing to the wheel having only four blades and these cast *en bloc* with the hub, it is claimed to be stronger than a Francis wheel.

American Electric Vehicle Exports.—During June last 20 industrial electric vehicles valued at £4,616 were exported from the United States, as compared with only 8 (£1,243) in the corresponding month of 1924.

Choosing and Using an Electric Washer.

Diary of a User's Experience.

By "WREN."

DEPRESSED by the shortage of competent and trustworthy domestic labour—unemployment figures notwithstanding—and alike oppressed and incensed by the charges of, and services rendered by, steam laundries, hand laundries, and their kin, the writer has decided to investigate the possibilities of electric washers. Please note the tense of this announcement! At the time of commencing this article the washer has not been purchased, not even chosen, but it seems evident that if this record is to be of help to others it must be made in the form of a diary. Once a washer—or any other piece of electrical apparatus—has been purchased and used for some time, it is impossible to regain the standpoint which one formerly occupied. However honest one's intentions, notes written after the event must be affected by the lessons of experience. Hence, at the possible expense of other considerations, this record starts with the writer as an interested and hopeful inquirer. How it will end remains to be seen, but, if the Editors of the ELECTRICAL REVIEW will permit it, it shall be published as it stands. Perhaps users of other electrical appliances will present their experiences on the same system. A contemporary record written each day, or week, from the experience of that period must have certain merits attainable by no other means.

The First Step.

To-day, December 8th, 1924, a long series of "Black Mondays" has culminated in one blacker and more fatiguing than usual. Also Christmas and the problem of presents are upon us. Are electric washers really any good and, if so, can we afford one?

A mental review of our acquaintances reveals the fact that none has an electric washer. This looks suspicious, especially as we have noticed machines more or less casually at exhibitions for years past. On the other hand, reliable reports from Canada and the United States say that hundreds of thousands of electric washers are used in those countries, and periodic "washer campaigns" by central station authorities add hundreds of washers a month to the mains.

Evidently there must be something in the washer *per se*, whatever the reason for its rarity in this country. Inquiries from the local electricity offices and from Mr. J. W. Beauchamp, of the Electrical Development Association, bring forth a list of reputable makes and also make clear the probable cause of the fewness of electric washers in British homes. It is a matter of first cost. The energy consumption is a negligible item—less than that of an electric iron—but the initial outlay of forty, fifty, or sixty pounds for a "first-class machine" and of, say, twenty-five pounds for a "mechanical washer fitted with a motor" is rather staggering.

Still, money is cheaper than flesh and blood, so we will proceed, a little less exuberant than before, but still hopeful that, either by outright purchase or some form of "easy payments," we may acquire a machine to perform the most irksome of all domestic duties. A few minutes on the telephone and the good offices of the friends mentioned have given us a start and provided us with information on which to base a tour of inspection.

The local electricity supply office—in a London borough of 100,000 population!—is perfectly courteous in the matter, but has only one copy each of the pamphlets describing three different makes of washers. These are lent to us on the understanding that we will *return them some time when passing!* Evidently anyone else in the neighbourhood who contemplates the purchase of a washer will have to wait till we return the pamphlets. No doubt the makers of the machines would supply a thousand copies of these descriptive leaflets to the electricity department on demand, but, in this district at any rate, it is evidently no one's business to advance the cause of the electric washing machine. The nearest machine on view in an electricity showroom is five miles away, so we are informed. As there seems to be some doubt on this point, we decide to visit the maker's showrooms.

Viewing Machines.

Without mentioning names, for to do so might lead to invidious distinctions, the first firm visited may be termed Messrs. A. Two machines were on view in an admirably-appointed showroom, but neither machine could be seen in action—disappointment No. 1 from our point of view, mistake No. 1 from the seller's point of view. However admirable the verbal explanation, we would have liked to see in action the machine for which we were asked forty-five pounds. Even in the case of the cheaper equipment, costing a mere ten or twelve pounds, a little electricity, a few clothes, and an actual demonstration of what could be done in ten minutes would have been both interesting and convincing.

However, no signs of a demonstration being forthcoming, we proceed to inspect the inanimate machine. The demonstrator appointed to assist us—possibly not the regular demonstrator, but still the person entrusted with the potential sale of an expensive machine—is most courteous and, up to a point, helpful, but does not know: (*a*) Where the emptying cock is—or even if there is one at all! (*b*) What power the machine absorbs. (*c*) What is the purpose of a certain device which, we soon find out for ourselves, is designed to release the pressure on the wringer rollers instantly in case of emergency. (*d*) Whether the wringer can be fixed in any desired position and, if so, how. (*e*) How a certain important pair of gears is lubricated. All of these problems we were able to answer for ourselves, but it ought not to have been necessary for us to do so—mistake No. 2 from the seller's point of view!

Also, though this machine has well-arranged switches and gearing, the demonstrator shows no response to our suggestion that we should like to look inside. If there is any reason why the covers of this particular machine cannot be removed, surely specimen switch and gear boxes could be kept permanently open for inspection? Mistake No. 3 for the seller.

A visit to Messrs. B. reveals another machine similar in many respects to the one first seen, and in this instance there is no hesitancy as to the location or purpose of any part. There is again no demonstration of the machine in action, but—important advance—there is a pressing offer to have the machine demonstrated in our own home. This offer we decline with thanks, feeling that we should be committed to some extent did we accept. Still, we should like a demonstration, and it ought to be on the seller's premises. Electric vacuum cleaners are performing all sorts of marvels over the way, so why cannot the electric washer be dealing with some of the staff laundry?

Messrs. C. bring to our notice a comparatively inexpensive equipment, with no wringer, it is true, but, on the other hand, it washes the clothes and boils them at the same time. This seems to be an advantage, but: (*a*) We have a gas-heated "copper" already, and (*b*) we happen to know that electric heating is rather expensive when gallons of water in an unlagged vessel are concerned—by the way, the demonstrator does not point this out. He ought to do so—it is a fact which could not be concealed once the meter had been read!

In view of the great difference in price between this and the other equipments so far inspected—some £35 *difference*—we do a little mental arithmetic. The expensive machines consume about 200 watts, *i.e.*, half as much as our electric iron, and could be run from a lamp socket. The cheaper outfit consumes 2,000 watts and would involve a power cable; on the other hand, the latter would give us the benefit of the power tariff of 2¼d. per kWh instead of 7d. as for lighting. Per hour of use, the dearer machine would cost 1.20d. and the cheaper one 4½d. for energy alone. This is a considerable difference, but it would take $\frac{35 \times 240}{(4.5-1.2)}$ or 2,550 running-hours—about 16 years at three hours a week—to save, on the energy bill, the extra cost of the dearer machine. Having the advantage of a slow-combustion anthracite stove which provides abundant hot water at the cost of a few pence per day, we could eliminate the use of the electric heater for bringing water up from cold, so that the actual energy bill would not differ so much between the two equipments as would at first sight appear to be the case.

Here, however, the feminine member of our committee of two steps in and asserts that in her opinion—which is, of course, final in such matters—the motor-driven washer will deal with more clothes, and more effectively to boot. Also, it gives the advantage of a motor-driven wringer, which is no small consideration.

Thus ends the first day's inspection—definitely in favour of a motor-driven washer and wringer. From the excellent workmanship of the machines so far seen, and bearing in mind that they embody a first-class ¼-h.p. motor, a substantial washing vessel and cylinder, a first-class wringer, and the requisite gearing and switches for automatic washing and for wringing in either direction from any angle, it is already evident why the first cost is high. The equipment and the facilities offered exceed our expectations, but, more than satisfied though we be on these points, it is evident that electric washers cannot be used extensively in this country until the price is reduced—and if they were in general demand the price would doubtless be lower. Once again the vicious circle of high price and limited demand appears and, as in other cases, its paralysing consequences must be broken by the price being first reduced so as to increase the demand.

From a consideration of the retail prices of the principal components of an electric washer it would appear that the amount charged for these machines could quite well be reduced. The following retail prices have been quoted to the writer to-day:—

¼-h.p., d.c. motor, from £5 15s. to £8 10s.
Wash-tub on stand, from £1 15s. to £2 5s.
12-in. wringer with rubber rollers, £1 10s. to £2.

Doubling the price of the wash-tub to allow for the cylinder of an electric washer, the sum of the above three items is from £10 to £15. The difference between these figures and that of from £45 to £60 asked for complete electric washers is from £35 to £45, surely an excessive amount for the gearing and assembly of the components.

Consumers, as a class, cannot afford the high-priced washers of to-day, but manufacturers can afford a temporary loss—or rather an investment—on bulk production of a low-priced machine of high quality. That an adequate demand would be forthcoming cannot be doubted.

Already, it will be perceived, the writer is an enthusiastic believer in the electric washer. It only remains to decide which machine shall be purchased.

Constructional Faults and Merits.

Since writing the preceding section, several more machines have been seen and several showrooms have been revisited in order to confirm, or correct, first impressions in the light of further experience. As a result, many points have been noted, and it may help potential users to have a summary of constructional faults and merits as seen by the writer and his wife from the engineering point of view and from the standpoint of the user respectively. In stating what, in our opinion, are good features and what weak, mention of specific makes is purposely avoided. No machine seen possesses all the good features, and none all the drawbacks cited.

Desiderata in Electric Washers.—In point of electrical and mechanical safety, all the machines inspected reach a high standard. The risk of shock appears to be definitely eliminated and it is, of course, essential that this should be so in a machine which may be used on damp stone flooring and supplied from 200-250-volt a.c. mains. The motor should be definitely insulated from the frame of the washer by mounting the motor on an insulating base and connecting it to the load through an insulating belt or coupling.

The use of sheet-metal doors to protect the motor completely from splashes of water, whilst eliminating the risk of skirts being caught by rotating shafts, belts, or couplings, is a good feature. Naturally, such doors should give complete and easy access to the motor when desired. Some form of clutch must be embodied between the motor and load, and it appears to matter little whether this is in the form of a friction clutch, or of a belt which serves as a clutch whilst taking the place of part of the speed-reducing gear otherwise required.

The duty to be performed in most of the machines inspected is the oscillation of a relatively heavy cylinder through water, which adds to the inertia to be overcome at the moment of reversal. The nature of this drive, together with the conditions of service and the more or less unskilled manipulation to be expected, makes it desirable that gears, clutches, and other parts of the mechanical transmission should be of relatively heavy construction. The gears must be machine-cut and thoroughly lubricated, otherwise the frictional loss becomes excessive.

A press-button switch on the washer itself (in addition to the wall-plug switch) is desirable in the interests of economy and safety. All mechanical controls should be conveniently situated; easily manipulated when the hands are wet; not liable to be displaced accidentally; and capable of movement without risk to the user or the machine, whatever the position or state of motion of the component parts. Preferably, it should be possible to lock the wringer in any position with regard to the vertical axis round which it swings.

Some place or method for supporting the "lid" of a washing cylinder without dripping on to the floor whilst emptying or filling the machine is an obvious convenience, but one which is not always provided. An indication of the correct water level given inside the washer is much more convenient than the usual filling line marked on the *outside* of the container.

Limitations or Defects Noted in Existing Machines.—The sheet-metal door enclosing the gearing of a certain machine is secured by a catch which is very easily displaced. It is conceivable that this might lead to a nasty accident, especially as the catch must offer temptation to a young child. A limitation common to most of the oscillating-cylinder machines inspected is that no provision is made for fitting the drain cock at the other end of the machine if desired by the user. This is not so trivial an objection as it may sound, for in these days of diminutive houses it is not always easy to move the machine for connecting a hose pipe to the existing outlet.

In one excellent machine the main control handle is distinctly liable to catch the knee or leg of a passer-by; apart from any discomfort thus occasioned, there are the unpleasant possibilities of unexpected starting or stopping of the machine. In another machine the control handles are arranged very neatly, but on attempting to use them the writer found that their clearance was insufficient; a bruised thumb was the result, and had the skin been softened by moisture the mishap would have been more painful.

The press-buttons on the washer (for starting and stopping the motor) are sometimes placed where they might be actuated inadvertently by the user leaning

over the machine. One of the main advantages of press-button control is sacrificed if the buttons are not placed in the most convenient situation.

The method of securing the lid or door of the washing cylinder itself is generally good, but in one machine an extraordinarily primitive device is employed. The consequences of the lid coming off whilst at the bottom point of its revolution can be visualised so easily that there is no excuse for providing an inadequate latch. In some machines the details of the safety pressure-release on the wringer are so much inferior to those of other makes as to be reckoned a defect when making a critical comparison.

Grease cups and grease-packings are used extensively on electric washing machines, and in most cases they ensure satisfactory running for long periods with a minimum of attention, but in several machines there are a few parts which require much more attention than the rest and—this is the point—there is no apparent reason why these parts also should not have been made self-lubricating.

Separate pressure screws at each end of the wringer rollers introduce the risk of applying uneven pressure. A single central device for applying pressure, with equalising bars in the mechanism, would be preferable, provided that it could be combined with reliable means of releasing the pressure instantly in an emergency. A safety device to prevent fingers being trapped by the wringer rollers would presumably be compulsory in any machine with similar risk for use in factories, and there seems to be no reason why it should not be embodied in clothes wringers for domestic use. The risk of such an accident occurring is quite appreciable. Machines which have not a flat top for use as a table during 6½ days of the week are at a definite disadvantage, particularly in the small home where space-sparing is the guiding principle of the architect, and hence, perforce, of the householder. The complete enclosure of the framework or stand of the machine appears to be desirable on grounds of cleanliness. The open lower framework of some machines offers many lodgments for dust and many corners which are difficult to clean. A plain sheet-metal enclosure affords protection in both directions and is easily wiped down.

(To be concluded.)

The Hydro-Electric Exhibition at Grenoble.

By Our Special Correspondent.

An important exhibition was opened in May at Grenoble, in the French Alps, a noted centre of development in connection with hydro-electrical engineering, and a favourite holiday resort, the town being situated in a district of exceptional interest and beauty. A large block of buildings has been devoted to exhibits of water-power plant, in which most of the space has been taken

Fig. 1.—Water-power Section of Grenoble Exhibition.

up by French makers of such machinery and accessories (fig. 1); heavy turbine plant has been installed in an annexe.

The exhibits are to a large extent made up of contour models, photographs, and diagrams, the photographs being, as a rule, very well done. Some of the most interesting exhibits are those of companies in districts where water power is linked up with steam-power stations.

French Water-power Areas.

One can see that, so far as present development and future possibilities in France are concerned, the Rhone, with its numerous tributaries from the Alps, easily takes first place, followed by the Pyrenees and then by the watersheds of rivers having their sources on the southern and western sides of the great Southern Plateau, between the Loire, the Garonne, and the Rhone. The Dordogne, which runs for many miles through a sort of chasm, is one of the rivers which are being utilised in this last district.

Contrary to what one would suppose, there is but little water power on the western side of the Vosges, although on the eastern side there are some important installations, and there is evidence that on the Alsatian side of the Rhine from Strasburg to the Swiss frontier very important developments will take place in the near future in relation to a combined canal and water-power project.

In the northern districts there is very little scope for water power, although development will take place shortly in the valley of the Chevreuse, the pretty rural district near Versailles.

In the Alpine districts of France the glaciers form in many cases natural reservoirs, which tend to reduce the seasonal variations. In the Alpine, Pyrenees, and Central Plateau areas the water has, in many places, cut deep gorges through sound rock, so that large quantities of water can be held up with short dams arched in plan.

The linking-up of the Rhone valley from the Swiss frontier near Geneva to its mouth is going ahead slowly but surely, the canalisation of the river for heavy barge traffic forming part of the scheme; the construction of a tunnel for 1,400-ton barges into the Marseilles docks is one of the most remarkable engineering undertakings going on in Europe at the present time.

If one can judge by photographs and exhibits of steel towers, a number of installations are in progress at from 90,000 to 150,000 volts; it is interesting to note the way in which certain national tendencies influence design, some of the long-span towers being somewhat over-elaborate and expensive in design, whilst others are of the less expensive American type.

Italian Power Companies.

The Italian power companies and manufacturers have made a valuable contribution to the Exhibition, a special building being set apart for their exhibits. At first sight one would think that the water-power developments would be almost confined to the northern Alpine glacier-fed districts, whereas, in fact, great developments have taken place in Southern Italy, Sicily, and Sardinia in districts supposed to be poverty stricken large bodies of water being held up by dams which make artificial lakes, irrigation going hand in hand with the electrical developments. An interesting and ingenious diagram is to be seen in this section. By means of miniature red and white coloured lights to denote steam- or water-power stations, placed on a large scale relief map of Italy, which lamps are switched on in groups, the progress of electricity supply from 1891 to the present day can be seen in five-year steps. The progress of the last few years has been remarkable.

In the same section the firm of Marelli has an interesting stand, on which are to be seen a 2,000-kVA 55,000/6,600-V, 3-phase transformer and a small turbo

generator; a number of table and other fans represent a line of business in which this firm has obtained an important position.

Another firm that has a reputation outside the limits of Italy is that of Richard-Ginori, a concern that has been for many years a manufacturer of high-class porcelain ware, and, like the Frank Haviland Co., of Limoges, has taken up the manufacture of porcelain insulators. This firm exhibits pin insulators for a working pressure of 80,000 volts, although some power concerns in England and elsewhere begin to use suspension insulators at about 30,000 volts. There are also on view several types of suspension insulators by this maker for very high pressures.

Swedish Section.

A wooden building of an artistic character is used to house the Swedish exhibits. A special feature is a panorama of part of the Gellivara Railway, which trans-

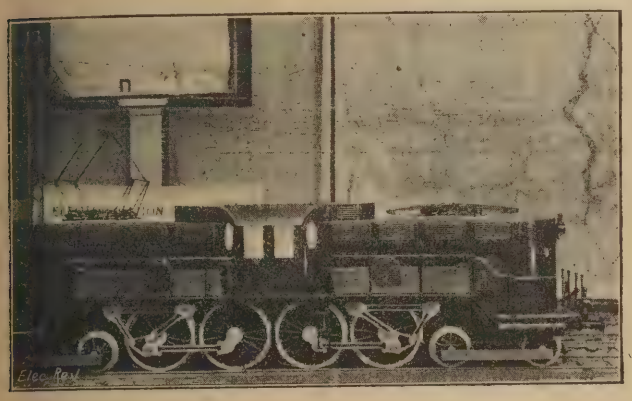

Fig. 2.—Model of Locomotive for the Orleans Railway.

ports iron ore to the ice-free port of Narvic over the Norwegian border. This railway is within the Arctic circle. A large model is exhibited of an articulated locomotive used on the railway; it is equipped with electrical apparatus made by the Swedish General Electric Co. Photographs and diagrams are on view of a number of typical Swedish water-power undertakings, among them Trolhattan and Porjus.

There is also a building devoted to the travel and water-power exhibits of several foreign countries, among them Poland. At first sight one would think that there could be but little water power available in that country. The Germans in East Prussia have developed the several low falls on the basin of the Baltic, and in Poland the same thing is taking place. The south of Poland, which borders on part of the Carpathians, is mountainous, and some high falls are already being utilised. There are some exhibits in the same building in connection with Norway and Germany.

Railway Section.

The section devoted to railways is of considerable interest, several heavy electric locomotives being placed in a wide and lofty building.

At the time of the writer's first visit, some of the locomotives belonging to French railways had not arrived at the Exhibition, although there were two of note—one of the French State railways for working in the Paris western suburban area, and the other of the Midi Railway, which covers the district from Bordeaux to Toulouse and Biarritz and the Spanish frontier. The former is a direct-current, 8-wheel locomotive suitable for 750 or 1,500 volts; it is one of 30 being supplied largely for hauling long-distance and other passenger trains from the Underground Invalides station in Paris to Versailles-Chantiers station. This duty is very similar to that performed by the latest type of Metropolitan Railway electric locomotives, which haul long-distance trains over the electrified section to a point where steam locomotives are attached. The locomotive is fitted with four geared axle-hung auto-ventilated motors each of 275 h.p. on a one-hour rating. The maximum speed is about 70 miles an hour, the maximum tractive effort is 12 metric tons, and the total weight is 62 metric tons. It was made by Messrs. Schneider, working in conjunction with the Jeumont and French Thomson-Houston companies.

The Midi Railway shows one of its high-speed passenger 4-6-4 electric locomotives made by the Constructions Electriques de France, of Tarbes. It is fitted with the "English Electric" system of camshaft control and vertical geared motors. As compared with locomotives with side-rod and crank drive, the Midi locomotive looks less complicated, and as compared with the State Railway locomotive above described, it has the feature of external neatness which would appeal especially to English locomotive engineers.

There are also several interesting locomotive models shown by the Orleans Railway. Fig. 2 shows a model of a type of locomotive being built for this company by Ganz.

Italian Locomotives.

The Italian Government Railway Department exhibits three heavy locomotives. They are made by the Ansaldo, Italian Westinghouse, and Ernesto Breda companies respectively. All three are for use on the three-phase railways in Northern and Central Italy, where long and very heavy gradients and frequent tunnels have to be negotiated. The three locomotives have certain features in common: two large motors each coupled by cranks and side rods and connected to the driving wheels by coupling rods, links, or grooved slots; liquid starting resistances and switchgear in general operated by means of compressed air. They have many points of resemblance to the locomotives developed for the Valtellina Railway about 25 years ago.

The locomotive of the Ansaldo Co. has 10 coupled wheels driven by two three-phase motors of 1,200-1,300 horse-power each, $16\frac{2}{3}$ periods. The two motors can be put in parallel or in cascade; they are connected directly to the line at 3,300 volts. The reversing is carried out by six vertical plungers arranged in a circle making contact with six tubes, the reversing being carried out by dropping and revolving the plungers and then lifting them into contact again, operation being by compressed air. The locomotive has a weight of 75 metric tons and 12 metric tons draw-bar pull. Many of the features of all three locomotives show the influence on design of the six-coupled locomotives first used on the Valtellina line twenty years ago. In order to enable stators of maximum width and power to be placed between the main frames of this locomotive, the slip rings

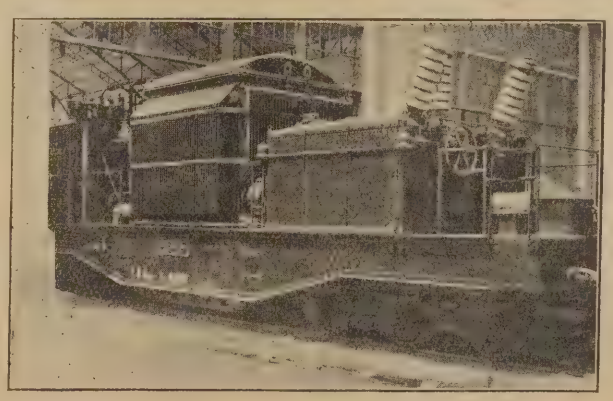

Fig. 3.—Portable Transformer Substation.

are put outside the frame and outside the cranks of the combined rotor and jack shafts; these rings are covered with sheet-steel guard cases and are very accessible. There are two 12-kVA transformers for the supply of low-pressure current for lighting, the operation of air compressors, and other auxiliaries. The resistance for starting consists of a liquid contained in a riveted steel tank with a diaphragm across it; the phases are connected to triangular plates made of an iron alloy. The liquid, which is a mixture of soda and water, is driven up into the resistance chamber and into contact first with the points of the plates and then with the full width, the plates then being automatically short-cir-

cuited. The whole arrangement of the resistance is simple; it forms a striking contrast to the complicated connections and resistances required for some modern d.c. contactor gears.

Considering the great simplicity and operating success of this type of displacement liquid resistance in connection with three-phase motors of large capacity which has now been in use in Italy for 25 years, it is remarkable that so little use has been made of the system in industrial work. Perhaps like the passive opposition which at times took place in official circles during the war to simple contrivances, some people may prefer to fry more expensive fish than is always necessary.

There are 100 locomotives of this type operating heavy goods and "omnibus" trains on sections with heavy gradients up to 1 in 36 near Turin. It is understood that these comparatively simple three-phase locomotives have proved to be efficient in practice and economical in upkeep costs. The motors are ventilated with fan draught.

There is also a 75-ton 6-coupled locomotive made by the Italian Westinghouse Co. of a type which has done good service for some time. It is arranged for four speeds. The motors can be connected up as 8-pole machines with 3-phase windings or as 6-pole with 2-phase windings, the change being made by Scott transformer connections. The locomotive itself is of the 1914 type, but a new kind of link work has been adopted which is lighter than that fitted to the other Italian locomotives on view.

16⅔- and 50-cycle Locomotive.

The third Italian locomotive, that of Ernesto Breda, of Milan, has some novel electrical features. It is designed for regular operation on a three-phase circuit at 10,000 volts, 50 cycles, the supply being from power stations which also carry an industrial load. The locomotives are designed so that they can operate without material loss on a 3,300-volt 16⅔-cycle circuit. T two driving motors, which are of 1,300 h.p. each, a geared to jack shafts by double gearing and connect to the driving wheels by coupling rods. For 10,00 volt circuits a transformer is used.

Travelling Sub-Station.

The Italian State Railway Administration has also view a transformer sub-station on a railway truc fig. 3, for use with three-phase circuits of 102,6 volts, with star connection, or of 59,300 volts when mesh. The secondary pressure is 3,700-4,460 volt A triple-tank, 3-pole circuit breaker, an oil-immers transformer, and a small operating cabin are fitted the truck frame. It is made by the Officine de Savi liano, of Turin.

There is a long building to be devoted to applicatio of electricity, but at the time of the writer's visit thin were not sufficiently far advanced for a very defini opinion to be given as to the value of the exhibits.

There is near the entrance to the Exhibition a tow made of reinforced concrete 270 ft. high, equipped wi an electric lift. From the top of the tower a remarkab view of the Belledonne and Chartreuse mountains ca be seen.

For the convenience of strangers wishing to vis Grenoble for the Exhibition, an office has been opene at the P.L.M. railway station to enable accommodatio to be procured without difficulty or delay.

Since the above was written, information has come hand that one of the Exhibition buildings was struc by lightning on the night of August 19th and burnt the ground; but although it contained a number of sma items of electrical interest, the main electrical exhibi were not damaged at all.

The exhibition is well worth a visit, especially as th cost of accommodation is very reasonable, and the trai service from Paris is convenient.

The Super-Heterodyne Radio Receiver.

A Simple Explanation of the Principles Involved.

By R. ROBERT.

A good deal of attention is being paid at the moment to the methods of securing critical tuning in wireless receivers. With the large number of stations sending out interesting programmes, the broadcatcher has developed a very decided *flair* for distance. He desires at times to cut out his local station and to hear, reasonably free from interference, say, Madrid or Brussels. This has led, naturally, to the evolution of receivers combining range with ultra-selectivity, one of the most popular of such receivers at the present moment being the supersonic-heterodyne.

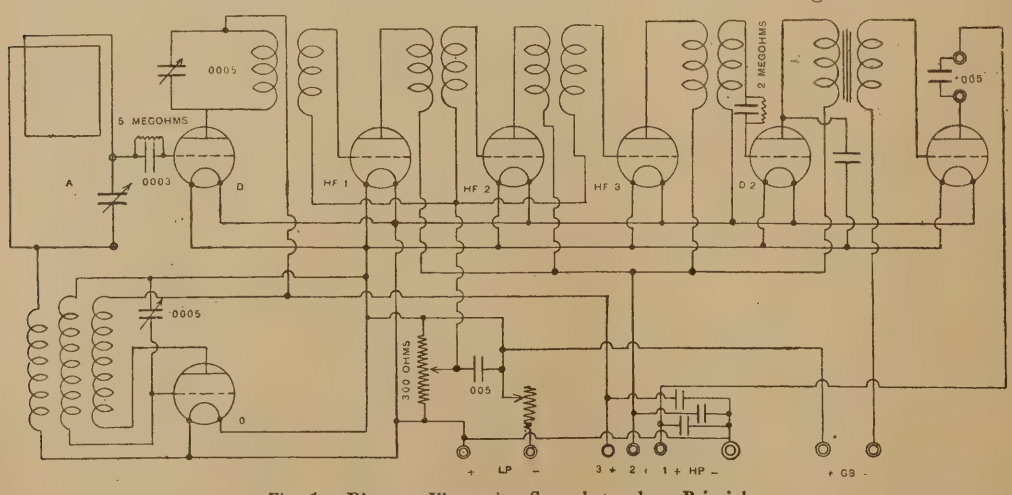

Fig. 1.—Diagram Illustrating Super-heterodyne Principle.

The Heterodyne Principle.—The principle of th exceedingly effective receiver may be roughly gathere from the diagram reproduced in fig. 1. There is, firs the frame aerial—used on account of the extra selectivit obtainable—shunted by the condenser A. The h. oscillations generated in this circuit may be amplifie if desired, by one or tw h.f. valves before bein passed on to the detecto valve D. Superimpose upon the oscillations du to the incoming signa there are the local osci lations generated by th oscillator valve O; th frequency of these oscilla tions is so arranged, b the insertion of suitabl values of capacity an inductance, that it i either slightly higher o lower than the frequenc of the incoming signa the result being that "beat" frequency is s up. To take a concret example: The incoming signal might have a frequenc of 1,000,000 cycles per second (corresponding to 30 metres); the local oscillations might be set at 1,060,00 cycles per sec., in which case the "beat" note woul have a frequency equal to the difference, *i.e.*, 60,00

cycles per second. This beat signal (60,000 cycles corresponds to a wavelength of 5,000 metres) is now rectified and amplified by the three h.f. valves, HF_1, HF_2, and HF_3. The signal is rectified a second time at D_2, whence it may be passed finally through one or two stages of audio-frequency amplification.

Advantages.—The advantage of this arrangement lies in the fact that by "converting" the wavelength of the incoming signal from 300 to 5,000 metres it is more readily amplified (multi-stage h.f. amplification on the short waves is, of course, notoriously difficult). Moreover, a slight change in the frequency of either oscillator or incoming signal will make an enormous difference to the wavelength of the "beat." If, for instance, the wavelength of the incoming signal were increased from 300-305 metres, we should get:

305 metres $= 3 \times 10^8/305 = 983{,}606$ cycles per second.
Heterodyne = 1,060,000 cycles; "beat" frequency = 76,394 cycles.
λ of "beat" $= 3 \times 10^8/76{,}394 = 3{,}926$ metres.

Therefore, the difference created by 5 metres change in the incoming wave = *1,074 metres*! This will, of course, largely explain the super-het.'s quite phenomenal selectivity!

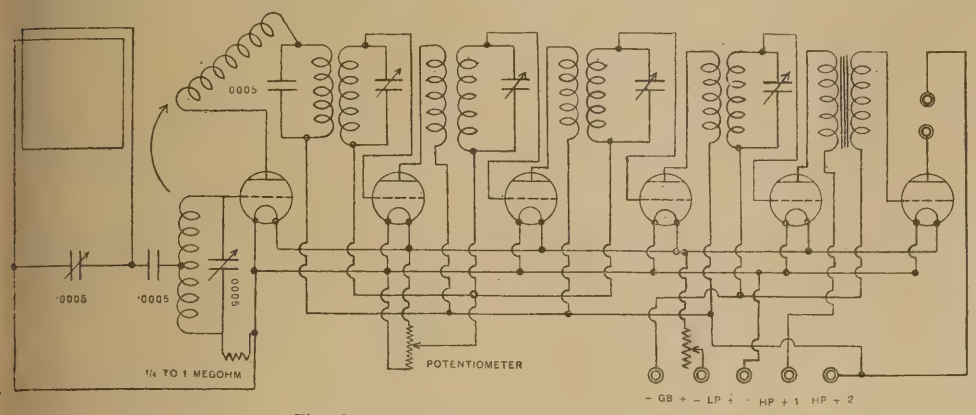

Fig. 2.—Arrangement of Tropodyne Circuit.

Essential Components.—In the case of a super-heterodyne receiver, particular care has to be exercised in the choice of components. The most important items will be the intermediate h.f. transformers and the tuning condensers; the latter should be of the "low loss" pattern, and geared dials are an absolute essential. Matched h.f. transformers suitable for the "super-het." are now freely available on the market, amongst the most efficient, so far as the present writer's experience goes, being an American pattern, the main features of which are the laminated iron cores and the small mica variable condensers by means of which the secondary windings may be tuned; the design, it is claimed, results in high amplification being obtained without in any way affecting selectivity. The oscillator coupler is another essential unit, and several excellent components—of both British and American designs—are now on the market. As it is usual to operate the "super-het." on dull-emitter valves, suitable rheostats must be chosen, though, generally speaking, one rheostat may be made to control the whole of the valves, thus making for simplicity. Finally, in order to ensure freedom from microphonic noises, the valve-holders should preferably be of the anti-phonic" pattern.

The Tropodyne Receiver.—A super-heterodyne set that is particularly interesting on account of the comparatively small number of valves required, is the "Tropodyne." Six valves are used, as against the more customary eight or nine, the arrangement of the circuit being shown in fig. 2. From this it will be seen that all h.f. valves ahead of the first detector have been eliminated; furthermore, by a slight modification of the circuit the first valve is made to act in the dual capacity of detector and local oscillator. The rest of the circuit is straightforward enough—three stages of intermediate h.f. amplification are employed, followed by a second detector and a l.f. stage. A noteworthy feature, however, is the omission of the customary grid leak and condenser for the second detector valve. Rectification is brought about by operating on the bends of the characteristic curve, and a grid bias terminal is provided on the panel for this purpose. It is now possible to obtain complete kits for building up the "tropodyne" receiver quite readily, the kits comprising a suitable oscillator coupler and four intermediate transformers of the type already referred to.

Manipulation.—The ease with which the "super-het." may be operated is the last, though by no means the least, of its many advantages. On a straightforward set there are usually only four controls, *i.e.*, for the filaments, (2) aerial tuning, (3) potentiometer (stabilising the intermediate h.f. amplifier), and (4) oscillator condenser. The procedure of tuning-in is somewhat as follows:—The frame is first rotated so as to be approximately directional for the transmitting station; the oscillator condenser is then moved one or two degrees at a time, each adjustment of this condenser being followed by a complete swing of the aerial-tuning condenser. The long-wave amplifier should be kept just below the oscillating point, a condition which may be brought about by suitable adjustment of the potentiometer. The station will be found to come in at two points on the oscillator condenser, and it is usual to work in that position, which gives greatest freedom from interfering signals. The adjustment of the condensers will be found to be extremely critical, a degree or two either way being usually sufficient to lose the signal. When certain types of transformers with tuned secondary windings are used, they should be carefully tuned to a particular wavelength—say, 5,000 metres—after which they do not require any further attention or adjustment.

Legal.

Colwyn Bay U.D.C. v. Llandudno and Colwyn Bay Electric Railway, Ltd.

IN the Vacation Court on August 26th, Mr. Justice Finlay had again before him the motion by the Colwyn Bay Urban District Council to restrain the defendants until the trial of the action from running tramcars on Sundays in alleged breach of agreement (*vide* our last issue, p. 333).

Mr. G. B. HURST, K.C., for the defendants, contended that the agreement in question was superseded by a Provisional Order of September 30th, 1907, which gave the Council power to regulate the running of the cars by the making of by-laws which would have to be sanctioned by the Board of Trade, before whom the public would have the right to oppose them. He also submitted that the Light Railways Act, 1896, imposed a statutory obligation upon the company to construct, maintain and run the cars which was incompatible with an agreement made with the Council behind the backs of the public. The public had to be considered as well as the Council and the company, and the agreement was against public policy.

Mr. E. W. CAVE, K.C., for the Council, said that the general public were not affected, as the cars were only run for the benefit of the members of a golf club.

Mr. JUSTICE FINLAY said that it was not without some hesitation that he thought he ought to make an order in this case, but in his opinion the object of the agreement was to avoid the necessity of the Council's having to make by-laws preventing the running of the tramcars. He granted the interim injunction asked for.

Hotel Without Bells.—House telephones, which can also be used for outside calls, will take the place of the old-fashioned push bell in the new hotel which is being erected on the steel skeleton which has stood for ten years in Piccadilly. Arrangements have been made for the installation of four hundred telephones. The occupant of any room will be able to call up, on one instrument, any department in the hotel, or any number in the directory; he will be able to talk to his next room neighbour, or to the North of Scotland. Inside calls, of course, will not be charged for.

D

Electricity in Agriculture.

Abstract of I.E.E. Committee's Report.*

THE Committee appointed by the Institution of Electrical Engineers in March, 1923, to consider the use of electricity in agriculture held five meetings, and has summarised the information it obtained in the form of a report under the following headings :—

Uses of Electricity.

Lighting.—Electric light is of considerable assistance to the farmer, and its use permits certain operations which at present are carried out in daylight only to be performed by artificial light. The risk of fire, always serious on the farm, is minimised.

Motive Power.—Electric motors are generally stationary, either attached to the machines they operate, such as chaff-cutting and corn-grinding machinery, or driving by means of shafting a group of machines, as in dairies. Special types of portable motors suited to farm work have been evolved, particularly on the Continent, fitted with suitable reduction gearing for the operation of portable and stationary machines which run too intermittently to justify separate motors. Table 1 may be taken to be a reasonable estimate of use for an average farm, and Table 2 sets out the ascertained figures of use on 33 British farms in a certain supply area.

TABLE 1.

Consumption on a Farm of 150 Acres.

	kWh per annum.
Lighting (house)	100
Lighting (buildings)	150
Motive power, barn and dairy	1,500
Heating and cooking	1,500
	3,250

TABLE 2.

Annual use on Farms in Great Britain.

Motors on each farm, average	1.4	
Average horse-power	10	
Electric lamps per farm house	18	
Electric lamps in buildings	18	
Average consumption per annum—		
Lighting	370	kWh
Heating	470	,,
Power	1,370	,,
Average total consumption per annum	2,210	,,
Average acreage	230	,,
Average consumption per acre per annum	9.5	,,

Statistics of use on Continental farms which have used electricity for several years show a higher consumption than this, averaging 22 kWh per acre. The consumption of electricity per acre of arable land is apparently a function of the fertility of the soil. In a very fertile region in the North-East of Germany the consumption averages (without any electric ploughing) 100 kWh per acre. In accordance with the returns for 34 rural districts in Germany, the consumption per acre was 12.5 to 22.5 kWh for lighting and 27.5 to 42 kWh for power, a total of 40 to 65.5, or an average of 50 kWh per acre.

In the Field.—The principal potential use of electric motors is for ploughing, harrowing, &c., and for thrashing. The application of electricity to ploughing requires motors of from 12 to 125 h.p., and is carried out in one of several ways, those most generally adopted being :—

(i) By means of two stationary motors placed one at each side of the field to be ploughed, with a single steel cable traversing the distance between them, the plough being hauled in one direction by one motor and in the other direction by the other motor.

(ii) By the Howard or Fisken system, which uses a single fixed motor and, by means of ropes with movable anchored pulleys, draws the plough or other implement backwards and forwards on the field.

In general these systems, as in the case of steam-ploughing on the well-known Fowler system, are applicable to large farms, or suitable for employment by contractors who carry out the work on terms for the individual farmer. The problem of electric ploughing, although it is one of the most important on the farm, particularly in view of the growing importance of the sugar-beet industry, which requires deep ploughing, cannot be said to be fully solved. It would be the most important load on the farm from the point of view of the power supply engineer. All the arable land on a farm might well be ploughed twice a year, with a consumption of at least 20 kWh per acre, that is, 40 kWh per acre per year. Cultivation work on similar lines would take about half this amount say, 20 kWh per acre, or a total of 60 kWh per acre; that is, on a farm of 150 acres, half arable, 4,500 kWh for the field operations alone. In the absence of any extended experience of electric ploughing in this country comparative costs are not available.

Cost of Electric Ploughing.

The following (Table 3) prices at which electric ploughing is done in France by contract represent cost and profit, the price being regulated by competition with horse ploughing. The figures are given subject to a caution that comparison between the British and French figures must not be taken too literally as the external and internal values of the franc are very different :—

TABLE 3.

Contractors' Price List.

Depth of Ploughing.	Subsoiling.	Total depth.	Price per acre.	
in.	in.	in.	fr.	s. d.†
10—12	5—6	15—18	137	34 3
8—10	5—6	13—16	130	32 6
12—14	—	12—14	127	32
10—12	—	10—12	120	30
6—8	5—6	11—14	120	30
8—10	—	8—10	93	23
6—8	—	6—8	66	16 6

† At 80 fr. to the £.

The charge for scuffling to a depth of about 4 in. was 40 fr (say, 10s.) per acre. In France it is usually reckoned that 10 fr. (say, 2s. 6d.) per 4 in. of depth is a reasonable charge to pay to contractors for ploughing and subsoiling. In the 1924 season an electric ploughing set ploughed 1,453 acres (588 hectares); scuffling was done at the rate of 49½ acres (20 hectares) per day, while a six-furrow plough accomplished from 16¾ to 19¾ acres (6 to 8 hectares) in the same time, and a four-furrow deep plough did 12¼ acres (5 hectares).

Thrashing by means of portable electric motors is another operation which is frequently done on the Continent through contracting firms, which supply a portable transformer for connecting to the distribution system, a cable drum, and the necessary large portable motor.

Crop Stimulation.

A good deal of isolated and badly co-ordinated experimental work has been done by various observers as to the stimulation of field crops, from which a general impression only can be received; it would appear, however, to be established that it is possible in certain cases to increase considerably the quantity and quality of certain crops. In 1918 a committee was formed by the Government, under Sir John Snell, to investigate this question, and seven reports‡ have been prepared. The results of the field experiments were so conflicting and difficult to reconcile that it has been decided at present to concentrate on pot-culture experiments, with a view to determining as quickly as possible the general conditions of electrification which are favourable, after which field operations will be resumed.

It has been stated in the second report of the Committee referred to, that increase in yield averaging about 30 per cent. has been obtained in field experiments. The matter has reached a stage which is as yet of no very great practical importance, or direct application, owing to lack of commercial data and apparatus suitable for placing in the hands of the farmer. The amount of electricity used for the purpose is insignificant, not amounting to more than about 10 watts per acre, applied for, say, 2 hours a day for one to two months of the growing period.

Capital Outlay.

At the Farm.—Generally, it is probable that as regards the larger field operations the capital outlay is so considerable relative to the amount of use on any particular farm, that except in the case of the largest farms the ploughing and cultivating tackle, as has occurred in the case of steam tackle will be owned by contractors who will do the work for the farmer. On the other hand, the use of electricity in the house, barn, and dairy will be made with machinery and appliances provided by the farmer, and the cost may be estimated as follows :—

	£
Three electric motors, aggregating 10 h.p., with starting and reducing gear	60
Electric light, 36 points in house and building	36
Sundry cable and switchgear, not included in the lighting	20
	116
Sundry household apparatus	40
	£156

There is evidence that farmers will willingly pay for lighting 8d. per kWh, for heat 2d., and for power 4d. (electric ploughing from 1d. to 2d.). It is difficult to put any precise figure on the financial return to the farmer. It is probable that on farms employing five men and upwards where other power has not been installed, at least one man can be saved. On smaller farms the advantage would be rather in reducing the number of hours the farmer and his family would have to

* From the *Journal* of the Institution of Electrical Engineers, August, 1925.

‡ Copies may be obtained from the Ministry of Agriculture

work and reducing the actual manual toil involved, reducing risks of fire, or increasing the output of the farm. There is no doubt also that the provision of good lighting in the mornings and evenings of the winter months contributes to saving of waste of materials and of time lost. In the case of farmers owning a considerable head of poultry, it has been established that by lighting the poultry houses in the winter months morning and evening there is an improvement in the average value of the eggs produced, not so much in an increased total number as in their distribution towards the months when daylight is shortest, with a consequent advantage of about 20 per cent. in their average value. The result of these various factors is that in the case of an ordinary farm it is estimated by the Committee that these outlays will repay themselves in about four years, after which there will be a return, allowing for repairs, of probably 20 per cent. per annum on the money spent on the equipment. Although this is attractive, the fact has to be faced that farmers have lost a large amount of their capital during the last few years, and that it is probable that in the majority of cases some system of furnishing the equipment on hire-purchase terms would be necessary to encourage the adoption of electricity.

On Distribution.—In this question lies the principal problem of the supply of electricity for agricultural purposes. Whatever the future may hold, there is universal agreement that, in the early stages of establishing a network of mains to supply purely agricultural areas with electric power, there will not be a load which will produce a fair return on the expenditure for distributing mains if the development of the uses of electricity is left almost entirely to the initiative of the farmers. The experience in England, France, Italy, Switzerland, Holland, Sweden, and Canada leads to the same conclusion and to the general statement that (1) there must exist other sources of income for the transmission system capable of carrying a large, if not the major, part of the capital charges on the investment during the period required for the natural education of the farmers; or (2) there must be an abnormal economic demand for the energy, rendering possible its sale at an abnormal price; or (3) there must exist an abnormal supply of electrical energy which could not otherwise be sold, rendering economic its sale at a price well below the average cost of production, or (4) there must exist social or political reasons why the supply should be furnished at an uneconomic price on account of other advantages to be gained.

In the first category is Sweden, where the transmission lines from the waterfalls pass along the valleys in which the agricultural areas are situated, and the lines are easily tapped. In Holland lines are put up for distribution to towns and for the driving of drainage pumps throughout the country, which lines are again easily tapped for agricultural purposes. Or, again, in Switzerland, a large number of small towns in which are situated semi-domestic industries are bear costs of the transmission and distribution networks used for agricultural purposes.

In the second category is France, where the shortage of man power stresses the necessity for the supply of motive power, and, in addition, the necessity of maintaining a source of military strength necessitates the maintaining of the agricultural areas at their highest working power and making them as attractive as possible to the population, even at the expense of the State.

The third case is illustrated by Italy, where there is a superabundance of hydraulic power from the Alps in the summer time, the season of the year when the industrial demand is at its lowest and the farming demand at its maximum.

In this country it is probable that the first-mentioned consideration will be the predominating influence, though it is likely that the existence of loads other than those provided by agricultural operations or, alternatively, the establishment of industries providing such loads, will be dominant factors so far as rural electricity supply is concerned. Also, in other countries, notably in Scandinavia, Canada and Italy, financial assistance is given by the State towards the provision of rural distribution lines.

Schemes in Operation.

In some parts of the Continent the supply of electricity is remunerative. When the electrical equipment of railways becomes an accomplished fact there will be a general distribution system in existence which will enable electricity to be carried more widely into the agricultural areas. The towns of Altrincham, Aylesbury, Chester, Hereford, Wolverhampton, &c., have already extended, or decided to extend, their lines into the surrounding districts, while the power supply undertakings in South Wales, Fife, Kilmarnock, &c., are already supplying a number of farmers. With regard to the actual cost of such distributions, for 6,600-volt overhead bare lines on insulators with creosoted poles carrying three conductors, each No. 10 S.W.G., all to comply with the Electricity Commissioners' regulations, the cost would lie between £500 and £600 per mile, and it is probable that cheap underground cable systems could be laid in the open country for about the same figure, but the fact remains that the lines erected in agricultural districts in foreign countries have cost much less—even as low as £100 per mile in Sweden—and it is probable that a study of the best methods of erecting such lines will lead to a figure of £250 to £500 per mile to comply with the regulations necessary in this country. There is little doubt that the single-phase system is cheaper and there is some simplification in transforming and switching gear. On the other hand, the motors are rather larger and more costly, and, so far, whatever installations have been completed have been upon the three-phase system.

In order to summarise this part of the report, it may be well to give the following actual example (in Sweden) obtained by a member of the Committee where conditions were not favourable to a large consumption per acre, as the land was poor. In a rural area of 3,700 acres (of which 1,700 were woodland and waste) about 15 miles of distributors were used to supply 22 farms and 29 other rural customers whose consumption, averaged over several years, was 82,000 kWh per annum. The return on the capital expended (which was heavy, as the work was carried out during the war) was 5 per cent. per annum. The consumption per acre was 22 kWh, or 5,570 kWh per mile of distributor.

Steps Which Might be Taken by the Institution.

Although the actual consumption per acre or per farm appears small, yet the total acreage of farm lands in this country is nearly 27 millions out of the total area of 56,788,366 acres in England, Scotland, and Wales, and the supply of electricity to farms, if carried out, would aggregate a very large total, say, under English conditions, 260 million kWh per annum without electric ploughing or cultivation, and from two to three times this amount if electric ploughing and cultivation as in Continental practice were adopted. The laying out of the work, the construction of the generating plant and cables or overhead lines, and the supply of plant and accessories would form a very important addition to the activities of the electrical industry. This, added to the social and economic betterment arising therefrom, is of such importance that it is recommended that the Institution should use its influence in promoting this object. To this end the following are some of the steps that might be taken:—

(1) The appointment of a permanent Committee, to advise the Council of any development arising which it should take note of, or on which it should take action.

(2) The presentation of a memorandum to the Government pointing out the advantages that would arise from a wide distribution of electricity to agricultural counties, and that this should be taken into consideration in fostering schemes of railway electrification.

(3) That a special recommendation should be made to the Government in connection with the provision of financial assistance, either in the form of direct grants or the provision of finance at specially low rates and repayable over long periods, towards the cost of provision of distribution lines in rural areas in districts where there is a prospect of the undertaking becoming profitable in the course of a few years.

(4) That the Institution should take steps to encourage the design by the leading British manufacturing firms of electrical apparatus especially suited to agricultural conditions.

(5) That in connection therewith the Government should be urged to issue through the Ministry of Agriculture in conjunction with the Electricity Commissioners authoritative leaflets on the subject, showing what has been done and what can and ought to be done by farmers when a supply is available.

(6) That the Institution should offer to co-operate with the Royal Agricultural Society and other agricultural bodies in tests and experimental work, and in formulating a policy for the supply of electricity to the farming population.

(7) That the Institution should take steps to obtain a paper each year on a subject dealing with the applications of electricity to agriculture, and that joint meetings with the Royal Agricultural Society or with one of the other farmers' organisations should be arranged.

(8) That the Institution should take steps to initiate experimental work by, or through, existing bodies:—(*a*) In improving the efficiency of farm implements and machines by redesign to use the new forms of power available. (*b*) In improving the efficiency of methods of crop treatment by means of the new form of power available. (*c*) In carrying out investigations that would provide useful data in relation to the application of electricity to agriculture.

(9) That the Institution should take steps to propose rules for rural distribution networks, overhead and underground, these rules only to apply to distribution to farms, villages, and small industries, leaving other work to be carried out under the existing regulations as at present approved by the Electricity Commissioners.

J.I.E. Library Catalogue.—We have received from the Junior Institution of Engineers a copy of the catalogue of books in the Institution Library, which has been recently compiled and is, we understand, being sent free to all members of the Institution with the September issue of the *Journal*. The material is classified so as to enable one to see at a glance what books on any particular branch of engineering the Institution possesses. The fact that the Institution embraces all branches of engineering naturally means a non-specialised Library; the rapid increase in recent years of the number of books in its possession made it imperative that a comprehensive list should be issued, and much consideration was given to the method in which the books should be catalogued. The blank spaces left at the end of each section are a special feature, designed for the inclusion of new works as these are added to the Library; particulars will be printed on gummed paper and issued quarterly to the members, who will thus be able to maintain their lists up to date.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

On Finding the Right Man and Keeping Him.

I have read with interest the article by Mr. W. Roland Needham in your issue of August 21st, and agree that employers are apt to employ men who have "notable credentials," a bouncing manner, and on paper, "a man who can reel off a most formidable itinerary of service," but who "in fact is a most ignorant person." I myself have had experience of such; one will come in contact with men at work who are absolutely incompetent for the positions they hold. Why? because nine times out of ten, the men under them do the work and these incompetent "officials" get the credit and therefore hold their "jobs." My idea is this: If you have a man who is trustworthy, keen, and intelligent, look after him and encourage him and one day you can offer him that vacant senior position. Grow a man for the job. I know of one works manager who will not employ new labour if he can possibly avoid it, but grows all his men for the vacant responsible positions and he always gets satisfaction. I noticed an advertisement in a technical journal lately to this effect: "Advertiser seeks position, age 23," then a long list of experience in almost every branch of the electrical trade and outside the electrical trade; common sense should tell that no man of 23 has had such experience. To conclude, let the managers, assistant managers, and engineers keep their eyes open amongst the men, and select those to whom they can safely offer senior positions and not go by what they are told, or because "his father or relation is a friend of mine."

Mr. Nervous Man.

Pontypridd, *August 27th*, 1925.

Is There an Age Limit?

The letters on the above subject are really amusing to me, as a unit of the despised working class.

It does not seem credible that persons who have held important positions under the employers as stated are ignorant of the existence of the age limit as a definite law which the workman is confronted with, as of necessity they must have enforced it as efficient servants of Capital.

Your correspondents, if they take the trouble to inquire, will find that all transport concerns, Government departments, and all large establishments, have the age limit strictly enforced, with the solitary exception of the judicial profession, where you could be employed till you were 150. At the present time in the electrical industry the employable age would appear to be from 14 to 30, and after that oblivion.

Thanks to the patriotic efforts of our rulers in enforcing payment of our debts to the profiteers who bled the British people when they were fighting for existence and who are too cowardly to exact payment from their own debtors, the nation is now bankrupt. Of course this statement will be challenged, but the facts remain: A nation's wealth lies in its skilled workmen, and England's have departed or are rotting in the streets.

It appears that in the near future electrical work will be erected with the aid of the paste pot, and the efficiency of the workman will be graded on the merits of his application thereof.

Trades are now recognised as a blind alley, not a living wage when one is out of work four months in the year, and it is a crime to apprentice boys to them. It was stated, I believe, by the man who won the war—the Minister of Munitions—that it was an engineers' war. The only thing to be said is: May the Saints help England in the next, when there are no skilled craftsmen left.

With reference to Major Porter's letter, I would point out that a criminal receives better treatment than an ex-Service man.

Ex-Sapper, Royal Engineers.

August 18th, 1925.

Charges for Electricity Supply.

With reference to the issue of the Electrical Review dated August 28th, 1925, my attention has been drawn to the statement on page 346 dealing with "Charges for Electricity Supply."

I note that your correspondent includes Eccles in a list of undertakings which do not hire-out electric cookers. This statement is not correct, as the Eccles electricity undertaking has had in operation a hiring scheme for electric cookers for over 12 months. The rental charged for the hire of the cooker is at the rate of 7s. 6d. per quarter, and the rate of charge for a supply of electrical energy for cooking purposes is 1d. per unit, plus 12½ per cent., less 5 per cent.

I shall be obliged if you will kindly publish this correction so as to remove the mistaken impression arising from the statement in last week's Electrical Review.

H. W. Angus,
Borough Electrical Engineer.

Eccles Corporation Electricity Works, *August 31st*, 1925.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Electricity in North Wales.—Speaking at a luncheon last week attended by members of the Conway and Colwyn Bay Joint Water Board, Mr. H. J. Jack, managing director of the Aluminium Power Corporation, intimated that an electricity distribution company with a capital of £250,000 would shortly be formed to light with electricity North Wales towns at present without a supply.

Coal Meter Orders.—The Lea Recorder Co., Ltd., has recently received orders for its coal meter from the following electricity supply undertakings, &c.: Barking (24), Liverpool (14), Nottingham (18), Preston (15), Salford (18), Stoke-on-Trent (19), Devonport Dockyard (26), Colenso (Natal) (16), Hong Kong Electric Co. (16), Calcutta Electric Supply Corporation (15), and Copenhagen (4).

Brazil's Wire and Cable Imports.—Statistics published in *Commerce Reports* show that during 1923 Brazil imported 890 metric tons of uninsulated copper wire, 957 tons of insulated copper wire and 1,332 tons of electric cables. The bulk of the total came from the United States, although Great Britain was the principal supplier of electric cables.

Lead Market Report.—Messrs. James Forster & Co., reporting on August 29th, stated:—"Official closing prices yesterday were £39 for August and £36 16s. 3d. for November, showing a fall on the week of 5s. a ton for forward, with August unchanged. The firm tone which set in at the end of last week was continued, and prices by Wednesday had advanced a further 17s. 6d. for August and 11s. 3d. for November, until £39 17s. 6d. and £37 12s. 6d. respectively were touched. On Thursday and Friday there was a reaction of about 16s. 3d. a ton in all positions. The close is steady at £39 2s. 6d. for August, £38 8s. 9d. for September, £37 10s. for October, and £36 16s. 3d. for November. Consumers, particularly cable-makers, have bought heavily this week for September and October delivery. Arrivals this month should total well over 20,000 tons, but in spite of this prompt lead is scarce, the premium over forward now standing at 45s. a ton. The question of future supplies is complicated by the constant friction in the shipping trade in Australia, where steamers are being delayed and lead is accumulating at the ports."

Hungarian Electrical Exports.—According to the *Board of Trade Journal* the exports of electrical machinery and apparatus during the first six months of the current year amounted to 14,932 quintals valued at 5,742,000 kr. (gold). This compares with 18,600 quintals (7,891,000 kr.) in the first half of 192

Boiler Contracts.—Messrs. Yarrow & Co. (1922), Ltd inform us that they have recently secured an order for four of their patent water-tube boilers, with Yarrow superheaters and air heaters, for an important power station in London, each boiler having a maximum output of about 100,000 lb. of steam. They state that this is the third important electric power station in London which has recently introduced their boilers, the others being the County of London Electric Supply Co.'s power station at Barking and the London Electric Supply Corporation's station at Deptford

Trade Announcements.—Mr. S. Crosby, radio engineer, has opened premises at 8, Walton Road, Stockton Heath, near Warrington.

The National Gas Engine Co., Ltd., has removed to its new offices at Australia House, Strand, W.C.2, as from September 1st. The telephone numbers will remain the same as before *viz.*, "Central 7084 and 7085."

Mr. Harold Field, A.M.I.E.E., for the last 10 years engaged as works manager and lately as general manager to the Western Engineering Co., Swansea, has now purchased the whole of the works and premises of that company, and intends to carry on business on his own account at that address. He asks for catalogues of electrical and mechanical plant.

The Z Electric Lamp & Supplies Co., Ltd., has appointed Mr. D. J. Crawford as its Nottingham and district representative in the place of Mr. Thorburn, who has left the company. Mr. R. P. Stewart, 30, Commercial Street, Dundee, has been appointed Dundee and district agent.

Messrs. Morley & Thuey have opened premises at 21a, High Rise, Richmond, Surrey, for the sale of electrical and radio apparatus, and ask for catalogues.

Messrs. F. Winkworth & Co., electrical engineers, have removed from 137, Victoria Street to 82, Victoria Street, S.W. Their new telephone numbers are Victoria 1770 and 1771.

Catalogues and Lists.—METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester.—Descriptive Leaflet No. 783/2-1, containing illustrated particulars of applications of arc welding.

THE EVER READY CO. (GREAT BRITAIN), LTD., Hercules Place, Holloway, N.7.—General catalogue for 1925-26 of dry batteries for radio and general applications; Leclanché cells; pocket lamps and small lighting sets; and accumulators.

THE MULLARD RADIO VALVE CO., LTD., Nightingale Lane, Balham, S.W.12.—An illustrated pamphlet describing the company's publicity scheme for the coming radio season.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—The "Benjamin Reflector" for August, dealing with correct illumination, &c. Also an illustrated pamphlet dealing with the "Rodalux" longitudinal street lighting reflector.

MR. ALAN WRIGHT, Sentinel House, Southampton Row, W.C.1.—A folder containing illustrations of "Inventum" toasters, irons, bowl fires, kettles, and other appliances. Priced.

THE LISENIN WIRELESS COMPANY, Connaught House, 1a, Edgware Road, W.2.—An illustrated and priced trade catalogue of radio components and accessories.

MR. GEORGE ELLISON, Perry Barr, Birmingham.—An illustrated booklet, entitled "Starting and Stopping Electric Motors," and containing particulars of the firm's controllers in non-technical language.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester.—An illustrated folder, giving details of an "Exide" publicity "campaign" which is being carried out by the company, together with specimens of showcards, posters, &c., which are being issued in connection with it.

CLEARTRON RADIO, LTD., 1, Charing Cross, W.C.—A price list of "Cleartron" radio valves for various applications.

THE CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Place, S.W.1.—A mailing card advertising "Cambridge" automatic temperature regulators.

MESSRS. HENRY POOLEY & SON, LTD., John Bright Street, Birmingham.—Catalogue No. 1,825, dealing with counter scales and scale beams.

MESSRS. HERBERT MORRIS, LTD., Loughborough.—Book 104, containing illustrated particulars of overhead hand-power cranes.

ELECTRO-DYNAMIC CONSTRUCTION CO., LTD., Malt Street, S.E.1.—A price list of variable-speed polyphase commutator shunt motors.

POPE'S ELECTRIC LAMP CO., LTD., 5, Arthur Street, New Oxford Street, W.C.2.—A priced folder and an illustrated leaflet advertising "Elasta" electric lamps.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—An illustrated pamphlet dealing with a number of street-lighting fittings and appliances which are to be shown at the forthcoming conference of the Institution of Public Lighting Engineers.

JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, S.W.1.—Two illustrated and priced leaflets dealing with water-heating apparatus; also a blotter for September.

MESSRS. WOOTTON & CO., LTD., High Street, Ponder's End, Middlesex.—A catalogue of wood fittings for electrical purposes. Illustrated and priced.

MESSRS. L. G. HAWKINS & CO., LTD., 30-35, Drury Lane, W.C.2.—An illustrated price sheet of "Universal" domestic appliances, including fans, vacuum cleaners, irons, cookers, &c.; and "Silverlite" shop-window reflectors.

MESSRS. WARD & GOLDSTONE, LTD., Frederick Road, Pendleton, Manchester.—A well-illustrated price list of radio receiving sets, components, and accessories.

THE ELECTRIC STREET LIGHTING APPARATUS CO., 6, High Street, Canterbury.—A catalogue containing illustrations, details, and polar curves of a number of street-lighting fittings.

THE LEA RECORDER CO., LTD., 28, Deansgate, Manchester.—Two pamphlets, containing the names and opinions of users of "Lea" coal meters.

Bankruptcy Proceedings.—H. WILSON, electrical contractor and decorator, 1057, Grangefield Avenue, Thornbury, Bradford.—Receiving order made August 21st on debtor's own petition. First meeting, September 7th, at the Official Receiver's office, 12, Duke Street, Bradford; public examination, October 5th, at the County Court, Bradford.

M. O. HECKELS, electrical wholesaler and agent, 643, Welbeck Road and Star Buildings, Northumberland Street, Newcastle-on-Tyne.—Trustee, Mr. W. Brittain, 4, Northumberland Street, Newcastle-on-Tyne, released July 13th.

C. BINNS (United Electric Co.), electrical engineer, 55, Low Briggate, Shipley, Yorks.—First and final dividend of 1s. 0¾d. in the £, payable at the Official Receiver's office, 12, Duke Street, Bradford.

W. DUNCAN, electrician, New Road, Dunblane.—Meeting of creditors was called for September 3rd, at County Buildings, Dunblane. Mr. C. H. Urmston, agent, 140, Princes Street, Edinburgh.

F. J. TIZZARD and N. TIZZARD (Tizzard Bros.), electrical engineers and contractors, 27, Dalkeith Street, Barrow-in-Furness, and 121, Market Street, Dalton-in-Furness.—Receiving order made August 26th, on debtors' own petition.

S. G. WILKINSON, electrician, 25, Havelock Road, Harrow, and 16, High Road, Wembley. Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released July 23rd.

J. HILLIER, electrical engineer, 58, Trafalgar Terrace, Swansea.—Trustee, Mr. H. Rees, Official Receiver, Government Buildings, St. Mary Street, Swansea, released July 17th.

Company Liquidations.—E. S. COMPANY, LIMITED, electrical and wireless dealers, 233, Tottenham Court Road, London, W. The following are creditors, in addition to those mentioned in our issue of August 14th (p. 257):—

ROBINS WHOLESALE ELECTRICAL & WIRELESS CO., LTD., Fanny Street, Cardiff.—A meeting of the creditors of the above was held recently at the offices of Messrs. Clarke, Dovey & Co., Cardiff. A statement of affairs was presented, which disclosed liabilities of £4,261, including £3,372 due to trade creditors. In addition, there were fully secured creditors for £11, who held security valued at a like amount. There were debentures for £2,148, with interest accrued amounting to £74. The net assets amounted to £595, leaving a deficiency as regarded the creditors of £3,666. The issued share capital amounted to £999, making the total deficiency £4,665. The company was incorporated on August 7th, 1922, as the Robins Electric & Wireless Depository & Institute, Ltd., for the purpose of dealing in radio requisites, both wholesale and retail. The nominal capital of the company was £1,000. For the purpose of obtaining wholesale terms from members of the N.A.R.M., a separate company was registered in September, 1924, under the name of Robins, Ltd., and the name of the original company was changed to the present title, the intention being to deal in a wholesale way only. The whole of the purchases of Robins, Ltd., had been made from the present company, and the latter had also purchased goods for another small company which was formed in February of this year. The deficiency was attributed to depreciation written off the assets, and loss on trading. At the present time there was a sum of £1,316 due from the retail company for goods supplied. Mr. Robins, who was the debenture holder in respect of cash advanced and machinery, plant and stock, stated that he was willing to take over that debt and credit it against his debenture. A fire took place in October, 1923, and £1,800 was received from the insurance company. In consequence of the company being pressed by creditors, the debenture holder, on April 17th, appointed a receiver, who was now in possession of the assets, and the sum of £300 had been paid off the debenture by the receiver to Mr. Robins. It was decided that a petition should be presented for the compulsory winding-up of the company. The following are creditors:—

DIAMOND WIRELESS, LTD., late 184, Oxford Street, W.—A meeting of creditors was held on August 24th, at 16, Fitzroy Street, W., when Mr. C. W. Harman, 80-2, Wardour Street, W.1, the liquidator in the voluntary liquidation of the company, reported that the liabilities amounted to £1,491, of which £680 was due to trade creditors and the balance to Mr. Jones. In addition, there were secured creditors for £12 who held security valued at £20, leaving a surplus of £8. The net assets were £77, leaving a deficiency of £1,414. The

company was incorporated on February 6th, 1924, with a nominal capital of £3,000, to acquire the business previously carried on by Mr. W. Jones, the purchase price being £2,000. With regard to Mr. Jones's claim for £810, it was stated that he would not claim against the estate. Accounts to March 31st last showed that there was a gross loss on the trading of £520. Mr. Jones stated that he was not in a position to make an offer to the creditors. It was decided that the meeting should be adjourned for 14 days with a view to Mr. Jones making an offer of 5s. in the £. The following are creditors :—

	£		£

		Batey, E. J.	49
Lighting, Heating & Glass, Ltd.	134		

ELECTROLITE, LTD., 138, Southbridge Road, Croydon.—The winding-up order in this matter was made on a creditor's petition. The statement of affairs shows liabilities of £10,565, and net assets of £1,974, which is insufficient by £8,398 to meet the loans of debenture bonds of £10,372. The issued share capital amounts to £500, so that there is a deficiency as regards the contributories of £11,065. The failure of the company is attributed to the slump in trade, depreciation in value of stock, and bad debts. The company was incorporated in December, 1912, as a private concern, and was formed to acquire as a going concern a lighting sundries business carried on at Croydon. The nominal capital was £1,000, of which £500 was issued between 1913 and 1922 to subscribers for cash. The price paid by the company for goodwill, stock, plant, book debts of the vendor's business was £500, a sum fixed by mutual agreement. Debentures covering all the assets and bearing interest at 5 per cent. are stated to have been issued for £500 in April, 1913, and for £1,500 in August, 1914, against cash advances for similar amounts on or about these dates. In addition, on August 23rd, 1921, a further debenture for £7,500 is stated to have been issued as a covering charge in respect of advances made to the company and liability in respect of guarantees given to third parties. In October, 1924, a creditor commenced an action for damages and an injunction to restrain the company from infringing a copyright; an interim injunction was refused, and the action continued, but on account of the action the holders of the debentures first issued, on February 28th, 1925, appointed a receiver. The Court has made an order appointing the Official Receiver as liquidator with a committee of inspection.

ALKUM ELECTRICS, LTD. — First meetings of creditors and contributories, September 2nd, at the County Court House, Halifax.

CARTER & MITCHELL, LTD.—Meeting of creditors at 24, Allsopp Street, Upper Baker Street, N.W., on September 8th. Liquidator, Mr. J. H. Higson, 11, Cheapside, Bradford.

Chinese Tariff Proposals.—*Reuter's Agency* reports that it has received from an authoritative Chinese source an assurance that China does not desire tariff autonomy for the purpose of imposing excessive duties and hampering trade. On the contrary, the proposals are characterised by "extreme moderation."

Conditions in Austria.—The *Monthly Review of Central Europe* published by the Anglo-Austrian Bank, Ltd., states that although unemployment among Austrian commercial employés is on the increase there has been a slight improvement in the metal and machine industries. In the electrical industries the situation is satisfactory as there is a sufficiency of orders to provide employment for some time.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from August 26th :—

Rogo. No. 460,350. Class 1. An anti-frothing solution used in connection with electric accumulators.—A. W. Creasey and G. S. Coop, trading in co-partnership, 24, Ruskin Avenue, Manor Park, E.12.

Radiac. No. 458,272. Class 8. Apparatus, instruments and accessories for use in radio telegraphy and telephony.—Radio Accessories, Ltd.

Sodium. No. 459,270. Class 8. Thermionic valves.—R. A. Rothermel, Ltd., 24-26, Maddox Street, W.1.

H. A. H. Hunt's (lettering and design). No. 459,510. Class 8. Electric batteries (not medical), induction coils, electric cables and radio-telephonic apparatus.—A. H. Hunt, Ltd., Tunstall Road, Croydon.

Atlas (lettering and design). No. 458,675. Class 8. Electric batteries (not for medical purposes), &c.—O. Ruhl (1922), Ltd., 85, City Road, E.C.2.

Supercision, F. C. H. (lettering and design). No. 460,458. Class 8. Electrical measuring instruments.—F. C. Heayberd & Co., 8 and 9, Talbot Court, Eastcheap, E.C.3.

German Electrical Goods in New Zealand.—The Christchurch (N.Z.) correspondent of the *Daily Mail* states that considerable quantities of German electrical material are getting into use in New Zealand. Most of this is of very inferior quality, and one of the Electric Power Boards has determined to have nothing whatever to do with German goods, even if they are lower in price than similar British manufactures. Instances have been reported where German motors have been sold with the name-plates removed.

A Novel Electric Sign.—A sign of large dimensions and incorporating a novel device has recently been erected for Messrs. Colgate, manufacturers of toilet requisites, between Charing Cross and Westminster Bridge on the south side of the Thames. The sign has an area of about 5,000 sq. ft. and is illuminated by over 4,000 "Osram" lamps. It incorporates a "thermometer" which by electro-mechanical means records the actual atmospheric temperature; this thermometer is 60 ft. in height and it has very legible markings in figures 20 in. high. The sign was designed and erected by Borough Electric Signs.

Salonica International Fair.—The Greek Minister in London informs us that, owing to the very short time that the prospective participants would have for the preparation and dispatch of their exhibits to Salonica to be in time for the opening of the Fair, the organisers have found it necessary to postpone the opening to a later date—probably until the Spring of 1926.

Travelling Exhibits.—The recent report of the Imperial Economic Committee, urging that those within the Empire should buy British goods, has met with response by the four leading railway companies of Great Britain. In order to demonstrate British-made goods to 300 cities and towns in England, Scotland, and Wales, the companies have constructed four exhibition trains of corridor carriages which, stocked with all manner of British commodities, will run over the various systems, making stays of from one to six days in railway station sidings. From outlying districts visitors will be taken to the exhibition trains by local excursions. The travelling displays will be seen free by the trade up to noon and by the public from then until 9 p.m. Salesman-demonstrators will travel with each train, and the displays will include wireless and electrical appliances.

Electricity at a Flower Show.—A flower show held recently at Chertsey gave the Woking Electric Supply Co., Ltd., which supplies energy in the district, an opportunity for a little propaganda work. A special marquee was pitched and a number of electrical appliances were arranged within it for demonstration purposes. In this way visitors to the show were able to gain an idea of the benefits of electric cooking, washing, ironing, &c. The accompanying illustration shows the cooking section in which there were two cookers and a number of smaller appliances as well as a card announcing the rates charged for cooking energy.

Electricity at a Chertsey Flower Show.

Spanish Radio Exhibition.—Plans are under consideration by local agents of radio apparatus manufacturers for the holding of another international radio exhibition in Madrid this year.

British Trade with Esthonia.—In the course of a report upon conditions in Esthonia which he recently forwarded to the Department of Overseas Trade (Stationery Office, 1s. net), Mr. H. Montgomery Grove (British Consul-General at Reval) says that British goods are very popular, and unless their trade competitors' prices are very much lower, the preference is for British goods. The use of electricity is advancing, and the demand for electrical fittings, goods and lamps should increase. It seems fairly certain that the construction of the Narva hydro-electric plant will be commenced this year, and this should lead to a largely increased demand for all electrical goods. This scheme projects the erection of a power station at Narva Waterfall in conjunction with a plant to extract nitrogen from the atmosphere. Should the project be successful, it is anticipated that Esthonia will become self-supporting in the matter of artificial manures. During 1924 the electric railway line between Reval and Nomme (8 km.) was constructed, and the number of passengers carried by it was 2,831,132 (more than double the Republic's population). Actual details of Esthonia's electrical imports are not given in the report, but it is stated that the imports of "machinery (not agricultural) and means of transport" amounted to 7 per cent. of the total; of this from a half to two-thirds came from Germany, then, a long way behind, come the United Kingdom and Sweden. There is no doubt that the difficulty which Germany has in granting credit and the rise in German prices for goods of all sorts did a great deal, during 1924, to assist the imports of British-made goods into Esthonia.

French Interest in Portuguese Scheme.—The North Portugal Waterfall Co., whose head office is in Lisbon, has acquired several concessions for the development of hydro-electric power on the Cavado River and its affluent, the Rabagao, about 45 miles north of Oporto. The banking firm of Pinto and Sotto Mayor, the Portuguese Government, and a group of French financiers are interested. Energy will be distributed in northern Portugal, especially in the city of Oporto. Work was begun on the first station in December, 1924, but only on a small scale. During the current year only preliminary work will be done, but it is hoped that by the summer of 1926 operations on a more extensive scale can be commenced. It is estimated that the completion of the undertaking will require more than five years. The chief problem will be raising the funds necessary to carry out the enterprise.—*Commerce Reports.*

Electrical Apparatus for South African Mines.—According to recently-published statistics showing the values of various classes of goods purchased from abroad by the South African mining companies during 1924, electrical machinery, spares, and fittings to the value of £621,277 were imported during the year.

The Southampton Corporation Electricity Showrooms.—Visitors to the meeting of the British Association could not fail to notice the Corporation Electricity Department's showrooms situated in a prominent position in Above Bar Street, one of the main thoroughfares of Southampton. The attractive display arranged in the windows, which is seen in the accompanying illustration, draws large crowds, both during the daytime and in the evening. In the course of the day demonstrations of electric washing and ironing are given with "Thor" machines; at dusk a special lighting scheme carried out by the General Electric Co., Ltd., comes into play. This consists of batteries of "Gecoray" reflectors fitted with colour screens and controlled by a motor-driven flasher. A wide range of colour changes is produced by this means. Inside the showrooms is a large collection of electrical appliances of all kinds, from irons and other domestic apparatus to battery-charging devices. Jackson cookers are exhibited, this pattern being provided under a hire-purchase scheme which the department has instituted—with success.

The Southampton Corporation Electricity Showrooms.

American Loan for German City.—A loan of 32.5 million marks has been raised in the United States by the municipal authorities of Munich for the purpose of extending the electricity works and tramways in the city, &c.

Great Britain and Argentina.—The *Review of the River Plate*, in referring to the advantage which Great Britain possesses over Germany in her practically limitless credit, says:—"As yet the financial power of Great Britain has not been applied to its fullest extent in the conduct of her foreign trade outside the Empire, but one is inclined to think that this will be done ere many months are past, either by a system of bounties or in the shape of long-term credits granted to those manufacturers who are in a position to employ large numbers of workmen, provided that they can meet the credit needs of their customers. In this respect Argentina offers a very fruitful field, and it would not surprise us to find Great Britain co-operating with this Republic on some such basis before many months are out."

Australian Tariff Decisions.—Among the recent decisions of the Customs Department are the following:—Unmachined castings for the frames of tramcar motors, free under the British preferential tariff; free under the intermediate tariff; 10 per cent. under the general tariff. Transformers 3,000 kVA, 22,000/4,150-V, free; 5 per cent.; 10 per cent.

Electrical Progress in Spain.—In the course of a report upon trade conditions in Spain, *Commerce Reports* says that the new improvements in hydro-electric and municipal electric plants are resulting in a continual use of new electrical equipment.

Dutch Trade in Radio Apparatus.—Official statistics of Holland's foreign trade in apparatus for radio telegraphy and telephony show that the imports in the first half of the current year represented a value of 1,235,000 fl., as compared with 537,000 fl. in the corresponding half of 1924. Great Britain is credited with having supplied goods to the value of 401,000 fl., Germany 385,000 fl., France 175,000 fl., and the United States 163,000 fl. On the other hand, the exports from Holland rose from 137,000 fl. in the first half of 1924 to 378,000 fl. in the first six months of the current year. Of this, goods to the value of 223,000 fl. were sent to Great Britain, 35,000 fl. to Germany, and 67,000 fl. to the Dutch East Indies. The exports of metal-filament lamps, which include valves, declined from 12,002,000 fl. in the first half of 1924 to 10,835,000 fl. in the equivalent period of this year. The imports also declined from 485,000 fl. to 412,000 fl.

Electrical Trades Commercial Travellers' Association.—A general meeting of the Association is to be held this evening (Friday) at the St. Bride Institute. The agenda includes the election of vice-presidents, chairman's and treasurer's reports, &c. An invitation is extended to visitors.

The Future of Wembley.—The Board of the British Empire Exhibition has appointed a committee, with Mr. J. H. Thomas, M.P., as chairman, to consider offers for the disposal of the Exhibition. A syndicate headed by Mr. H. Day, a Socialist Member of Parliament, has already made an offer for the ground and buildings with a view to the formation of a housing estate.

Trade with China.—In the report of the Maritime Customs Board on the Foreign Trade of China for 1924, which has just reached us, it is stated that during the year under review, there was no improvement on the previous year so far as electrical machinery was concerned. The continued state of unrest hampered and retarded the development of this industry, whilst intense international competition depressed prices to such an extent that the year's result is reported to have been far from profitable to those engaged in the trade. Nevertheless, a few important orders were placed for power-plant extensions by the Changchow Electricity Works, the Pei Piao Coal-mining Company, the Soochow Electricity Works, the Chee Hsin Cement Works, and the Amoy Electric Light and Power Company, most of which were secured by manufacturers in Continental Europe. British manufacturers, on the other hand, secured contracts for electrical machinery at Tengchowfu and Lincheng in Shantung, and for plant extensions in Manchuria, Honan, and Fukien. Trade in electrical accessories was much the same as in 1923, with a brisk demand for electric fans. Competition in the latter line of business is also growing very keen, European manufacturers coming well to the front, but the bulk of the trade is still in American hands. The total value of electrical materials and fittings imported into China from abroad was 8.2 million taels in 1924, as compared with 8.1 million in 1923, and the share taken by the principal countries of origin during the past two years was as follows:—

	1923. Value. Taels.	1924. Value. Taels.	Inc. or dec. Taels.
United States	1,322,002	1,215,343	−106,659
Belgium	232,707	315,231	+ 82,524
Germany	2,064,119	2,170,973	+106,854
Great Britain	1,244,519	1,236,112	− 8,407
Holland	219,062	366,836	+147,774
Japan	2,495,131	2,170,844	−324,287

American Electrical Exports. — The official statistics of the foreign trade of the United States during June show that the value of electrical goods and machinery exported was $5,991,636. This compares unfavourably with the total for June, 1924, which was $7,201,223. In the electrical machinery section there were some large decreases, notably in the case of d.c. generators—from $295,557 to $46,652; accessories and parts for generators—from $229,471 to $52,012; transformers—from $459,798 to $222,865; switches and circuit breakers—from $372,749 to $90,826; electric railway locomotives—from $468,680 to no recorded value; and accessories and parts for motors—from $225,985 to $117,384. There were also heavy falls in the exports of telephone switchboards—from $127,549 to $31,444; unspecified electrical apparatus—from $600,063 to $440,562; and bare copper wire—from $227,399 to $114,952. On the other hand, there were a number of important increases, the most prominent of which occurred in the case of radio apparatus, which rose from $307,884 to $670,605. The value of exported a.c. generators rose from $17,795 to $81,532; that of domestic appliances from $156,041 to $204,296; industrial electric furnaces and ovens from $16,744 to $34,015; sparking plugs, magnetos and other ignition apparatus from $178,408 to $394,899; and insulated copper wires and cables from $252,448 to $318,856. Figures for the past fiscal year (ended June 30th last) show that the United States exported

electrical machinery and apparatus of a total value of $66.9 million, as compared with $68.8 million in 1923-24, and only $21.1 million (average) from 1910 to 1914.

Book Notices.—"Aluminium Overhead Conductors." By the British Aluminium Co., Ltd. Pp. xi + 150; fully illustrated. Price 10s. 6d.—Although in the main this little book is a treatise on the use of aluminium as a medium for the transmission of electrical energy, much valuable information is contained therein treating of transmission lines in general. A wealth of data both from calculation and experiment is supported by curves and tables, the latter being prepared to meet the specific requirements of the practical engineer. Among the many illustrations are a number of views depicting notable transmission systems using aluminium conductors in various parts of the world. We understand that the British Aluminium Co., Ltd., 109, Queen Victoria Street, London, E.C.4, will send a copy of the book to any responsible engineer interested in the subject.

"The Fuelling and Lubrication of Heavy Oil Engines."—In this small publication of Messrs. Shell-Mex, Ltd., considerable technical information and many data are given concerning the requirements of heavy oil engines for both fuelling and lubrication. Tables depicting the running conditions of such engines, and comparing the fuel costs for oil, gas and steam engines, make an interesting addition.

"Poppy Day Report, 1924." London: The British Legion. —This contains exhaustive details of the results of the sale of poppies on "Poppy Day," 1924. Mention is also made of a few typical cases assisted during the past year, and particulars are given of wreaths, the sale of which helps the Legion's benevolent fund.

Local Exhibition.—BERMONDSEY.—The Borough Electricity Department is organising an electrical exhibition at the Town Hall for the week commencing September 14th.

New Belgian Companies.—Among the recently-formed Belgian companies are the following:—The "Osram" S.A., with a capital of 500,000 fr., to manufacture and sell electric lamps, &c.; the Cie. Continentale "Trialmo," capital 200,000 fr., to produce radio-telephone apparatus, &c.; Accumulateurs Gaulois, capital 120,000 fr.; and the Chauffage et Electricité, capital 475,000 fr., to deal with central heating and electrical installations.

Lighting and Power Notes.

Australia. — MELBOURNE. — According to the *Industrial Australian and Mining Standard*, the Electric Supply Committee of the City Council has recommended that, owing to the increase in the demand for electricity, tenders should be invited for the supply and delivery of a 5,500-kW turbo-alternator, which is to be substituted for the existing 2,500-kW turbo-alternator at the Council's power station. The old alternator is stated to be obsolete, and insufficient for present requirements. The cost of the new one is estimated at £33,000.

"SERVICE" RENDERED.—The Adelaide Electric Supply Co., of South Australia, has, we learn, lately acquired a fleet of ten "Triumph" motor-cycles to enable its service staff to promptly answer any calls.

Barnsley.—LOAN.—The Town Council has applied for sanction to a loan of £5,230 for cable extensions, including public lighting, for Ardsley Hill.

Barrow-in-Furness.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer: Mr. H. R. Burnett) for the year ended March 31st last show a total income of £89,113, as compared with £75,647. Working expenses amounted to £58,472, as against £47,765, leaving a gross surplus of £30,641 (£27,882). After providing for capital charges, there was a net surplus of £5,433, as compared with £2,195 in 1923-24. The capital expenditure during the year, which included £10,500 for machinery and plant, and £9,082 for mains, amounted to £23,045. The electrical energy sold increased from 8,494,387 to 11,379,093 kWh, and the load factor from 26.76 to 37.33 per cent. A new water-tube boiler was installed during the year, and three 75-kW generators were replaced by two 750-kW rotary converters. In connection with the proposed hydro-electric station at Backbarrow, a complete survey of the proposed site of the power house has been made by Messrs. Vickers, and plans of the proposed scheme are in course of preparation.

Bury.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer, Mr. J. G. Potts), for the year ended March 31st last, record a total income of £90,563, as compared with £83,294 in the preceding year. Working expenses were £54,693, as against £50,385, leaving a gross profit of £36,239 (£32,909). After payment of capital charges, &c., a net surplus of £2,121 remained, as compared with £1,501 in 1923-24. The capital expenditure during the year, which included £10,969 for plant, amounted to £26,588. The electrical energy sold increased by 457,635 kWh to 18,479,648 kWh and the maximum supply demanded from 7,080 to 7,690 kW. During the year, work was commenced on the change-over of the system of supply from d.c. to a.c. In connection with the bulk supply to Heywood, a new trunk feeder was laid during the year.

Continental.—SWITZERLAND.—The Swiss Government has recently granted a concession for the construction of a dam and the erection of a hydro-electric station to utilise the water power of Lake Wallen.

ITALY.—The Italian Government has recently granted powers for the establishment of a 12,000-V transmission line between Cassano Spinola and Villaro Enagnano by the Società Distribuzioni Elettriche Iria, for a 11,500-V line between Paiseo and Forno Allione (Brescia) by the Società Alti Forni Franchi Gregorini, a 15,000-V line between the Mesce and Gaudarena power stations at Terida, Cuneo, by the Società Elettro Mineraria, and a 30,000-V line between Rimasco and Valsesia (Novara) by the Società Idro-elettrica Valsesia.

FRANCE.—According to the annual report of the Société de Force et Lumière des Pyrenées the company has recently acquired the electricity undertaking at Montgalliard and the Lac Bleu hydro-electric station of the Société de l'Energie Industrielle. In order to meet the increasing demand arrangements are in hand for an extension of the distribution mains in the Upper Pyrenees.

CZECHO-SLOVAKIA.—*Commerce Reports* states that a meeting of representatives of the cities of Uzhorod, Mukacevo, and Berehov has been held and plans made to form a company to construct a municipal hydro-electric power system in that neighbourhood.

BULGARIA.—With the assistance of the Government and local authorities, a syndicate in Sofia is erecting several hydro-electric plants in the Rhodopege mountains, all of which will be connected up to a central distribution station.

Earby.—ELECTRICITY SCHEME.—At a meeting of the Urban District Council, on August 20th, a resolution was passed stating that it was desirable that the supply and distribution of electricity in the district should be developed under the control of local authorities. It was decided to request the Electricity Commissioners to prepare a scheme for the guidance of local authorities concerned.

East Preston (Sussex).—INQUIRY.—In response to a communication from the local Council, the Electricity Commissioners have intimated their decision to hold an inquiry into the applications of the East Preston Rural District Council and the Worthing Corporation for Special Orders to supply electricity in the area.

Glasgow.—WIRING OF SMALL HOUSES.—In connection with the wiring of private premises it was reported to the Corporation Electricity Committee that 31 houses were added in July, making the total to date 1,099, while 52 applications were made for the hire of domestic appliances, the total to date being 7,284.

MAINS EXTENSIONS.—The Committee has recommended that the manager be authorised to proceed with the extension of mains during the winter at a cost of £90,140, and that application be made to the Unemployment Grants Committee for a grant towards the cost of the work.

LOAN.—The engineer has reported that for the purchase of heating and cooking apparatus to be let out on hire, for the cost of showroom premises already purchased, and the extension of offices, a sum of £160,000 will be required for the next three years. The Electricity Committee has recommended that application be made for sanction to the borrowing of this amount.

India.—ELECTRICAL DEVELOPMENT IN MYSORE.—The total electric power that is now being generated at Sivasamudram is about 32,000 h.p., the whole of which has already been taken up. The demand for additional power likely to be required during the next three years, including that for small industries, fans and other domestic purposes, is estimated at 12,800 h.p. After a careful investigation of the various schemes for the generation of the additional power required, the Government has sanctioned necessary estimates for a seventh installation, providing for the generation of an additional 14,000 h.p. at Sivasamudram generating station at a total approximate cost of Rs. 45½ lacs, including subsidiary works for the transmission and distribution of the power. The development of the Krishnarajasagara station is deferred for the present.—*Indian Engineering.*

Irish Free State.—DALKEY (CO. DUBLIN).—At a recent meeting of the Urban District Council a committee was appointed to ascertain whether the Urban District Council of Kingstown would be willing to undertake the electric lighting of the town, and if so the probable cost of the scheme.

Mid-Cheshire.—NEW ELECTRICITY CHARGES.—The Mid-Cheshire Electricity Supply Co. announces the following new scale of charges for electricity as from October 1st next:—Flat rate: Lighting, 9½d. per kWh. Heating: 2d. per kWh. Power: First 100 kWh per quarter per h.p. connected, 3½d., next 100 kWh 2½d., beyond, 1½d. Combined lighting, heating, cooking and domestic power contract system: A fixed charge per quarter dependent upon the connections plus a charge of 2d. per kWh for the first 200 kWh, and 1d. beyond for the winter quarters, and 1d. per kWh per quarter for all electricity consumed in the summer quarters.

North Wales.—ELECTRICITY SUPPLY.—The Merioneth County Council has granted the North Wales Power Co., Ltd., permission to carry overhead transmission lines from Llanfrothen to Maentwrog, and from Maentwrog to Blaenau Festiniog.

(Continued on page 383.)

A Scottish Colliery Power Station.

The Fife Coal Company's Electricity Generating Plant.

The supply of electrical energy to collieries is beset with difficulties which prevent any hard and fast rules being laid down as to the mode of deriving the supply. Providing the conditions, however, are suitable to enable a central station to operate efficiently, then there is no doubt about the economies which will result from the utilisation of such a source of electrical energy—an example being the Fife Coal Co.'s Kelty station, adjacent to the Aitken pit, which generates the whole of the electricity used by the company at its numerous pits in the Kelty and Cowdenbeath districts as already explained.*

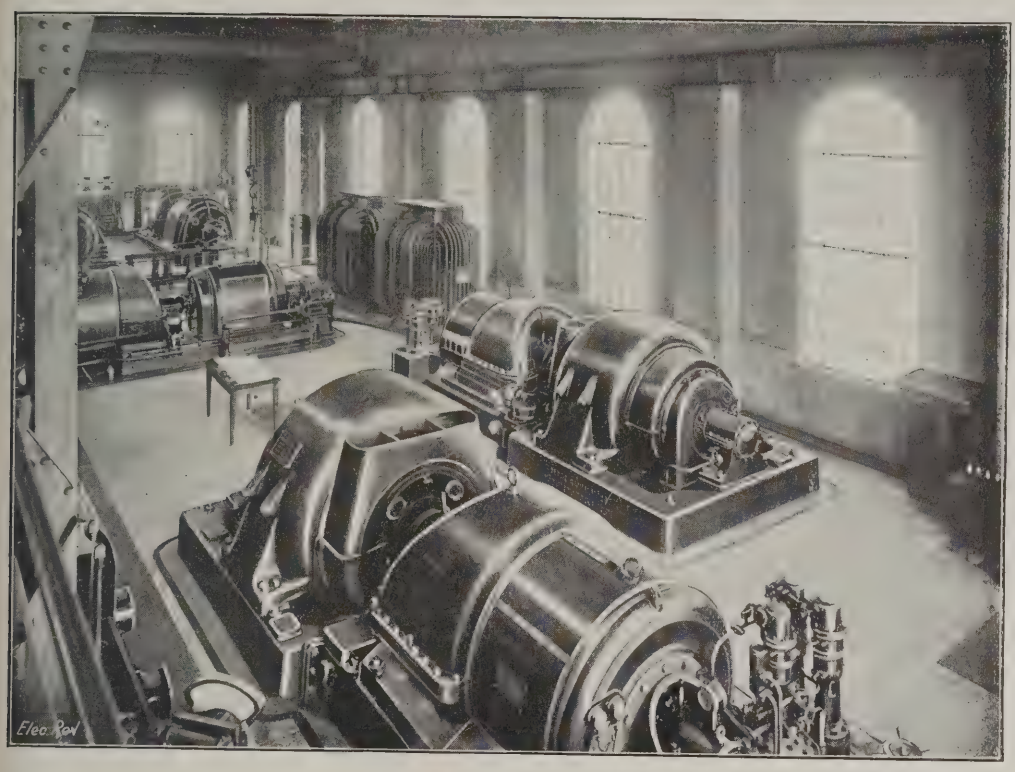

Fig. 1.—Turbo-generator House, Kelty Power Station.

The company utilises electricity for all purposes on the surface and underground; it is transmitted from the power house to the 14 pits already electrified by means of transmission lines, part of which is in the form of a ring main, of a total length of 17 miles, the pressure of 12 miles of line being 3,000 volts, while the remaining five miles of line is operated at 6,600 volts, at which voltage all future extensions are to be carried out. Except at certain railway and road crossings, where short lengths of cable are used, the whole of the lines are carried overhead on wood poles.

Practically all colliery power stations have been evolved from small beginnings, their capacity having been gradually built up as confidence in the application of electrical methods to mining processes was increased. In view of the facts that some years must elapse before the capital expenditure necessary at the commencement can be economically utilised, and that the final power requirements can only be guessed at, the problem of determining the source, or method, of supplying power to a new colliery undertaking is extremely complicated. It is accordingly not surprising that colliery companies prefer to develop gradually by the use of steam winding engines, generally the largest individual units of a colliery plant, in conjunction with mixed-pressure turbo-generators to carry the auxiliary load, notwithstanding the lower efficiency of such a scheme as a whole, as compared with the all-electric method. Nevertheless, there is a good deal of misconception with regard to such a scheme, for it is at the best but a compromise. The exhaust-steam turbine is strictly nothing but a utiliser of steam that would otherwise be wasted in connection with existing plant, and its adoption in the case of a new colliery undertaking depends on the relative proportion of the available exhaust steam to the auxiliary power requirements. In the case of the undertaking under consideration, however, the fourteen collieries have been completely electrified, including the winding engines, and consequently the whole of the boilers and steam plant at these pits have been discarded and removed. The 16,500-kW Kelty power house, the turbine room of which is illustrated in fig. 1, contains six turbo-alternators, the total capacity of which is 22,000 kVA; a mixed-pressure British Thomson-Houston turbo-generator was placed in commission in October, 1919, to utilise the steam exhausted by the winding engine at the adjacent Aitken pit. The turbo-alternator comprises one mixed-pressure set of 1,500 kW capacity and the turbine is of the three-stage horizontal Curtis type, running at 3,000 r.p.m.; it is coupled direct to

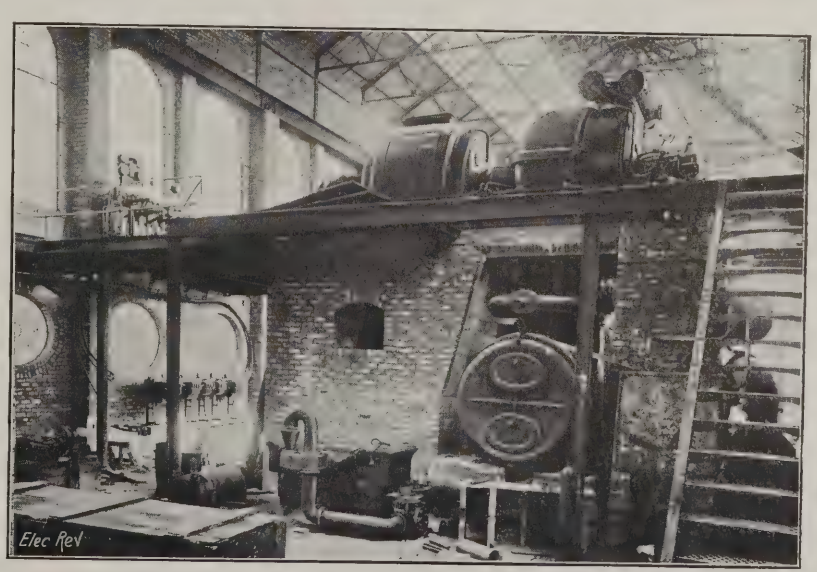

Fig. 2.—Re-erection of 3,000-kW Generator in New Turbine House.

* Elec. Rev., May 15th, 1925; pp. 779-81.

an alternator designed to give a normal output of 1,875 kVA at 80 per cent. power factor, 3,300 volts, three-phase, 50 cycles, the overload capacity being 25 per cent. for two hours. The steam conditions are: High pressure, 200 lb. per sq. in. gauge, superheated 200 deg. F., and the vacuum at full load is 28 in.; low pressure, 16 lb. per sq. in. absolute. This machine is working in conjunction with jet condensing plant of the "Korting" type supplied by Messrs. Samuel Bullock and Co., and a steam-driven exciting set, which can also be used for station lighting purposes, is located in the condenser basement, as shown in fig. 5, although the mixed-pressure set is a self-excited machine. Means are

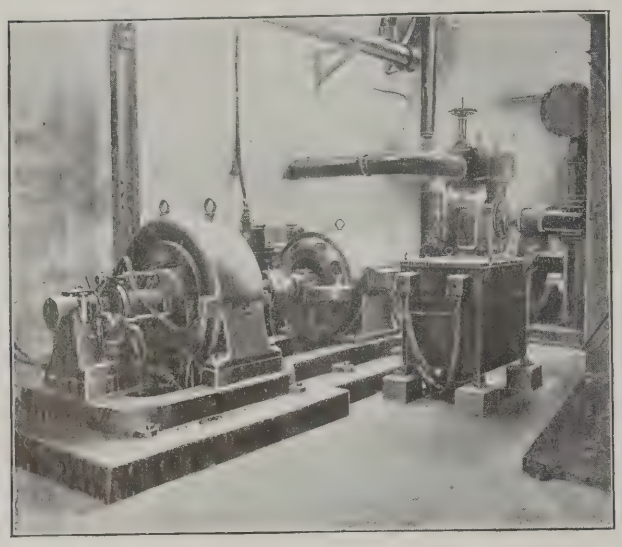

Fig. 3.—Motor-driven Exciter Set.

thus provided of starting the generating station after a shut down with steam obtainable from an independent external source. The main generating plant consists of three Fraser & Chalmers-General Electric Co. 50-cycle, 3-phase, 3,300-volt steam turbo-alternators running at a speed of 3,000 r.p.m. and of a capacity of 3,000 kW each. The turbine room also contains a British Thomson-Houston 50-cycle, 3-phase, 3,000-r.p.m. turbo-generator, while a duplicate machine was, on the occasion of our visit, being re-erected in an extension of the power house. These two sets were originally built by the B.T.-H. Co. to the order of the Ministry of Munitions, having been installed in 1916 at the Gretna Government munition factory. They were later purchased by the Fife Coal Co. and, together with their auxiliary plant, were dismantled, removed to Kelty, and re-erected by the Coal Co.'s engineering staff without outside assistance. Fig. 2 is a view of one of these machines during the course of its re-erection at Kelty. The steam conditions for the whole plant are a gauge pressure of 200 lb. per sq. in., superheated 200 deg. F., and the B.T.-H. sets were designed to give a normal output of 4,000 kVA at 75 per cent. power factor, 6,600 volts. Their overload capacity is 25 per cent. for two hours.

The condensing plant for both these sets is of the surface type manufactured by Messrs. Cole, Marchent and Morley, each being designed to deal with 43,000 lb. of exhaust steam per hour and capable of maintaining a vacuum of 28-in. mercury when supplied with 260,000 gallons of cooling water per hour at a temperature of 75 deg. F. Each air pump, which are of the Edwards three-throw type, is driven by a 17-h.p., 440-volt, three-phase, 50-cycle B.T.-H. motor, whilst each circulating pump is driven by a 100-h.p. B.T.-H. motor. The three G.E.C. turbines have Bullock condensers of the Korting jet type, one of which is illustrated in fig. 4, a somewhat unusual feature; this is, of course, pre-war plant, and it has operated quite satisfactorily. The condenser auxiliary plant consists of two sets of Platt 4,080-gallon, 40 ft. head, 550-r.p.m. pumps, driven by

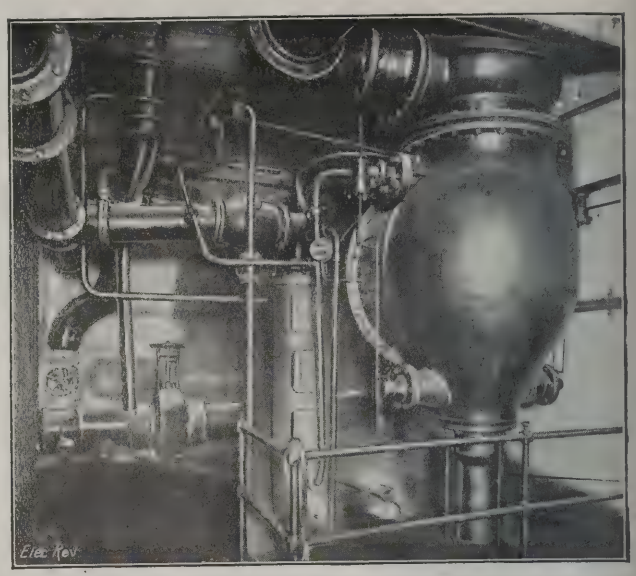

Fig. 4.—A Korting-type Bullock Jet Condenser.

Belliss & Morcom 3-cylinder steam engines; and two W. H. Allen sets, each comprising two pumps on one shaft driven direct by a G.E.C. 3-phase, 50-cycle, 730-r.p.m., 3,000-volt, 120-h.p. motor with G.E.C. switchgear, as shown in figs. 3 and 5.

In conjunction with an electrically-driven Weir water pump and a spray filter, a "Sirocco" fan draws outside air into the basement, whence it passes up through the G.E.C. alternators, whilst the two latest B.T.-H. generators are each provided with a Heenan & Froude

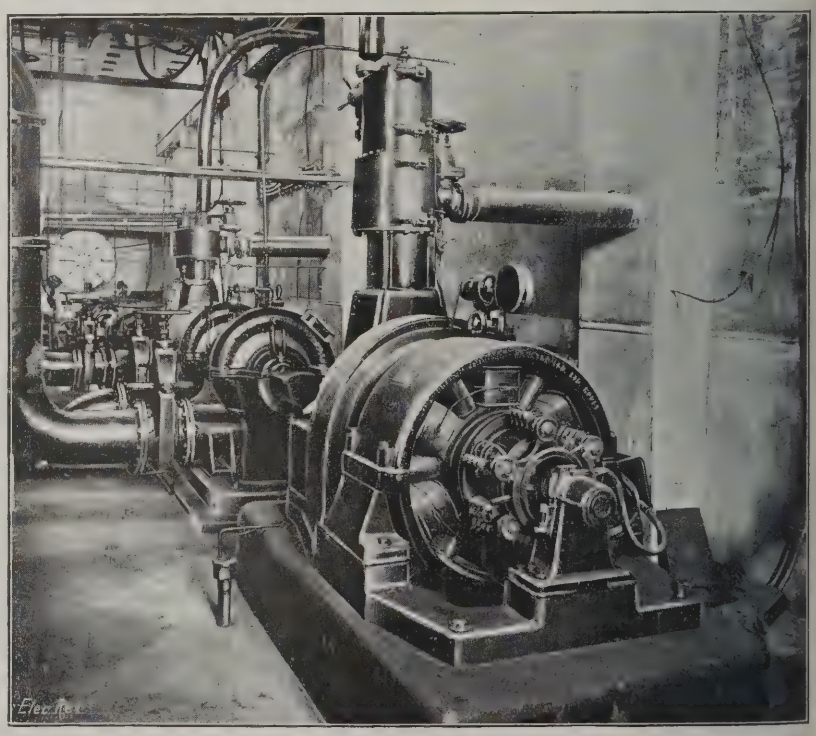

Fig. 5.—Steam-driven Exciter and Condenser Pumps.

air washer with B.T.-H. motors. In the basement there is a Fox oil filter, the station cranes being by Anderson, Grice & Co., Ltd.; they are of 30 tons capacity, and are electrically operated.

Although the three main B.T.-H. turbo-generators are provided with exciters mounted as usual on shaft extensions, the G.E.C. machines are not self-excited. Accordingly, three separate exciting machines have been provided: two of them are G.E.C. sets, each consisting of

a 69-kW, 50-116-volt, 225-r.p.m. d.c. generator coupled direct to a 130-h.p., 3,000-V, 50-cycle motor as shown in fig. 3, while the third (which has already been referred to, fig. 5) is a 46-kW, 6-pole, 115-volt, B.T.-H. d.c. generator driven direct by a verticle single-cylinder Belliss & Morcom steam engine at 480 r.p.m. Thus a very flexible means is available of exciting any one, or all, of the main generating sets through the separate switchboard illustrated in fig. 7 with B.T.-H. control, which is arranged to trip the main generator switch and break the field circuit in the event of a fault developing.

To form a link between the two 6,600- and the four 3,000-volt generating sets and the respective portions of the transmission system, two Johnson and Phillips 1,500-kVA, three-phase, 50-cycle transformers have been provided, their h.p. windings being connected in star and the l.p. sides delta connected. At present they are temporarily situated in the turbine house, as shown in fig. 1, and their switch panels are of the Reyrolle draw-out metal-clad type, each of 300 amp. capacity, with overload protection and the middle pole of the overload relay arranged for earth-leakage protection. Synchronising equipment is mounted on a swinging frame at the right-hand end of the board, two other panels of which control two 6,600-V feeders to the Nos. 1 and 2 Kirkford pits, being provided with overload protection, and the third is a 600-amp. generator panel having Merz-Price mid-point protection and an instrument bracket mounted on the top of the bus-bar chamber. These panels will be moved into the new turbine house when completed and added to similar Reyrolle gear for the other B.T.-H. generator. The 3,000-volt switchgear consists of 15 complete sets of generator and feeder equipment of the remote mechanically-operated B.T.-H. type. The isolators, bus-bars, and oil switches are housed in moulded stone cells on a gallery, the control panels being on the engine-room floor below, as shown in fig. 6; there are duplicate bus-bars throughout, and each set can be divided in two sections by means of bus-sectionalising equipment.

The fuel burned is in the form of slack coal (3/16 mesh), with a 25 per cent. ash content and a calorific value of anything from 7,000 to 10,000 B.th.u.; it is conveyed from the adjacent Aitken pit screening plant to the boiler-house dumping pit, fig. 9, which also shows the Babcock & Wilcox suction ash plant hopper, by means of an electrically-driven underground belt conveyor, by the Blantyre Engineering Co., with Reyrolle switchgear. Thence the coal is elevated by bucket conveyors to the boiler bunkers.

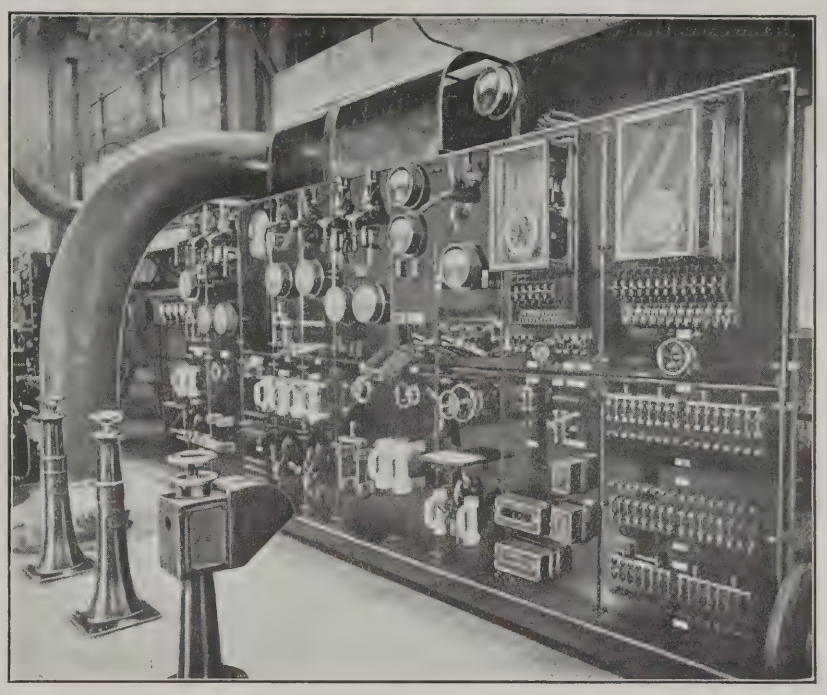

Fig. 7.—Main Generator Exciting Switchboard.

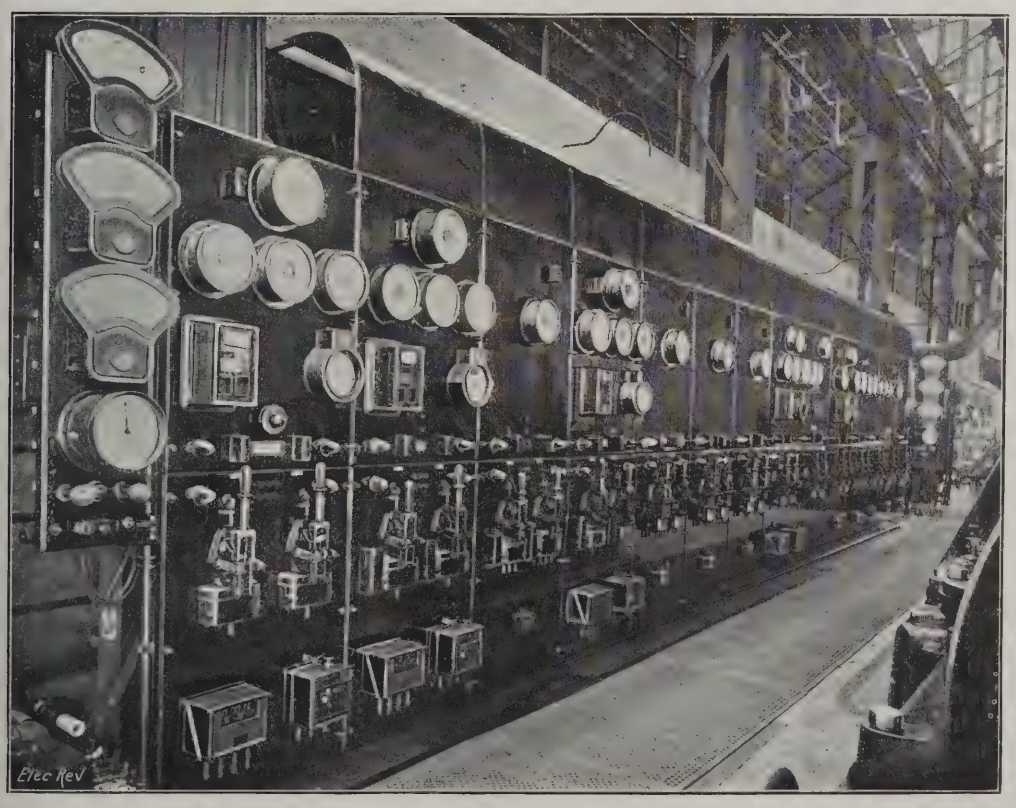

Fig. 6.—Main 3,000-V Generator and Feeder Control Board.

The present boiler house, a section of which is illustrated in fig. 8, contains two Babcock & Wilcox 18,000-lb. per hour boilers and three 27,000-lb. and three 30,000-lb. Stirling boilers. Five of them are equipped with Erith-Riley self-cleaning underfeed stokers, and the others with Erith-Roe stokers, which are driven by drip-proof 10-h.p. commutator motors of the a.c., 50-cycle, variable-speed (450- to 1,350-r.p.m.) B.T.-H. type. Steam is generated at a pressure of 200 lb. per sq. in. and superheated to a total temperature of 600 deg. F. A 35-h.p. electrically-driven forced-draught fan is provided for each boiler, and three "Sirocco" induced-draught fans are also available, but were not being used at the time of our visit; the single 215-ft. high steel chimney creates a draught equivalent to 1 in. of water. Economisers are not used at present, but will be installed in the new boiler house. The four Weir steam-driven reciprocating boiler feed-

water pumps each have a 9-in. bucket, 12-in. piston, and a 24-in. stroke; Crosby double-feed regulators and an Erith feed heater are installed with water-softening and oil-separating plant, the main and auxiliary steam ranges and feed water mains being arranged on the ring principle.

All the auxiliary plant which is electrically driven, with the exception of the 3,000-V pump motors mentioned earlier, are fed through a 500-volt a.c. ring main, the motor starters being of the Ellison and Reyrolle types. The source of supply, as shown in fig. 10, is one 460-kVA and two 202.5-kVA Brush, 50-cycle, 3-phase, oil-cooled, 3,000/500-V transformers, with B.T.-H. switchgear on

Fig. 8.—Section of the Existing Boiler House.

the l.p. side and Reyrolle switches on h.p. side; one 6,600/500-V transformer is capable of being changed over or of operating in parallel with the others, while two 25-kVA Johnson & Phillips 3-phase, 50-cycle, 500/100-V transformers are delta connected on their h.p. side and in star on their l.p. side to supply the lighting circuits. It is of interest to note that in case of accident any rotor of any of the main G.E.C. machines can be replaced immediately, for a spare turbine rotor and a spare generator armature are available in the station.

In conclusion, it may be mentioned that the station extensions, as already indicated, will consist of a new turbo-generator house (in which the machine shown in fig. 2 has been re-erected) and a parallel boiler house, both at right angles to the old turbine room, which is 125 ft. 6 in. long by 51 ft. 5 in. wide. The new turbine room is 140 ft. 4 in. long and 54 ft. 6 in. wide, and will accommodate, besides the machine shown in fig. 2, three 6,000-kW turbo-alternators and six transformers. The company has generating plant of 7,500 kW capacity installed at collieries in other districts, Mr. J. R. Copping, the Fife Coal Co.'s chief electrical and mechanical engineer, being responsible for the whole of the plant, together with the laying out of the extensions. We have to thank him for the facilities placed at our disposal on the occasion of our visit to the Fifeshire coalfield. The total output of the generating station six months ago was 1,045,000 kWh per week.

Technical Information.

How to Make Use of it.

By W. R. N.

There is no doubt that most engineers worthy of the name have read much valuable matter. How many men, however, say a month later, are able to recall salient points, or to lay hands upon any particular article which they have mentally noted and approved? Some few are able to do so, though not many without having recourse to mechanical means for aiding the memory. The pre-

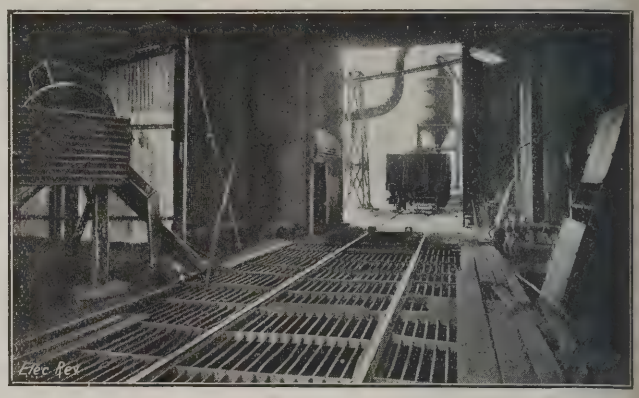

Fig. 9.—Coal Elevator Pit and Ash Hopper.

sent writer finds it necessary to keep a note book wherein he makes his entries of technical treasure trove.

An excellent plan is to use a sectionalised note book. This reduces the manual labour involved, in that it largely cuts out the work of classification and cross indexing. The subjects take their own copy at the initial entry. All that is necessary is to book the work up intelligently. Not the least important aid is the provision of a special column to cover actual location of article. It may not always be an easy matter to procure a copy other than the one which has been read. Actually where that copy finds a home is, therefore, of some consequence. The following table, dealing with the subject of metallurgy, exemplifies what is meant:—

C.—Metallurgy and Micrography.

Ref.	Title of Article &c.	Author.	Source.	Location.
1	Non-ferrous Metals	D. P. Cowell	Engineering Era	L. Arundel & Co.'s staff library
2	Duralumin	Dr. D. C. Roper	Metal World	K. Burton.
3	Micrography of Stainless Steels	R. Malone, B.Sc.	Proc. Eng. Inst.	Lideman's library

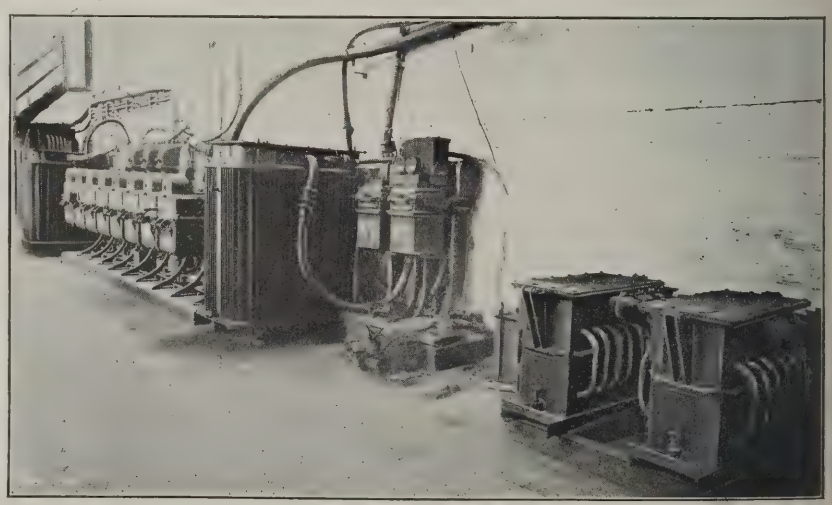

Fig. 10.—Station Auxiliary Transformers and Switchgear.

The existing machinery of technical journal clubs can usually be made use of. The necessary innovation is such that in most cases it would affect the working very little; and it need not interfere with the ordinary routine at all. The members would be asked to note down in some convenient form such articles as arrested their attention and seemed worthy of serious consideration. Exactly *how* the notes are made, or what form

they take, is of secondary importance. The table given below illustrates one method. Doubtless something much better suited to existing conditions will suggest itself to those interested. The blank but ruled form would be pasted on every magazine or journal issued. Roneo-ed copies of the form prove admirable for the purpose.

THE "ENGINEERS' REVIEW," JANUARY, 1924.

Name.	Date received.	Useful articles.	Page.
M. Panter	2/2/'24	Turbine Disks	112
		Lubrication of Gearing	128
T. Bird.	5/2/'24	The Engineer as Organiser	142
A. K. Sylvester	10/2/'24	Electrification of Railways	135
P. Brant	12/2/'24	Water *v.* Steam Power	138

Finally, if the periodicals concerned are kept in a staff library it may repay the members if they arrange that an indexed register—either book or card index—be kept of such entries. Either one person may take on the work or different members in rotation for stated periods.

Lighting and Power Notes.

(*Continued from page 378.*)

Oldham.—YEAR'S WORKING.—The report of the borough electrical engineer, Mr. F. L. Ogden, on the working of the Corporation electricity undertaking for the year ended March 31st last, shows a total revenue of £233,448, and working expenditure of £145,949, leaving a gross profit of £87,498. The previous year's figures were: Income, £205,439; working expenses, £113,130; gross profit, £92,309. To the gross profit was added a balance of £18,956 from the past year's account, a Government grant of £500 in respect of relief work, and interest on loans £7,759, making a total of £114,714. After deducting capital charges, &c., transferring £10,955 to reserve fund, and £8,000 to plant insurance fund, a balance of £21,652 was carried forward. During the year, £59,320 was spent on capital acount, the chief items being £31,975 for mains, and £18,536 for buildings, machinery and plant. The sales of electrical energy increased from 34,576,979 to 41,444,810 kWh, and the maximum supply demanded from 19,484 to 22,043 kW. The average price per kWh obtained fell from 1.426d. to 1.352d. A new 6,000 kW turbo-alternator and additional e.h.p. switchgear were installed during the year, and a scheme was submitted to the Electricity Commissioners for the erection of a new power station at Chadderton. Sanction was received to the change-over of the system of supply from d.c. to a.c.

Padiham.—ELECTRICITY SUPPLY.—Representatives of the Town Council have interviewed representatives of the Lancashire Electric Power Co., to discuss the terms on which the company will distribute electricity in Padiham area. The manager of the company stated that it was proceeding with the work of supplying Clitheroe and places *en route*, and it would be eight months before Padiham could be supplied.

Plympton. — ELECTRICITY COMMISSIONERS' DECISION. — The decision of the Electricity Commissioners on the applications of the Plymouth Corporation, Plympton Rural District Council, and Messrs. Heath & Co. for power to supply electricity in the Plympton rural district, which was the subject of an inquiry which concluded in London on May 9th, was made known to the authorities concerned on August 21st. The Commissioners have rejected the applications of the Plymouth Corporation and Messrs. Heath & Co., and granted the application of the Plympton Rural District Council for a Special Order to supply electricity in the whole of the rural district. The Plympton Rural District Council has come to an agreement to purchase the Plympton undertaking of Messrs. Heath and Co. for £7,000, and proposes to take all its supply from Plymouth, distributing it by means of sub-stations in the chief centres of population.

Salford.—YEAR'S WORKING.—The report on the working of the Corporation electricity undertaking (engineer, Mr. S. J. Watson) for the year ended March 31st last, records a total revenue of £281,595, as compared with £269,169 in 1923-24. The working costs, including bulk supply purchased, were £171,173, as against £156,388, leaving a gross profit of £110,422 £112,781). Interest and sinking fund charges accounted for £83,361, and there was a net profit of £27,061, as compared with £41,015 in the preceding year. Of this amount £10,000 was contributed to the district fund, and the balance is to be transferred to the reserve and renewals fund. The capital expenditure during the year amounted to £263,315, the chief item being £205,979 for plant, &c., at Agecroft power station. The sales of electrical energy increased from 38,746,444 to 44,744,494 kWh, of which 4,736,012 kWh was purchased from Manchester Corporation. The average price per kWh obtained fell from 1.65d. to 1.49d., and the maximum supply demanded rose from 17,094 to 18,647 kW. The agreement with the Manchester Corporation for the supply of electricity in bulk expired on March 31st last, and negotiations are pending between the two Corporations for an agreement for reciprocal, emergency, and week-end supplies. During the year 12 additional transformer sub-stations were connected up to the 6,600-V system, making a total of 50 sub-stations.

South Shields.—LOANS.—The Electricity Committee is applying for sanction to loans of £30,000 for services, £40,000 for mains extensions, £10,000 for meters, and £2,000 for transformers.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Prestatyn Urban District Council to supply electricity in its area.

The County of London Electric Supply Co., Ltd., has applied for a Special Order for the supply of electricity in the parish of Merstham.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—According to *Power* the Muscle Shoals Hydro-Electric Co. has applied to the Federal Power Commission for a licence to construct a 54-ft. dam with a power house immediately below it, on the Tennessee River, in Lauderdale and Colbert Counties, Ala. The proposed installation will have a total primary capacity of 60,000 h.p. The Mississippi Power Co. has also applied to the Commission for a licence to construct a dam and power house in the Tennessee River in Tichomingo Co., Miss., and Lauderdale County, Ala. The proposed installation will have a total primary capacity of 66,000 h.p. The electrical energy generated at these stations will be used for public utility purposes.

Whitehaven.—LOAN.—The Rural District Council has decided to apply for sanction to a loan of £2,600 for lighting the Council houses and streets at Thornhill by electricity. The Council proposes to take a supply of electricity from the Cumberland Waste Heat Co.

Tramway and Railway Notes.

Argentina.—BUENOS AIRES.—A *Reuter* message from New York states that a technical commission has favourably reported on the tube scheme put forward by the Anglo-Argentine Tramway Co., and an *ad referendum* agreement was signed by the company's manager and the Mayor of Buenos Aires, but before any contract is finally accepted it must be passed by a number of municipal bodies. The actual sum involved in the contract is estimated at £10,000,000 sterling, but any expenditure will necessarily be spread over a period of years. It is further stated that the Argentine Post and Telegraph Department will spend 500,000 pesos for the construction of an underground system of cable tubes.

Ashton-under-Lyne.—RAILLESS CARS.—A railless car service between Ashton and Oldham was inaugurated on August 26th. The route extends for over three miles, and the cost of the scheme, including the purchase of ten cars, was £30,000.

Australia.—NEW SOUTH WALES RAILWAY ELECTRIFICATION.—The work of widening the tracks and providing electrical equipment is proceeding rapidly. The *Industrial Australian and Mining Standard* states that four sub-stations are now under construction at Sydney Station Yard (Prince Alfred Park), Sydenham (Meeks Road), Hurstville, and Sutherland, and are to be completed in readiness for the opening of the Illawarra section which has been scheduled for January 1st, 1926. At these sub-stations the h.p. a.c. supply from the White Bay power house will be converted to 1,500-V d.c. and supplied by feeders to the overhead wire. At Prince Alfred sub-station, the equipment will consist of three 4,500-kW rotary converters with automatic starters, and with electrically-operated remote control switches for operating the feeder circuits. Meeks Road sub-station will be equipped with three 3,000-kW double-unit converters, each consisting of two 1,500-kW machines in series. The other features will be similar to those at Prince Alfred sub-station. In addition, this station will function as feeder to those at Hurstville and Sutherland, and for this purpose two 5,400-kVA transformer banks are being installed. The h.p. supply from the power house will be stepped up to 33,000 V for transmission to Hurstville and Sutherland, the whole of this equipment being of the outdoor type. Hurstville sub-station will be equipped with one 3,000-kW and two 1,500-kW converters. At Sutherland sub-station the equipment will consist of two double-unit 1,500-kW converters. The converters and switchgear are being supplied by the Australian General Electric Co. and Metropolitan-Vickers, Ltd.

Brazil.—NEW ELECTRIC RAILWAYS.—It is reported that an agreement is about to be entered into between the Government and a German group of financiers, who propose the construction of a new network of railways consisting of four lines, all to be electrically operated. The whole of the necessary material will be supplied from Germany, and German engineers alone will be employed on the work of construction.—*Reuter's Trade Service* (Rio de Janeiro).

Continental.—CZECHO-SLOVAKIA.—Orders for the first electric locomotives required in connection with the electrification of the Czecho-Slovakian State Railways have recently been placed. The Skoda Works, of Pilsen, is to supply three express and two shunting engines, the Ceskomoravska Kolben Works, Prague, five goods locomotives, the Krizik Co., Prague, two passenger engines, and the Adamstal Co. and Siemens Co. each two shunting locomotives.

AUSTRIA.—The first section of the electrified Vienna Metropolitan railway—that between Hutteldorf-Haiking and Alserstrasse—was recently opened for traffic. The total

length of the line to be electrified is 16½ miles, along which there are 25 stations or stopping places. The line is on the overhead system with double conductors, and was installed by the Austrian Siemens Schuckertwerke, of Vienna. The cars are each provided with two motors of 90-100 h.p. The necessary current for the operation of the line is supplied from the Vienna municipal central station, this being converted to 750 V d.c. by means of four mercury rectifiers. A feature of the installation is the provision of a travelling rectifying station to meet occasional heavy demands for energy. This was built by the "Elin" Gesellschaft für Elektrische Industrie, Vienna, and comprises a 750-V oil-transformer and a 700-kW, 750-V, d.c. rectifier, together with the necessary switches and measuring gear. The transformer car can be run to any desired point, provision being made at various places for connecting up both to the 5,000-V a.c. mains and to the line conductors.

HOLLAND.—ONE-MAN CARS.—A number of one-man controlled tramcars have recently been put in service on the municipal tramway system in Amsterdam. The vehicles are operated on the system of the Bergmann Elektricitatswerke Gesellschaft, Berlin. One man acts as both driver and conductor; all passengers enter by a door at the front end of the car and dismount by one at the rear, the doors being electro-mechanically opened and closed.

Cuba.—HAVANA.—A concession for the construction of the subways in the city of Havana was granted by the Cuban Government seven years ago, but the world sugar crisis of 1920 affected the economic condition of Cuba so greatly that the project has been held in abeyance. With the return of more favourable conditions in that country, the Cuba North and Southern Railroad Co., which holds the concession, is taking steps to carry out its programme. The present plans of the company call for tubes similar to the East and North River subway tubes of New York. These will extend under Havana harbour, and will connect the city with rapidly developing suburbs. The subways are expected to involve an eventual expenditure of hundreds of millions of dollars.—*Electric Traction.*

Leicester.—NEW ROUTE.—The Corporation proposes to construct a new tramway from Uppingham Road to the Coleman Road estate. A portion of the track will be laid on sleepers with crossings at various places for ordinary traffic. The cost of the scheme is estimated at £12,500.

London.—PROPOSED "GOODS" TUBE.—According to the daily Press an Anglo-American company proposes to construct an underground electric goods railway for London. The scheme would link all the principal railway termini and serve all the principal markets and trade centres. About 69 miles of track would be laid, and work would be provided for 55,000 men for three years. The estimated capital cost of the scheme is £32,000,000.

NEW "UNDERGROUND" PLANT.—Additional strain upon the present electricity supply of the London underground railways will shortly be caused by the opening of several new stations and escalators. To ease it new sub-stations will be built at South Wimbledon and Balham, and a semi-automatic station at Lambeth North. The last will have two 1,500-kW rotary converters. A new 2,000-kW rotary converter will be placed in Victoria sub-station, and another of 1,500 kW in Baker Street sub-station. A new 15,000-kW turbo-generator is to be installed at Lot's Road power station.

METROPOLITAN DISTRICT RAILWAY ORDER.—The Minister of Transport has approved an application of the Metropolitan District Railway Co. for an Order authorising it to acquire land in the borough of Westminster for works in connection with its undertaking.

South Shields.—PROPOSED NEW ROUTE.—The Corporation has asked the borough engineer and tramway manager to report on the question of extending the tramway along Sea Road.

Telegraph and Telephone Notes.

Australia.—TELEGRAPH AND TELEPHONE SERVICES.—The result of the year's working of the Postmaster-General's department for the twelve months ended June 30th, 1924, shows a telegraph income of £1,481,455 and a telephone revenue of £3,601,023, while radio receipts amounted to £15,599. In the telephone service, says the Melbourne *Herald*, many exchanges were placed in continuous day and night service, resulting in a considerable increase of staff. Last year 47,000 miles of new aerial wires were brought into service, for 46,624 net new telephone subscribers. The aerial mileage showed an increase of 20.8 per cent., making a total of 272,000 miles, and the percentage increase of new instruments was 14.6 on a total number of 318,000. The 46,624 new instruments cost an average of £60 each for apparatus and fixing. The capital expenditure from loan money on new telephone and telegraph works was £3,980,000. At the end of June, 1924, the outstanding number of applicants for telephone service was 12,341. By June this year this number had been reduced to 8,500, despite a progressive increasing demand of 5,000 a month. Amongst the causes of the financial balance being on the wrong side of the ledger were reductions of £80,000 through alteration of trunk call charges, and of £18,000 through reduced cable rates.

China.—TELEGRAPH SERVICE.—According to a report recently issued by the Chinese Government Bureau of Economic Information, there are now 84,837 miles of telegraph lines in operation in China.

International Telegraph Conference.—PARIS MEETING.—Mr. Stanley J. Goddard, vice-president, and Admiral C. P. R. Coode, C.B., D.S.O., general manager in Europe, of the Western Union Telegraph Co., left for Paris on August 31st, to represent the company at the International Telegraph Conference, which is meeting there this week after, says *The Times*, an interval in its gatherings of not much less than 20 years. The British Post Office was to be represented by six delegates. The union deals with international telegraph regulations, and was to have before it over 1,100 propositions, coming from most of the countries in the world, mainly of a detailed technical kind. The union comprises practically all the countries of the world, with the exception of the United States and Canada.

New Zealand.—SHIPS' RADIO REGULATIONS.—New regulations governing the installation of radio apparatus on vessels registered in New Zealand have been gazetted. They are intended to minimise the danger of coastal voyages, and the date of their operation is January 1st, 1926. A full explanatory statement has been issued by the Minister for Marine (Mr. G. J. Anderson), who states that every ship which carries more than 25 persons will be required to carry radio apparatus, although certain exemptions are provided for.

Radio-Telephony at Sea.—LIGHTSHIPS AND LIGHTHOUSES.—The Port Director of Basrah, Mesopotamia, has ordered three further Marconi radio telegraph and telephone installations of the YB1 type, similar to those recently installed on the dredgers *Liger* and *Tigre* at Basrah. Similar sets of equipment are being fitted by Marconi's Wireless Telegraph Co. for the Northern Lighthouse Board, in the Sule Skerry and Monach lighthouses, and also at Stromness. A third group of Trinity House stations, based on Yarmouth, is being equipped also with YB1 telephone apparatus. Groups previously fitted with this apparatus are the light vessels based on Ramsgate (the Goodwins) and Harwich. The steam vessel *Argus*, belonging to Trinity House and based on Yarmouth, will also carry the same type of equipment, together with a wireless call bell, which device is already carried by the *Alert* of the London group. These installations will make a total of 31 British lightships, lightvessels, and harbour authority offices fitted with Marconi radio telephone equipment. The YB1 installation needs a power supply of 100 watts, and has an approximate range of 50 miles for telephony and about 130 miles for continuous-wave telegraphy. The sets are designed for use as portable and semi-portable stations.

Radio Notes.

Australia.—LICENCES.—The number of licences granted in the various States are, according to the *Electrical Engineer* of Australia and New Zealand, as follows:—New South Wales, 33,964; Victoria, 19,481; Queensland, 1,211; South Australia, 2,895; Western Australia, 3,427; and Tasmania, 540. A sum of £113,658 has been collected in licence fees, and the amounts paid to the various broadcasting companies are said to be as under: 2 FC, £34,629; 2 BL, £12,018; 3 LO, £14,444; 3 AR, £4,090; and 6 WF, £4,220.

Broadcasting Development.—PER CAPITA STATIONS.—Our French contemporary, *Radio Electricité*, points out that the United States has now 5.1 broadcasting stations for each million of the population. Sweden follows with 2.2 stations for a similar number, South Africa 1, Holland 0.78, Great Britain 0.49, Norway 0.45, Belgium 0.3, Rumania 0.17, Germany 0.14, Spain 0.087, and France 0.077. It should be remembered, however, that the figures do not form a true guide to the development of the broadcasting movement in the respective countries as the transmitting power of the stations, and consequently the number of listeners served, varies considerably.

Copyright.—A B.B.C. INJUNCTION.—In the Vacation Court, on August 26th, before Mr. Justice Finlay, motion was made by Mr. Jenkins, K.C., on behalf of the British Broadcasting Co., Ltd., for an injunction to restrain the Wireless League Gazette Publishing Co., Ltd., from infringing the copyright in programmes printed in its weekly, *Radio Times*, by reproducing them in *The Wireless League Gazette*, the defendants' weekly organ. Mr. Jenkins explained that the programmes were prepared six weeks in advance, and submitted that they were compilations coming within the protection of the Copyright Act, 1911. Mr. Macgillivray, for the defendants, contended that there was no copyright in programmes which were simply records of arrangements made; alternatively, if there was copyright, it was of so flimsy a character that what the defendants had done did not amount to infringement. The amount of skill required in a compilation protected by copyright was absent. Counsel further argued that the partial reproduction of the programmes came within the exceptions to the operation of copyright law as being "fair dealing for the purposes of newspaper summary." His Lordship said 35 per cent. of the programmes in the *Radio Times* had been copied. He was satisfied that there was a real question to be argued at trial. He would make no order on the motion, and there would be liberty to apply for speedy trial of the action.—*Daily Telegraph.*

Jugo-Slavia.—NEW STATION.—Apparatus for the broadcasting station near Zagreb has, says *Commerce Reports*, been ordered from Germany on reparations account and will be installed by Jugoslavenski Siemens, the local representatives of the Siemens-Schuckert Werke. The station is to be used solely by the State, but it is hoped that later it will be released for general use. There are now 145 receiving sets in Zagreb.

Manchester Wireless Society.—TEST TRANSMISSION.—From September 2nd the testing station G6MX of the Manchester Wireless Society will transmit regularly on the following wavelengths at the times stated:—On Saturdays from 6.30 to 7 p.m., G.m.t., on 45 metres; on Sundays from 7 to 7.30 p.m., G.m.t., on 90 metres; and on Wednesdays from 5 to 6 a.m., G.m.t., on 25 metres. Reports should be sent to the hon. secretary, Mr. Y. W. P. Evans, 66, Oxford Road, Manchester. Special tests can be arranged, and members of the Society are prepared to report on reception from any part of the world, while experimenters willing to co-operate in tests on 3 to 5 metres should notify the secretary as early as possible. The Society is prepared to try any commercial apparatus in its various short-wave tests, the apparatus being returned on completion of the test with a full report.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Adwick-le-Street.—Urban District Council. September 14th. Internal wiring for electric lighting of Council houses. (August 21st.)

Australia.—MELBOURNE.—October 7th. Victorian Government Railways. Two electric transporters complete. (AX.2303.)*

Electricity Commission of Victoria. 6,600-V and l.p., lead-covered and armoured cable. (See this issue.)

Commonwealth. October 27th. Timing clocks and calculagraphs. (August 21st.)

P.M.G.'s Department. October 27th. Telephone transmitters and parts.*

November 10th. Telephone receivers and parts.

Belgium.—September 23rd. Ministry of War. 4,500 km. of field telephone cable.*

Birkenhead.—September 17th. Mersey Railway Co. Stores, *viz.*:—Electrical sundries, &c., and metallic and carbon filament lamps and fittings. Form of tender from Mr. J. Shaw, general manager and secretary, Central Station, Birkenhead.

Brentford.—September 22nd. Board of Guardians. Electric wiring, &c., at the Institution, Warkworth House, Isleworth. (See this issue.)

Devizes.—September 10th. Corporation. Installing electric lighting in Town Hall. (See this issue.)

Edinburgh.—September 7th. Electricity Supply Department. Electric lighting installations at 288 houses under the Gorgie housing scheme. Specifications from engineer's office.

Egypt.—CAIRO.—September 15th. Director-General, Mechanical Department, P.W.M., Cairo. Six generating sets for steamers for the Government workshops, Bulag.

Gainsborough.—October 17th. Urban District Council. Generating plant, mains, transformers, and meters. (See this issue.)

India. — September 15th. Madras and Southern Mahratta Railway Co., Ltd. Telegraph line materials, copper wire, &c. (August 21st.)

India Stores Department. Accumulator and alkaline cells. (See this issue.)

London.—H.M. OFFICE OF WORKS.—September 15th. Supply of electrical and mechanical engineering labour-in-daywork in Cardiff. (August 28th.)

September 24th. Electric wiring installation at the White Wing, British Museum. (See this issue.)

BERMONDSEY.—September 9th. Board of Guardians. Six months' supplies of electric lamps. Forms of tender from Mr. H. H. Reeve, Clerk to the Guardians, 283, Tooley Street, S.E.1.

WESTMINSTER.—September 9th. Board of Guardians. Electric lamps, fitting, &c. Forms of tender from Mr. W. J. Leckley, Clerk to the Guardians, Guardians' Offices, Princes Row, S.W.1.

METROPOLITAN ASYLUMS BOARD.—October 7th. Installation of a fire-alarm system at Tooting Bec Hospital. (See this issue.)

ISLINGTON.—September 17th. St. Mary's Board of Guardians. Electrical supplies for six months. Mr. A. King, clerk, St. John's Road, N.19.

Newport (Mon.).—September 7th. Electricity Department. Induced draught plant, extension of flues, &c. (August 21st.)

New Zealand.—CHRISTCHURCH.—January 5th, 1926. Drainage Board. Three electric sewage pumps. (AX.2349.)*

Spain.—BILBAO.—Ministero de Fomento. Eight electric cranes for the port of Bilbao. Particulars from the Junta de Obras del Puerto de Bilbao, Bilbao.—*Reuter's Trade Service* (Madrid).

Stoke-on-Trent.—Town Council. E.h.p. testing equipment. (August 21st.)

South Africa.—JOHANNESBURG.—S.A. Railways. October 15th. Incandescent lamps.*

Warrington.—September 7th. Electricity Department. Twelve months' supply of earthenware conduits. (August 21st.)

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—MELBOURNE.—City Council. Accepted:—

6,000 100-c.p. metal filament lamps (£619).—J. Danks & Son Pty., Ltd.

Lead-covered, multi-core cables.—(£767) Enfield Cable Works (Australia), Ltd.; (£103) B.I. & H. Cables, Ltd.; (£1,956) Noyes Bros. (Melbourne), Pty., Ltd.

Single-core cables.—(£10,424) Enfield Cable Works (Australia), Ltd.; (£3,013) Metropolitan-Vickers Electrical Co., Ltd.; (£3,013) Noyes Bros. (Melbourne) Pty., Ltd.; (£314) Johnson & Phillips, Ltd.

H.p. and l.p. switchgear (£4,335).—Metropolitan-Vickers Electrical Co., Ltd.

SYDNEY.—Electric Supply Committee. Recommended:—

Bare copper cables (£13,356).—B.I. & H. Cables, Ltd.

House fuse boxes and fuses (£7,250).—B.W. Electric Co., Ltd.

Conversion of existing meters to high capacity (£737).—Electricity Meter Manufacturing Co., Ltd.

Federal Capital Commission. Accepted:—

Two motor generator sets for lifts (£1,011).—Siemens Bros. & Co. —*TENDERS.*

Dover.—Electricity Committee. Recommended:—

Cable.—Siemens Bros. & Co., Ltd.

Dundee.—Electricity Committee. Accepted:—

Piping and feed pumps, &c., in connection with new turbo-alternator at Carolina Port (£4,537).—Aiton & Co., Ltd.

Lamp Contracts.—EDISON SWAN ELECTRIC CO., LTD., has received contracts for gasfilled, vacuum, and carbon filament lamps from the Admiralty, and for inert cells from the Air Ministry.

METRO-VICK SUPPLIES, LTD., has received from the Admiralty a part-contract for Cosmos vacuum type, ordinary type, and gasfilled electric lamps.

Halifax.—Tramways and Electricity Committee. Accepted:—

Four 2,500-kVA transformers for Halifax-Huddersfield linking up scheme (£5,610).—British Electric Transformer Co., Ltd.

Heckmondwike.—Urban Council. Accepted:—

Installing electric light at 46 houses.—Urban Council Electricity Department.

Leeds.—Finance Committee. Accepted:—

Installation of electric light at premises in Park Lane (£570).—T. M. West.

Tramways Committee. Accepted:—

Feeder and telephone cables (£3,029).—W. T. Henley's Telegraph Works Co., Ltd.

60 gear wheels (£431).—National Steel Foundry Co. (1914), Ltd.

Electricity Committee. Accepted:—

Cable (£1,045), Enfield Cable Works Ltd.; (£5,523) W. T. Henley's Telegraph Works Co., Ltd.

Leyton.—Urban District Council. Accepted:—

1,700 time switches for street lighting.—Venner Time Switches, Ltd.

Northampton.—Corporation. Accepted:—

Electric lighting and central heating installation at Cedar Road School (£809).—Lowke & Sons, Ltd.

Salford.—Tramways Committee. Accepted:—

200 B.S.S. steel rails (£1,982).—Cargo Fleet Iron Co., Ltd.

Coal for six months for the Electricity Department. 2,500 tons Astley 2-in. dry slack, at 18s. per ton, delivered at Agecroft Power Station. 1,500 tons Newtown 2-in. dry slack, at 15s. 9d. per ton, delivered at Agecroft Power Station.—Clifton & Kersley Coal Co., Ltd.;

2,500 tons Agecroft dry slack, at 15s. 9d. per ton at the pit. 5,000 tons Agecroft washed fine slack, at 11s. per ton at the pit.—Andrew Knowles & Sons, Ltd.

2,500 tons No. 1 washed slack, at 16s. 8d. per ton at Pendlebury Wharf.—Bridgewater Wharves, Ltd.

2,000 tons Swan Lane washed pea slack, at 16s. 4d. per ton at Brindle Heath railway sidings.—J. B. Scholes & Sons, Ltd.

1,500 tons Starkie (Westhoughton) rough slack, at 18s. 9d. per ton delivered at Agecroft Power Station.—Peter Andrew.

2,500 tons Wilton best Cannel coal slack, at 17s. 3d. per ton, delivered at Agecroft Power Station.—Brynn Hall Colliery Co., Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Recommended:—

The following tenders are recommended for acceptance in connection with a scheme for improving the lighting of the city:—

Street lamp fittings, &c.—(£3,800 and £173) South African General Electric Co., Ltd.; (£3,932 and £183) H. Davies & Co., Ltd.

Bare copper wire.—1½ tons (£192), G. Findlay & Co., Ltd.; 1 ton (£82), A. J. North & Co., Ltd.; ½ ton (£57), Wilson & Herd, Ltd.; 10 tons (£886), Telegraph Manufacturing Co., Ltd.; 32 tons (£2,822), British General Electric Co., Ltd.; 20 tons (£1,633), W. T. Henley's Telegraph Works Co., Ltd.

Forthcoming Event.

Municipal Tramways Association.—September 9th to 11th. At Brighton. Annual Congress.

N.A.R.M.A.T. Wireless Exhibition.—Royal Albert Hall, London, S.W. September 12th-23rd.

Notes.

Educational.—We have received calendars for the day and evening classes of the Brighton Technical College for the 1925-26 session which commences on September 14th. In the day classes of the electrical engineering department, preparation courses are provided for the London University B.Sc., the college diploma, &c. Ordinary and higher certificate courses are included in the evening class syllabus. Well equipped engineering laboratories are provided. It is interesting to note that since 1922, 25 students have obtained B.Sc. degrees, including five first class and 12 second class honours, all of whom have taken two or more electrical subjects.

THE POLYTECHNIC, REGENT STREET, W.—*Electrical Engineering Department.*—The 1925-6 session will open on September 28th. Enrolments will commence on September 16th. Full particulars and prospectus can be obtained from the Director of Education. (See our advertisement pages to-day.)

Large-scale Industrial Heating.—The idea is widely held that although electricity is excellent for small furnaces, drying ovens, and other industrial heating applications, it is better to use some other agent for larger purposes. That this is erroneous is proved by many existing installations. For example, an oven measuring 10 ft. long, 6 ft. wide, and 6 ft. high is used by an American company for tempering bed springs. The oven, which was made by the Westinghouse Electric & Manufacturing Co., is of sturdy construction; it has a total loading of 60 kW and four inches of insulation to keep the heat inside. When fully loaded the oven contains about 1,800 lb. of spiral springs. Starting from cold, and fully loaded, the oven comes up to about 475 deg. F., the operating temperature, in about two hours. When empty it will reach the temperature in about 1¼ hours. Due to the efficiency of the insulation, very little heat is lost by radiation; at 275 deg. the outside is cold, while at the operating temperature it is only moderately warm. The springs are by this means very efficiently and uniformly tempered.

Inquiry into a Pit Explosion.—At the resumed inquest at Wallsend-on-Tyne on August 24th into the circumstances of an explosion at Willington Square (Edward) Pit, by which five men lost their lives, Peter Turner, a coal-cutter, said in the course of his evidence, that before the explosion he had detected gas by his lamp, but it was the end of his shift, the current was off, and he did not report it. At the time of the accident he felt a rush of air and received an electric shock. No men on his machine had been supplied with rubber gloves. He had once seen sparking when the control-box joint opened a little owing to the screws working loose with the running of the machine. Charles Lyons, a repairer, said he had received a shock from a worn, faulty cable. Some wrapping was put round the cable, which was used to the end of witness's shift. John Mayne, another miner, said he had found gas on three occasions, but had not reported it. Charles Carr, also engaged on a coal-cutter, questioned about the machine, said that on seven or eight occasions since June there had been faults found in trailing cables and the cables had been taken to bank. He had never received a severe shock. The inquiry was again resumed on August 26th. William Donald Lauder, another machine man, said that he went down the pit on the morning of the accident and received a shock while getting his machine ready. At the same instant he heard a muffled report, something struck him in the back, and he fell beside his machine. He had had shocks before but they were not similar to the one he got that morning. He had only seen his machine spark once, and that was when a stone fell on the cable and struck it. There were rubber gloves on the machine. Considerable evidence was given as to the presence of gas in the pit, which men stated they had not at times reported, and as to the examination of the pit after the explosion, also as to ventilation. A. D. Nutman, chief officer of the Houghton-le-Spring Rescue Brigade, spoke to finding the body of a machine worker named Coxon. The flesh was almost raw from severe burns. A rubber glove was on one hand and the other glove was clasped in the deceased's hand. E. Nutley, manager of Edward Pit, said that prior to the accident they had no cognisance of gas in the place. In reply to a question from the Coroner as to the cause of the explosion, witness said that in his opinion there was certainly a light from some source or other. It was something attributable to the machine, and there must have been some small accumulation of gas somewhere. In answer to a further question, witness admitted that it was dangerous to use electric coal-cutting machines where there was gas. William Toward, asked if he had seen any sparking on the machine, said "I have seen flames on the machines, never mind sparking." George Harrison, electrical engineer, said that when he examined Coxon's machine he found that the plug at the end showed slight signs of burning. He had never received any reports as to sparking on the machines. At the conclusion of the evidence, the jury returned an open verdict, stating that the cause of the explosion had not been proved.

"Wired Wireless" in Canada.—The City of London, Canada, is the first municipality served by the Hydro-Electric Power Commission of Ontario to use radio equipment for emergency communication between its transformer sub-stations. The Commission's laboratories installed, according to the H.E.P.C. *Bulletin*, during the early part of May this year three complete guided-radio sets for the Public Utilities Commission of London in the two sub-stations at Horton and Ridout Streets, and on Cabell Street, respectively, and a third set was installed in the pumping station in Springbank Park, about four miles west of the city. The stations can communicate with each other in any of the three combinations desired, the voice signals being very pure and exceptionally loud. This "channel" does not use the telephone lines, and therefore is entirely independent of faults occurring on those circuits.

The equipment is as simple as possible; there are only two adjustments on the transmitter, namely, the filament rheostat and the grid inductance, or regeneration control, whereas the receiver has adjustable removable coils, variable condensers, and filament rheostats, to render it as flexible as possible and to allow of sharp tuning.

The transmitter and receiver are connected together through a switching system whereby either the aerial or telephone lines may be selected as the channel of communication and a transmit-receive switch is thrown alternately from one side to the other during conversation. The aerials are placed closed to the 13,200-volt power lines and are quite short. The capacity effect of the aerials to the power lines is approximately 0.001 microfarad. The one-way system has advantageous features; since it is usual on power systems to give instructions from one central point, the one-way system allows complete instructions to be sent without interruption from the station receiving the transmission. The receiving operator will listen more intently when he knows he cannot ask questions during the issuing of orders. The tuning, particularly when operating over single sections of the lines, is very broad, and signals are very loud; in consequence, the operator will receive messages clearly when only roughly tuned to the transmitting station. This radio system is supplementary to the existing telephone circuits, and both may be used at the same time, without any interference of one circuit with the other; all induced charges are drained to ground and do not produce audible sounds in the receivers.

Motor-car Battery Standardisation.—The Society of Motor Manufacturers and Traders has lately issued a data sheet, No. 123, giving dimensions for motor-car accumulators, cases, or moulded containers and for terminal posts and cable connectors. The data have been collected after many meetings of the sub-committee, and it is anticipated that the adoption of the dimensions recommended will result in considerable advantage both to the trade and the user. So far as the latter is concerned, it will mean less loss of time and expense in dealing with battery replacements and repairs. The new standards are intended to become operative on January 1st, 1926.

Institute of Metals.—For the autumn lecture, delivered at the meeting of the Institute on Tuesday last, Sir John Dewrance, K.B.E., vice-president, took the subjects of "Education, Research, and Standardisation." He reviewed the great discoveries of the century that has elapsed since railways were introduced, expressing the view that the next century would witness even greater progress, and laid stress on the importance of stimulating originality in the minds of students in order to produce discoverers. For this purpose he considered that the practice of giving advanced students research work was on the right lines. Much benefit had been derived from the formation of the Department of Scientific and Industrial Research, not only by the direct financial assistance given to research associations, but also by its bringing before the directors of industrial concerns the necessity for research and discovery. Sir John also reviewed the work of the National Physical Laboratory, and the special researches carried on by the Admiralty, the War Office, and the Royal Air Force. He held that the field for research was unlimited, and cited numerous instances in which success had been attained by this means. Standardisation, he said, was akin to research, and often research was necessary before standards could be fixed. The British Engineering Standards Association, with its 400 voluntary committees, had effected great national economies.

Very gradually the nation was raising the status of the discoverer and research worker, but many such workers were insufficiently rewarded for their labours. The object of the lecture was, by reciting what had been done, to hasten the process. The human race was in need of further education by the attainment of new knowledge and standards, and this country could not afford to fall behind others in doing its share. All who had benefited by knowledge should feel it a duty to do something for the acquisition of further knowledge.

Electricity Report of the Minister of Transport.—We have received a report respecting the proceedings of the Minister of Transport under the Electricity (Supply) Acts, for the year ended March 31st last. The report contains confirmations of the Electricity District Orders and the Special Orders made during the year. Particulars of special cases which the Minister referred to the Electricity Commissioners for their advice are also given; and a list of Orders, &c., revoked by the Minister is included. A lengthy list is given of cases where consent has been given to the erection of overhead lines.

The Minister approved an estimate submitted by the Electricity Commissioners of their receipts and expenditure during the year. This amounted to £67,000, compared with £75,000 for the previous year, comprising £43,550 in respect of the net administrative expenses of the Commissioners and £23,450 in respect of the repayment to H.M. Treasury of the third and final instalment on the advances made to meet the expenses of the Commissioners during the first two years after the passing of the Act of 1919.

Consent was given to the establishment of 12 new generating stations, the extension of 103 existing generating stations and to the establishment of main transmission lines in respect of 47 applications. The new stations sanctioned represent an initial installation of 16,700 kW of generating plant, and the extensions represent about 463,200 kW of plant

596 applications were received from local authority undertakers for sanction to the borrowing of money, and at the beginning of the year there were 101 applications which had not been disposed of. Sanctions were granted in respect of 562 applications, and 28 were transferred to other departments or withdrawn. The total amount of the loans sanctioned was £13,364,181. At the commencement of the year 74 applications for Special Orders were before the Commissioners and 88 more were made during the year. In 66 cases orders were submitted to the Minister for confirmation, 10 applications were refused and 7 withdrawn; the remainder were under consideration when the report was made. The Commissioners approved in 26 cases of agreements being entered into between authorised undertakers for mutual assistance or for the taking of bulk supplies. Two Orders authorising undertakers to give bulk supplies to other undertakers were made and also 80 Orders permitting authorised undertakers to supply electricity to specific premises situated outside their authorised areas of supply. The Commissioners have also in 25 cases consented to the alteration of the system and/or pressure at which electricity is supplied to consumers.

Electricity and Prosperity.—Under this heading, in the *Gloucester Journal* of August 22nd, Mr. R. C. Hill, R.N.R. (ret.), criticises the fashionable advocacy of "National Electricity Supply" as the sovereign remedy for all our industrial ills, on economic grounds. He says the optimists "ignore the experience of the North-East Coast. There, as every electricity supply engineer knows, the ideal system (held up as the model for the national scheme) has been in operation for some years. 'Super-stations,' 'ring-mains,' 'linking-up,' all the familiar hackneyed terms so dear to the propagandists, are there to be found in actuality. Not only so, but the bulk of the large power users are most advantageously situated in relation to the generating stations. And yet there is no locality plunged more deeply in the morass of industrial depression at the present time than Tyneside and Cleveland on the North-East Coast.

"Then, again, the fact is overlooked that the majority of large manufacturing centres throughout the country are already adequately supplied with electrical power at rates as cheap as any obtainable under a 'national scheme.' Those districts—mainly rural—which at present have little or no supply of electricity would certainly benefit, but this would not help matters at all in the larger centres where the slump is most keenly felt; in fact, it is quite conceivable that the former would benefit at the expense of the latter, rural electrification being, at the best, a very controversial subject. . . .

"It may be argued that the State electrification schemes in progress on the Continent justify us in pushing ahead with ours. The conditions, however, are totally dissimilar, the Continental schemes being based upon harnessing huge reserves of water power, which we do not possess. . . .

"A final but very important point against a huge linked-up network is its vulnerability in times of internal or external strife. This, with the seriousness of its possibilities, is self-evident."

In conclusion, Mr. Hill says: "We must realise that the present situation is not due to a lack of cheap power in the centres of industry, but to post-war economic conditions, over many of which we have no direct control. 'National Electricity' may be a very excellent slogan, but do not let us expect it to achieve that which is not within its legitimate province."

Fatalities.—What appears to have been a practical joke ended in the death of Charles Hughes, 20, of Glasgow, employed by Messrs. Brown, Macfarlane & Co., Ltd., metal merchants, of Tollcross. During the meal hour, it is alleged, someone connected a wire from an electric light switch to the handle of a door, and when Hughes grasped the handle to open the door he received a shock which ended fatally 15 minutes later.

A lad named George Ernest Taylor was recently killed by electricity. The boy climbed one of the poles bearing a h.p. line from the Hereford Corporation electricity works to Lyde, and, coming into contact with the wires, received a severe shock and burns.

A Substitute for Brazing Spelter.—A note on "Zinc-Cadmium Alloys: Their Shear Strengths as Solders," was presented by Mr. R. B. Deeley, A.R.S.M., B.Sc., at the annual autumn meeting of the Institute of Metals, held in Glasgow, on Wednesday last. The material of this note formed part of an investigation, taken up by the British Motor-Cycle and Cyclecar Research Association, on the possibility of producing a satisfactory substitute for brazing spelter. The limits of the melting range were fixed by the fact that the working temperature of the substitute solder had to be below that likely to promote coarse crystallisation of the hard-drawn steel tubing of the frame, and further, that the melting point must be sufficiently above the enamel stoving temperature (about 180 deg. C.) for joints made with the alloy not to fail during the enamelling process. Tests of zinc-cadmium alloys in pure shear showed the strongest alloy to be near the eutectic composition. This alloy was considerably stronger than tinman's solder, 8 tons/sq. in. of alloy in shear being an average value compared with 4 tons/sq. in. for lead-tin solder in a similar joint. At a temperature of 235 deg. C., the alloy had a strength in shear of 48 lb./sq. in., and at 200 deg. C. of more than 112 lb./sq. in.

Appointments Vacant.—Cable jointer for the Eccles Corporation Electricity Department. Electrical engineering draughtsman (£315) (temporary) for the Metropolitan Asylums Board. (See our advertisement pages to-day.)

The Kent Coalfield.—In view of the prospect that the Kent coalfield will be further developed and that industries will grow up in its neighbourhood, a conference of local authorities has prepared a regional town planning scheme to ensure that the amenities of the county shall not suffer. It is anticipated that about a score of pits will be sunk, and that the annual output will be 13½ million tons of coal, and that iron and steel production will be commenced, involving an increase of population of about 400,000 persons. The scheme is drawn up with the intention of facilitating the development of mineral resources whilst preserving the agricultural activities and the natural attractions of the country side, and it is held that the new industries can be accommodated in the rural areas near Eastry and Dover, which are at present sparsely populated. An essential feature of the scheme is the generation of electricity on a large scale near the colliery, for transmission to the Metropolitan area.

The Wing-Rotor.—An interesting account appeared in *The Engineer* of August 21st of a new type of wind motor invented by Engineer-Captain Sigurd J. Savonius, of Helsingfors, and called by him the "wing-rotor." It is stated that extended trials of the device have been made, with remarkable results. The rotor resembles the two halves of a vertical cylinder attached to a vertical spindle in such a way that the inner edge of each lies in the axis of curvature of the other, and the spindle is half way between those axes. It was found that if the two inner edges coincided with the spindle, forming a letter S in plan, and the rotor was allowed to run light, the peripheral speed was equal to the speed of the wind, and if the two wings were moved farther apart, leaving a space between them, the speed was reduced. But when the overlapping arrangement above described was adopted, the air current striking the concave side of one cylinder was deflected on to the concave side of the other, the torque being thereby increased to three times that of the S-shaped rotor, and the peripheral speed rising to 1.7 times the speed of the wind. The efficiency was improved by fitting end-plates to the half-cylinders.

It is claimed that the "wing-rotor" is well adapted for driving pumps, &c., having fewer working parts than an ordinary windmill, less frictional loss, and no directing vanes. Its speed can be varied between wide limits by altering the ratio of diameter to length, and it can be made self-regulating.

Two such motors were mounted on a small boat, each wing-rotor having a width of 67 cm. and a height of 280 cm. In a breeze of 15 to 20 miles per hour, the power developed for propelling the boat was from 3 to 4 horse-power. Evidently the wing-rotor would be suitable for driving a dynamo, and should cost less than a windmill both to purchase and to maintain. It is stated that the device has been patented.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Miss Wormald has been appointed welfare superintendent at the Bedford works of the Igranic Electric Co., Ltd.

It is announced that Mr. F. C. Hibberd has resigned the position of managing director of Messrs. G. D. Peters & Co., and has retired from the board of that company and its associated companies.

Major G. G. Mallinson, T.D., has been appointed assistant branch engineer at Messrs. Johnson & Phillips's Newcastle office, succeeding Lt.-Col. A. P. Pyne, who has been promoted to an appointment at Charlton. Major Mallinson has been associated with Vickers, Ltd., Barrow; Siemens Bros. Dynamo Works, Ltd., Stafford; and Palmer's Shipbuilding & Iron Co., Ltd. During the war he served in France and commanded a heavy battery, and he was for some time on the artillery staff of the French Army. He has the Cross of the Legion of Honour and was mentioned in dispatches.

The marriage took place on August 26th, at the Parish Church, Ashton, of Mr. Wilfred Moody, who is engaged with Messrs. Mirrlees, Bickerton & Day, Hazelgrove, near Stockport, and Miss Hilda Andrew, of Ashton. Mr. Moody, before taking up his present position, was for 6½ years assistant superintendent at the Colombo (Ceylon) power station.

The Halifax Transport Committee has appointed Mr. A. E. Boyer, of Wembley, as manager of the Transport Department, at a salary of £500 per annum.

One of the Citizens' Lectures at this week's British Association meeting at Southampton was delivered by Capt. P. P. Eckersley, the Chief Engineer of the British Broadcasting Co., Ltd., whose portrait accompanies this note. Capt. Eckersley, by virtue of his position and the success which the company has attained, due in no small measure to his efforts, is well known to the British public. He was born in Mexico in 1892, and left that country, after attending the Bedales School, to go to Manchester University, from which institution he obtained a certificate of technology. He then served an apprenticeship with Messrs. Mather & Platt, Ltd., and the Lancashire Dynamo & Motor Co., Ltd. In 1915 Capt. Eckersley joined the Royal Flying Corps as wireless equipment officer and served in the Middle East, Egypt, and Salonica. He was invalided home in 1916, and was appointed officer in charge of wireless training in the Southern Brigade. Later, in 1917, he proceeded to France as brigade wireless officer, but being again invalided home he joined the wireless

experimental establishment at Biggin Hill where he was responsible for experimental work in duplex telephony on aircraft. In 1919, Capt. Eckersley joined the Marconi Company as head of the experimental section of the Aircraft Department. While in this post he designed the Croydon ground station transmitter and was jointly responsible for the design of the radio-telephone set used on all modern British aircraft. He was appointed head of the experimental section of the Aircraft Department in 1921, and it was during this period that he

London] [*Maurice Beck and Helen Macgrégor.*

Capt. P. P. Eckersley, M.I.E.E., F.Inst.R.E.,
Chief Engineer of the British Broadcasting Co., Ltd.

carried out the first regular broadcasting in England, from Writtle (2 MT.). Upon the formation of the British Broadcasting Company in 1923, Capt. Eckersley was appointed to his present post. He is a member of the Institution of Electrical Engineers and a Fellow of the Institute of Radio Engineers. He has been a prolific writer for the technical and popular Press and has published two excellent books for beginners in radio work. He informs us that he has no recreations and we think that we can understand why.

Obituary.—Ald. W. Bruce.—The death has occurred at Sunderland of Alderman William Bruce, J.P., who was chairman of the Sunderland Corporation Electricity Committee from its inception, for 16 years until 1919, when he resigned owing to ill-health. It was due to Ald. Bruce's business acumen and steadfastness of purpose that the Corporation's electricity undertaking was able to develop in face of much adverse criticism.

Wills.—The late Mr. Matthew W. W. Mackie, of Surbiton, principal of Messrs. W. Mackie & Co., civil and electrical engineers, left £51,268 gross and £36,279 net personalty.

Mr. George Crighton, late London manager of the Western Cable Co., left £766.

New Companies Registered.

Consulting and Radio Service, Ltd. (13,790).— Private company. Registered in Edinburgh August 19th. Capital, £3,150 in 3,000 preference shares of £1 and 3,000 ordinary shares of 1s. each. Objects:—To carry on the business of consultants and advisers in relation to the erection, installation, and use of all wireless, telegraphic and telephonic, electrical, magnetic, radio-active, hydraulic, mechanical, and other instruments, &c. The subscribers (each with one shilling share) are:—G. Beveridge, 49, Keir Street, Pollokshields, Glasgow, C.A.; and Marion B. Finlay, 186, Henderson Street, Glasgow. The first directors are not named. Solicitors: Baird Smith, Clapperton & Co., 205, St. Vincent Street, Glasgow.

Vulco Dry Battery Co., Ltd. (208,026).—Private company. Registered August 22nd. Capital, £5,500 in 1,500 6 per cent. cumulative preference shares and 4,000 ordinary shares of £1 each. Objects:—To carry on the business of manufacturers of, and dealers in dry and electric batteries and all kinds of electrical appliances, &c. The permanent directors are:—W. E. Chantrill (chairman), "Aberfoyle," Keynsham, near Bristol; and G. B. Atkinson, Burwood Cottage, Hersham, Walton-on-Thames. Qualification, 100 fully-paid shares. Solicitors: Freeman, Haynes & Co., 11, Great James Street, W.C.1. Registered office: 56, Marlborough Road, Holloway, N.

Pagets Radio Components, Ltd. (208,046).—Private company. Registered August 24th. Capital, £1,000 in £1 shares (100 8 per cent. cumulative preference and 900 ordinary). Objects:—To acquire the business of manufacturing and selling machines, apparatus and articles in connection with wireless signalling, electrical, scientific and mechanical devices at present carried on by G. Paget-Usher at 4, Leysfield Road, Shepherd's Bush, and at Orchard Works, Coleville Road, Bollo Lane, Acton, together with the benefit of provisional applications filed by the said G. Paget-Usher for patent No. 30,021 of 1924 for improvements in or relating to holders for electrical coils, and patent No. 30,023 of 1924 for improvements in or relating to crystal detectors for radio apparatus, and the benefit of all designs and inventions which may be made by him in connection with wireless signalling apparatus or any electrical apparatus or device during such time as he shall be in the service of the company. The first directors are:—G. Paget-Usher (chairman), 32, Glenthorne Road, Hammersmith, W.6; and H. Vieler, 31, Seaside Road, Eastbourne, Sussex. Qualification, 10 shares. Secretary: H. Vieler. Solicitors: Watson, Sons & Room, 16, Hammersmith Bridge Road, W.6. Registered office: Orchard Works, Coleville Road, Bollo Lane, Acton, Middlesex.

Baker & Co. (Doncaster), Ltd. (207,990).—Private company. Registered August 21st. Capital, £2,000 in £1 shares. Objects: To acquire the business of an electrical and mechanical engineer, manufacturer of the Baker patent piston removers and Baker patent ring compressors, and anti-dazzle devices now carried on by E. Baker at Chequer Road, Doncaster, as the "Baker Patent Piston Ring Remover Co.," and to acquire English patent No. 115,930-1917, and American patent No. 1,283,620-1918, owned by the said E. Baker, and to carry on the business of motor, mechanical, electrical and general engineers, &c. The first directors are:—Dr. E. J. Chambers, 19, South Parade, Doncaster; E. Baker, 50, Beckett Road, Doncaster; and A. Baker, 15, Glyn Avenue, Doncaster. The first two named are permanent. Qualification, £100 shares. Remuneration as fixed by the company. Solicitor: A. Loy, 3a, Hall Gate, Doncaster. Registered office: 27, High Street, Doncaster.

Reactone, Ltd. (208,013).—Private company. Registered August 22nd. Capital, £500 in £1 shares. Objects: To acquire the business of manufacturers of wireless appliances now carried on at 88/90, Chancery Lane, W.C., by F. L. Harding and R. G. E. Spawforth as "Lewis Harforth and Co.," together with the exclusive rights to use the name "Reactone," &c. The permanent directors are:—F. L. Harding, 34, Mackenzie Street, Slough; R. G. E. Spawforth, "St. Denys," The Drive, Wembley Park. Qualification, 1 share. Registered office: 88/90, Chancery Lane, W.C.2.

William Curran & Son, Ltd. (1,269).—Private company. Registered August 20th in Belfast. Capital, £4,000 in £1 shares. Objects: To acquire the business of a sanitary and electrical engineer carried on by William Curran at 58, Antrim Road, Belfast. The first directors are:—W. J. Curran, Cub-ban, Innisfayle Road, Belfast, plumber and electrical engineer; Mrs. Agnes Curran, Cub-ban, Innisfayle Road, Belfast; T. Curran, Cub-ban, Innisfayle Road, Belfast, plumber and electrical engineer. W. J. Curran shall be governing director so long as he holds 1,000 shares. Registered office: 58, Antrim Road, Belfast.

G. Lawrence & Co., Ltd. (208,106).—Private company. Registered August 28th. Capital, £2,000 in £1 shares. Objects: To acquire the business of a radio and electrical engineer now carried on at 10, New Bridge Street, Truro, Cornwall, as "George Lawrence & Co." The directors are:—G. Lawrence, 10, New Bridge Street, Truro; P. H. Tonkin, 2, Devonshire Terrace (both permanent, subject to holding 200 shares each). Qualification of ordinary directors, 100 shares. Remuneration (except managing directors, if any) as fixed by the company. Solicitors: Nalder & Son, Truro.

Wireless Listeners League, Ltd. (208,125).—Registered as a private company August 28th with a nominal capital of £5,000 in £1 shares. Objects: To carry on the business of the Wireless League, to express the views and protect and advance the legitimate interests of users of wireless communication, to formulate suggestions and schemes for the improvement of and to organise broadcasting and other wireless programmes, &c. The subscribers (each with one share) are:—G. Russell, 37, Norfolk Street, Strand, W.C.2, solicitor; A. M. Low, 1, Woodstock Road, W.4. The first directors are not named. Solicitors: Charles Russell & Co., 37, Norfolk Street, Strand, W.C.2.

Malay and Eastern Power Development, Ltd. (208,113).—Registered as a private company on August 28th with a nominal capital of £40,000 in 10,000 "A" preference, 29,000 "B" preference, and 1,000 ordinary shares of £1 each. The objects are:—To acquire, develop and turn to account any concessions, grants, decrees, rights and powers relating to electrical or other undertakings in the F.M.S. or elsewhere. The subscribers (each with one "A" preference share) are:—Hon. Gideon Murray (Master of Elibank), 38-39, Parliament Street, S.W.1 (director of Armstrong, Whitworth (Jugo-Slavia), Ltd.); B. C. Lockhart Jervis, A.M.I.C.E., 38-39, Parliament Street, S.W.1, H. Stokes Waite, 38-39, Parliament Street, S.W.1, civil engineer. The first directors are not named. Secretary: D. C. Brook. Solicitors: Withers & Co., 4, Arundel Street, W.C.2. Registered office: 11, Ironmonger Lane, E.C.1.

Official Returns of Electrical Companies.

Will Smith, Ltd.—R. D. French, of 21, North John Street, Liverpool, was appointed receiver on August 21st, 1925, under powers contained in debenture dated May 29th, 1925.

Whitfield Electrical Co., Ltd.—Satisfaction in full on June 5th, 1925, of debenture dated March 17th, 1924, securing £2,000.

Morgan Weston, Ltd.—Satisfaction in full on July 22nd, 1925, of debenture dated December 9th, 1924, securing £400.

London and Provincial Radio Co., Ltd.—Particulars filed of £1,000 debentures authorised August 18th, 1925, charged on the company's undertaking and property, present and future, including unpaid capital, the whole amount being now issued.

Rely-A-Bell Burglar and Fire Alarm Co., Ltd. — Particulars filed of £1,000 debentures authorised July 29th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

W. J. Tough & Partners, Ltd.—Debenture dated August 4th, 1925, to secure £200, charged on the company's property, present and future, including uncalled capital. Holders: J. Wright, "Throxenby," South Heath, Bucks.; and A. E. Perkins, 81, Leagrave Road, Luton.

Petersfield Electric Light and Power Co., Ltd.—Further debenture charged on the company's property and assets, including uncalled capital and goodwill, dated August 4th, 1925, to secure all moneys due or to become due from the company to the Westminster Bank, Ltd.

Premier Accumulator Co. (1921), Ltd. (178,158).—Capital, £40,000 in £1 shares. Return dated July 6th, 1925. All shares taken up. £18,749 paid (£1 per share on 11,249 and 15s. per share on 10,000). 18,751 shares considered as fully paid. Mortgages and charges, nil.

Gas and Electricity Development Co., Ltd. (181,648).—Capital, £2,000 in £1 shares. Return dated December 31st, 1924 (filed July 28th, 1925). All shares taken up. £2,000 paid. Mortgages and charges, nil.

Teignmouth Electric Lighting Co., Ltd. (179,116).—Capital, £20,000 in 7,500 7 per cent. cumulative preference and 12,500 ordinary shares of £1 each. Return dated July 15th, 1925. 1,977 preference and 7,500 ordinary shares taken up. £9,537 paid. Mortgages and charges, £12,854.

Tisbury Electric Supply Co., Ltd. (176,539).—Capital, £6,000 in £1 shares. Return dated May 21st, 1925. 5,000 shares taken up. £5,000 paid. Mortgages and charges, nil.

Electrical Power Engineering Co. (Birmingham), Ltd. (138,377).—Capital, £5,000 in £1 shares. Return dated November 4th, 1924 (filed June 23rd, 1925). 2,445 shares taken up. £1,100 paid. £1,345 considered as paid. Mortgages and charges, nil.

D. P. Battery Co., Ltd. (44,084).—Capital, £100,000 in £1 shares. Return dated August 1st, 1925. All shares taken up. £28,000 paid. £72,000 considered as paid. Mortgages and charges, nil.

Lancashire Electric Light and Power Co., Ltd. (77,202).—Capital, £2,071,415 in 571,415 first preference, 750,000 7 per cent. preference, and 750,000 ordinary shares of £1 each. Return dated May 29th (filed August 13th), 1925. 511,440 first preference, 562,500 7 per cent. preference, and 628,560 ordinary shares taken up. £1,700,100 paid on 511,440 first preference, 562,500 7 per cent. preference, and 626,100 ordinary shares. £2,400 considered as paid on 2,400 ordinary shares. Mortgages and charges, nil.

Northern Counties Electricity Supply Co., Ltd. (67,924).—Capital, £200,000 in £1 shares. Return dated April 3rd, 1925. 149,990 shares taken up. £145,991 5s. paid (including £1 5s. on 10 forfeited shares). £4,000 considered as paid. Mortgages and charges, £188,460.

Key Engineering Co., Ltd. (76,459).—Capital, £5,000 in 4,993 ordinary and 7 deferred shares of £1 each. Return dated April 17th, 1925. 4,070 ordinary and 7 deferred shares taken up. £4,077 paid. Mortgages and charges, £5,000.

Vickers, Ltd. (3,543).—Capital, £26,500,000 in 18,000,000 ordinary, 7,000,000 cum. preference, and 750,000 5 per cent. preference shares of £1 each, and £750,000 preferred 5 per cent. stock. Return dated April 29th, 1925. Issued: 12,315,483 ordinary, 6,883,807 cum. preference, and 750,000 5 per cent. preference shares and £750,000 preferred 5 per cent. stock. Total paid and considered as paid, £20,679,290. Mortgages and charges, £1,250,000 5 per cent. first mortgage debenture stock; £2,000,000 5½ per cent. ditto, ditto; £102,122 11s. 1d. houses and land at Erith; £31,639 16s. 2d. houses and land at Crayford; £61,072 18s. 6d. houses and land at Barrow.

Avon Agricultural Co., Ltd.—Mortgage on certain land and buildings at Stratford-on-Avon, dated August 12th, 1925, to secure £1,500. Holder:—Dr. J. G. Clegg, F.R.C.S., Ashmount, Heaton Mersey.

Delhi Electric Tramways and Lighting Co., Ltd. (88,758).—Return dated July 14th, 1925. Capital, £170,000 in 140,000 preferred and participating and 30,000 ordinary shares of £1 each. 100,000 preferred and participating and 29,000 ordinary shares taken up. £100,000 paid. £29,000 considered as paid. Mortgages and charges, £36,000.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

German Companies.

The *Emag Electricity Company*, of Frankfort-on-Main, records a loss of 45,000 marks for 1924. A great improvement in the turnover has taken place this year; the orders will provide activity until December, and prices are profitable.

The *Continental Company for Electrical Undertakings*, of Nuremberg, reports net profits of 320,000 marks for 1924-25. It is proposed to pay a dividend at the rate of 6 per cent. on the 1922 preference shares and 4 per cent. on those of 1907, the ordinary shares, which are few in number, receiving nothing.

The *Contact Company* (makers of special electrotechnical articles), of Frankfort-Rodelheim, reports a loss of 150,000 marks for 1924, most of which has been covered by an appropriation from the reserve fund. Business is now reported to show an improvement, and the turnover in the first seven months of 1925 far exceeded that in the whole of 1924.

The *Rhenish Electricity Company*, of Mannheim, states that competition in electrical constructional and installation work in 1924 became so keen that the level of prices in part fell below that in 1913. The accounts show net profits of 1,020,000 marks, permitting of the payment of a dividend at the rate of 6 per cent. on the preference, and 7 per cent. on the ordinary shares.

Belgian Companies.—The *Lampe Belge* concern proposes to double its present capital of five million francs.

La Société d'Electricité du Bassin de Charleroi has increased its capital from 14 to 15 million francs.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159, and they have been ordered to be officially quoted:—

Torquay Tramways Co., Ltd.—30,000 ordinary shares of £1 each, fully paid, Nos. 120,001 to 150,000.

Pennsylvania Water and Power Co.—A dividend of $2 per share has been declared upon the common shares for the quarter ending September 30th.

Clarke, Chapman & Co., Ltd.—An interim dividend of 2½ per cent. has been declared on the ordinary shares.

Oxford Electric Co., Ltd. — An interim dividend at the rate of 5 per cent. per annum has been declared on the ordinary shares in respect of the past half-year.

Hightown Gas and Electricity Co.—An extraordinary meeting is to be held on September 15th for the purpose of considering resolutions agreeing to the transfer of the company's undertaking to the Liverpool Corporation on agreed terms.

Davis & Timmins, Ltd.—It is proposed to pay the dividend on the 6 per cent. preference shares, and an interim dividend at the rate of 6 per cent., free of tax, on the ordinary shares in respect of the half-year to June 30th last.

Northern Mexico Power and Development Co.—A dividend of 7 per cent. has been declared on the preference shares in respect of 1924.

Brazilian Traction, Light and Power Co., Ltd.—A quarterly dividend of 1½ per cent. has been declared on the preference shares.

Stocks and Shares.

MONDAY EVENING.

THE long-expected recognition of Mexico by the British Government is at length to be accomplished. Diplomatic relations will be resumed at once. The United States "recognised" Mexico two years ago, but there was some difficulty in the way of Great Britain following suit. However, all is now declared to be well. Mexican Government, City, utility, industrial and mining issues are substantially higher in consequence. Mexican Light & Power first mortgage bonds have risen 4 points. The others are all up, though to a smaller extent. It has been more of a task, this week, to buy Mexican stock than it was to sell the same stock a month ago. The chastened tone that breathed through the recently-issued annual reports of the Mexico Tramways and the Mexican Light and Power Companies is forgotten in the newborn hopes engendered by the magic word "Recognition."

Foreign stocks and bonds are better in various cases. Brazilian Tractions have gained 4¼ points at 70½, thanks to the previously-mentioned anticipations of an increase to 5 per cent. in the dividend. Anglo-Argentine Trams have further spurted on the impression that the company is almost certain to be given the power to build subways, &c., by the Buenos Aires Municipality. British Columbia deferred stock rose 3 upon a demand of which part came from Canada. Mexicans are, as just mentioned, several points higher.

The London railway and traction group is glum by contrast with the brightness shown by the foreign section. Metropolitan Consolidated slipped back to 68. Central London Assented stock is easier, on balance, at 66 ex dividend, though Underground Electric Railways stocks are rather better.

London electricity shares make a good showing. A number of prices in this section were quoted ex the interim dividends last Thursday, and in various instances, these were recovered, either partially or altogether. Westminsters strengthened to 44s. Metropolitans are 1s. 6d. higher at 39s. 6d. City "Lights" at 48s. 3d. have gained 1s. 9d., allowing for the dividend, and Charing Cross again are better, at 49s. 6d.

Investment is turning money into the shares of the provincial power and lighting companies, on the assumption that these offer scope for appreciation as business will extend in the future. Lancashire Electrics at 26s. 6d. are 1s. 6d. up. Isle of Thanet Electrics are better at 17s. Midland Counties remain at 23s. 3d. Newcastle 7 per cent. preference picked up to 25s.

Speculation is rife as to what shape new issues are likely to assume in the London electricity companies when the capital re-organisations are completed. It is thought that future emissions of stock—after this year—may be in some company, or public body, that will act as a common corporation for the financing of the principal concerns. Possibly there may, it is surmised, be two distinct corporations, dealing with the two groups into which the London companies became divided by the Parliamentary Bills. Any such stock, or stocks, would doubtless be endowed with all the character of a gilt-edged security. Such speculation may appear to be a case, now, of beating the air, but it probably possesses a basis of shrewd and intelligent anticipation.

Cable, telephone and wireless issues are uninteresting by reason of the quietude of their quotations. Oriental Telephones are 2s. 6d. lower at 2. Automatic Telephones rose to two guineas. Great Northerns at 31¾ are 5s. better, and the Eastern group exhibits no change. Marconis can be bought at 25s. and the debenture stock is 103. Canadian Marconis have not moved from 4s. 6d. Radio Common are 10⅝, the preferred shares 9¾. But the manufacturing section keeps very hard. The feature this week is a rise of 3s. 9d. in British Aluminiums, the price spurting to 35s. upon dividend anticipations which, in some quarters, are put down at 12½ per cent.; in others, at 15 per cent. In the last completed year, the company paid 10 per cent. Johnson & Phillips, after a very brief reaction, put on a florin, to 49s. 6d.

Edison Swans are up to 8s. again. English Electrics at 19s. 6d. are 9d. higher on the week. General Electric 6½ per cent. "A" preference can be sold at the middle price of 23s. 6d. The ordinary advanced 2s. to 28s.; a modest demand found the market to be short of shares. Brush are better at 23s. 3d. Siemens hold their rise at 30s. The iron, steel and engineering section is still disposed to dulness. Rubber shares have further hardened in consequence of the strength displayed by the raw material. People are very sensibly buying shares, where these can be obtained, of the better-class £1 variety: there is not so much of the striving-for-threepences as there was in the madness of six weeks ago.

The London Electrical Engineers.—27th A.A. Battalion, R.E. (T.A.).—Honorary Colonel: Col. R. E. B. Crompton, C.B.; Officer Commanding, Lieut.-Col. C. H. S. Evans, O.B.E., A.M.I.E.E. The following orders have been issued for September:—

304th Company (Major W. H. Merrett, T.D., A.M.I.E.E.).—Mondays, 7 p.m. to 9-30 p.m. Completion of training for the year ending October 31st, 1925.

305th Company (Major A. W. Mawby, O.B.E., A.M.I.E.E.).—Tuesdays, 7 p.m. to 9.30 p.m., from September 15th, for completion of training.

306th Company (Major F. C. Clarke, A.M.I.E.E.).—Fridays, 7 p.m. to 9.30 p.m., from September 18th, for completion of training.

The battalion finishes the annual camp on September 13th. The 304th Company left Watchett on Sunday, August 30th, after a fortnight of very indifferent weather; much valuable work was done, but with four stations manned only, the camp duties were unusually heavy, owing to the small numbers in camp with only one company. It is earnestly hoped that many of those who enjoyed camp, despite the weather and heavy work, will bring along recruits to the unit, which will largely ease up the duties when in camp in future. Twelve lights will be manned by the Battalion at the British Empire Exhibition, Wembley, throughout the month.

Headquarters, at 46, Regency Street, London, S.W.1, will be open until 8 p.m. on weekdays and 1 p.m. on Saturdays. The address of the officers' mess will be at headquarters from September 13th.

The Reorganisation of Krupps.—The Berlin correspondent of the *Financial Times* says that the Friedrich Krupp A.G., Essen, is negotiating for the sale of certain assets, including the electrotechnical building department, the fine mechanical workshops and the textile-spinning machine factories, all of which have proved unremunerative in their present form. The remaining works are again to be reorganised.

The British Association.—II.

The Southampton Meeting.

The opening of the proceedings of the Association was accompanied by variable weather, but this did not deter visitors from proceeding on the interesting itinerary which had been arranged for them. There was a very large attendance at the inaugural meeting to hear Dr. Lamb's presidential address, and it was announced that the Association had definitely decided to accept the invitation to meet in Oxford next year with the Prince of Wales as president.

Dr. Lamb prefaced his address with a few remarks upon the nature and purpose of science in general. He claimed that it was disinterested investigation and the arrangement of facts into an intelligible scheme. If the material effects of any discoveries were such as to work harm to the human race, or if they did not produce anticipated benefits, science could not be held responsible.

The proceedings on August 27th were outlined in our last issue. Taking advantage of a lack of matter of electrical interest in the morning, a visit was paid to the Pirelli-General Cable Works, which are situated conveniently near the heart of the town. Here were seen many interesting processes, some of which we hope to describe and illustrate in a subsequent issue. On the afternoon of the same day, a visit was paid by members from the Engineering Section to the Southampton Docks. Particular attention was paid to the electricity supply and electrical equipment there which formed the subject of a paper by Mr. H. Wauchope, the Southern Railway Co.'s electrical engineer at the docks, which was presented to the Engineering Section on the following day. Other papers read before this Section on the same day were "The Quay Walls of Southampton," by Mr. F. E. Wentworth Shields, O.B.E. ; and "The Electrical Power Station at Southampton," by Mr. W. G. Turner, the Borough Electrical Engineer. There was also a joint discussion with Section B.—Chemistry—upon the ignition of gases, to which Prof. H. B. Dixon, F.R.S., Prof. W. T. David, and Dr. O. C. de C. Ellis contributed. Prof. Dixon described a number of experiments carried out for the Safety in Mines Research Board. In the Mathematical and Physical Science Section, Prof. A. E. Kennelly read a paper upon "Some New Properties of Hyperbolic Functions and Integral Series of Numbers, with Applications to Electrical Engineering." The president of Section F —Economical Science and Statistics—(Miss Lynda Grier) delivered her address, dealing with "The Meaning of Wages." In this the vexed question of "fair wages" was discussed and the effect of low wages upon the community considered. In the same Section, Mr. R. F. Harrod read a paper on "The Trade Cycle and the Theory of Distribution," showing that where there were fluctuations in the system of distribution of products among the factors of production, the volume of production would probably fluctuate also, causing periods of prosperity or depression.

On Saturday evening a Citizens' Lecture was delivered at the Avenue Hall by Prof. E. V. Appleton, who dealt with "The Rôle of the Atmosphere in Wireless Telegraphy." The week end proved fine, and a number of excursions to places of recreation and interest, of which there are many within easy reach of Southampton, were arranged. On Monday last a paper on "High Efficiency Steam Installations for Ship Propulsion" was presented to the Engineering Section by Mr. S. S. Cook. This paper made special reference to the use of auxiliary machinery, four classes being dealt with, *viz.*, steam-driven, steam-electric, Diesel-electric, and mechanically-driven from the main engine. On the same morning Mr. C. le Maistre read a paper upon "Engineering Standardisation," emphasising its importance and reporting upon progress. In the Chemistry Section, Mr. J. A. V. Butler read a paper on "The Seat of the Electromotive Force of the Galvanic Cell," and Mr. E. A. Ollard presented another describing experiments upon electro-deposited chromium to determine its resistance to corrosion. On the evening of the same day Capt. P. P. Eckersley, whose portrait appears in our "Personal" column, delivered a Citizens' Lecture upon "Some Technical Problems of Broadcasting."

On Tuesday last Prof. H. Bateman, in the Mathematics and Physics Section, read a paper entitled "The Force on a Spinning Electron." Two papers on radio matters were presented before the same Section, "Some Thermionic Valve Problems," by Prof. E. V. Appleton, and "The Study of Wireless Wave Fronts by Directional Methods," by Dr. R. L. Smith Rose. Prof. J. J. Nolan dealt with "Atmospheric Ionisation." The only matter of electrical or allied interest which was raised on the concluding day (Wednesday) was a demonstration by Prof. J. G. Gray of gyroscopic apparatus for the use of engineering students.

During the meeting an invitation to Leeds in 1927 was received and accepted by the Council. The 1928 meeting will probably be held in Glasgow.

The Southampton Electricity Undertaking.

By W. G. Turner, A.M.I.E.E.

(*Abstract of Paper read before Section G.—Engineering.*)

Electricity was first supplied to Southampton in 1891 by the Southampton Electric Light and Power Co., Ltd., which obtained a Provisional Order in 1895, the area being the county borough as then constituted. In 1896 the Southampton Corporation purchased the undertaking, and the power station, in the centre of the town area, was re-built and extended. This station, by reason of the limitations of the site, could not be extended sufficiently to deal with the rapidly growing demand, and, moreover, was unsuitable for the economical generation of power, there being no railway or water facilities. Consequently, a site of about four acres of mudlands on the foreshore of the River Test, was reclaimed, and in 1903-04 a large new station was built on piled foundations. This station is close to the centre of the load, has an adequate supply of cooling water for condensing purposes, a railway siding connecting it to the Southern Railway over which coal is obtained, together with ample room for the disposal of ashes, and has been gradually extended in size until in 1920 it contained generating plant of 9,060-kW capacity. Since then it has been modernised and enlarged. Three machines aggregating 1,300 kW, and practically obsolete, were removed, and two machines aggregating 11,000 kW substituted, making the present generating plant capacity 18,760 kW. The station as now laid out, is capable of accommodating plant of upwards of 65,500-kW capacity. The size of the boiler house which is arranged parallel to the longitudinal axis of the engine room, has been doubled by adding an additional row of boilers parallel with the existing row, there being a common firing floor between the two rows. Its ultimate size is 275 feet long by 114 feet wide. Already a machine of 10,000-kW normal capacity, the first of five machines of this size, to be placed in the extended engine room, is on order for installation next year; this will make the station the largest in the Southern Counties. All machines recently installed have their shafts at right angles to the longitudinal axis of the building, as will also future machines (see fig. 1). A 50-ton electrically operated overhead travelling crane is to be installed.

The coal consumption is now upwards of 33,000 tons per annum, and is rapidly increasing. Coal wagons are hauled from the Southern Railway Company's Southampton West Station sidings by the Corporation's electric locomotive, and are unloaded by means of a grab, capable of lifting half a ton, operated from an electric jib railway crane. The grab delivers the coal into a receiving hopper provided with a chute from which it gravitates through an automatic filler to an endless chain gravity bucket travelling conveyor capable of handling about 20 tons of small coal per hour. Some of this plant will shortly be inadequate and is to be replaced by an electrically-rotated wagon tippler with hand operated clamping gear, capable of dealing with from 12 to 15 wagons per hour each carrying 12 tons. The coal will be delivered into a receiving hopper provided with a chute leading to the automatic filler of an endless chain gravity bucket conveyor capable of handling 80 tons of small coal per hour, and a chain speed of from 55 to 60 feet per minute. The whole of the new plant

is being supplied by Babcock & Wilcox, Limited. The old coal bunkers are being removed, and new and more capacious bunkers erected. The ashes are removed in small wagons mechanically hauled along a narrow gauge track to an ash tip where they are dumped, and later they are sold.

There are five boiler feed pumps, three of which are Weir's direct acting reciprocating type, and two Weir's turbine driven rotary type. Together they are capable of delivering a total of 43,500 gallons of feed water per hour. A further turbine driven rotary type pump capable of delivering 20,000 gallons of feed water per hour is on order from J. P. Hall and Company. The water treatment plant consists of an oil eliminator and filter for dealing with the oily condensate from the reciprocating engines, and a water softener and filter.

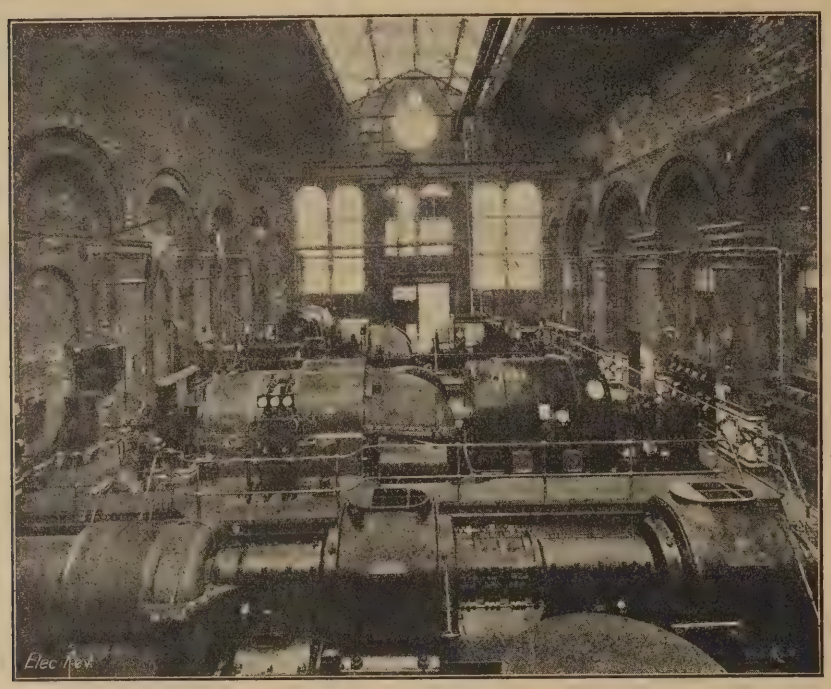

Fig. 1.—Interior of the Southampton Power Station.

There are at present installed in the boiler house, eight Babcock & Wilcox water tube type boilers suitable for a working pressure of 200 lb. per square inch above atmosphere, and having a total equivalent evaporative capacity of 274,418 lb. of water per hour. They are all fitted with integral superheaters capable of imparting a superheat of 150 deg. F. to the steam, making the total temperature 538 deg. F. The automatic stokers are all of the travelling chain grate type, one being of the Underfeed Stoker Company's make, and most of the remainder of Babcock & Wilcox double lap intersecting link type. Four boilers are fitted direct with economisers, and the remaining four discharge through a common economiser. Six of these boilers are connected to the original brick chimney. The two boilers most recently installed, discharge through separate Green's economisers behind the boilers, into a common Prat steel chimney. Each of these two boilers, in common with two previously installed and two more shortly to be erected, has a total active heating surface of 9,273 square feet, a total grate area in two grates per boiler, of 210 square feet, and an equivalent evaporative capacity of 46,780 lb. of water per hour when burning 10,500-B.th.u. bituminous coal. The total heating surface of each superheater on these boilers is 2,200 sq. ft. The economisers on each of the two boilers recently installed and the two shortly to be erected are Green's vertical cast-iron type, each with 320 pipes, capable of raising the temperature of the feed water from 90 deg. F. to 195 deg. F. at boiler pressure. Thus the temperature of the flue gases leaving the boiler is reduced from 500 deg. F. to 350 deg. F. The combined efficiency of the boiler plant on the above bases is 82 per cent. The Prat chimney works on the ejector principle. It has been decided to fit a "Cyclone" dust collector to the steel chimney for the boilers shortly to be erected.

Ultimately the boiler house will be capable of accommodating 18 large boilers with a total equivalent evaporative capacity of 842,000 lb. of water per hour, or sufficient after allowing for spares, to steam upwards of 55,000 kW of plant. Each of the boilers at present installed is provided with the usual mountings and instruments, including a CO_2 indicator. The two boilers shortly to be installed are each to be provided with a panel bearing all the necessary indicating instruments. They will also be provided with automatic feed water regulators, volumetric Lea coal meters, a combined temperature and electrical CO_2 recording apparatus for recording the flue gas temperature at the economiser outlet and the percentage of CO_2 in the boiler exit gases, a multi-point electrical distance thermometer for indicating various temperatures of boilers and economisers, and various local gauges and thermometers. It is proposed to increase the steam temperature in two stages. The decrease in steam consumption of the turbine plant with the higher temperature, will be from 12 to 15 per cent.

The station also houses a Willans and Robinson reaction type condensing steam turbine driving tandem 565/630-kW Brown-Boveri a.c. 440/530-V generators, running at 1,800 r.p.m.; two Cole, Marchent & Morley vertical triple expansion drop Corliss valve gear condensing steam engines, each driving a 1,000-kW Dick, Kerr d.c., 450/550-V generator, running at 110 r.p.m.; two B.T.-H. impulse type (Curtis) condensing steam turbo-alternator sets of 1,500-kW and 3,000-kW capacity respectively, two-phase, 2,200 V between each phase and the common return at 50 cycles per second; one Metropolitan-Vickers impulse type condensing steam turbo-alternator set of 5,000-kW capacity, three-phase, 6,600 V between phases, 50 cycles; and one Parsons reaction type condensing steam turbo-alternator set of 6,000-kW capacity as above. The whole of the plant has an overload capacity of 25 per cent. for two hours, and the alternators will give their full output at 80 per cent. power factor. The 5,000-kW turbine has an integral surface feed water heater located in the exhaust end which raises the temperature of the hotwell water coming from the main condenser, from 71 deg. to 150 deg. F. The 6,000-kW turbine already installed and the 10,000-kW machine on order, are similarly equipped. Closed-circuit cooling is employed. The 6,000-kW turbine is fitted with "end-tightened" blading in the high-pressure portion. The minimum radial clearance of this portion is about 3/16 in., whilst the radial clearance in the remainder of the blading ranges from ⅛ in. up to ¼ in. The danger of very fine radial running clearances is thus eliminated.

Each of the three-phase turbo-alternator sets is provided, in addition to various local instruments, with panels having suitable instruments mounted thereon to indicate all conditions. The condensers are also provided with Kent's "Venturi" water meters to measure and record the amount of condensate. A turbo-alternator efficiency indicator designed by the author and made by Nalder Brothers & Thompson, Ltd., is combined with the water meter on the 6,000-kW set. This instrument, without having recourse to highly organised simultaneous readings made by at least two observers, of various instruments situated usually in different places, and subsequent reference to the "Willans line" of the machine, indicates simultaneously the load on the alternator, and the actual as against the guaranteed total steam consumption of the turbine at that load on one instrument in the hands of one observer only. Causes of high steam consumption which might otherwise have continued unnoticed for a considerable period can thus be rectified without unnecessary and costly delay and the risk of possibly a serious breakdown can be obviated. The readings can be logged as part of the regular station routine and thus provide a continuous check on any deterioration from the guaranteed efficiency and incidentally show any improvement in the running. It has been decided to fit a similar instrument to the 10,000-kW turbo-alternator set now on order. The latter set, representing the latest practice, is of particular interest. The steam turbine is being made by Fraser & Chalmers Engineering Works and embodies improvements made as a result of the Reports of the Steam Nozzles Research Committee formed by the Institution of Mechanical Engineers and the British Electrical & Allied Manufacturers' Association. For a number of technical reasons the makers of the machine decided to apply the low steam velocity in the high-pressure part of the turbine, and the high steam velocity in the low-pressure part of the turbine. In the new design the velocity compound wheel has a small diameter and utilises a very moderate drop. As a result its steam flow efficiency is substantially higher than in the older design with a larger velocity wheel utilising a large pressure drop. Then follow a large number of small diameter single impulse stages utilising low steam velocities, instead of a small number of large diameter stages as previously. The low pressure part of the turbine is designed on similar lines to the older design, and consists of a number of large-diameter single impulse stages, except that the large mean diameter is now applied right through the low pressure part instead of in the last few stages only, in order to obtain a high steam flow efficiency in all the low pressure stages. Stages of medium diameter, which would incur medium steam velocities with lower efficiency, are entirely eliminated from the design. All the high and low pressure stages are housed in one casing, the length of the turbine being slightly increased when compared with the length of the older design. The alternator, which is being made by the General Electric Co., Ltd., and has combined axial and tangential ventilation with an external fan, will have a continuous output of 12,500 kVA, and an overload output, for two hours, of 15,625 kVA. The condenser is being made by Hick, Hargreaves & Co., Ltd., and is designed for a flow of 12,100 gallons of circulating water per minute; it will have a cooling surface of 11,800 square feet. The plant with a vacuum of 28.5 inches Hg (barometer 30 in.) will have a steam consumption at full load of 11.22 lb. per kWh, which will be reduced to 10.29 lb. when the steam temperature at the turbine stop valve is increased to 700 deg. F.

These figures include the power required for driving the alternator ventilating fan but are exclusive of feed heating and all steam and power for the condenser auxiliaries. As the "heat drop" under the more favourable conditions is 432.2 B.th.u. per lb., the thermal efficiency of the turbo-alternator from steam input to electrical output is 76.8 per cent.

The condenser circulating water system is not without interest. As the River Test recedes from the quay wall at low water by about 1,000 yd., a cooling pond capable of holding about 2,000,000 gal. was constructed adjacent to the station. This pond is replenished at each high water, and as there is a second high water two hours after the first, with only a small fall of the tide, high water lasts in effect for nearly four hours at each tide, *i.e.*, twice in every twenty-four hours.

The switch and control rooms are adjacent to the engine room on the side opposite to the boiler house. The switch room contains British Thomson-Houston e.h.p. three-phase switchgear in moulded stone cell structures. The rupturing capacity of the original oil switches is 150,000 kVA, but as this will shortly be insufficient special arrangements will be made to safeguard them. The new oil switches have a rupturing capacity of 300,000 kVA.

The control room is equipped with four main switchboards for the d.c. three-wire power and lighting system; the d.c. traction system; the two- and single-phase a.c. system; and the three-phase system.

The number of consumers connected in 1925 was 8,455, this being an increase of 182 per cent. over 1914. The total sales to private consumers were 13,542,401 kWh, an increase of 220 per cent., and the total sales to all consumers 17,909,256 kWh, an increase of 150 per cent. The total load connected was 25,664 kW, an increase of 255 per cent. There are a number of very large private consumers, including the Docks.

The Resistance to Corrosion of Electro-deposited Chromium.

By E. A. OLLARD.

(*Abstract of paper read before Section B.—Chemistry.*)

Chromium, since it was first deposited by Bunsen in 1854, has been considered as a possible metal for plating purposes. With the advent of stainless steel, a good deal of attention has been drawn to the non-tarnishable properties of chromium and chromium alloys. The chief properties of chromium are its hardness and its resistance to corrosion by the atmosphere and certain acids. It is, however, readily attacked by hydrochloric acid, and is also easily corroded when it forms the anode of an electrolytic circuit. A good deal of technical difficulty, however, was experienced in the early attempts to electroplate chromium on to other metals, and it is only within the last few years that processes have been evolved which have been satisfactory on an industrial scale. The test pieces and other objects mentioned in the paper were plated by Dr. Liebreich's process, which is being used commercially in Germany and France, and appears to give quite satisfactory results.

The object of the work described was to investigate the properties of chromium-plated material and discover for what purpose it is specially suitable. This investigation has chiefly taken the form of a comparison with other plating processes. Sufficient time has not yet elapsed for conclusive results, but it is thought that a summary of the factors or data obtained so far may prove interesting.

A number of steel test pieces were cut from a bright steel strip and a hole bored in one end to suspend them by. These test pieces were then plated in groups of nine with different metals or combinations of metals. Of these groups, three were exposed to atmospheric corrosion on the roof of a chemical laboratory, three were placed in a boiler and exposed to the action of steam, two were placed in salt spray, and one was heated in the presence of air. While chromium will not protect steel from rusting when plated on it directly, it was thought probable that if an underlying metal such as nickel or copper were first plated on the steel it might be possible to prevent it from rusting, and at the same time obtain the advantageous properties of the chromium plating. Groups of test pieces were therefore plated in the following manner:—Group 1: One hour deposited in a cadmium cyanide bath; Group 2: 3 hours deposited in a nickel sulphate bath; Group 3: 1 hour deposited in cadmium cyanide bath and 1 hour in nickel sulphate bath; Group 4: 1 hour in nickel sulphate bath and 1 hour in cadmium cyanide bath; Group 6: 1 hour in nickel sulphate bath, 1 hour in copper sulphate bath, then buffed and plated, ½ hour in nickel sulphate bath; Group 7: ½ hour in chromium bath; Group 8: ½ hour in copper cyanide bath followed by ½ hour in chromium bath; Group 9: 1 hour in cadmium cyanide bath followed by ½ hour in chromium bath; Group 10: 1 hour in nickel bath followed by ½ hour in chromium bath; Group 11: ½ hour in copper cyanide bath followed by 1 hour in copper sulphate bath; Group 12: 2 hours in nickel bath followed by ½ hour in chromium bath.

The test pieces plated in this manner were then tested as described above. They were all measured and weighed before and after the tests, and the loss of weight per unit area was calculated. Notes of the appearance of the test pieces were also kept and specimens of one of each of the groups exposed on the roof. These examinations are recorded in tables appended to the paper.

The specimens were hung from a frame on the roof of the laboratory, suspended directly above a trough of water and exposed to the Trafford Park atmosphere. The time allowed for this test was 768 hours. The nickel plated specimens were readily attacked, and showed a greenish deposit on the surface. The cadmium specimen stood fairly well, but appeared to be evenly attacked. The copper specimen was very much tarnished, and also lost a good deal of weight. In the case of the chromium deposited directly on the steel, the chromium plating was almost entirely removed, having apparently been thrown off by the corrosion of the steel underneath it. The chromium deposits, however, which had been made on copper and nickel stood quite satisfactorily, with only slight traces of local rusting. Chromium deposited on to cadmium stood remarkably well, but in some places the chromium flaked away from the cadmium coating. The chromium plating does not appear to adhere well to the cadmium and, especially in the subsequent tests which involved temperature rise, the chromium plating was almost entirely removed from the cadmium. The most satisfactory specimen from the point of view of loss in weight was that in which the steel was first coppered and then chromium plated, although those with nickel as an underlying metal also stood very well.

In the boiler test, the specimens were suspended in the steam space of a small boiler. In this case the chromium with underlying nickel proved the most satisfactory, while the nickel plating stood fairly well. The cadmium protected the steel fairly satisfactorily from rust, but lost weight, and would have been removed in time.

As chromium is attacked very violently by hydrochloric acid, it was thought that the conditions prevailing in the salt spray would corrode it very rapidly. It was found, however, that the salt spray had very much less action on the chromium plating than was anticipated. In this test the most satisfactory platings were those consisting of both nickel and cadmium. The chromium plating with nickel as an underlying metal, however, stood quite satisfactorily, losing about the same weight as the nickel plated specimens and less than the cadmium plated specimen. The copper plated specimen was very badly corroded.

One specimen of each group was heated intermittently in an oven at about 400—420 deg. C. for 150 hours of actual heating. In this case, again, the cadmium plated samples were badly attacked, and also the chromium plating on cadmium. In the latter case the chromium was almost entirely thrown off. The other chromium-plated samples all seem to stand fairly well, the surface of the plating, however, oxidising slightly. The nickel plated specimen also stood well. Another test piece of steel was made which was plated first with nickel for about an hour, then immersed for an hour in the copper sulphate bath, then re-plated with nickel for half an hour, polished and finally chromium-plated for half an hour. This specimen was exposed on the roof of the chemical laboratory for about two months, and at the end of this time was still quite bright, showing no apparent sign of rusting.

Besides the laboratory tests described above, a number of articles were chromium-plated and put into service under different conditions. As tests of this nature require a fairly lengthy period of time before any conclusion can be reached, it is not possible at present to give the results of many of these. Some of them, however, are worth mentioning. The bracket holding the wind screen mirror on a car was plated, and this has kept bright much better than the nickel plating on the rest of the car. Another important application for chromium plating has been in the protection of die casting moulds. This application was suggested by the British Non-Ferrous Metals Research Association, and a small steel pin from one of these moulds was plated with chromium. These pins are made of expensive special steel, and it is hoped that an ordinary steel, chromium plated, could be substituted for this. The pin in question has now made some 5,000 castings, and no difference in size can as yet be detected with the micrometer. A chromium-plated terminal was also exposed in Sheffield for two months under conditions where a nickel-plated terminal rapidly tarnished. At the end of this exposure the terminal was still bright and just as good as when it was first exposed. A large number of articles are being plated and placed in service under different conditions, but it will be some time before the results of these tests can be collected.

From these tests it appears that the most satisfactory plating for all round purposes is chromium with nickel as an underlying metal. Steel plated first with cadmium and then with chromium appears to stand very well against atmospheric corrosion, but has the difficulty that the chromium has a very strong tendency to strip from the cadmium. Also chromium plated on cadmium will not take a high polish. Steel articles plated first with nickel and then with chromium, especially if a layer of copper is put in between, will stand atmospheric corrosion extremely well. Composite platings of this nature may be objected to commercially on the grounds of cost. One of the chief costs of plating an article, however, lies in the setting up, cleaning and pickling processes. In the case of plating a specimen with a series of different metals, it is usually only necessary to swill the specimen and transfer it to the next bath and, therefore, the cost of the operation is not increased as much as might be expected. It seems probable that certain important applications will be found for this process in industrial practice. The test made on the die casting pin seemed to show that the process may have a big future in this industry, and it is by no means unlikely that platings of this description may find applications in chemical plant, &c.

The above tests are merely preliminary work on this subject, and it is hoped to continue tests on a more extensive scale, both in the laboratory and in service. The work was carried out in the Research Department of the Metropolitan-Vickers Electrical Co., Ltd., and the author acknowledges the assistance of Messrs. Pollitt and Mather, of the Chemical Section.

Earthquakes and Electrical Installations.

Observations of the Damage done to Electrical Plant in Japan by the 1923 Earthquake.

ALTHOUGH, of course, it was inevitable that the electrical installations in Japan could not escape damage from the great earthquake of 1923, in which over 150,000 lives were lost and 500,000 houses destroyed, little has been known till now of the extent of the injuries. An outline of a report on the investigations made by a joint committee organised by the Institute of Electrical Engineers of Japan, the Japanese Electrotechnical Committee, and the Electrical Association of Japan into the effects of the earthquake and fire, which we have received, throws some light upon the subject. The object of the report was to examine into and record the general conditions of the damage done, and to obtain data for instituting precautionary

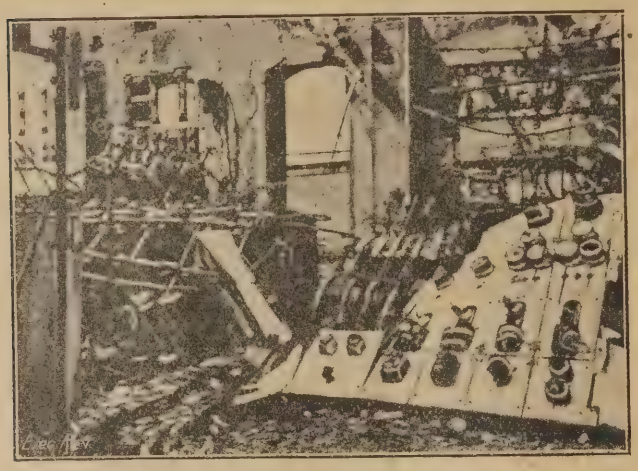

Fig. 1.—Eirakucho Sub-station, after Fire.

measures, it having been decided that if such measures had been taken, much of the loss and devastation could probably have been avoided.

It is generally known that the severity of an earthquake and its effect upon any locality depend upon the distance from the origin, the general contour of the land and its geological formation; but it is extremely difficult to record its effects precisely. Fig. 4 is a map divided into three districts, each denoting by the depth of shading the intensity of the shock, which will help in following the observations made in the report.

The injuries to the hydro-electric installations were the result of either the earthquake directly or the consequent landslides therefrom. The intake constructions were, in general, not heavily damaged; but there were a few cases where the concrete piers of the head and sand gates were cracked at the bottom. In the Katsuragawa system, where the earthquake was not severe, the only damage done to those constructions was some slight cracks in the piers, most of the other parts escaping any damage. Of the earth-fill dams, the case of the Ono reservoir in the Katsuragawa system is very interesting. The dam is 125 ft. high by 900 ft. long. The slopes are 2 to 1 inside, and 3 to 1 outside, having a puddle core at the centre. Many longitudinal cracks appeared running parallel with the dam, and reached generally vertically downward to a distance of about 50-70 ft., their width gradually diminishing and finally reduced to a hair crack. They were afterwards examined very carefully by boring in the dam, but were found to be not of any serious nature. Repairs were done by filling with a mixture of clay, sand and water as in ordinary mortar. The reservoir was then gradually filled and thereafter worked with no trouble. It is a matter of conjecture, however, what would have been the extent of the damage if the dam had been located in the more severely affected area. It may be inferred that the strength of earth-fill dams against heavy earthquakes is worthy of further investigation. Head tanks and penstocks are usually necessarily placed on mountain slopes at a very steep angle. It was natural, therefore, that the pipe lines should suffer considerable damage from landslides. In the Katsuragawa district, however, damage was less than in the Hakone district, but in one case where the side wall of the head tank had large cracks as above mentioned, pipe lines and anchorage blocks were also dislocated. Thus water gushed out from the pipe and washed away the surface of the slope and flowed into the power station.

Practically all injuries sustained by the machinery in the steam and gas power stations were the results of the sinking of foundations, the collapse of buildings or the falling of chimneys, &c. The principal reason for the severity of damage caused to the stations is that they are located near the sea shore or river banks, where the soil formation is less suitable for installing heavy machinery, for the purpose of getting better facilities for fuel handling and water supply. Boilers as a rule suffered no serious damage from the earthquake direct, but many injuries were caused by the collapse of the buildings or chimneys, &c. Two Erie-City boilers installed on Tsurumi reclaimed land, although their upper drums were situated very high and therefore seemed rather susceptible to earthquakes, were intact, due probably to the effectiveness of the struts used in the supports.

At the time of the earthquake most of the reserve plants were not in operation. In the Akabane steam power plant of the Imperial Government Railways, however, one 6,000-kW horizontal Westinghouse-Parsons type steam turbine was in operation. At the first shock the machine was stopped immediately. Oil for the bearings was supplied by an auxiliary pump. When the machine was later examined it was found that many of the turbine blades were bent, but there was no damage to the bearings. Another turbine of the same type, which was uncovered for inspection, was also damaged in a similar manner. This phenomenon may be attributed to the fact that the direction of the earthquake vibrations was along that of the machine shaft. A 7,500-kW General Electric steam turbine in the Kanagawa power station of the Tokyo Electric Light Co. was running at no load for drying the armature at the time of the earthquake. It was also immediately stopped and was found afterwards to have sustained no damage whatever.

In the Kanagawa power station, in which were installed many sets of economisers within a flue of brick construction, the flue was totally destroyed and the economisers, therein contained, were all toppled over. The economisers in the Akabane power station were placed directly behind the boilers upon a solid foundation and were contained within reinforced concrete flues, and the only damage sustained by them was a slight leak. The former installation was somewhat out-of-date, and the latter was of a new earthquake-proof type.

The pipe systems in the steam power stations almost entirely escaped damage due to their being flexibly installed. All the steam pipes, which were of steel, came out unharmed, but in some of the water piping, where cast iron was used, many cracks in the flanges and some complete ruptures occurred. In the Kanagawa station the upper part of the flange of a 20-in. suction pipe, installed for the condenser circulating pump, was broken at the neck, so that service was completely interrupted. This occurred not at the time of the great earthquake on September 1st, but during one of less intensity on January 15th, 1924. The turbine was running and the pipes were filled with water in the latter case, while in the former case the pipes were empty; the water column in the pipes might have caused the breakage. From this the necessity of supporting such pipes by stays, &c., was learned.

Considerable damage was done to the chimneys of the generating stations, and from a table summarising the injuries in this direction it is noted that of 10 reinforced concrete chimneys used in thermal power stations, only one remained undamaged, while all the steel chimneys suffered no damage.

The damage to the electrical installations in most of the generating stations and sub-stations was less, being caused mainly by the failure of buildings and other structures. The

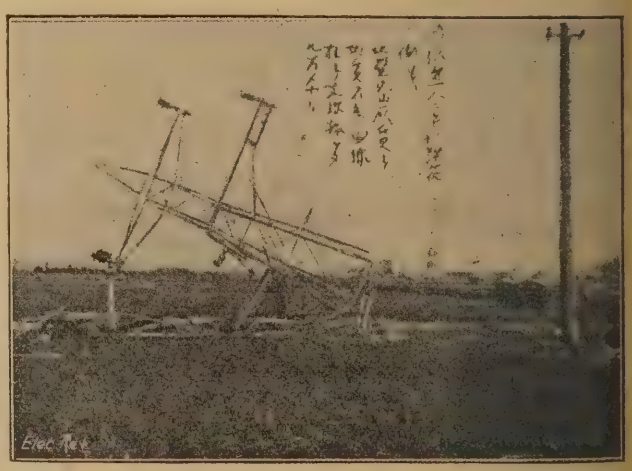

Fig. 2.—Angle Tower Overthrown by Earthquake.

foundations of the rotating machinery were generally built on solid rocks or otherwise very strong pile-work, as a result of which the machinery was not very much damaged. In some rare cases slight cracks were observed in the foundations, probably due to unsatisfactory workmanship, but in all cases these slight injuries did not prevent the machinery from operating.

In the case of the Yamura water-power station, where the building sustained somewhat severe damage, the generators and the water turbines were not affected in the least, although the generating sets were of the vertical type with shafts about 70 ft. long. No difficulty was experienced afterwards in resuming the operation of these units. Fig. 1 is a view of the

Eirakucho sub-station of the Imperial Government Railways, which was burnt down. It is interesting to note that almost all of the generating sets and water turbines in the affected area remained undamaged.

Owing to the fact that transformers are usually equipped with small rollers or wheels and that in the case of the outdoor-type they are placed on rather less solid foundations, they were more or less affected. Of the transformers installed in the Oku sub-station, 15 single-phase units, 6,000 V, 3,500 kVA, were found to have moved 9 or 10 in., although the direction of the vibration was at right angles to that of wheel movement. This was probably due to the fact that the wheels were of the flat type without any flanges. In the transformers of the Tabata sub-station, the porcelain bushes were cracked, due to the transformer leads being installed without slack.

Fig. 3.—Curiously Distorted Tramway Lines.

Four 3,500-kVA transformers in the Kawasaki outdoor sub-station were tilted due to uneven settling of the foundation, thereby breaking the suspension type insulators supporting the high-pressure leads. It is also to be noted that in many cases the failure of oil and water piping caused much inconvenience in resuming the service. From these instances it should be noted that precautions should be taken to prevent any movement of transformers in the case of an earthquake.

It would require much space to describe in detail the effect of the earthquake upon oil circuit breakers, disconnecting switches and switchgear in general. In short, where the buildings containing these appliances were of the earthquake-proof type, the damage was very slight, if any, and attention must be given to the selection of a proper type of supporting material, such as fittings, insulators, bushings, &c. It is also necessary to add that some margin in slackness must be given to all leads.

It can be said in connection with installations of storage batteries that no attention has heretofore been given to providing against earthquakes, and consequently practically all the batteries installed in the affected area were disabled. Some were either overturned, dislocated or short-circuited, while others were completely destroyed, and only a very few could be immediately used for resuming the service.

Inasmuch as the immediate cause of the damage occasioned to transmission lines was landslides of the ground upon which the supporting poles or towers stood, it is needless to say that the physical conditions of the country traversed by the transmission lines should be studied carefully. Towers placed upon mountain slopes were affected in such a manner that their legs on one side slid down, and thereby caused complete collapse. But those constructed on the mountain ridges escaped any serious damage in spite of the fact that along the sides of the mountains many landslides had occurred.

The steel towers which had foundation blocks of small taper were lifted up from the ground by the vibrations of the wires, where the soil was not hard enough to hold them. Those to which a horizontal cross beam was attached at the base of the tower seem to have withstood the shocks creditably. If that part of the foot of the tower between the ground line and the cross beam was too long, it usually caused distortion and then collapse of the tower. Moreover, the earthquake shocks exposed the negligence of the workmen during construction, such as incomplete tightening of nuts, improperly prepared fittings, &c. Generally speaking, reinforced concrete poles suffered most on account of their heavy weight and lack of foundation strength. It is evident that a concrete pole once inclined is very difficult to restore to its former position because of its weight. A view of an angle tower, after the earthquake, on the Hakone system is shown in fig. 2.

All over Japan, even in the large cities, wooden poles are generally used for the purpose of supporting distribution lines, and it was found that the injuries sustained by these wooden poles were mostly the result of damage to the nearby buildings. Even in the Kanagawa and Chiba prefectures, where the earthquake shocks were severe, the direct cause of the damage was as mentioned above, except where a few poles which had rotted at the base broke off. This shows that in most cases if all buildings had been made earthquake-proof wooden poles would have suffered little damage. The high-pressure distributing line conductors (generally 3,300 V) in the affected areas failed mainly by their swaying and the consequent short-circuiting. No trouble occurred with any of the low-pressure distributing lines (210 or 105 V). Many pole transformers dropped down from their supports, but it was found that in almost all cases the transformers had neither been properly supported nor fastened. With service wires the principal difficulty seems to have been the failure of small auxiliary poles fixed to the buildings. The best way to resume the service in case of an earthquake is to disconnect immediately the faulty wires so that energy can be supplied to the unaffected consumers, and it is important that operating electric companies or corporations should train their men in ordinary times so that in any emergency proper measures shall be taken.

Tokio and Yokohama were the only cities within the affected area where underground electric cables were used; these were mostly direct-laid and very few are in ducts. In practically all cases the injuries sustained were caused either by slipping of surrounding soil or by damage to bridges supporting them. In Tokio there were no serious injuries done to the cable except in a few cases where the conductors were disjointed in the joint boxes. Manholes are generally constructed of brick work, and they all suffered more or less from cracks in the walls.

The underground transformer chambers are constructed of either steel plates or brick masonry. The steel boxes withstood the shocks but failed under the intense heat of the fire, and the brick ones nearly all developed cracks as the result of the shocks.

It is reasonable to assume that the extent of damage done to buildings is also a measure of damage done to the interior wiring. The essential condition for the protection of all interior wiring and fixtures is to build all structures earthquake-proof. To provide for emergencies in case of a great earthquake, every consumer should be taught to cut off the circuit by the incoming switch as soon as possible. In some cases it may be necessary to construct special distributing mains with underground cables to certain consumers to whom electricity supply is indispensable. It is estimated that over 1.5 million electric lamps were destroyed.

Much damage, of course, was caused by fire, and it is reported that in over 80 places fires started in the city of Tokio soon after the first shocks of the great earthquake. Whether any of these fires were the result of damage to electrical installations is a matter of great importance. From experience gained by emergency measures taken after the disaster, it was found that fires due to electricity were very rare. The first measure was to provide lighting in order to quieten the alarmed populace. On the afternoon of September 3rd, power was supplied to the reserve pump motors of the City's waterworks. The plan of action taken by the Bureau of Electricity, Ministry of Communications, in this direction was as follows:—To disconnect all service wires from the demolished and leaning houses; to supply electricity at first for street lighting and then for the unaffected private residences; and to proclaim to all consumers the necessity of economising in the use of electricity.

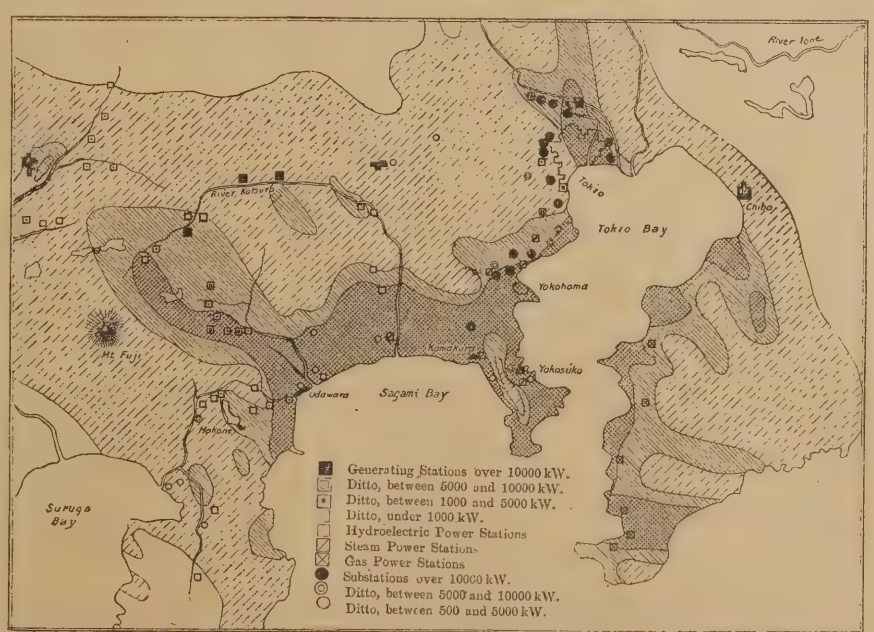

Fig. 4.—Affected Area; Depth of Shading Indicates Severity of Shock.

Simple minor injuries to the service wires and house wiring were repaired as soon as they were discovered, but owing to the chaotic conditions which prevailed at the time, there were many instances where the service wires of damaged houses were not cut, and consequently many consumers whose houses should have been cut off received a supply.

The chief troubles to the electric railways were brought about by the sinking of the road beds, &c. The most severely affected part was between the Hamamatsucho and Tamachi stations of the Government Railways, where the bed sank several feet. In Odawara, where the shocks were extremely severe, the road beds were so displaced that the tracks became wavelike in some places. These movements of the beds naturally resulted in movement of the poles and lines. In some instances railway feeders were loosened from their binding wires; but in general the injuries sustained by the aerial line were comparatively slight, so that they were all restored by the time the tracks and road beds were put in order.

A view of a deformed track in Yokohama is shown in fig. 3.

In closing the report the writer, M. Shibusawa, president of the Japanese Electrotechnical Committee and chairman of the Special Joint Committee, records the following conclusions drawn from the report:—

(1) That fire hazards from electricity can be avoided with little difficulty, if proper precautions are always taken in interior wiring and in installing appliances.

(2) Proper precautionary measures should be taken in ordinary times to interconnect the transmission systems so that in case of an emergency in one station, service can immediately be supplied from the others which are not affected.

(3) It is possible to construct sub-stations and transmission lines almost earthquake-proof. Therefore new ones should be built so, and those already built should be made earthquake-proof as soon as possible.

(4) It will be necessary to construct all communication circuits between generating stations, sub-stations, and the headquarters, earthquake-proof.

(5) It would be advisable, in the case of a large city, to construct a loop transmission line around the city, capable of being connected to all incoming transmission lines, so that in case of emergency in one incoming line others can immediately take its place.

(6) For consumers' interior wiring it is recommended to provide precautionary measures.

(7) For water supply stations, public telephone and telegraph stations, fire stations, and other public utilities which require specially quick reinstatement, independent earthquake-proof distribution lines (underground cables) are recommended.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A New Range of Oil Circuit Breakers.

We are informed by Messrs. George Ellison, Perry Barr, Birmingham, that they have recently marketed a new range of oil circuit breakers of the draw-out type. This switchgear is designed for use on a.c. circuits of up to 1,360-kVA carrying capacity, with a 72,000-kVA breaking capacity at 660 V, 3-phase. The draw-out feature has been adopted because it permits of quick and complete isolation and removal of the breaker from the busbars if desired and is especially useful where incoming units are installed side by side. It is also considered more economical in floor space than the "draw-out" truck type. The insulation is of specially manufactured reinforced synthetic resin which, it is claimed, will stand up to all atmospheric changes, chemical fumes, hot oils, and heating up to 350 deg. F. The breaker is of the free handle type and can be fitted with any of the usual automatic features; contact is made with the busbars by laminated sliding knife-switch type jaws. These contacts are shrouded so that there is no open space between the breaker and the busbar chamber when the circuit breaker is withdrawn. It is mounted on substantial slides bolted to the busbar chamber along which the breaker is moved by means of screws, the outward travel being limited by means of a nut which can be unfastened if it is required to completely remove the breaker. Mechanical interlocks are provided to ensure that the breaker is in the "off" position before it can be withdrawn or screwed home, and that it must be in the extreme position either way before it can be closed. The oil tank is also interlocked so that it cannot be lowered unless the breaker is withdrawn, and so that the breaker cannot be screwed home unless the oil tank is in position. The breaker lid is also interlocked with the tank so that it cannot be raised unless the tank is in the lowered position. The cable arrangements are such as to make the wireman's work as simple as possible. The usual instruments can be fitted. Fig. 1 shows an 800-A breaker drawn out from the busbars and with the oil tank lowered.

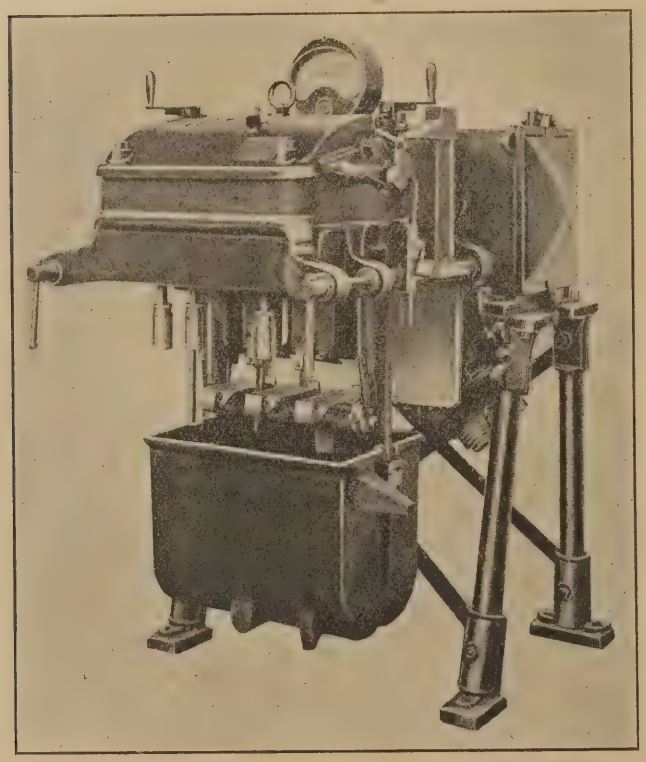

Fig. 1.—800-A Ellison Breaker.

A New Design of Small Fuse.

One of the latest products of Messrs. Edward Wilcox and Co., Ltd., Cross Street Works, Lloyd Street, Hulme, Manchester, is the "Slydlok" fuse, shown in fig. 2. It is a self-contained unit designed for use in positions where abnormal vibration is experienced, the feature being a novel sliding and interlocking contact. The base contacts are of solid cylindrical form, around which the semi-cylindrical hollow holder contacts make a close fit. The holder is placed in position by inserting the contacts in the wider parts of the "T" shaped apertures in the base and pressing downwards, the holder contacts thereby sliding over the base contacts, the side walls and interior face of the base acting as guides. Curved recesses in the fuse cover allow the gases generated by a fuse rupture to escape readily. The terminal ends permit the entry of the conductors from either the ends or the back of the base, grub screws being provided for the entry holes in the terminals not in use. The contact sleeves are cut from a special extruded metal rod, afterwards subjected to a reamering process to ensure alignment and perfect contact faces.

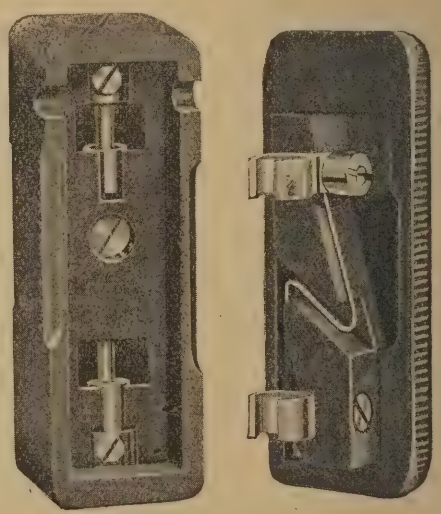

Fig. 2.—The "Slydlok" Fuse.

The fuse is made in a standard size, 10-15 A, 250-500 V. Its overall dimensions are 2⅞ in. long by 1 in. wide by 1¼ in. deep. All the parts are interchangeable, and spare parts can be provided. The conductors can enter either at the back or the ends of the base; plugs are supplied for the holes at the ends, which can be used as bushes in the latter case. They can be supplied either projecting or flush with the ends of the box.

A Drilling Machine with Four Radial Spindles.

The accompanying illustration (fig. 3) is of a product of the Avey Drilling Machine Co., Cincinnati, U.S.A., recently described in *Machinery*. It is a drilling machine with four radial spindles, spaced 90 deg. apart, each being driven by a separate electric motor, which can be fed simultaneously by hand by merely operating one lever A, which is mounted on the same shaft as the pinion which drives the large ring gear B. Each head is provided with a similar pinion C engaging the teeth of the ring gear; hence a movement of this gear feeds all four pinions by an equal amount. The shafts on which

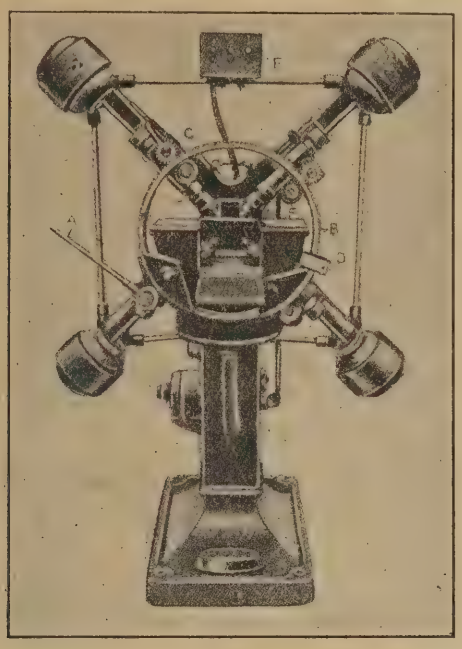

Fig. 3.—A Drilling Machine with Four Spindles.

these pinions are mounted each carry a second pinion driving the drill spindle through a rack. The forward feed of the spindles is governed by the setting of block D, while the return is controlled by a collar on one of the spindles striking the spindle head.

Two of the buttons on the upper control panel E control the individual spindle motors, each button controlling two of the motors. This arrangement allows the machine to be used in a number of ways. If six holes are to be drilled in a piece, the fixture can be indexed three times and only two holes drilled at each indexing. Each button controls the opposing spindles and the button governs the operation of the pump motor. The thrust of the pinions C on the ring gear is taken by a double-row ball bearing placed opposite each pinion as shown at F. The lower drill spindles are equipped with guards which prevent chips from getting into the spindle bearings or oil running into the motor bearings. The oil drains into a tank located between these two spindles from which it is drawn by the pump. The rotor of each motor is mounted directly on a sleeve in which the spindle slides so as to obtain a drive without intermediate gears. Two ball bearings are provided for the sleeve and one for the spindle.

Russian Electrical Notes.

Proposed Station for the Ukraine.—It is proposed to construct a new generating station to serve the needs of the industrial region of Kharkoff, the capital of the Ukraine and the centre of a big industrial district. Three schemes have been put forward, the expenditure for one being estimated at about 13,000,000 roubles. The electrical section of the State Planning Commission has decided that it is necessary to proceed with the erection of a station and has resolved that a provisional credit of 4,500,000 roubles for the purpose shall be included in the budget for 1925-26.

New Radio Station.—It is announced from Novonikolaevsk that a new Soviet radio station is being constructed at Chuguchak in Western China for meeting in the first place the requirements of the Soviet trading organisations and the Consuls.

Large Turbines. — The Leningrad Machine Trust has begun the construction of steam turbines of a pressure of 30 atmospheres, machines of this pressure not having been previously built in Russia.

The Trust has entered into a contract with the Ural Platinum Trust for the delivery to the latter of two 5,000-kW turbo-generators. These machines, it is said, will be the first of this size to be constructed at Russian works.

Electrical Extensions. — The Electric Planning Commission is applying to the State authorities for a loan for the construction of a new steam generating station, at a cost of 2,300,000 roubles, in the town of Kieff; a loan of 150,000 roubles for the erection of a new 3,000-kW turbo-generator at Archangel; and 169,000 roubles for works at Novgorod.

The Commission has also decided that a loan of 143,000 roubles shall be granted for the erection of a new 1,600-kW turbo-generator at the Omsk station; 200,000 roubles for extensions at the Krasnodarsk station; 210,000 roubles for Novonikolaieff; 200,000 roubles for the Poltoratska station; and 120,000 roubles for the Leninsk station.

Amalgamation of Trusts. — The Council of Labour and Defence has decided that the Central Electrical Trust and the Leningrad Electrical Machine Trust shall be amalgamated into a single trust. In accordance with this decision the General Electrical Commission is making arrangements with the trusts for the combination of their productive programme for 1925-26.

White Russia.—The White Russia section of the General Electric Commission is preparing information concerning the electrification of this region for submission to the Commission. In the meantime the Commission has granted out of the electrical estimates for 1925-26 a loan of 100,000 roubles to Minsk, 360,000 roubles to Vitebsk, and 200,000 roubles to the Shklovsk Spartan paper mill for electrification works.

Co-operation with Foreign Works. — With the object of utilising the experience and technical knowledge of foreign machinery works the General Metal Commission has acknowledged that it would be advantageous for the trusts and works in the metallurgical industries to secure the co-operation of well-known foreign firms. The Commission has, therefore, asked the trusts and works for information as to the kinds of production with regard to which they consider it would be appropriate to enter into relations with foreign firms, for the acquisition of drawings, projects, patents, &c.

Generator Trial.—The first large generator constructed by the Leningrad Electrical Machine Trust for the Volkhoff station was given a trial run with complete success at the station on August 4th. In all eight generators will be erected at this station, four of which have been ordered in Sweden and four in Leningrad.

Peat Fuel Station.—A trial run of the generating station at Nischni Novgorod was made on August 5th, and the station is expected to be put in operation in October. The boiler furnaces are fired with peat; the first turbo-generator is of 10,000-kW capacity, and the station will be connected with the 110,000-V line of the Electric Transmission undertaking.

A Large English Turbine.—According to the Berlin correspondent of a Moscow newspaper, the Soviet Trading Delegation in Berlin has recently had occasion to place two orders for turbines of 22,000 h.p. and 41,000 h.p. respectively, the latter being intended for the first State generating station in Leningrad. Applications were made to the largest firms in Europe for tenders for the 41,000-h.p. machine, and the decisive factor was the conditions of payment. German firms are said to have been unable to compete with English firms in this respect, and the order has consequently been given to an English works which has granted more favourable conditions, the length of the credit being stated to be five years.

Railway Electrification.—The question of the electrification of certain railways by way of a beginning is now reaching a mature stage, as the State Planning Commission, after hearing a report on the growth of the traffic on the Moscow suburban lines, which is impeding the longer distance services, has decided that it is necessary to proceed with the conversion of the Northern and Kazan lines, the White Russia-Baltic lines, and the Moscow-Kursk-Nischni Novgorod lines. With the object of making a start, the Commission, which ranks next to the supreme authority represented by the Council of Labour and Defence, has resolved to make provision in the 1925-26 budget for an allotment of 6,225,000 roubles to the Commissariat for Ways and Communications, of which the sum of 4,500,000 roubles has been assigned to the electrification of the Northern lines, and an instalment for the Kazan lines, while the balance is for preparatory works in connection with the other lines mentioned. The Commissariat for Railways has been requested to present within a month to the Planning Commission, for transmission to the Council of Labour and Defence, a plan of proposed works of conversion extending over five years in the particular order in which it is considered that the works should be carried out. Moreover, the Railway Commission has been provisionally authorised to place orders abroad for the delivery of the first series of motor cars for the Moscow region, electric locomotives for the Suram summit, and other parts of the electrical equipment. The further orders for motor cars are to be allotted to Russian works.

The Supreme Council of National Economy has presented a report to the Council of Labour and Defence, urging the necessity for the conversion without delay of the Moscow railways to electric traction and the inclusion of the requisite funds in the budget estimates for 1925-26. It is stated that it would be possible to obtain the energy from the general network of Moscow, although a further source is considered to lie in the construction of hydro-electric works on the river Malke or Bansane, which could be completed in two years.

An Improved Electric Clock System.

The "Inducta" Clock of the Stonebridge Electrical Co., Ltd.

Electric clock installations may be divided into two main classes, one in which the secondary clocks rely upon an outside source of energy (battery or supply) for their operation, and the other in which the operating energy for the secondary clocks is generated in the master clock itself. The general principle involved in the magneto clock, that employed in the latter class, is probably familiar to our readers. A magneto-

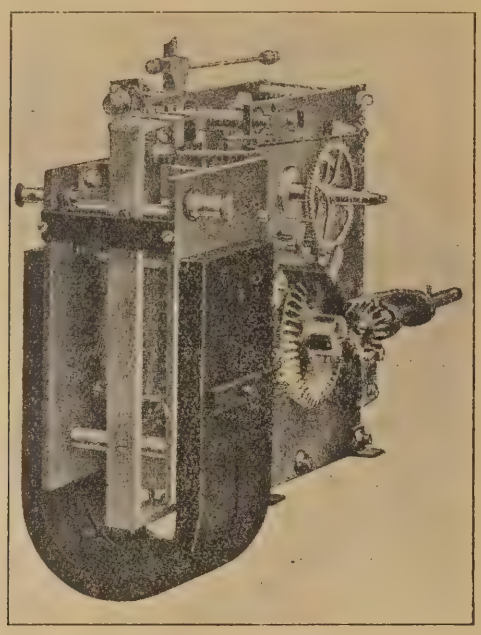

Fig. 1.—The Master Clock Magneto Element.

generator is installed in the master clock and is operated by its mechanism so that an impulse is generated at regular intervals (usually one minute), which operates the secondary clocks through suitable relays.

We were recently enabled to see some of the improvements introduced into the design of this type of electric clock by the Stonebridge Electrical Co., Ltd., resulting in the

Fig. 2.—A Tower Clock.

"Inducta" clock system. The principal advance made by the company in this direction lies probably in the introduction of the sub-master clock. This device acts as a secondary to the "master," but has installed an identical magneto-generator, enabling it to control secondary clocks in precisely the same manner. Thus by using these "sub-masters" to govern secondary circuits, any number of clocks may be included in one installation. The magneto element of the master clock is illustrated in fig. 1; the controlling element in the secondary clock is of similar construction.

A further improvement introduced into the "Inducta" clock is an automatic winding device. This operation is effected by a small electric motor, the shaft of which is connected through suitable train gear to the spindle of the winding equipment. The motor is propelled by energy from the supply mains and is controlled by means of switchgear which is brought into operation by a detent lever on the winding mechanism.

The makers standardise on the squirrel-cage motor for this automatic equipment, but will undertake to supply d.c. motors where so desired.

Another ingenious introduction is an automatic time regulating device. This is designed principally for operation on a system of recording instruments in which the recorder clocks retain their own pendulum movement, but are adjusted to accurate time at regular intervals. The sub-clocks are regulated so as to gain slightly on the master clock, and as soon as the gain exceeds a certain limit, usually two seconds, the recorder mechanism is "held up" until the clock is once more in step with the main clock. This operation is effected by the introduction of a synchronised relay into each recorder clock. A detent lever on the relay engages with the clock

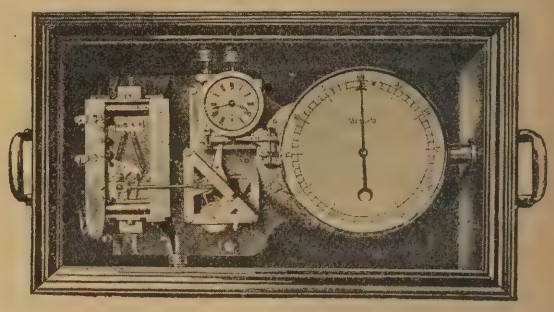

Fig. 3.—The Marine Master-Clock.

mechanism so as to arrest its movement when the limit of gain has been reached, and remains engaged until synchronism is once more obtained.

Another interesting feature is the regulating device employed in the "Inducta" marine-type master clock for use on ocean-going liners, rendering the necessary corrections, due to changes of longitude, to be made quickly by a simple adjustment. The secondary clocks are advanced by tripping the inductor of the controlling instrument, and are retarded by means of a pilot dial on the "master." By setting the period on the pilot dial, the installation is stopped for that time automatically, and upon the expiration of the period, the instruments are automatically started again. The secondary circuits can be either sub-divided or all the clocks put in series. Fig. 3 shows a marine-type master clock designed to control 50 secondary clocks.

It is evident that the possible uses of this system of electric clocks cover a wide field. One interesting application is that of the tower clock, fig. 2, which can be equipped with the inductor regulation from the ground level, and it has sometimes been found advisable to make the tower clock itself a master clock, in which case it can control additional circuits of secondary clocks.

The Late Sir Adam Beck and Canadian Water Power.—In a message to a convention of the Ontario Municipal Electrical Association and the Association of Municipal Electrical Utilities, held in June, Sir Adam Beck, whose death was announced a fortnight ago, referred to the vital importance of developing as required hydro-electric energy from the remaining water powers available in the Province of Ontario. He said: "On all sides there is a growing and more intelligent appreciation of the basic and intrinsic value that attaches to low-cost hydro-electrical energy. Control of this energy is coveted by many who would like to see it exported to the United States. One can hardly find fault with our neighbours to the South for desiring to have such a valuable commodity to aid in building up their industries and communities, but it is scarcely to be expected that Ontario citizens can be induced to part with a commodity so essential to their own necessities and welfare. What the municipalities of Ontario have accomplished through the Hydro-Electric Power Commission is so clear a demonstration of what can be accomplished by means of low-cost electrical energy that no justification exists for giving consideration to any proposal that would deprive the municipalities of electrical energy that could be utilised for the building up of the cities, towns, villages and rural communities of our own country."

Conditions in Jugo-Slavia.

A REPORT upon the economic and industrial conditions in the Serb-Croat-Slovene Kingdom (Jugo-Slavia) has been forwarded to the Department of Overseas Trade by Capt. Murray Harvey, O.B.E., M.C., British Commercial Secretary at Belgrade.*

This report says that 1924 was a bad year for industry, upon the whole. Manufacturers attribute their difficulties to a number of causes. The deflation policy of the Ministry of Finance is blamed for much of the trouble, and industrialists point out that the tariff devised for Serbia, a non-industrial country, has been adopted for Jugo-Slavia, whose needs are entirely different. Manufacturers complain that nearly all their expenses are higher than those of their foreign competitors. Money is dearer; machinery must be purchased abroad and in case of breakdowns it is sometimes months before replacements can be obtained; raw materials, fuels and other things necessary in manufacturing must be imported and stocked in large quantities; and there is a lack of skilled supervision and the Government does not encourage the immigration of skilled foremen.

Foreign Trade.

The foreign trade statistics for 1924 showed, for the first time, a good balance in favour of Jugo-Slavia. Trade with Great Britain continued to increase, this country being fourth in the list of exporters to Jugo-Slavia (after Italy, Czecho-Slovakia and Austria), having provided 10.63 per cent. of the imports during 1924. In the list of purchasing countries Great Britain is tenth, and there was a very substantial balance to this country's credit. The import statistics include electrical goods, 3,886 tons valued at 107.3 million dinars (about £357,000), and the report shows that Germany supplied electrotechnical goods to the value of 33.7 million dinars, Austria being credited with a value of 10.2 million dinars. The quantity of machines and apparatus imported is given as 15,441 tons, valued at 267.5 million dinars; of this Germany's share was 92.9 million dinars, Austria's was 68.4 million, and Hungary's 22.5 million.

The exports of Jugo-Slavia during the past year included 1,270,689 kg. of pig lead, 9,370,105 kg. of sheet lead, and 7,604,636 kg. of crude copper.

Electrical and Radio Developments.

In the province of Slovenia there is a spirit of optimism and enterprise that is lacking in other parts of the country, and much has been done towards preparing for large developments of hydro-electric schemes at Ljubljana, Fala, Ptuj, Kranj, and Maribor; it is an open secret that German industrial groups regard the province as the future manufacturing centre of Jugo-Slavia. In the Skoplje district, after keen competition, a Budapest firm has obtained the contract for the construction of a power station of 2,500-h.p. capacity at Tetovo. This station will primarily supply the lighting needs of the towns of Tetovo and Skoplje, but there will be a margin available for industry. During the year a contract was awarded (it is not stated to whom) for the electrification of Osijek (Slavonia). Considerable improvements were carried out at the port of Gruz (Gravosa). A new transit warehouse was completed and electric cranes and elevators were installed. It is stated, however, that the electrical generating plant has not yet been installed.

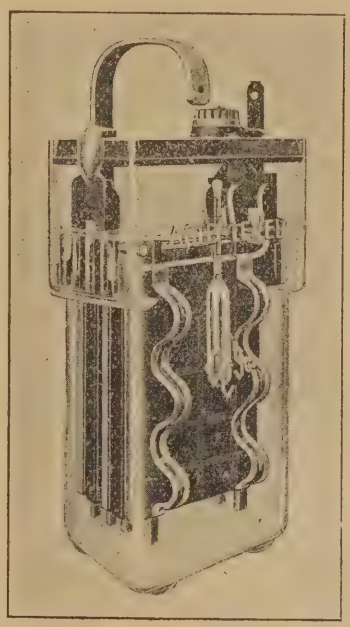
In the body of the report it is stated that radio-telephony cannot be said to have made great progress in Jugo-Slavia, only about 450 sets being in use. The use of private receiving sets was sanctioned in 1924 and this stimulated public interest. The majority of the sets in use are of the cheaper Austrian and German makes, but there is a certain market for English apparatus of higher quality. In an annexed report by the British Consul at Zagreb (Mr. G. T. Maclean) it is said that radio-telephony is making slow but sure progress, although the lack of a broadcasting station in Jugo-Slavia excludes the use of crystal and other simple sets. German and Swiss manufacturers carry on active propaganda, but British firms do not appear to have done much in this respect.

Trade Conditions.

In considering Jugo-Slavia as a market for manufactured goods, the comparatively low earning power of the greater part of the population, who are agriculturists, must not be overlooked. The principal demand is for goods of the cheaper qualities. The view is taken in the country that it will be to the advantage of Jugo-Slavia's economic development to eliminate Budapest and Vienna as intermediaries for foreign trade, and much has been written on the subject of establishing direct relations with countries like Great Britain with which no such relations previously existed.

Mr. Maclean says that among the methods adopted to initiate trade with Jugo-Slavia which have proved practically valueless are the sending of catalogues in English, with English weights and prices; inquiring for a representative without giving any idea as to the price of the article or the terms offered; and insisting on payment in cash against documents.

* Stationery Office. 1s. 6d.



A Storage Cell of New Pattern.

The Chloride DBG and DSG Cells.

AN accumulator cell in which a number of new features are embodied is being put on the market this week by the Chloride Electrical Storage Co., Ltd. It is illustrated herewith, and from the figure it will be seen that the cell is of the glass box type, for stationary use. The purpose of the designer has been to secure simplicity of erection and of putting into service, and to facilitate the renewal of parts, besides lengthening the useful life of the cell and eliminating sources of trouble.

In the first place, separate insulators have been dispensed with, by casting feet on the glass box itself, and the box is so shaped that it is easy to carry and to set up in position on the stand (the capacity of the cells concerned ranges from 50 to 180 ampere-hours). Platforms are provided at the sides of the box, from which all the plates are suspended by lugs cast on, and glass partitions are cast in the box which definitely separate plates of opposite polarity, these partitions being high enough to do away with any risk of short-circuiting by the deposit of sludge. Provision is also made in the moulding of the box for sealing the cover.

The positive plates of the Planté type are exceptionally stout, and the negatives are of the box type; pure lead is used for the plates, and a hard lead alloy for the lugs, which, as will be seen, are dissimilar, and are so designed that it is practically impossible to connect the cells with the wrong polarity. Special consideration has been devoted to the question of assembly on site, the groups of plates being so constructed that they go together in their right places with ease and certainty, and a novel feature of the design is that the wood separators can be put in or withdrawn without in any way disturbing any of the plates. It is claimed that this object has not previously been attained in cells suitable for sealing. The groups of plates are supplied in a specially treated condition, so that the first charge need only last about 15 hours, instead of the 45 or 50 hours formerly required.

New Chloride Cell, Types DBG and DSG, from 50 to 180 Ah.

The cells, however, can be supplied in a fully charged condition, the boxes being filled with acid, and the lids sealed in place to prevent spillage of acid in transit; in this case the cells only need a freshening charge after erection, and are then ready for service.

The lids are moulded of a flexible material, and are provided with a hole for the admission of a special hydrometer, one being supplied with each battery. This instrument is of the standard shape, but the scale is marked with coloured bands, so as to indicate clearly the state of charge or discharge. The aperture in the cover is closed with a vent plug. The wood separators are prevented from rising by transverse rods which are easily secured in place.

Patents have been applied for, covering the new features, which will undoubtedly be welcomed by battery users.

A Successful Athlete.—Mr. G. R. Goodwin, of the Anchor Cable Co., Ltd., and a member of the Surrey Walking Club, has had a successful season. For the fourth year he has gained the Surrey 10-mile and 2-mile championships, and for the third year the English 2-mile championship, in addition to performing many other feats. On August 22nd he won the 3-mile inter-county walking championship of Surrey.

Electrical Trade Statistics.

THE Board of Trade has published a volume containing the latest available statistics of the external trade of a number of foreign countries and British Dominions. The periods covered vary, as do the classifications, but we have been able to extract the following information :—

Russia.—The imports of electrical machinery for the five months ended February last were valued at 756,000 gold roubles, as compared with 326,000 roubles in the equivalent period of 1923-24.

Lithuania.—The value of imported "electrical and other apparatus" for the three months ended March last was 633,000 litai, as against 765,000 litai.

Finland.—Electrical machinery imported during the first four months of the year was valued at 4,717,000 marks (6,118,000 marks).

Sweden.—Imports for the first four months of the year of copper wires and cables, sheathed with lead or other metal, 187 metric tons (610 tons). Exports of electric dynamos, motors, &c., were valued at 4,700,000 kronor (5,684,000 kr.), and of telephone and telegraph apparatus at 1,962,000 kr. (2,343,000 kr.).

Germany.—Exports during the first four months of the year :—Electric cables, 915,500 kg. (707,600 kg.); metal filament lamps (number), 7,898,000 (6,896,000).

Netherlands.—Imports for first four months of the year :—Instruments, dynamos, &c., 5,248,000 guldens (4,433,000 gld.); insulated wire and cable, 1,783,000 gld. (1,808,000 gld.). Exports of metal filament lamps were valued at 7,692,000 gld. (8,419,000 gld.).

France.—The value of electrical machinery and apparatus imported during January—April was 35,796,000 fr. (36,169,000 fr.).

Switzerland.—Exports during the first four months of 1925 :—Galvanometers, 4,207,000 fr. (3,210,000 fr.); electric dynamos, 8,723,000 fr. (7,468,000 fr.).

Spain.—Imports during the latter half of 1924 :—Dynamos, electric motors, &c., 4,014,800 kg. (2,865,500 kg.); electric wire and cables, 302,400 kg. (144,500 kg.); telegraphic apparatus, meters, &c., 156,500 kg. (83,700 kg.).

Italy.—Exports of electric wire and cable :—During 1924, 19,838,000 lire (as against 17,212,000 lire in 1923); during the first quarter of 1925, 5,482,000 lire (2,642,000 lire).

Hungary.—Trade in electrotechnical apparatus during 1924 :—Imports, 3,692,000 crowns; exports, 17,399,000 crowns.

Czecho-Slovakia.—The value of electrotechnical machinery and apparatus imported during the first three months of 1925 was 29,029,000 korunė (28,314,000 korunė).

Siam.—Electrical goods to the value of 251,000 ticals were imported during the first quarter of the year (as against 432,000 ticals).

India.—Imports during April last :—Electrical machinery, 14,69,000 rupees (19,49,000 rs.); electric wires and cables, 7,91,000 rs. (3,10,000 rs.).

Australia.—Imports during the nine months ended March last :—Covered cable and wire, £1,112,000 (£865,000); other electrical machinery and appliances, £3,696,000 (£2,736,000).

New Zealand.—The value of electrical machinery and equipment imported during 1924 was £2,056,000, as compared with £1,449,000 in 1923. The figure for the first two months of the current year was £440,000.

South Africa.—Imports during 1924 :—Cable and wire, £374,000 (£368,000); motors and parts, £175,000 (£234,000); other electrical material and machinery, £1,071,000 (£949,000).

Canada.—Imports during the first four months of the year :—Dynamos and generators, $201,000 ($469,000); electric motors, $568,000 ($697,000); incandescent electric lamps, $117,000 ($144,000).

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

7,975. "Vacuum tube illuminating devices." J. R. Robertson. March 28th, 1924. (Cognate application 11,316/24.) (237,942.)

9,253. "Thermionic indicating means responsive to light variations." J. J. Dowling. April 11th, 1924. (237,952.)

10,196. "Automatic or semi-automatic telephone systems." Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. (Automatic Electric Co. in part.). April 24th, 1924. (237,953.)

10,764. "Insulation of conductors used in electrical apparatus." Sir C. A. Parsons and J. Rosen. May 1st, 1924. (237,960.)

11,180. "Manufacture of telegraph and telephone cables." W. S. Smith and A. D. Shuter. May 6th, 1924. (237,978.)

11,202. "Method for securing metal to insulating material." E. Y. Robinson, E. J. E. Hubbard, and Metropolitan-Vickers Electrical Co., Ltd. May 6th, 1924. (237,980.)

11,306. "Electric plug-and-socket connectors." British Thomson-Houston Co., Ltd., and H. C. Wheat. May 7th, 1924. (237,991.)

11,312. "Recording devices for use in measuring instruments, and more particularly electric meters." Landis & Gyr Soc. Anon. May 7th, 1923. (215,768.)

11,319. "Display apparatus." English Electric Co., Ltd., and H. W. Kefford. May 7th, 1924. (237,995.)

11,396. "Telephone receivers." A. E. Bawtree. May 8th, 1924. (Patent of addition not granted.) (237,997.)

11,404. "Dynamo-electric machines." British Thomson-Houston Co., Ltd., and A. A. Pollock. May 8th, 1924. (238,000.)

11,430. "Apparatus for the reception and transmission of sound." G. Lakhovsky. November 29th, 1923. (225,502.)

11,443. "Thermionic valve circuits." M. M. Melinsky. May 8th, 1924. (238,003.)

11,459. "Apparatus for indicating movements or positions of machinery or parts of apparatus or the like from a distance, and for transmitting actions or signals." Knowsley Electrical Co., Ltd., F. K. Woodroffe, and R. H. N. Dawson. May 9th, 1924. (238,004.)

11,588. "Electric trolley road vehicles." J. S. Highfield and W. E. Highfield. May 10th, 1924. (238,011.)

11,678. "Electric transmission mechanism especially applicable to the propulsion of motor vehicles." E. H. J. C. Gillett. May 12th, 1924. (238,016.)

11,726. "Means for mounting insulators suitable also for other purposes." G. H. Dean and Twiss Electric Transmission, Ltd. May 12th, 1924. (238,017.)

11,786. "Former for electric inductance coils." A. J. Clitheroe. May 13th, 1924. (238,018.)

12,699. "Electrical heating of rooms or buildings." R. Grierson and Grierson, Ltd. May 23rd, 1924. (238,024.)

13,081. "Electric motor control apparatus." English Electric Co., Ltd., and T. Zweigbergk. May 28th, 1924. (238,027.)

13,324. "Means for carrying and paying-out electric cable for collectors engaging an overhead conductor." Railless, Ltd., A. E. Short, H. O. Short, and E. M. Munro. May 30th, 1924. (238,030.)

13,475. "Illuminated signs." W. J. Beville. June 2nd, 1924. (Cognate application 290/25.) (238,032.)

14,842. "Telpher or overhead transporter systems." C. W. Loveridge. June 19th, 1924. (Cognate application 7,380/25.) (238,040.)

15,115. "Means for controlling dynamo-electric machines." British Lighting & Ignition Co., Ltd., and J. C. Hutton. June 23rd, 1924. (238,045.)

15,409. "Commutating gear of high-tension direct-current apparatus." J. E. Calverley and W. E. Highfield. June 26th, 1924. (238,046.)

15,793. "Electric switches." British Thomson-Houston Co., Ltd. July 3rd, 1923. (218,653.)

16,087. "Synchronous dynamo-electric machines." E. P. Hill and Metropolitan-Vickers Electrical Co., Ltd. July 4th, 1924. (238,053.)

16,554. "Electrical heaters." H. Grau. July 10th, 1923. (219,010.)

17,150. "Apparatus for electrical vulcanising." F. B. Dehn (Budd Manufacturing Co., E. G.). July 17th, 1924. (238,063.)

17,421. "Electrical toasting appliance." J. Lyons & Co., Ltd., and A. Goddard. July 21st, 1924. (238,066.)

18,491. "Electric switches." W. Preston. August 2nd, 1924. (238,074.)

19,945. "Inductance coils." M. J. O'Keeffe and Dickinson Electrical Manufacturing Co., Ltd. August 23rd, 1924. (238,081.)

21,735. "Electromagnetic sound-reproducers." M. C. Rypinski. March 13th, 1924. (230,780.)

22,060. "Inductance coils and insulators therefor." British Thomson-Houston Co., Ltd. September 18th, 1923. (222,134.)

22,939. "Glass-to-metal seals for vacuum tube devices." Metropolitan-Vickers Electrical Co., Ltd. September 28th, 1923. (222,508.)

22,942. "Vacuum electric tube devices." Metropolitan-Vickers Electrical Co., Ltd. September 28th, 1923. (222,511.)

26,617. "Electron discharge devices." British Thomson-Houston Co., Ltd. March 3rd, 1924. (230,011.)

27,019. "Adjustable electric resistance." S. Sokal (Wohlmuth Akt. Ges.). November 12th, 1924. (238,103.)

27,539. "Methods of cleaning up residual gases in evacuated containers and/or activating electron-emitting electrodes therein also applicable for the purification of rare gases." Westinghouse Lamp Co. December 8th, 1923. (225,838.)

28,132. "Dynamo-electric machines." British Thomson-Houston Co., Ltd. November 23rd, 1923. (225,244.)

29,413. "Contacts for electric heating-rods." S. Sokal (C. Conradty (firm of). December 8th, 1924. (238,114.)

29,565. "Reciprocating electromagnetic motors." N. Japolsky and M. Kostenko. December 9th, 1924. (Addition to 214,393.) (238,116.)

29,913. "Circuit arrangements employing thermionic valves for the production of alternating currents." British Thomson-Houston Co., Ltd. December 14th, 1923. (226,216.)

30,526. "Thermionic triodes." General Electric Co., Ltd., and C. J. Smithells. December 18th, 1924. (238,123.)

31,346. "Electromagnetic devices." British Thomson-Houston Co., Ltd December 31st, 1923. (227,118.)

1925.

241. "Process and installation for the electrolytic extraction of tin contained in bronzes, recovering copper at the same time." O. Scarpa. January 5th, 1924. (227,125.)

289. "Electrodes for electric furnaces." Norske Aktieselskab for Elektrokemisk Industri Norsk Industri-Hypotekbank. January 17th, 1924. (227,822.)

2,013. "Wireless systems." Soc. Francaise Radio-Electrique. January 22nd, 1924. (228,178.)

2,285. "Flow-meters and the like." British Thomson-Houston Co., Ltd. January 26th, 1924. (228,193.)

4,054. "Electrical resistance." C. E. Scott. February 13th, 1925. (238,140.)

5,743. "Manufacture of tubular electric incandescent lamps." General Electric Co., Ltd. August 30th, 1924. (238,146.)

5,950. "Fuses for electric lamps and other devices." British Thomson-Houston Co., Ltd. March 4th, 1924. (230,461.)

7,797. "Automatic electric circuit-controlling devices." T. L. M. Millar. March 23rd, 1925. (238,151.)

10,279. "Sound connecting and transmitting devices for dictation machines and other apparatus embodying speaking-tubes or similar devices." Dictaphone Corporation. May 29th, 1924. (234,786.)

10,609. "Electric clocks." C. J. V. Fery. April 23rd, 1924. (232,975.)

10,963. "Dynamo-electric machines." O. Kraus. April 27th, 1925. (238,160.)

12,417. "Electric condensers." Wilkins & Wright, Ltd., and J. H. Hewitt. May 13th, 1925. (238,162.)

17,275. "Electric motors." Lancashire Dynamo & Motor Co., Ltd., R. S. McLeod, G. E. Mason, and W. Stansfield. March 5th, 1924. (Divided application on 236,609.) (238,169.)

Electric Smelting in Norway.—After experiments extending over some years, the Norwegian iron works, A/S Norsk Staal, has developed a new electric smelting process which, according to the Press, bids fair to lead to a revival of Norway's iron and steel industry, especially because of the abundance of cheap hydro-electric power in Norway. The share capital of the company is being increased from 900,000 to 1,350,000 crowns, of which amount 410,000 crowns has already been subscribed in Norway and in foreign countries.—*Commerce Reports.*

The

Electrical Review

VOL. XCVII. SEPTEMBER 11, 1925. No. 2,494.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON." Code, A B C. Telephone Nos.: Central 8260 and 8261

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Rural Electricity Supply.

OUR recent comments on existing and prospective regulations in respect of overhead lines in rural areas have drawn an interesting letter from Mr. R. Borlase Matthews, who was a member of the I.E.E. Committee on Electricity in Agriculture. He instances two estimates of the cost of tapping high-pressure mains which surely are outside figures in both directions; we should imagine that the lower one represents the influence of the rate of exchange, and that in order to obtain a correct impression of the cost to an Italian undertaking it should be multiplied by four. Even then it would be a modest figure.

As Mr. Matthews remarks, in this country we need some intermediate value between £300 and £14; and we hope it will be found in the neighbourhood of £50. We believe this can be done—provided that common sense is permitted to have its way, and that the alarmists are held in check. It is a constant source of wonder to us that electrical engineers, who provide the public with the finest commodity ever produced, should go out of their way to deter prospective consumers from deriving the utmost benefit from it, by hedging it about with vexatious conditions—not only with regard to the sale of electrical energy under incomprehensible and complicated tariffs, but also with regard to its subsequent use in private households; and upon the suppliers themselves is laid the burden of maintaining a standard of construction of overhead lines which can only be regarded as luxurious in these days of high prices and dear labour. Hence, when it is suggested that no rules have yet been formulated for the use of electricity on farms, and that an opportunity therefore offers itself to draw up a new and unwanted code of regulations to cover this virgin field, we fear the worst. Only one thing would set our minds at rest—an assurance that such rules would be put forward with a view to simplifying and moderating the rigour of the high-class standards at present in force. Whilst there are many thousands of farms to electrify, there is little capital available for luxuries.

It should not be forgotten that farmers have a very practical alternative to taking a high-priced supply from public mains—at a moderate outlay they can provide themselves with electric power. Oil-engine-driven sets are now so cheap, so easily operated, and so reliable, that they put up no negligible competition with public supply, and a farmer might well be excused for preferring to have plant of his own rather than enter into onerous agreements and considerable outlay which he cannot recover. With his own plant installed, he could snap his fingers at regulations. But the adoption of private plant would by no means suit the plans of the

Electricity Commissioners, who will naturally be solicitous for the load factor of the public supply; much of the farmer's work being a daylight load, and at a minimum in the winter months, its diversity would be of value to the central station. That is an additional reason for avoiding any policy which tends to impede the development of the agricultural demand on the public supply service. Moreover, the installation of small private plant would tend to restrict the development of the uses of electricity on the farm.

Turning to a different aspect of rural electricity supply, the time is now approaching when the reorganisation work of the Commissioners will bear fruit. Most of the Electricity Districts have been definitely constituted, and although only one Joint Electricity Authority has begun to function, the constitution of others is far advanced, and several Advisory Boards and Committees have been established. When they settle down to work, the conditions of electricity supply in their respective Districts will be profoundly modified. For one thing, it will be their business to see that areas at present without a supply of electricity shall be provided with it as soon as may be practicable; and, on the other hand, distributing authorities will have a right to call upon the J.E.A. to furnish them with a bulk supply of electricity, should they desire it. Thus the path will be smoothed for local authorities and companies in the areas not yet covered by statutory powers, as they will not have to face the capital cost and running cares of small generating stations; they need only lay down a distributing network, which, so far as we can foretell, will not be liable to become obsolete like generating plant—not for many years, at any rate. Capital will be readily forthcoming on such good security; certainly there will be no need for State subsidies for electricity supply, to which we are as sincerely opposed as our friends of the gas world. It is true that the extension of mains into areas which offer little prospect of an immediate remunerative return is not likely to make much progress without State aid, and the same applies to the erection of long main transmission lines interconnecting large generating stations; in these cases, following the precedent of the trunk telephone lines, the State, or the Joint Electricity Authorities, may own the mains. But that will not affect the local distribution undertakers, and we anticipate that a considerable number of applications for Special Orders will be lodged with the Commissioners as the new Authorities get into their stride.

A Directive Wireless "Lighthouse."

The new short-wave direction-giving wireless installation which has been erected by Marconi's Wireless Telegraph Company at the South Foreland Lighthouse, and of which a description appears elsewhere in this issue, is a noteworthy development of the "beam" system of radiation, for which the credit attaches to Senatore Marconi and his expert staff. The idea arose out of the experiments which he commenced in Italy in 1916 for military purposes, using waves two or three metres in length, with parabolic wire reflectors; these investigations were continued at Carnarvon, and in 1920 an experimental revolving reflector was erected on the isle of Inchkeith, with a 4-metre wave, to act as a "wireless lighthouse." Two years later an improved reflector was installed, of which an illustrated description was given in the Electrical Review of September 21st, 1923, and the South Foreland installation embodies the improvements which experience has shown to be desirable. In particular, the method of reflection adopted is quite different from that employed at Inchkeith, as will be gathered from our article, and appears to be highly efficient in confining the bulk of the radiation to a narrow beam or sector. The use of Morse letters to identify the sector of the chart in which the receiver happens to be is similar to the method adopted at Inchkeith.

On Friday last we attended an interesting demonstration of the working of the system, voyaging from Dover to Southend in the *Elettra*, and found that the signals (which on this occasion were reproduced with a loud-speaker) could be heard and identified with the greatest ease, even when they passed over many miles of land surface. With the aid of a large chart it was easy to ascertain the directional position of the yacht to a high degree of accuracy, and if a second transmitter had been in operation the exact position of the ship could have been fixed. A material advantage of the system is that signals reach the vessel every two minutes, so long as she is within a range of 100 miles (over water), so that her progress is constantly under observation.

Our congratulations are due to Senatore Marconi and his associates on the success of the demonstration, which may prove to be the forerunner of far-reaching changes in lighthouse practice.

Central American Markets.

We review in this issue an article by Mr. R. A. Lundquist, Chief of the Electrical Equipment Division, United States Department of Commerce, upon electrical conditions in the Central American Republics as he found them in the course of a recent tour.

With the exception of Mexico, and perhaps Guatemala, very little electrical progress appears to have been made, and upon the whole even this has not been on very sound lines. Although as regards population these countries are small, they are comparatively very rich in mineral resources, particularly oil, and it would therefore appear that a high standard of life is possible. It may be that the Latin temperament retards progress, but what is being done in Spain may eventually have its repercussion in the former Spanish settlements. If and when this happens there should be numerous opportunities for sellers of electrical machinery and appliances. In Mexico, however, owing probably to the influence of the foreign capital invested in the country, much greater development has taken place. Due to its proximity, the United States has secured the bulk of the electrical business there; in 1920 American electrical exports to Mexico were valued at $4,298,223, while in 1924 the figure rose to $6,173,755. German penetration is mentioned by Mr. Lundquist, low prices and attractive credit terms being Germany's principal methods of securing orders. Sweden and Holland are also said to be doing a fair trade, the former in transformers and the latter in motors.

In the whole of the report there is no mention of Great Britain, although British capital, as well as American, has been invested in most of these countries. Nevertheless, British traders may glean information of value from Mr. Lundquist's notes, which is our object in reviewing them.

Transmission at Very High Pressure.

In a leading article in our issue of January 23rd last, referring to the paper which Major A. M. Taylor had just read before the Junior Institution of Engineers, we commented upon the high dielectric losses of his 150,000-volt cable as described in that paper. Major Taylor has since pointed out to us that at the date of reading that paper he was occupied with demonstrating the extremely high dielectric strength tests which the cable had stood up to, and the impracticability of 3-core (non-concentric) cables for pressures above 66,000 V on account of thermal considerations, rather than dealing with the dielectric losses.

We understand that Major Taylor now claims that the dielectric losses with "intersheath" cables are no greater, for a given high transmission voltage and for a given power transmitted, than they would be with single-core, or with 3-core cables.

It will be remembered that Messrs. Clark and Shanklin, in their paper of 1919 on "Single-Conductor Cables," predicted that the contrary would be found to be the case; but, in view of the actual tests which have now been very extensively conducted on a working size of "intersheath" cable, Major Taylor suggests that their inference would certainly appear to be mistaken.

Overhead Electric Power Transmission Line Spans.

A Simple, Practical Method of Computing Sag and Tension.

By Wm. T. TAYLOR, M.Inst.C.E., M.I.E.E.

THERE is a proper ratio between the permissible span length and the size of conductor; and, for a given material, the size of conductor has more of a determining effect upon the possible length of span than any other condition. The *most economical* span length depends not only upon the material, size, and arrangement of the conductors, the weather conditions, the factor of safety, and other factors, but it also depends upon the type, height, strength, and cost of the line supports and the cost and quality of insulators.

Long spans will usually produce relatively less damaging strain than short spans. It has been the tendency for a number of years to employ long spans. This tendency came about with the employment of higher line voltages. As the insulator is the weakest part of a high-voltage line, the fewer the insulators the fewer will be the number of supports and number of points of hazard as regards both the line supports and insulators; hence there is greater economy for a given quality.

The first step in laying out a transmission span is to determine the allowable tension in the conductor. The more common problem is to determine the minimum sag at various temperatures and under normal conditions of loading to which the conductors may be strung, so that, when they are subjected to an extreme load at datum temperature, the total tension will not exceed the ultimate strength of the conductor *divided* by the factor of safety. For high-voltage power transmission lines the Regulations (in this country) specify that the factor of safety shall be 2·0; that this value shall be based on the breaking load and shall be calculated on the assumption that the live conductors are at a temperature of 22° F. and have a covering of ice to a radial thickness of ½ inch; and that they are simultaneously subjected to a wind of 50 miles per hour at right angles to the line, this wind to be taken as exerting a pressure equivalent to 8 lb. per sq. ft. calculated on the whole of the projected area of the ice-covered line conductors; the weight of ice to be taken as 57 lb. per cu. ft.

At the present time several methods are in use for computing sag and tension. The fundamental factors involved are :—

Quantity of ice per ft. of length—$0{\cdot}0218[d_1(d + d_1)]$ cu. ft.

Total vertical weight of conductor per ft. of length—

$$w_{II} = w + 57 \times {\cdot}0218 d_1(d + d_1) \text{ lb.}$$

Load due to wind pressure— $w_{III} = 0{\cdot}666\ (d + 2d_1)$ lb.

Total resultant load per ft. of length—

$$W = \sqrt{[(w + w_1)^2 + (w_{III})^2]} = \sqrt{[(w_{II})^2 + (w_{III})^2]}$$

Total maximum allowable tension— $P = A p$ lb.

Modulus of elasticity— $E = 18{,}000{,}000$ (copper)
$= 10{,}000{,}000$ (aluminium)

Coefficient of expansion per °F—$\alpha = 0{\cdot}0000096$ (copper)
$= 0{\cdot}0000133$ (aluminium)

Weight per ft. of length per sq. inch section—
3·935 (copper) lb.
1·195 (aluminium) lb.

where d = diameter of bare conductor, in inch.
d_1 = thickness of ice covering, in inch.
w = weight of bare conductor per ft., in lb.
A = sectional area of conductor, in sq. inch.
p = lb. per sq. inch in conductor under maximum tension.
w_1 = weight of ice per ft., in lb.

Let us take an example* and solve by means of two distinct methods to see how the final results compare with regard to tension and sag. *Example* :—A 7/·174-inch aluminium conductor is to be erected with a 300-ft. span length (supports practically on a level) to conform to the I.E.E. proposals (½ an inch ice, 13·5 lb. per sq. ft. wind-pressure, temperature 22° F., factor of safety 2·0). It is required to find the tension and sag which occur in still air at 120° F., also the sag under the ice load condition at the lower temperature.

CONSTANTS.

A = ·167 sq. in.	d = ·522 in.	$d + 2d_1$ = 1·522 in.
w = ·199 lb.	w_{II} = ·636 lb.	W = 1·324 lb.
l = 300 ft.	P = 2,71 lb.	E = 10,000,000 sq. in.
t = 120° − 22° = 98° F.	α = 0·00133 per °F.	w_{III} = 1·028 lb.

METHOD NO. 1 (*Theoretical*).

Wherein $P_d^3 + P_d^2 [(l^2 W^2 A E/24 P^2) - P] - l^2 w_{II}^2 A E/24 = 0$ ... (1)

and $P_t^3 + P_t^2 [(l^2 W^2 A E/24P^2) - P + \alpha t A E] - l^2 w^2 A E/24 = 0$ ... (2)

and $P_g^3 + P_g^2 [(l^2 W^2 A E/24 P^2) - P] - l^2 w^2 A E 24 = 0$ ... (3)

where: P_d = tension at datum temperature under ice loading, w_{II} *only* (no wind);
P_t = tension at a temperature, t, above datum (no wind);
P_g = tension at datum temperature, for the bare conductor, w *only*.

The sag in feet under the total loading, W, (ice and wind-pressure) is expressed :—

$$D_{limit} = l^2 W/8P = 300^2 \times 1{\cdot}324/8 + 2{\cdot}171 = 6{\cdot}861 \text{ ft.} \quad (4)$$

It can be shown—but is purposely avoided here—that in developing from the equation of the *catenary*, the first few terms of the series are sufficient to give values close enough for the closest practical working. In fact, by limiting these calculations to the second member of the series, the error in a span of 1,000 ft. is no greater than 0·0062, or 0·00062%.

Solving for P_d we have—

$$P_d = \sqrt[3]{\{2183185781 - 53^3 + \sqrt{(4366371562 [1091592890 - 53^3])}\}} + \sqrt[3]{\{2183185781 - 53^3 - \sqrt{(4366371562 [1091592890 - 53^3])}\}} - 53$$

and

$$P_t = \sqrt{\{124000631 - 778^3 + \sqrt{(248001262 [62000315 - 778^3])}\}} + \sqrt{\{124000631 - 778^3 + \sqrt{(248001262 [62000315 - 778^3])}\}} - 778$$

P_d = 1581 and $D_d = l^2 w_{II}/8P_d$ = 5·941 ft.

P_t = 305 and $P_t = l^2 w/8P_t$ = 7·340 ft.

These results check with those given by the British Aluminium Co., Ltd.; that is to say, the maximum limit of sag (from formula 4) is 6·861 ft., and the required sag (from equation 2) is 7·24 ft. However, the expression which they give for K is not a *constant*, because the values l and q are variable.

METHOD NO. 2 (*Practical*).—If no great accuracy is required, then, assuming that the difference due to ignoring the modulus of elasticity (E) is equal to $l_{max}\ (P - P_t)/AE$ = 1 (almost), we may write

$$D = \sqrt{D_k^2 + \tfrac{3}{8} \alpha t l^2} \text{ where } \sqrt{D^2_{limit}} = D_{limit} = l^2 W/8 P = 6{\cdot}861 \text{ ft.}$$

wherein D_k = sag depending upon the loading conditions; D_{limit} = sag for *maximum* loading.

Therefore, we may write for this case—

$$D_d = l^2 w_{II}/8P = 300^2 \times {\cdot}855/8 \times 2171 = 4{\cdot}327$$

hence—

$$D_t = \sqrt{(D_d^2 + \tfrac{3}{8} \alpha t l^2)} = \sqrt{62{\cdot}712679} = 7{\cdot}918 \text{ ft.}$$

* Using a different method to those given herein, this example is found on page 18 of the brochure "Economic Electric Power Transmission" produced by the British Aluminium Co., Ltd., London. By their method of calculation, sag D_d = 6·9 ft. and sag D_t = 7·34 ft.

For any material and sectional area of conductor, the *minimum* sag is expressed

$$D_{min.\ (limit)} = l^2\, w/8\, P = l^2\, \delta A/8\, AP = l^2\, \delta/8P\ ;$$

where $\delta = 1{\cdot}198$, and $P = 13{,}000$.

For aluminium stranded conductor this may be written: $0{\cdot}0000114 l^2$; for this case we have—

$$D_{min.\ (limit)} = 0{\cdot}0000114 \times 300^2 = 1{\cdot}026 \text{ ft.}$$

From the values of sag obtained by this simple practical method we see that the required sag checks close enough to warrant its employment. It is a method largely used in this country, and as within fair practical accuracy provided the temperature range is kept within about 60° F., which value approximates the usual stringing temperature. For the higher temperatures and for certain problems, the value of D as obtained by this method cannot be relied upon. Method No. 1 gives results to a high degree of accuracy.

The value D_t given by the British Aluminium Co., Ltd., is obtained from the stress A_{p_1} (lb. per sq. in.), in which the loading is Q_1 is found from the equation:

$$P_1 - l^2\, Q_1{}^2\, \delta^2\, E/24\, (P_1)^2 = P - [l^2\, Q^2\, \delta^2\, E/24\, (P)^2] - a\, t\, E$$

$$D_t = l^2\, \delta\, Q_1/8\, P_1$$

Wherein $P = P/A$; $Q = W/w$; $\delta = 1{\cdot}198$ for aluminium.

The Design of Squirrel-Cage Motor Starters.

Suggestions for Alterations Necessary to Meet Heavier Load Conditions.

By J. O. KNOWLES, M.A.

A RECENT article in these columns (ELECTRICAL REVIEW, May 22nd, page 805, "Motor Starting Equipment," by F. W. Davies) suggested that "finality had not yet been attained" in the design and standardisation of a.c. starting gear. The writer feels, however, that the remarks made in that article on the design of three-phase starters could be considerably amplified, and that the increasing use and possibilities of large squirrel-cage motors call for increased attention to the design of large squirrel-cage starters. The objections to the use of large squirrel-cage motors are disappearing as the power reserves immediately behind the supply mains are also increasing. The surges of current that, in a small feeder circuit, would cause such a fall in pressure as to trip the neighbouring circuit breakers and cause all the lights to flicker, will make little disturbance in a feeder of ample dimensions near a sub-station of large capacity. On the other hand, the same reason that enables squirrel-cage motors of large horse-power to be used makes the duty of the starter more severe. Not only must a large current be interrupted on the starter contacts, but the energy in the interrupted circuit is supported by a large reserve of power in the feeder and the sub-station behind it.

It would be a pity if the use of squirrel-cage motors for increasingly large horse-powers were retarded by backwardness in the design of squirrel-cage starters, for the simplicity and cheapness of their design reduces the cost of electric power and so benefits, among others, the electrical industry itself. Yet there is a considerable prejudice against the squirrel-cage motor, not among the smaller engineers who are apt to regard maintenance expenses as "all in the day's work," but among engineers responsible for large installations, who cannot afford to tinker with inefficient apparatus.

Remembering, then, that the troubles that are annoying in small squirrel-cage starters are likely to be serious in installations of large size and of large horse-powers, it is only reasonable to expect that the design of squirrel-cage starters will improve up to a higher standard.

What then are the weakest features of the present designs which are likely to give trouble under severer conditions? No attempt is made in what follows to arrange these weak points in order of importance, as the order would vary for different makes of starters. Neither need any mention be made of those obvious features which are commonly found in the good makes at present.

Consider first, however, the damage that an unskilled operator can do. He cannot start a star-delta starter in delta without passing through the starting position, but some men have such a wholesome fear of electrical gear that they are half-afraid of a starter that lets the motor speed up with a rush. These and others, more cautious if less fearful, attempt "inching" the starter to make sure that everything is all right. In other cases "inching" may be really desirable at the commencement of the process, but a squirrel-cage motor may have been supplied, and the operator acquires a certain amount of "skill" in "inching" on the squirrel-cage starter, to the detriment of the contacts. A control-gear maker must expect that his starters will sometimes be operated by clumsy and ignorant labourers and sometimes by over-'cute mechanics. He can, of course, say that it is not his fault if his starters break down under such usage, but it is better for his reputation if his starters are designed to resist or prevent such ill-treatment. Unlike high-pressure switchgear, motor starters are operated by all classes of labour, from the lowest upwards, and as the control-gear maker is probably a sub-sub-contractor, his knowledge of the conditions under which his starters will be used is probably even less than that of the sub-contractor who decides the placing of the order for the starters. Is it not, therefore, desirable to have a quick-make action in the starting position of squirrel-cage motors? There is considerable scope for variation in the design of this feature, inasmuch as few, if any, makers now provide it. A nearly perfect form is a cam with a steep rise or a strong star-wheel action, either of these forms compelling a considerable pressure on the handle, which pressure is naturally maintained for the necessary instant after the restraining pressure is replaced by the resistance of the contact springs, so that a decisive closing of the contacts is almost inevitable. An alternative is the use of a separate contactor type of circuit breaker operated electrically from the starter. This scheme, although it provides both free-handle action and a quick make, is expensive in small and medium sizes. Fortunately, however, the larger sizes are those in which the necessity for a quick make is likely to become more prominent in the near future. Apart from electrically-operated contactors, it is possible to ensure a quick make by compressing a spring which, when released, closes the switch, but in this case the switch handle should necessarily in the larger sizes follow up the action of the spring so as to ensure a good contact.

The change-over from "start" to "run" should be similarly a quick-make-and-break action independent of the operator. This movement should be designed primarily for the auto-transformer type of starter, as the severity of the break will then be greatest. The upper limits of size for which the drug type of switch is suitable can best be tested on these change-over contacts by repeatedly switching on the motor through the transformer and by changing over with insufficient intervals of time. That there *are* limits to the drum-type change-over switch will then be tested, and this

is generally agreed, but the limit of suitability is still largely a matter of opinion. For large currents, however, as for high pressures, the drop-switch form is easier to construct in a sound manner, *i.e.*, with ample head of oil deepening as the break increases. The contacts themselves may be formed as wedges (see fig. 1), in which case the arcing point of the wedge should not be in contact when the switch is "on," or butt contacts

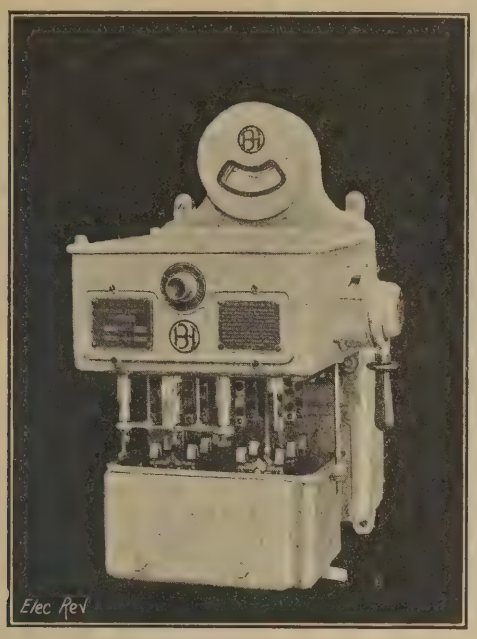

Fig. 1.—A Brookhirst Drop Switch Straight-on Starter for Medium Horse-powers—Wedge Contacts.

(see fig. 2) may be used in conjunction with a drop-switch action.

Again, the matter of no-volt and over-load protection becomes of increasing importance with the increase in the size of units. The burn-out of a small motor because of some trivial failure in the protective features is annoying, but a similar failure in a 100-h.p. or a 200-h.p. motor through a trivial detail is more than annoying—it may be so costly as to give the user a prejudice against the manufacturer of the faulty starter for years or for ever, while a stoppage due to a burnt-out no-volt coil may cost more than the value of the starter.

Consider first the no-volt feature. The ordinary requirements in a good design are that the plunger should always move home without sticking, that the no-volt catch should be sensitive without being either so weak as to open under vibration or so strong as to fail to open when required, and that the coil itself should not get so hot as to burn out or warp the plunger guide. In future, however, there will be more need of a no-volt release which will not operate if the pressure dies down momentarily to, say, 33 per cent., or even 25 per cent., of the normal voltage due to a heavy short circuit in some adjacent part of the system. Otherwise a breakdown of one supply may throw out of action a whole sequence of motors in another section (*e.g.*, the auxiliaries of a boiler house or of a paper-making plant), and restarting may cost money and be very inconvenient. It is not a bad idea to be generous in giving space to the no-volt coil frame so that unusual specifications such as the above can be met without an excessive temperature rise.

The adjustment of over-load releases becomes a more serious matter as the horse-power of the motor increases. In spite of the robustness of the modern motor, it is not immortal; repeated overheating for prolonged periods eventually breaks down the insulation. Speaking of the squirrel-cage motor only, the starting peak current is fairly innocuous. On the other hand, there are many applications where the motor can be run for considerable periods (intermittently) to 25 per cent. or 50 per cent. over-load without the knowledge of the electrical engineer, who is then likely to blame the motor maker. The latter should blame the starter manufacturers more often than he does. There is still too great a tendency to regard the robustness of the squirrel-cage motor as an excuse for poor over-load protection; thus over-load releases are provided with time lags which, in hot weather, will only hold them down during starting by screwing down the overload calibrator to trip at a high figure. Then the motor has inadequate protection during running, and might be overloaded for long periods without anyone being the wiser—till repair bills began to mount up. In some circumstances such long period over-load conditions are, of course, impossible, in others improbable, but, as before mentioned, the control-gear maker must standardise on a design which will stand up to conditions which may reasonably be expected in a fair proportion of cases where this standard design is to be used.

Again, it is too usual to cut the overload releases out of circuit in the starting position. If there is one time when a short circuit is likely to occur, it is at starting up. The sudden rush of current during starting completes the insidious breakdown of insulation, or the usual "accidental" short circuit or crossed connection in connecting up, or even a spanner dropped in the wrong place—all these faults are discovered when restarting. If the overload releases are cut out of action during starting, there is either an expensive firework display while the operator continues to hold the starter handle in the "start" position, or the main fuses or main breakers open and other plant is also shut down.

A simple solution of the over-load problem is to lower the over-load cores during starting and until the running kick has died down. In this way the overload release will act on 400 per cent. to 500 per cent. overload during starting; but without fitting any dashpots at all, the releases can be set to trip even as low as 25 per cent. above normal current during running conditions. If this lowering of the over-load cores is done automatically from the starter handle, the device is made foolproof (see fig. 1).

There used to be a "rule of thumb" that read "straight-on starting to 3 h.p., star delta to 25 h.p.,

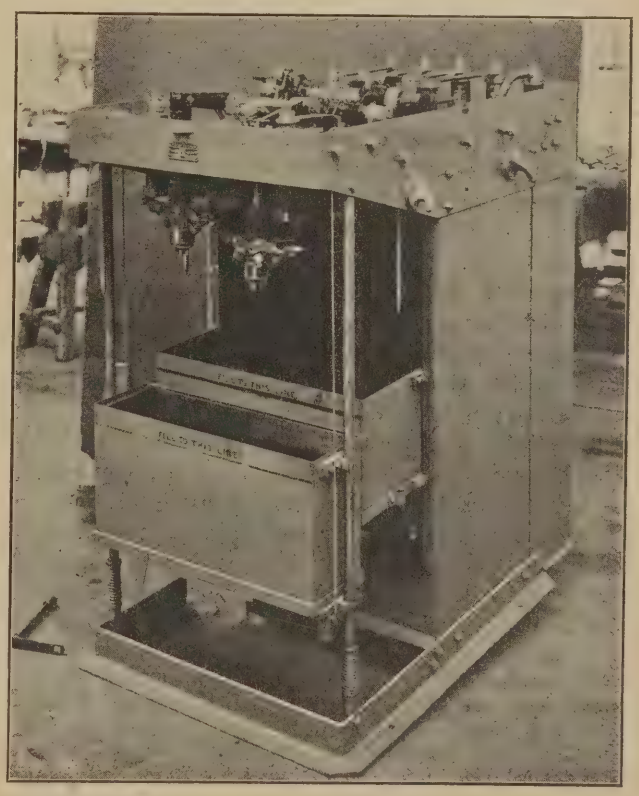

Fig. 2.—A Transformer Regulating Switch—Butt Contacts.

auto-transformer to 50 h.p., and wound rotor motors above 50-100 h.p." Like most time-honoured rules, it is not a bad guide, but times are changing—and designs. Perhaps the most important development of squirrel-cage motors is the adoption of high-resistance rotors, so as to increase the rotor resistance during

starting. This has been done in various ways by different motor manufacturers, but the result is just what is wanted to improve the starting conditions in the squirrel-cage motors.

The efficiency in running is usually slightly less than in the normal motor (granted that this slight difference means money if the motor is run continuously day and night). Here, then, is a squirrel-cage motor which can be started by a simple starter, but which gives a good starting torque without excessive current kicks. The reactance effect can be designed for different conditions. If frequent starting is required against heavy torque, the reactance effect is made full use of at a loss in efficiency which makes this type truly economical only for motors on somewhat intermittent duty. If the starting torque required is not so severe the efficiency can be improved.

Here at least is an avenue for improvement which will also call for improved designs in large squirrel-cage starters. For intermittent work a simple straight-on starter will be required for larger powers than at present, and such starters will lend themselves easily to automatic control. Thus a float switch, push button or tappet switch may operate a simple contactor, air-break or oil immersed, with over-load releases for protection, the latter having a restraining device similar to that above described, to allow for the surge in starting. For reversing work a quick-make-and-break hand-operated reverser with a separate protective panel or a combination of contactors with master switch may be used, as a motor having this automatic starting reactance can be reversed even at full speed without electrical injury.

Then again there is the matter of speed control for which wound-rotor motors with wasteful expensive rotor regulating resistances have been used of necessity and not of choice. Consider a fan drive, for instance. To a certain extent the draught can be throttled down mechanically, using a constant speed motor.

For greater speed variation, why not use a two-speed motor with two stator windings and a squirrel-cage rotor? Such a motor can be started by straight-on, star-delta or auto-transformer starting on the lower speed and then switched over for the higher speed. By using also simple pole changing, three or four speeds can be obtained. By using the drop-switch type of starter the whole of the starting equipment can be made into a compact unit, including circuit breaker protection, correct-sequence operation, and automatic over-load restraining while switching, the over-load calibrations being adjusted, where the powers vary on the different speeds, to suit the capacities of the two stator windings.

Such are some at least of the possibilities of the squirrel-cage motor of the future. Other features may be invented to fill up the gaps in the applications of the types mentioned, especially if the supply authorities take a broad-minded view. At the same time the control gear must keep pace with these improvements so that the repeated complaint that at least a third of the motor breakdowns are caused by defective starters may be made less and not more true as the duty of the starters becomes more severe.

Choosing and Using an Electric Washer.

Diary of a User's Experience.

By "WREN."

(*Concluded from page* 368.)

The Washing Action.

The actual process of washing clothes, by whatever means, consists—or should consist—of sluicing warm soapy water through the fibres to loosen and remove all dirt. Rough treatment is destructive, and any tendency to close packing of the clothes obstructs the washing action described above. In the machine washer the requisite movement of the clothes through the water is obtained *either* by a "dolly" with a reversing rotary motion about a vertical axis, the clothes being loose in the tub and dragged to and fro by the dolly; *or* by placing the clothes in a perforated cylinder which has a reversing rotary motion about its own axis, this being horizontal. The relative merits of the two systems are a matter of personal opinion, the writer's view being that the "dolly" is somewhat rougher and more local in its action than the cylinder.

The cylinder, being provided internally with radial battens, is supposed to engage sufficiently with the clothes to pull them through and lift them from the water, then letting them fall back into the latter from the upper part of the cylinder as the drum rotates. This action, we were told, could be observed in a machine fitted with glass drum and container ends. It would surely be an effective piece of salesmanship to have a demonstration machine thus equipped in every showroom.* Given this facility the prospective purchaser would be convinced at once of the efficacy, or otherwise, of the washing action, and he (or she) would be able to decide whether the principle of six revolutions forward and six reverse is better, or worse, than that of reversal at every revolution—a point, by the way, on which the writer has been unable to obtain convincing evidence or opinion. From first principles it would seem that reversal at each revolution gives maximum sluicing action and does not permit any "packing" of clothes by centrifugal force.

In some cylinder machines the oscillating drum is made of wood, and in other cases metal is employed. Here, again, it is largely a matter of personal preference, and it would be good policy for makers to supply either a metal or a wooden drum according to the purchaser's desire. Only in one or two instances has the writer been given this option.

The points to be looked for in any washer-cylinder are strength, balance, smoothness, and adequate perforation. If possible, a demonstration machine which has seen a fair amount of service should be examined. Wooden cylinders should be inspected for any signs of warping, and the method of attaching the side-pieces (*i.e.*, the cylinder walls) to the ends of the drum should be examined carefully to make sure that there is no tendency for the drum to come to pieces. The holes in metal cylinders are generally, but not always, guarded against sharp edges by counter-sinking and/or some form of beading. Any sharp edge, roughness, or projecting screw, &c., has disastrous consequences. A liberal provision of perforations is desirable to secure a free flow of water into and from the cylinder. Any tendency to form scum or slime on the cylinder parts should be regarded with suspicion. There should be no parts in the container or cylinder which can rust.

* Since these lines were written, the writer has found one demonstration machine fitted with glass windows to allow the internal action to be observed. Such machines are not, however, generally available. The maker of every electric washer should surely arrange that all his demonstration machines can be seen inside and out whilst in motion.

Six Months' Experience.

After concluding the preceding paragraph a machine was purchased, and it has now been in use for over six months, to our entire satisfaction. In the words of the writer's wife, we "would not part with the machine for anything." Not the slightest mechanical or electrical trouble has been experienced, and on several occasions during the spring a day's washing at least three times as heavy as could have been done by hand was accomplished with less fatigue than that entailed by an "ordinary wash-day" before the advent of the electrical machine.

The only mishap has been the blowing of a fuse owing to clothes sticking to the rollers of the wringer and "winding in." The rubber rollers, working under high mechanical pressure and at high speed, compared with a manual wringer, are very apt to carry round a few threads of frayed material, or a tape, and once the strands re-enter the front of the rollers the whole of the material follows and the safety pressure-release must be tripped promptly to prevent jamming. If jamming occurs, the only consequence (with our machine) is that the fuse is blown. Replacing the fuse is less trouble than extracting the wound-on clothes, if the latter be jammed tightly. On the only occasion when this occurred with our machine, a large piece of rough canvas with many loose ends was being washed; it jammed between the bottom roller and the frame so tightly that it had to be cut and picked out piecemeal. Obviously it is as well to practise the use of the wringer with some material of no value!

No trouble has been experienced with the washer itself, and the only attention required has been occasional lubrication. This is, of course, essential and must be done periodically and with suitable oil. The gears are grease-packed, but there are half a dozen bearings with small oil cups which need attention every fortnight or so.

During the damp weather an unpleasant mould grew on the wooden battens of the washer drum during the week owing to the wood being shut up, whilst damp, in a confined space. In summer time the wood dries completely in a couple of hours, if the drum be stood out of doors, but no method has been found for avoiding the mould in winter save by leaving the cover off the machine. Possibly hinged brackets which would hold the cover open 2 inches or so would provide sufficient ventilation to keep the wood sweet, whilst still permitting the cover to be used as a table. The tendency for mould to grow on wood seems to be a distinct argument in favour of all-metal drums.

Comparison of Costs.—The following comparison of costs is a thoroughly representative one, made after the machine had been in use for three months. The articles washed included household linen of all kinds—everything that requires washing in a household of five persons, with the exception of starched collars. Price schedules were obtained from four laundries, and it was found that the minimum charge for the articles in this wash would have been £1 4s.; at two of the laundries the charge would have been considerably higher.

The actual total cost of the wash when using the electric washer and an electric iron was 2s. 0½d., made up as follows:—Soap, 1s.; starch, 2d.; hot water, 2d.; electricity for washing machine, 3d.; electricity for electric iron, 5½d. To these items must be added the capital charges on the machine; allowing 5 per cent. interest and 10 per cent. depreciation on £50 (the first cost of the machine), we arrive at £7 10s. per annum or, say, 3s. per week. On this basis the above-mentioned wash would cost, at home, 5s. 0½d. per week—a saving of 19s. a week as compared with laundry charges, so that the first cost of the machine would be saved in $50 \times 20/19$ or 53 weeks. If no allowance be made for the capital charges, and it is hardly necessary to do so when the whole outlay is recovered so quickly, the first cost of the machine is saved in $50 \times 20/22$ or 45½ weeks.

In order to meet any possible criticism of the cost items stated above, the following explanations are added: Plenty of soap is essential for satisfactory results; the amount of water in the machine is small, but it must be very "sudsy" if the best and quickest washing is to be obtained. The allowance of 2d. for hot water may appear to be low; actually it is ample. The writer has an anthracite stove which costs 1s. 5d. per 24 hours (coal at 85s. per ton), so that the total cost of fuel for three hours, *i.e.*, the duration of the wash considered, equals 2.1d. By charging 2d. to the washing bill, we are on the safe side, because during this period two radiators were in full operation, and waste heat from the stove was helping to warm a cooking oven. The actual consumption of electricity by the machine during three hours was 0.425 kWh, costing 2.975d. at 7d. a kWh. A 400-watt electric iron used for two hours consumed 0.8 kWh, costing 5.6d.

The amount of dirt extracted from clothes the first time they are put through the electric washer will be gratifying, or humiliating, according to the way one regards it! In making the above comparisons of cost, no allowance has been made for the fact that clothes last much longer and are a much better colour when washed at home than when sent to a laundry, but this is a consideration of real importance. Clearly the electric washer, even at £50, is a splendid investment, but it is not everyone who can afford the initial outlay. To meet their case there is surely a sound argument for the sale of electric washers on easy payment terms. The amount saved on the laundry bill is so considerable that the instalments needed to pay for the machine in, say, two years still leave a net reduction in the weekly expenditure of the household.

In preparing these notes the writer started with an open mind and has endeavoured to preserve an unbiased attitude throughout. That he is now an enthusiastic believer in the electric washer goes without saying, and it is hoped that these notes will induce others to invest in these machines. The central station engineer who omits to encourage electric washers by every means in his power will be losing a valuable opportunity for, whilst the actual energy consumption per week is less than that of a 40-watt lamp used five hours a day, invaluable service is rendered by the washer in advancing the cause of electricity in the home. Prospective users of electric washers may have every confidence in the utility of these machines, and the writer's experience may assist them in their choice. Perhaps, too, actual and prospective makers of electric washers will not consider these notes unworthy of consideration.

Low-Temperature Coal Carbonisation Installation.—What will be, according to *Power*, the first low-temperature coal distillation system of its kind to be installed in America, is to be erected at the Lakeside plant of the International Combustion Engineering Co. of New York. It is said to have been perfected after more than two years of experimentation at the Lakeside power station. The initial plant will provide for the treatment of at least 210 tons of coal per day, or about one-fifth of the plant's present requirements. The coal is pulverised before being heat treated, and the oils, gas and other residuals are recovered under low temperature. This leaves the coke in such a form that it can be readily burned in a pulverised-fuel furnace, and, it is claimed, with certain advantages over the burning of pulverised raw coal.

A description of the process appears on pp. 412-3 of this issue.

Thawing Meat Electrically.—A demonstration of an Australian electrical invention for accelerating the defrosting of imported meat took place recently at the Poplar electricity works, when Australian beef was defrosted in 23 hours. The inventor, Mr. A. U. Alcock, of Melbourne, explaining the process to a *Daily Mail* reporter, is reported to have said: "The beef is hung from a hook which carries the controlling device for securing a uniform flow of electricity through the whole piece of meat, so that in less than 24 hours the temperature can be carried from 20 deg. to 35 deg. F. at the bone, thus eliminating all ice from the meat. At present, defrosting in the ordinary atmosphere takes three days in summer and six days in winter, so that the butcher has to order a long way in advance and wait for the meat to thaw. With the new device he simply turns on the ordinary alternating current in his shop and the process is complete in 24 hours at a cost of 6d. for hindquarters of beef and in 8 hours at a cost of 2d. for mutton." It is claimed that under the electrical treatment the meat retains the original flavour and weight much better than under the atmospheric method, and that the quickness of the process has many advantages in cleanliness and economy for both the butcher and the consumer.

Pilot-Wire Control for Street Lighting.

By A. C. JOHNSON.

In his paper on "Street Lighting," read at the Brighton Convention of the I.M.E.A., Mr. Haydn Harrison points out that scientific lighting has recently made great strides, and that further improvements must be looked for in a decrease of the capital and operating costs incurred in switching, which costs—at any rate in side-street lighting—form such a large proportion of the total costs.

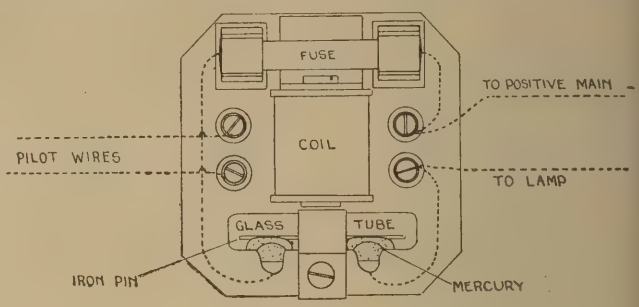
Even after making allowances for extra current and lamp renewals, hand switching still holds its own and remains generally a cheaper method of control, and certainly a more reliable one, than time switches the use of which is often confined to isolated districts and scattered lamps.

The only capital outlay for hand switching is that of the switchgear, and the annual costs per 100-watt lamp are approximately as follows, depending on local conditions and wages, *viz.* :—

Loan charges on switchgear—10 per cent. of 17s. 6d.	£0 1 9
Labour on switching	0 12 6
Extra lamp renewals due to additional 456 hours over schedule lighting hours	0 1 9
Extra energy—46 units at 1½d. ...	0 5 9
	£1 1 9

The loan charges on time switches are often taken at 20 per cent. In the following comparison with hand switching, I have assumed that the time switch has an average life of 10 years:—

Loan charges on time switch—13 per cent. of 65s.	£0 8 5
Loan charges on switch casting and fuse—10 per cent. of 17s.	0 1 8
Winding, attendance, and minor repairs on site	0 8 0
Repairs and overhauling	0 3 0
Extra lamp renewals due to additional 270 hours over schedule lighting hours	0 1 0
Extra energy—27 units at 1½d. ...	0 3 4½
	£1 5 5½



The pilot-wire control has many advantages over other systems of control. It is perfectly reliable in that a fault on the pilot wire automatically lights up the street lamps and cannot, therefore, plunge the streets into darkness. The lamps being controlled from one control station situated anywhere on the network can be switched on at exact schedule lighting hours and there is no waste of either current or lamps. In the event of fog or storm, the lamps can easily be switched on before schedule time. Time switches entail extra burning hours of from 40 to 60 minutes per day for various reasons, amongst which the following may be mentioned, *viz.* :—

1. The vagaries of clocks.
2. Allowance for occasional dull weather and storms.
3. The clock is usually wound once a fortnight, during which time the lighting hours vary as much as half an hour at night and half an hour in the morning, but light must be provided for the longest night.

A description of the pilot control system will be found in the Electrical Review dated April 24th, 1925, and the accompanying figure shows a simple and weatherproof combined relay switch and fuse constructed so that it can be inserted in any standard street-lighting switch casting provided, of course, that the hand switchgear has been previously removed; therefore, a change-over from hand to pilot control does not entail a heavy expenditure on switch castings.

Further, the relay illustrated only entails an annual consumption of about 1 kWh.

The cost of installing the pilot system of remote control depends largely on the cost of the pilot wires laid in the ground. When new service mains are laid, a pilot wire can be incorporated with the lighting cable at a small extra cost of approximately £3 per 1,000 yards. Overhead wires on traction poles and wires drawn into existing underground ducts can also be laid

Combined Relay and Fuse.

at a small cost. If, however, there are no ducts and special armoured cables have to be laid, the cost is higher, but as loans for cables are generally borrowed for a period of 25 years, the total annual charges are still lower than with hand switches even when the cable is laid under made-up paths.

100-watt Lamps (40 Yards Apart).

—	One or two wires.	Cost of pilot wire laid.	Cost of relay switch fuse and switch casting.	Loan charges on cable at 7½ %.	Loan charges on switchgear at 10 %.	Repairs and maintenance of cables and switchgear.	Total per lamp per annum.
		£ s. d.	£ s. d.	s. d.	s. d.	d.	s. d.
New lighting mains laid & 1/18 S.W.G. pilot incorporated	One	7 6	1 0 0	7	2 0	6	3 1
	Two	10 0	1 0 0	9	2 0	6	3 3
Armoured pilot laid direct in ground in open trenches	One	2 15 0	1 0 0	3 11	2 0	6	6 5
	Two	4 7 0	1 0 0	6 2	2 0	6	8 8
Armoured pilot laid direct in ground in unmade paths	One	4 5 0	1 0 0	6 1	2 0	6	8 7
	Two	5 17 0	1 0 0	8 4	2 0	6	10 10
Armoured pilot laid direct in ground in slabbed paths	One	7 5 0	1 0 0	10 4	2 0	6	12 10
	Two	8 17 0	1 0 0	12 7	2 0	6	15 0

The accompanying schedule gives the approximate annual costs incurred by the pilot control system, assuming 100-watt side-street lamps situated 40 yards apart.

Laying C.T.S. Cables Underground.—The use of C.T.S. cables has been extended in some cases to underground mains. Owing to the comparatively high cost of C.T.S. this is not a general practice, but it is sometimes convenient for connections between houses, stables, &c. Trouble has occasionally been reported on C.T.S. cables laid underground, which, while it has been put down to the cab tire sheathing being affected by the action of the soil, has, on inspection, in every case been found to be due to sharp stones, &c., being driven through the C.T.S. by the use of the usual heavy earth rammer used for consolidating the trench. After such experiences it has sometimes been arranged to lay boards, tiles, or bricks over the cable, but this is an expensive measure. One method of effectively protecting such cables at the minimum of cost consits of cutting out a small rebate at the side of the trench, and pushing the cable into it; the usual filling-in and ramming process can then be carried on without any fear of damage to the cable, as it is effectively protected from the rammer in its little cave. It is claimed that earth does not affect C.T.S., and the claim is based on many years' experience of such cables laid in a rose garden, which, of course, is well manured land.

Some Notes on Individually-Driven Textile Machinery.

The Importance of Low Rating and High Starting Torque.

By A. HAIGH, B.Sc.

The question of "Individual electric driving of textile machinery" *versus* either electrical group driving or engine-driven mills has received a large amount of attention, and most of the advantages and disadvantages are now generally understood. The two chief advantages of individually-driven machinery are absence of cyclic variation and reduced risk of a complete "shut down." The former means a more uniform quality of material produced, and in such machines as ring spinning frames fewer breakages of yarn. These advantages are easily understood by mill owners, but in many cases the question of first cost weighs very heavily against individual driving. It cannot be disputed that in every case the first cost of individual motors is more than for group driving, and unless it can be clearly demonstrated that this additional outlay justifies itself, manufacturers cannot be expected to scrap existing systems in favour of an individual motor for each machine. The purpose of this article is to show how the initial expenditure on an individually-driven installation may be kept low, and also justify its use in low running costs and improved production. The statements made are essentially applicable to a cotton preparation and spinning mill, though they can equally be applied with small modifications to any other textile processes.

If the cost of an installation is to be kept low, the motors used must have a rated output as low as possible consistent with efficient running. This fact would at first sight appear so obvious as not to deserve any consideration, but in many installations, motors with rated outputs of anything up to 50 per cent. in excess of normal requirements are used for various reasons which will be discussed later. Textile machines, particularly ring spinning frames, require a starting effort greatly in excess of full-load torque to ensure reasonably quick and steady acceleration to full speed. This is particularly the case on Monday mornings in winter, when the frames have been standing all the week-end and the viscosity of the oil is rather high. The starting torque required is in the neighbourhood of from two to two and a half times full-load torque. To overcome this difficulty, one of two methods is usually employed, and quite often both. These are the installation of motors of a higher rating than is required for normal running, and the use of centrifugal couplings to allow the motor to run partly up to speed before taking the load from the frame. Both of these methods are costly, and they are not necessary.

The extra cost of centrifugal couplings over the standard leather disk flexible type is in the neighbourhood of £4, while the increased cost of motors of higher ratings than necessary may be anything from £5 to £10. Ring spinning frames of average length require from 4 to 5 h.p. to drive them, but the starting effort is between 10 and 12 h.p. If therefore standard motors capable of accelerating against a load of about 1½ times full load are installed, they will require to be at least 7½-h.p. machines. They will then be running for most of the time at two-thirds full load with a power factor and efficiency much below their performance on full load. If this method of overcoming the difficulties of starting is employed, not only is the initial expenditure higher than need be, but the running costs are also considerably increased. The only objection to centrifugal couplings is their cost. It must be admitted that they perform their duty quite well.

The first requirement therefore for textile motors is high starting torque. All motors up to 10 h.p. should be capable of exerting a starting torque of 2½ times full-load torque. This can be achieved without any undue sacrifice of power factor, efficiency, or speed, as will be shown later by tests on actual motors. If motors possessing this characteristic are employed, they will not require to be of a higher rated output than the average power required to drive the machine. Furthermore, flexible couplings of the type already described can be used in place of centrifugal couplings. Under these conditions the breakages of ends will not be found to be in any way excessive when starting the frames, provided the rings are always moving in a downward direction, as is usual. It must, however, be admitted that the strain on the rotor joints on starting is greatly increased, but if due precautions are taken in the mechanical design of the rotor, no trouble will be experienced. The necessity of textile motors having high starting torques cannot be over-emphasised, and sufficient attention has not been paid to this point by many motor manufacturers.

The second requirement of textile motors is low temperature rise. Enclosed ventilated machines with perforated covers over openings are not entirely satisfactory, as there is a tendency for the openings to be seriously contracted due to "fly" adhering to the perforations. There is no doubt that totally enclosed machines are preferable for this class of work, but often their increased cost prevents their use. There are, however, on the market, types of motors which, though their windings are totally enclosed, yet have a system of cooling not unlike surface condensers. This keeps down the size of the motors, and the price is not greatly in excess of that of enclosed ventilated machines. Though their first cost may be higher, the running cost is reduced, as they do not require cleaning more often than about every two years, whereas protected type machines have to be cleaned about every six months. This saving can easily amount to ten shillings per motor per year. From the point of view of upkeep charges, ball and roller bearings require far less attention than ring lubricated sleeve bearings, and for this reason alone they are preferable.

For individual motors to compete with group driving in keeping down running costs, they must have high power factors and efficiencies. The improved quality of electrical steel, and the use of ball and roller bearings, have made it possible to obtain performances which at one time would have been thought impossible. The accompanying table gives performances obtained on test

Rated output of motor B.H.P.	Full load.			Starting torque. % of full load torque.
	P.F.	Efficiency.	R.P.M.	
1·0	·85	84%	960	260%
1·5	·88	87%	970	290%
2·5	·89	89%	970	300%
4·0	·89	90%	970	270%
5·0	·89	90%	970	260%
10·0	·90	90%	975	255%

Actual performances of squirrel-cage induction motors, 3-phase, 500 volt, 50 cycles, 1,000 r.p.m. (syn.).

on a number of small induction motors. In each case they are 3-phase, 500-volt, 50-cycle, 6-pole machines. It will be noticed that these motors have an average power factor about 4 per cent. greater than most commercial machines, while their average efficiency is about 5 per cent. higher. The saving in power by their use is considerable and well worth the extra first cost entailed. The money value of increased power factor is

difficult to determine, as, if power is bought in bulk, there may or may not be a penalty and bonus clause relating to power factor. On the other hand, the power may be obtained from a generating station at the mill. It can safely be assumed that the 4 per cent. increase in power factor is equivalent to 1 per cent. gain in efficiency in most cases. The total gain by using high performance machines is then in the neighbourhood of 6 per cent. in efficiency. On 1,000 h.p. of motors, working at full load for, say, 2,200 hours per year, with energy at one penny per unit, the saving is over £60 per annum. The cost of high performance machines is about 5 per cent. greater than that of ordinary motors. Therefore if the latter cost, say, £5,000, the additional outlay for high performance machines would be £250, and would bring in a return of £60 per annum or nearly 25 per cent. The above estimate has been made out on a conservative basis, and the saving possible is probably much greater. For reasons already stated, if ordinary motors were employed, they would be working well down their characteristic curves owing to the high torque required on starting, and consequently their performances would be much worse than those taken for the above estimate. It may here be pointed out that textile motors must be designed so that their characteristic curves are as flat as possible, as the load varies somewhat between empty bobbin and full bobbin.

Finally the question of speed requires consideration. Many motor manufacturers do not realise the importance of the fact that duplicate machines should have the same full-load speed. It is practically impossible for this to be achieved within 0.75 per cent., but in many cases the variation is much greater than this. If textile machines for the same process vary considerably in speed, labour troubles have a tendency to occur, due to one machine running faster than its neighbour, particularly if "piece work" is being done.

The next item of expenditure to consider is the driving gear between the motor and the machine. It has previously been shown how the centrifugal coupling may be replaced by a cheaper flexible type. In the case of ring frames, where only one spindle speed is required, the motor can in most instances be coupled direct to the tin roller shaft by means of a flexible coupling. If, however, various spindle speeds are required due to the spinning of different classes of yarn on the same frame, direct coupling is not permissible, and some other means of driving is required. One of the cheapest methods is to mount the motor on the top of the frame end with or without a spring cradle, and drive on to the tin roller shaft by means of a leather belt and pulleys. In this way, by changing the pulleys, different speeds can be obtained. This method, while fulfilling all reasonable requirements, is not æsthetic, and cannot be compared with chain driving from an appearance point of view. The disadvantages of chain driving, however, are high first cost, high upkeep charges, and the necessity of a gear case with oil bath which is difficult to make absolutely oil tight. For this class of drive there is room for experimental work on the part of makers of leather belts, such as are used for driving the air circulating fans on motor cars. A satisfactory flexible leather belt which would transmit 5 h.p. without undue slip, and with pulley centres between 1 ft. 6 in. and 2 ft. apart, would provide a cheap method of driving machines under the above conditions. Such belts would require to have a reasonably long life, and to contain no metal fastenings which would fly off as the belt became worn, and thus be a danger to workers in the vicinity. Another type of belt that might be used is of the kind used to transmit the power from the engine to the rear wheel of a motor cycle. So far, however, neither of these types can be said to be absolutely satisfactory, chiefly owing to their short life and to the danger of parts flying off. But it should not be beyond the power of manufacturers to produce a satisfactory belt on the lines suggested. In some cases, gearing may be used to transmit power from the motor to the machine, but unless the speed reduction required is great, gears are too expensive to be used as a standard drive.

The last item of equipment deserving consideration is the switchgear. In many installations this part is far too elaborate and costly. For all motors up to 10 h.p. in reasonably large installations a straight "throw-on" switch without any trip coils or fuses meets with requirements. This does not mean that each motor should not be protected by fuses, but that the fuses should all be grouped together on distribution boards and the circuits run straight from these boards to the motor switches. The danger of taking excessive currents from the line on starting can be obviated by starting up the motors in each room one after the other. If this is done, the power supply company will usually waive their requirements as to the use of star-delta starters. The switchgear should be of the quick-make and break, air-break, ironclad type, and reasonably easy to operate. It should not be forgotten that in most cases young girls perform the duty of starting and stopping the motors, and some switches are far too heavy for such people to operate with ease. The operating handle should be mounted on the outside of the case, and not brought through the cover, so that no flash can be seen when breaking the circuit, as girls are apt to become somewhat frightened if they are able to see a flash on operating a switch. For very small motors, some money may be saved in wiring by having a fusebox for each motor located on the floor, and looping, say, four such motors on to one circuit of the main distribution board. The advantage of having the motor fuses in a separate box from the switch is that the fusebox can be fixed underneath the frame out of the way, and the switch case is kept smaller in size.

In conclusion, the whole electrical equipment should be small in size, and whenever possible incorporated inside the machine. In this way motor bedplates can often be dispensed with, as the motor can be mounted on some part of the frame. This method also economises floor space, and allows a larger number of machines to be installed on a given area, thus reducing overhead charges. When deciding on the position of a motor, due regard must be paid to accessibility, as it is false economy to have practically to dismantle a frame to release the motor in the case of a breakdown.

From the above remarks it will be seen that individually-driven machinery can be made to operate at high efficiencies, with a reasonably low initial expenditure, and if due regard is paid to the driving equipment, the additional cost entailed over group driving is more than compensated by the advantages that such a system offers.

The Future of Electricity Supply in France.—Among a series of articles now being published in a French industrial newspaper concerning the possible situation of French industries in a period of 25 years from the present time is one by M. Jean Tribot-Laspière, general secretary of the Union des Syndicats de l'Electricité, who expresses the view that by 1950 the thousands of small generating stations will have long disappeared and the wastage of coal and heavy oils will have ceased. These small stations will be replaced by large stations, some of which will have a capacity of 500,000 kW each. At present there are 110 central stations of 10,000 kW and over; this capacity will be considered very small in 25 years and the total number of works will perhaps not exceed 100. The large stations will no longer be isolated, but be interconnected by means of high-pressure lines which will ensure the regularity and security of generation. These h.p. lines will constitute a national network and will probably be operated at 220,000 V, permitting the producing companies to transmit and interchange considerable quantities of energy. It is also considered that the electrification of the rural districts will have been solved by 1950 and that 40,000 French communes will then have a supply of energy as compared with the 10,000 at the present time. Electric power will have replaced domestic servants or reduced their labours, and factories and workshops will all be electrically equipped. M. Tribot-Laspière foresees that all the railways will have followed the example of the Orleans, the Southern and the Paris, Lyons and Mediterranean railways, and have substituted electric for steam traction. Moreover, a great future is held out for electrical vehicles when garages and charging stations exist all over the country and accumulators will have been standardised and spare sets rendered available for placing on vehicles in a few minutes.

Electric Trucks for Peru.—It is reported that the Central Railway Co., of Peru, has recently ordered from England a number of electric platform trucks for use at the Desamparados station in Lima. This is the first instance of such trucks being used in Peru.

The Revolving Short-Wave Beam System.

The South Foreland Experimental Direction-giving Installation.

The probability of a great advance upon the present lighthouse system of guidance for ships at sea may be inferred from the success which the latest developments of Marconi's Wireless Telegraph Co., Ltd., have met in the experimental stages. These developments, the revolving short-wave beam wireless system, and the experimental installation which has recently been erected on the cliff at South Foreland, were successfully demonstrated on Friday last to a party of Government, shipping and Press representatives in which we participated. An eight-hours' cruise was undertaken on Senatore Marconi's yacht the *Elettra* from Dover, round the East Goodwins, to Southend. Signals were sent out by the transmitting station and picked up aboard the *Elettra* continuously throughout the cruise. Senatore G. Marconi himself welcomed the visitors, and his assistant, Mr. C. S. Franklin, conducted the demonstration.

The Marconi revolving beam is a special application of the principles of directional wireless transmission to the purposes of navigation. Signals are projected in a narrow beam of, say, 15 deg., and a different Morse signal is transmitted as the beam points successively to different selected points of the compass. The observing officer on the ship listens through the medium of a simple form of receiver and hears a series of perhaps five or more Morse letters as the beam sweeps slowly past the ship. The Morse letters which he hears tell him, by reference to a chart similar to the one illustrated in fig. 4, the direction in which the beam is pointing at that instant, and therefore the bearing corresponding to the middle letter of the series of letters heard gives him his exact bearing in relation to the transmitter. The navigator is able to take any number of bearings at short intervals, and by co-ordinating these observations with the speed and course of the vessel he may determine his exact position by ordinary methods of triangulation.

The principal features of the rotating-beam system of direction-giving are as follows:—

It is quite independent of the weather conditions. The signals are transmitted on a very short wavelength; they do not, therefore, interfere with the working of any of the commercial wireless stations in the vicinity, nor are they jammed by such stations. The signals are received by the observer on an instrument which can be set in operation by merely closing a switch, and which requires no adjustment other than turning a handle to reduce its sensitiveness should the vessel be too close to the beam transmitter. No technical knowledge or skill is required in its use. The receiver can be installed in any convenient position in the chart house, enabling the navigator to make his own observations whenever he requires them. Each signal consists of a single Morse letter sent at a speed of about 10 words per minute, therefore only a very elementary knowledge of the Morse code is necessary to interpret an observation. The freedom of the signals from any kind of interference is a great advantage in this respect. The receiving apparatus is entirely independent of any other wireless installation with which the vessel may be equipped. All the expensive and complicated part of the system is centralised in the transmitting station on land. The simplicity and consequent low cost of the receiving apparatus brings the system within reach of all classes of vessels, large and small. Even small tugs and fishing trawlers can therefore take advantage of the great assistance to navigation offered by the system.

These characteristics make the rotating-beam system of direction-giving particularly suitable for use in congested waters near points of danger to shipping and near the approaches to harbours. Its range of action is approximately the same as that of a lighthouse, but, being unaffected by conditions of visibility, it becomes an invaluable auxiliary in time of fog and storm.

The transmitting apparatus located at the South Foreland Lighthouse comprises a valve transmitter which with the necessary generating machines and auxiliaries is housed in a small hut, and a unidirectional aerial system mounted on a revolving steel framework. The energy for the transmitter and for revolving the aerial is supplied from the Dover electricity undertaking. The valve transmitter operates on a 6-metre wave, the high-pressure supply to the anode of the valve being about 280 W, and a high-frequency supply is conducted from the transmitter to the revolving aerial through insulated wires in an earthed metal conduit. The unidirectional aerial system, shown in fig. 1, comprises a number of energised aerials in a straight-line formation, together with a number of reflecting aerials arranged in a line parallel to the line of the energised aerials, the plane containing the reflecting aerials being approximately one quarter-wavelength distant from the plane containing the energised aerials. All the aerials are vertical, and are approximately one wavelength in height. Special arrangements are provided for ensuring that the currents induced in all the energised aerials are in phase with one another, and also that the phases in the top and bottom sections of these energised aerials are the same. The width of the aerial system is nearly four wavelengths, so that the plane area of this aerial system is nearly four square wavelengths.

The measured polar curve of radiation from the aerial system in the horizontal plane is shown in fig. 2, and measurements show that the energy sent out in the line of maximum radiation in the horizontal plane is between thirty and forty times that which can be obtained from a simple broadcasting aerial receiving the same amount of energy. The aerial structure is arranged to rotate continuously, and to send distinctive signals which

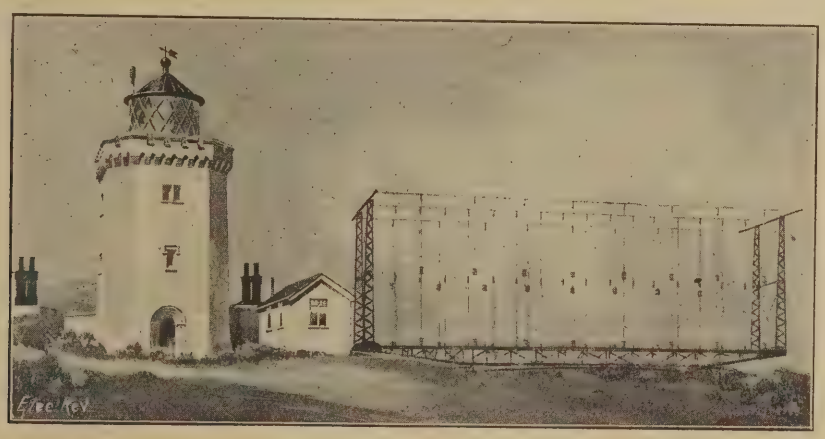


Fig. 1.—Transmitting Aerial at South Foreland Lighthouse.

Fig. 2.—Polar Curve of Radiation.

indicate the direction at which the aerial is pointed at that moment. On the chart a number of lines are set out radiating from the South Foreland, and when the aerial is pointing midway between any two of these lines, the sign marked on the chart is being sent.

The direction of maximum radiation is at right angles to the plane of the energised aerials, and in the direction away from the reflecting aerials. The transmission of the distinctive signs is arranged automatically by means of plates representing the Morse characters, mounted on a large ring carried by the revolving structure (fig. 3), which actuate a contact mechanism as the structure revolves, and so control the operation of the transmitter, thus ensuring that the signal transmitted depends upon the direction in which the aerial is pointing. The

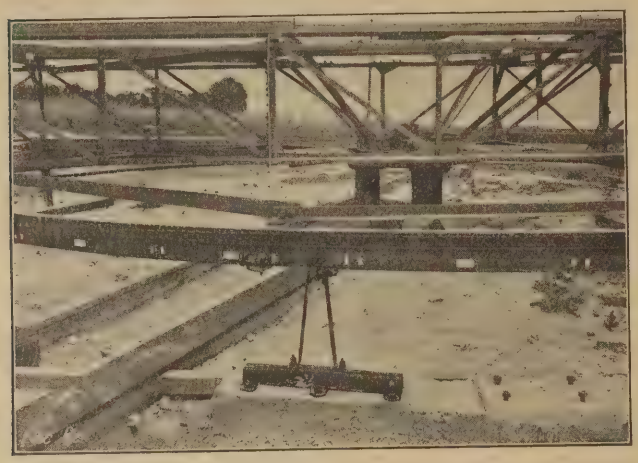

Fig. 3.—Base of Revolving Frame, showing contact mechanism.

wooden superstructure at present supporting the aerials, shown in fig. 1, is experimental, and in future practice the aerials would be supported from steel towers mounted at each end of the structure.

On the *Elettra* two receiving aerials are employed, mounted one at each end of the bridge. Connection is made to each aerial by means of a lead-covered cable, which is led into the chart house, and either can be connected to the receiver located there. This arrangement ensures against the aerial being screened too much by the ship itself for the longer ranges. The operation of determining the direction of the ship relative to the South Foreland is simple. At intervals of about two minutes three or four strong signals are heard in the receiver. By noting what these signals are, a glance at the chart, fig. 4, will at once show in which sector the ship lies. For instance, if the letters I X I T are heard, then the ship will be approximately on the line between X and I sectors (that is to say, exactly between the extreme I and T sectors.) Should the receiver be too sensitive, so that more than three or four signals are heard, the controls are adjusted to reduce the sensitiveness, and eliminate the weaker signals, leaving the stronger signals of the beam audible. The weak signals are produced by the small loops shown on the polar diagram of radiation, and are what are known in optics as "diffraction fringes." The main beam signals are always very prominent, but if the range is short the signals produced by these diffraction loops may be strong enough to blur the bearing, unless the receiver is adjusted so that they are

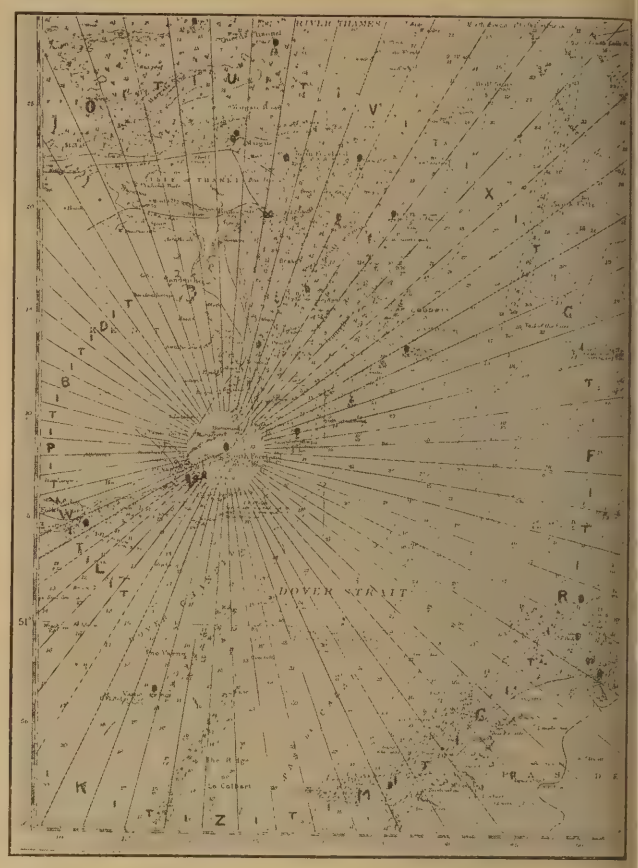

Fig. 4.—Chart of Area Covered from South Foreland.

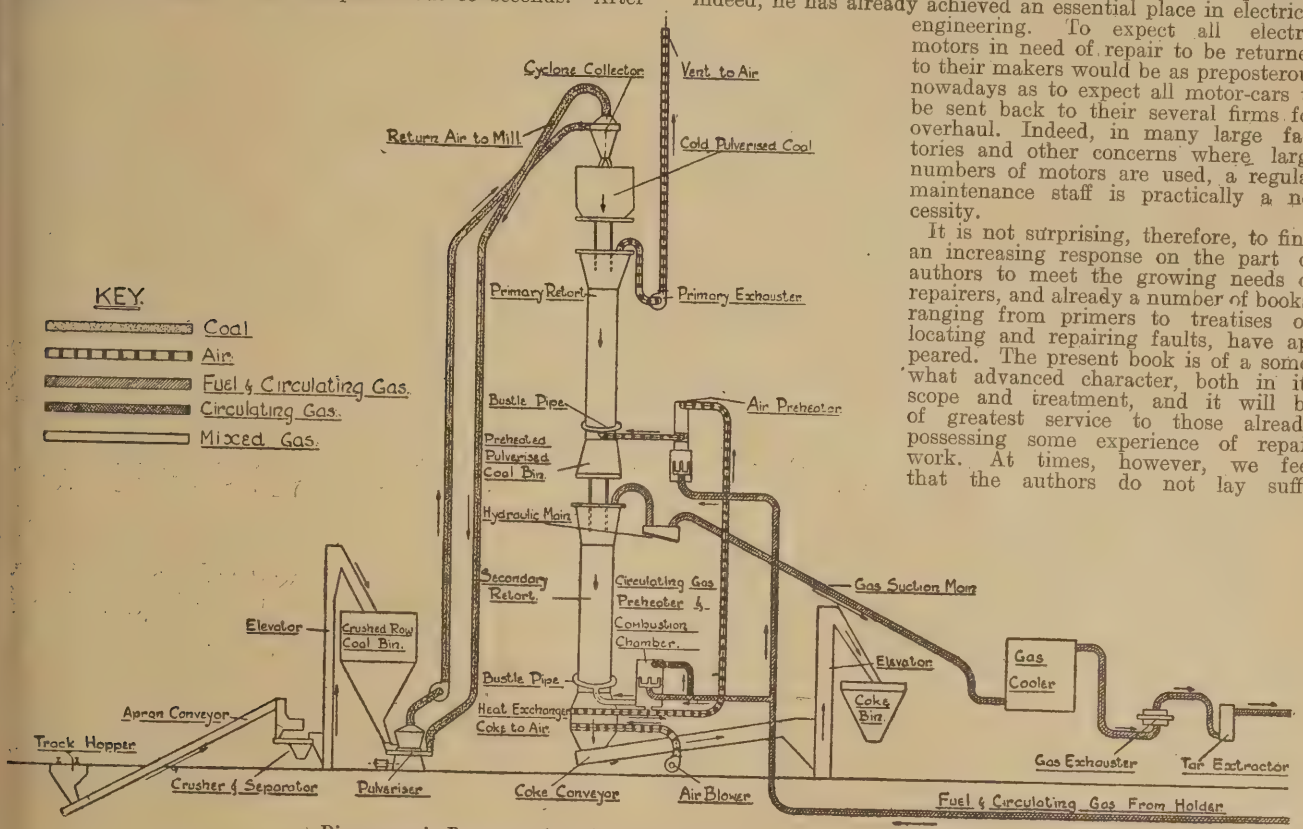
eliminated, or made very weak. The receiver now being used on the *Elettra* is not in its commercial form. This will comprise two cases: one, the receiver proper, which will be provided with a single control handle, whilst the other will contain the necessary batteries, which can be located in any convenient position.

The South Foreland installation has been tested, and has given signals to the *Elettra* up to 100 miles over sea. During the latter part of the voyage of the *Elettra* from Dover to Southend, the transmission from South Foreland to the *Elettra* took place, of course, mostly over land, affording an opportunity of noting that the effects of land, as regards both strength of signals and directional errors with these very short waves, were unimportant.

The Carbonisation of Pulverised Fuel.

The McEwen-Runge Low-Temperature Process.

WE recently drew attention to the advantages to be derived from the carbonisation of pulverised fuel by a process which at the same time strips the coal of its valuable volatile constituents and yields a solid fuel in the form of pulverised semi-coke, which is well adapted for immediate combustion in boiler furnaces. We have now received particulars of the process in question, from the inventor, Mr. S. McEwen, A.R.S.M., A.I.M.M., of which an abstract follows.



We may premise that many attempts have been, and are being, made to develop a satisfactory process for carbonising coal at low temperature and that the Fuel Research Board has not only carried on experimental investigations in its laboratories at Greenwich but has also offered facilities for testing processes devised by inventors unconnected with the Department. Hitherto, whilst one or two concerns have succeeded in placing semi-coke on the market, low-temperature carbonisation has been more or less under a cloud, except in political propaganda, where it has been utilised—on paper—with remarkable optimism. Two adverse factors have been mainly responsible for the delay in attaining commercial success—namely, the long time required to carbonise coal at low temperature, necessitating the use of retorts of small capacity; and the friability of the resulting semi-coke, which rendered it unsuitable for transportation. The new process overcomes the first difficulty by dispensing with retorts, and the other objection is removed by the increasing use of powdered coal in boiler furnaces. In fact, it is entirely due to the latter development that the carbonisation of pulverised fuel at low temperature has become commercially practicable. Obviously powdered fuel is useless for domestic purposes, and therefore the McEwen process can only be considered in connection with industrial applications.

Briefly, the McEwen-Runge process consists in the pulverisation of the coal and its elevation to the top of a tower, down which it falls in the form of a cloud, passing through a counter-current of hot inert gases. The enormous extent of surface presented to the hot gases by the powdered fuel ensures a rapid interchange of heat, so that carbonisation is effected by the time the fuel reaches the bottom of the tower. The process is extremely simple, and is continuous, the finely

divided semi-coke being withdrawn from the foot of the tower and delivered to the furnaces, whilst the gases carrying the volatile constituents of the coal pass away at the top to treatment plant of the usual description.

It is stated that the process may be operated in a variety of ways, to produce either a very rich gas or a low-grade gas, according to local requirements. It may be either a single-stage or a two-stage process; the latter has the higher thermal efficiency, and is better suited to a wide range of fuels. In the first stage moisture, CO_2, and gases of no heating value are eliminated, and in the second stage a higher temperature is employed, carbonising the fuel. The heat required for the first stage is extracted from the carbonised fuel semi-coke by a heat exchanger, thus recuperating the sensible heat of the semi-coke and securing a very high thermal efficiency.

The two stages are carried out in steel towers lined with refractory material, one above the other, about 30 feet in height and 6 feet in diameter. For the preheating stage air is used, heated by the semi-coke (without contact with it), and passing off into the atmosphere at a temperature of 500 deg. F. In the second stage the temperature of the gas at admission is about 1,500 deg. F., and it leaves the top of the tower at about 600 deg. F.; this gas can be heated by the combustion of about one-third of the gas that is manufactured. The treatment of the powder in each tower occupies about 35 seconds. After

Diagrammatic Representation of the McEwen-Runge Coal Carbonisation Plant.

treatment in the first stage the powder passes into a hopper, whence it is conveyed to the second tower; the whole process occupies about 6 minutes, and the through-put per day is stated to be 210 tons per unit of plant. The accompanying illustration shows diagrammatically the arrangement of the plant, omitting the gas-holder. The carbonising current of heated gases may consist of preheated permanent gas, or products of combustion either introduced into the tower or generated within it by the admission of a suitable quantity of hot air.

It is claimed that the powdered semi-coke is superior to pulverised coal for burning in furnaces, being less dense and presenting a greatly increased surface per unit of weight, so that combustion is very rapid. It can be transported to the consumer in tank cars, and may be treated as a fluid, being pumped through pipes, &c., like oil fuel. As it is dry, the cost of carriage per ton of combustible is less than that of coal, which always contains moisture, and the calorific value of the semi-coke is higher per pound than that of coal. A much greater quantity of tar is produced per ton of coal carbonised at low temperature than in the case of high temperature carbonisation, and from it can be obtained a variety of light and heavy oils and other products. The gas obtained is also of greater heating value than that produced at high temperatures—approximately 750 B.th.u. per cubic foot—and contains benzene. The particles of semi-coke neither agglomerate nor adhere to the sides of the towers; the powder does not cake when stored, nor is it liable to spontaneous combustion.

The process is being developed by International Combustion, Ltd.

Electric Launches for Italian Postal Service.—The Italian postal authorities are now using a number of electric launches fitted with Tudor batteries in connection with the postal service in Venice.

Reviews.

Connecting and Testing Direct-current Machines. By F. A. ANNETT, M.A.I.E.E., and A. C. ROE. Pp. x+237; figs. 172. London: McGraw-Hill Publishing Co., Ltd. Price 12s. 6d. net.

In informing the reader that most of the material in this book has already appeared in *Power*, the interesting revelation is made that the articles on "Locating Faults in Direct-current Armatures" appeared under the name of B.A. Briggs, who in real life is F. A. Annett, assistant editor of *Power*. The experience of the second author, Mr. Roe, would seem to qualify him as an author on repairing and testing electric machines.

The contents of the book are fairly well described in the preface, namely, reconnecting direct-current machines for a change in voltage, speed, or both; and locating and remedying faults in direct-current machines. Considering the great and increasing number of electrical machines in all countries, there is no need to emphasise the importance of the repairer—indeed, he has already achieved an essential place in electrical engineering. To expect all electric motors in need of repair to be returned to their makers would be as preposterous nowadays as to expect all motor-cars to be sent back to their several firms for overhaul. Indeed, in many large factories and other concerns where large numbers of motors are used, a regular maintenance staff is practically a necessity.

It is not surprising, therefore, to find an increasing response on the part of authors to meet the growing needs of repairers, and already a number of books, ranging from primers to treatises on locating and repairing faults, have appeared. The present book is of a somewhat advanced character, both in its scope and treatment, and it will be of greatest service to those already possessing some experience of repair work. At times, however, we feel that the authors do not lay sufficient stress on the difference between temporary makeshifts and sound repair. For example, when changing from lap to wave winding, the reader is told that "the extra bar may be eliminated by connecting two together and using them as a single bar." This is not good practice. Also it should be emphasised that cutting out armature coils is a temporary expedient. There are other points which do not rouse our admiration. "Changing coil pitch" is introduced thus: "In many cases when an armature is being rewound the coils are made up, and when they are being put into the slots it is discovered that in some manner they have been made shorter than those in the old winding. . . ." This strange indictment of repairers is followed by a technical discussion on fractional-pitch windings. Further, we do not see what good is served by illustrating and describing a winding having alternate two- and three-turn coils. More space might be devoted to methods of overcoming difficulties in accommodating other sizes of wire—for example, the use of small wires in parallel might be mentioned.

Also in the second part of the book some of the methods described savour of the makeshift. The various methods of locating faults in armatures and in field windings are dealt with in detail, and the information in these chapters is some of the best in the book.

Elements of Electrical Engineering. By ARTHUR L. COOK. Pp. viii+568; figs. 365. London: Chapman & Hall, Ltd. Price 20s. net.

This is an American text-book comprising four main divisions, covering respectively: direct current and magnetic circuits, direct current machinery, alternating currents, and alternating current machinery. In the first part we notice that the subject of direct current and resistance measurements which usually finds a prominent place in elementary d.c. theory, is

hardly touched upon, whilst the short chapter on electrostatics and condensers is somewhat meagre. The second part is more satisfactory, the treatment of direct current generators and motors being very clear and thorough. Short chapters on primary and secondary batteries, and d.c. transmission and distribution, are included in this section. In the third part the author has endeavoured to develop the elementary theory of a.c. circuits for the non-mathematical student, and considerable care has been devoted to a very complete consideration of polyphase circuits. The fourth part deals in considerable detail with transformers, alternators, a.c. motors of the induction and synchronous types, and rotary converters. The treatment is elementary, but thorough. The chapters on single-phase motors, a.c. rectifiers, and switchgear and protective devices are more superficial. The concluding chapter deals briefly with lighting and illumination. The chapter on the application of a.c. and d.c. motors is a very good one, and recapitulates the characteristics of these machines with reference to varied industrial requirements in a very practical fashion. In neither of the two parts dealing with a.c. working are there any but passing references to alternating current instruments or measurements. We note a slip on p. 423, where the constant 2.22 in the formula for the voltage of an alternator is said to be the form factor of a sine wave.

The impression received from a perusal of this book is that the author has been somewhat too eager to follow the prevailing American fashion of avoiding mathematics in elementary text books, and that the solidity of the foundational work has been considerably impaired. Fundamental theorems and formulas are given without, in many cases, any attempt to give an elementary proof. Whilst it is quite possible for students to acquire a sound knowledge of elementary a.c. theory without a knowledge of the methods of the calculus, we question whether any real progress will be made with the paucity of mathematical knowledge assumed by the author of this book. In the third section it would appear, therefore, that a detailed consideration of the properties of the sine function would have been of more real use to the average student than some of the rather superficial descriptive matter which is found in other parts of the book.

A large number of examples are given at the end of each chapter, the answers to which are not found in the book. The diagrams and the get-up of the book are both excellent.

Practical Handbook on Electroplating. Pp. xiv+269; illustrated. Ninth Edition. Birmingham: W. Canning & Co., Ltd. Price 4s. 6d. post free.

As stated in the introduction, the aim of this handbook is to "present in the simplest and most direct language the actual detailed operations, in such a way that the employer or foreman may gauge the materials to be employed, and the operator may intelligently grasp the essential details of the work." It is a compliment to Messrs. Canning that their book should run into nine editions, the first having appeared in 1889. The present edition has been entirely rewritten.

The book is divided into four sections, dealing respectively with grinding and polishing; cleansing and dipping; electroplating; and bronzing, lacquering and enamelling. Considerable attention is given to nickel plating, as it is of great commercial importance as well as a typical plating operation. The electrodeposition of other metals is also dealt with, *viz.*, cobalt, copper, brass, silver, gold, tin, zinc, lead, cadmium, chromium, and platinum. Several tables are given at the end of the volume, tabulating the current densities of the metals, voltage required for still plating, and the copper deposited from solutions at given current densities, together with comparisons of thermometric and hydrometric scales.

The volume contains a fair amount of propaganda work for the products of Messrs. Canning, which are kept well to the fore throughout the publication.

Practical D.C. Armature Winding. By L. Wollison. Pp. xii+228; figs. 152. London: Sir Isaac Pitman and Sons, Ltd. Price 7s. 6d. net.

This book is written from the practical winder's point of view, and is intended to provide in a small space all the information that is really necessary to the practical man. Some of the information comes within the scope of the designer and the draughtsman, and is usually given to the winder in the form of instructions, but we agree that the more thoroughly the winder understands his work, the better job he will make of it.

The author is the foreman of the winding departments of Messrs. Bruce Peebles, and also a lecturer in armature winding at the Leith Technical College. His practical experience is obvious throughout the book. The following extracts will make this clear. "In every instance, experience, commonsense, and continuous care are essential to the production of reliable winding. . . . Probably in armature winding, more than in any other trade, good workmanship at all stages is of the greatest importance. . . . The life and successful working of an electrical machine, and, incidentally, the reputation of its producer, may therefore depend in large measure on the careful workmanship of the armature winder. . . . 'Prevention is better than cure.'"

The first part of the book deals with the theoretical aspect, explaining how to arrive at the winding-spans, &c. The author's lecturing experience has enabled him to make his explanations very clear, but we wish to criticise some of the terms and symbols. For example, a single coil is called a "unit," which appears to be a very good name. A number of units grouped together to occupy a slot is, however, called a "coil." This name does not seem a happy choice, because it is not a coil, but a group of coils. Again, the number of slots spanned by a coil is called the "core-pitch." This term does not convey its meaning at first sight, and we suggest that "slot-span" might be better. Generally speaking, the word "pitch" could be replaced with advantage by "span," but in this the author only follows the usual practice of other writers. With regard to the symbols, R is used both for the number of equalising rings and for the degree of re-entrancy, while M denotes the number of pairs of paths, instead of the recognised *a*. Apart from these criticisms of minor details, the explanations are very clear, especially those of multiplex windings.

The second part deals with modern practice. It is, of course, impossible to deal with all the various methods which are in common use, but the author describes typical methods and points out concisely what is required to make a good job. Testing is gone into very thoroughly, it being recognised how important it is that a winding should not break down after it has been put into service. All the various faults which can occur are pointed out and the methods by which they can be detected are explained.

The diagrams are very clear, but it would have been an advantage to add a title to each one. The book will certainly be of use to the student as well as to the practical winder.

The Story of Electricity. By W. F. F. Shearcroft, B.Sc., Hons., Lond., A.I.C. Pp. 73; figs. 3. London: Ernest Benn, Ltd. Price 2s. 6d. net.

Although the title of this little book is probably not altogether suggestive of the contents, the work is certainly a story, fascinating, and well written in non-technical language which renders it readable by any intelligent person. It contains a survey of the theories of electricity which have been advanced from the time of Thales' observation of the peculiar property of amber up to the present day when our modern scientists are occupied with applications of the quantum theory, &c. The concluding chapters, in dealing with the construction of the electrons and protons, draw a picture which will give a clear idea of the fundamentals of matter and its close relationship to electricity to the person of non-technical mind. Its reading will not be a waste of time to any who pick up this little volume.

Relativity: A Very Elementary Exposition. By Sir Oliver Lodge, F.R.S. Pp. 41. London: Methuen & Co., Ltd. Price 1s. net.

This is a lecture delivered to the Literary and Philosophical Society of Liverpool in 1921, and it is well worth reading by those who have neglected to acquire a nodding acquaintance with the subject. There are three reasons why it is worth their while. First, because Prof. Lodge has a happy gift for exposition which makes the book a pleasure to read; secondly, because it is short and, as the sub-title most truthfully declares, easy to understand; thirdly, because it is well that those who have neglected to acquire even a slight acquaintance with the subject should avail themselves of a good opportunity for doing so. This last reason will be made the more manifest by a perusal of the book, for therein it will be seen with what reluctance the world of science allowed itself to be convinced of the importance of this subject.

At first sight the theory of relativity appears to any practical man mystical and visionary. His natural inclination is to dismiss it from his mind as void of all practical significance. This attitude was shared by almost all the lights of science up to the beginning of this century. It was only by sheer force of cumulative evidence that a change in that attitude was brought about. In the little book before us it can be seen how the weight of that evidence grew and began to tell, until now the whole field of physical science is embraced in it, and the veil of metaphysics seems to settle over all.

Thus the book closes with a quotation from Eddington: "We have found a strange footprint on the shores of the unknown. We have devised profound theories to account for its origin. At length we have constructed the creature that made the footprint, and lo! the footprint is our own."

Fifty years ago one who picked up a little book which ended with a paragraph like that would suppose he had got hold of a religious tract of some kind.

New American Plant in Service.—According to *Power*, the Bureau of Power and Light of Los Angeles placed the first 4,000-h.p. unit of its Big Pine power plant in operation on July 31st. Work on the installation was speeded up in order to be able to furnish an emergency service to a number of mines and industrial plants in the Owens Valley region, which were temporarily without power because of damage done to the feeder lines of the Southern Sierras Power Co. during a violent electric storm and cloudburst. Power from the Big Pine plant is to be used in pumping water from approximately 300 wells in Owens Valley into the aqueduct for the water department of the city of Los Angeles.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Cycle and Motor Cycle Show.—This show, which is to be held at Olympia, will be opened by Mr. L. C. M. S. Amery, P.C., M.P., Secretary of State for Dominion Affairs and the Colonies, on September 21st.

The Coal Inquiry.—The Royal Commission appointed to inquire into the coal industry is composed as follows:—Sir Herbert L. Samuel, G.B.E. (chairman), Sir William H. Beveridge, K.C.B., General Sir H. A. Lawrence, K.C.B., and Mr. Kenneth Lee. The following expert advisers have been appointed to assist the Commission:—The Rt. Hon. William Brace, Chief Labour Adviser to the Mines Department; Dr. Walcot Gibson, F.R.S., formerly an assistant to the Director of the Geological Survey of Great Britain; Major H. M. Hudspeth, D.S.O., Divisional Inspector of Mines; and Dr. C. H. Lander, Director of the Fuel Research Department of the Department of Scientific and Industrial Research. Mr. C. S. Hurst, O.B.E., of the Mines Department, will act as secretary. The terms of reference to the Commission are: "To inquire into and report upon the economic position of the coal industry and the conditions affecting it, and to make any recommendations for the improvement thereof."

A London Company's Hiring Scheme.—The WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD., has sent us a copy of a booklet which it is issuing to its consumers. This contains illustrations and particulars of charges and running costs of the appliances which can be hired from the company. Included in the list are cookers, fires, boiling rings, irons, &c. The cooking and heating rate is reasonable, as are the hiring charges, although we think that the payment of the latter in advance may act as a deterrent to many potential users.

Lighting Propaganda.—Preparations are now being made for the coming winter—another lighting season—and the lamp manufacturers have produced attractive schemes for the education and enlightenment of the public. The BRITISH THOMSON-HOUSTON CO., LTD., has sent us a selection of the pamphlets, &c., which it is issuing to contractors and others. A special window display employing and advertising "Mazda" lamps is offered and the price lists and other publications have been produced in an attractive style.

We have also received similar matter from the GENERAL ELECTRIC CO., LTD., but in this case the whole of the details of the company's campaign to popularise "Osram" lamps are contained in a large brochure which is copiously illustrated. Advice is given on window dressing and interior displays, the training of salesmen, postal and newspaper advertising, &c. The "Osram Baby" appears in a new design.

Another leading company which has also produced a special scheme is the SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD. The matter sent us includes a number of illustrated pamphlets and other publications, and the "Siemens Wizard Electric" game. A special feature is a design which is being used on posters and showcards—a nude figure silhouetted against the light from a "Siemens" lamp. The company's scheme also includes extensive newspaper and hoarding advertising.

Electric Lamp Trade Competition in South Africa.—In commenting upon the increased competition from foreign electric lamps in South Africa, the *British and South African Export Gazette* states that the Johannesburg Corporation Finance Committee, after examining certain tenders, reported that the lowest-priced lamps offered were of Continental manufacture, but that the Corporation had had practically no experience of that particular make. It was added that lamps which were of perfectly good appearance did not always prove suitable for street-lighting purposes, but might burn out in a short time, and though low in price, prove exceedingly expensive in use. Our contemporary urges British manufacturers to make greater efforts to keep the merits of British lamps constantly before municipal buyers, and adds:—"Additional propaganda work here, and also among the importing houses and their shipping connections in the United Kingdom, will go a long way towards restoring the British share of the trade to its former greatness, and will also ensure participation by the United Kingdom in the certain future expansion of the business."

New Municipal Showrooms.—The Salford Corporation proposes to purchase the premises of Messrs. W. H. Sutton and Sons, in Chapel Street and Bexley Square, for the purpose of showrooms for electrical appliances.

Lead.—Reporting on September 5th, Messrs. James Forster & Co. stated:—"Consumption is still very big, particularly in the electrical trades, but it must be remembered that the extensive buying by cable makers recently will probably mean that they will be out of the market for some weeks, and in order to prevent prices sagging further, other buying must take its place. Meanwhile, there is an acute shortage of early lead, particularly of good brands, owing to the shipping strike in Australia. This should be only temporary, however, as the lead which is being delayed will come forward in larger quantities later on. The outlook is rather obscure, and we think calls for a certain amount of caution on the part of consumers."

Hackney Publicity.—In preparation for the opening of its new showrooms and offices, which were described in our issue of June 13th, 1924 (p. 952), the Hackney Electricity Department is issuing a poster produced in conjunction with the British Electrical Development Association. This depicts a very imposing edifice of rather severe outlines bearing the Hackney coat of arms above the entrance. The building promises to be a veritable "Temple of electricity."

D.O.T. Advisory Committee Appointments.—The Parliamentary Secretary to the Department of Overseas Trade has recently appointed a number of additional members to his Advisory Committee, among whom are Col. F. V. Willey, C.M.G., president of the F.B.I., Sir Arthur Balfour, K.B.E., Sir William Larke, K.B.E., Sir Charles Mandleberg, Mr. J. T. Brownlie, Mr. P. J. Pybus, C.B.E., and Sir Max Muspratt, Bart.

Correction.—In the advertisement of HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD., appearing in our last issue (Supplement p. 2) an error occurred in the preparation of the copy. The third paragraph on the right-hand side referring to "Over Potential Test" should read as follows: "The overpotential test consists of the application—across the winding of twice the rated pressure for a period of 15 minutes. (The B.E.S.A. specification calls for a period of one minute only.)"

Annual Sports.—The annual sports of the staff and employés of the Metropolitan-Vickers Electrical Co., Ltd., were held at the Belle Vue Grounds, Manchester, recently. There was a large and enthusiastic attendance. The accompanying picture shows Mrs. J. C. Whitmoyer presenting prizes to the successful competitors. Supporting her (from left to right)

Metro-Vic. Sports at Manchester.

are Mr. Baxendale, hon. secretary of the Sports Committee, Mr. Fraser, superintendent of the Large Machine Department, Mr. Walmsley, superintendent of labour, Mrs. G. E. Bailey, Mr. G. E. Bailey, and Mr. A. E. du Pasquier, manager of the Publicity Department.

A Works Dental Clinic.—As an addition to the arrangements made by the CHLORIDE ELECTRICAL STORAGE CO., LTD., for the welfare of its employés, a dental clinic was recently opened at the Clifton Junction works. The clinic consists of a dental surgery, a rest room, and a waiting room, and is in charge of a fully-qualified dental surgeon assisted by an experienced nurse.

For Sale.—Carlisle Corporation electricity department has for disposal surplus transformers, h.p. fuses, isolating switches, &c. (See our advertisement pages to-day.)

Trade Announcements.—MESSRS. RADIO INSTRUMENTS, LTD., are appointing Mr. H. Patrick, 246a, Corporation Street, Birmingham, as their representative for Birmingham and the Midland Counties, and he will hold stocks at the above address. He will continue to act as agent for Messrs. H. Hunt.

MESSRS. ALLEN-LIVERSIDGE, LTD., have taken over the sole selling agency for Great Britain and Ireland of the electric welding products of Messrs. Buckley, Saunders & Co., Ltd., including "Pontelec" welders and rivet heaters.

New premises have been opened by Messrs. HILL, UPTON AND CO., electrical engineers, at "Radiant House," George Street, Oxford.

MR. H. FEATHERSTONE, electrical and radio engineer, of Tunbridge Wells, has opened a branch business in High Street, Wadhurst, Sussex.

THE AMPLION CORPORATION OF CANADA, LTD., 130, Richmond Street West, Toronto, Ontario, has been formed to import, assemble, and/or manufacture, and sell the products of Messrs. Alfred Graham & Co. in Canada. Hitherto Amplion business was administered, as general agents, by Messrs. Burndept of Canada, Ltd., who will continue, for the time being, to act as wholesale distributors for the Amplion Corporation. Messrs. Graham have also just opened a new Amplion showroom and depôt at 101, St. Vincent Street, Glasgow.

THE STEARN ELECTRIC CO., LTD., has opened a branch at 15, Park Row, Nottingham, under the management of Mr. M. Thorburn.

Catalogues and Lists.—MESSRS. L. ANDREW & Co., 2, Whitworth Street West, Deansgate, Manchester.—Wholesale price list of india-rubber gloves and gauntlets.

MESSRS. HANS RENOLD, LTD., Burnage Works, Didsbury.—An illustrated catalogue of driving chains of various patterns. Priced.

SUPERLAMP, LTD., 92-94, Paul Street, Great Eastern Street, E.C.2.—Two net trade price lists dealing respectively with electrical material and radio apparatus.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38 and 39, Upper Thames Street, E.C.4.—September price list of electrical appliances and materials. Also an illustrated folder giving prices of "Siemens" electric lamps, and List No. 8, giving illustrated and priced details of "Siemens" spotlight projectors.

THE CRESSALL MANUFACTURING CO., 40-41, Staniforth Street, Birmingham.—Leaflet No. 20, illustrating and describing "Cressall" steel-jacket unit heaters.

MESSRS. E. BROOK, LTD., Empress Works, Huddersfield.—Booklet No. 123, dealing with the firm's single-phase, high-torque squirrel-cage motors.

THE WHITWORTH ELECTRIC LAMP CO., LTD., 195, North End Road, West Kensington, W.14.—September price list of electrical materials and appliances.

MESSRS. FERRANTI, LTD., Hollinwood, Lancs.—Pamphlet Ta 154/1, illustrating and describing some large transformers built by the company.

"MANDA" MOTORS, LTD., 53-54, Royal Mint Street, E.1.—A trade list of electric fans, fractional-h.p. motors, &c.

MESSRS. GENT & CO., LTD., Faraday Works, Leicester.—Book 5, Section 1, illustrating and describing the "Pul-syn-etic" system of electric impulse clocks and time-keeping apparatus. Priced.

MESSRS. STURGE & BAKER, LTD., Premier Works, Sheepcote Street, Birmingham.—An illustrated and priced leaflet dealing with flex-winders for portable electric lamps.

HIGGS MOTORS, Witton, Birmingham.—September stock list of a.c. motors and d.c. dynamos and motors.

MESSRS. E. P. ALLAM & CO., 107-109, Gray's Inn Road, W.C.1.—September stock list of d.c. motors for sale or hire.

THE PYRENE CO., LTD., 9, Grosvenor Gardens, S.W.1.—A pamphlet advertising "Pyrene" fire extinguishers.

MESSRS. BELLING & CO., Bridge Works, Southbury Road, Enfield.—A well-illustrated and priced catalogue of electrical appliances, including fires, water-heating apparatus, cookers, irons, &c.

TOK SWITCHES, LTD., Granville House, Arundel Street, W.C.2.—A blotter bearing a calendar for September and an illustration of a double-pole "Barrier" switch.

THE MILLNS ELECTRICAL CO., 17, Whitefriars Street, E.C.4.—Leaflet FV5501, advertising "Meco" electric forge blowers.

TUNGSTALITE, LTD., 47, Farringdon Road, E.C.1.—A net trade price list of electrical materials and appliances; and a retail price list of "Tungstalite" lamps.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—An illustrated and priced leaflet describing an anti-microphonic valve holder.

CONTRACTORS' SUPPLIES CO., 5, Finsbury Square, E.C.2.—A price list of electrical accessories, including tumbler switches, switch-plugs, lampholders, fuse-boards, &c.

THE BORDESLEY ELECTRICAL ACCESSORIES CO., LTD., 162, High Street, Bordesley, Birmingham.—A well-illustrated and priced catalogue of electrical and radio accessories.

THE ARORA CO., Rosebery Road, Loughborough.—A booklet containing illustrations, details, and prices of electric fires, including some new designs.

Bankruptcy Proceedings.—F. J. TIZZARD and N. TIZZARD (Tizzard Bros.), electrical engineers and contractors, 27, Dalkeith Street, Barrow-in-Furness, and 121, Market Street, Dalton-in-Furness.—First meeting, September 12th, at the Official Receiver's office, 16, Cornwallis Street, Barrow-in-Furness. Public examination, September 25th at the Magistrates' Court, Barrow-in-Furness.

W. H. MURAD (W. H. Murad & Co.), wireless manufacturer, 126, Princess Street, Manchester.—First and final dividend of 1s. 3½d. in the £, payable September 14th, at the Official Receiver's offices, Byrom Street, Manchester.

A. J. BARLOW (Barlow Bros.), 9, Brunswick Place, City Road, E.C.—Trustee, Mr. A. Willmott, 14, Old Jewry Chambers, E.C., released June 4th.

W. A. BEAUMONT, electrical engineer, 44, Warrengate, Wakefield.—Trustee, Mr. B. S. Briggs, Official Receiver, 21, King Street, Wakefield, released July 20th.

R. SHEARD (R. Sheard & Co.), 2, Market Street, and 86, Station Lane, Featherstone, Yorks.—Trustee, Mr. B. S. Briggs, Official Receiver, 21, King Street, Wakefield, released July 20th.

J. B. SHIELDS, plumber and electrician, 221 and 198a, Linthorpe Road, Middlesborough.—Last day for proofs for dividend, September 15th. Trustee, Mr. C. P. Barrowcliff, 55-57, Albert Road, Middlesborough.

G. W. HUMPHREY (Humphrey Electrical Co.), electrical engineer, 24, Broad Quay, Bristol.—Supplemental dividend of 2½d. in the £, payable at the Official Receiver's office, 26, Baldwin Street, Bristol.

J. H. HOPKINS (Electrical Maintenance Co.), 140, Wardour Street, W.C.—Trustee, Mr. M. Hyams, 60, Chancery Lane, W.C., released August 19th.

H. J. W. EMBURY and K. S. EMBURY (H. & K. Embury), electrical and mechanical engineers, 110 and 29, Queen Street, Newton Abbot.—Trustee, Mr. A. L. Honey, 23, Catherine Street, Exeter, released August 7th.

T. BARTON, electrical engineer, Electric Works, Ainsworth Street, Blackburn.—Trustee, Mr. A. T. Eaves, 47, Mosley Street, Manchester, appointed September 2nd.

Company Liquidations.—ARROTA ELECTRICAL & MOTOR ACCESSORIES CO., LTD.—Winding up voluntarily. Liquidator, Mr. J. E. Cross, Fish Dock Road, Grimsby. A meeting of creditors was held on September 3rd. Particulars of claims to the liquidator by October 3rd.

ALKLUM ELECTRICS, LTD., Waterside Works, Waterside, Halifax.—The first meeting of creditors was held on September 2nd at the County Court House, Halifax. The statement of affairs showed liabilities of £75, and there were no assets. The issued share capital of the company was £1,000, so that there was a deficiency as regarded the contributories of £1,075. The company was incorporated on February 3rd, 1921, to carry on the business of general electrical engineers. It appeared, however, to have had no real trading existence owing, it was stated, to certain negotiations with a view to the introduction of capital by another firm having fallen through at the outset. As the company had, however, actually been floated, it was decided to experiment in and advertise accumulators only, with the object of creating a goodwill. It was alleged that the company did not manufacture accumulators, but that all orders received for the supply of accumulators were passed on to another company for execution, apparently without consideration. All the capital had been allotted as fully paid for cash. It was alleged that the company discharged all its liabilities, and when the £1,000 capital was exhausted early in 1924, it ceased operations, although the same advertisements were continued later, but to the order of the other company. On December 18th, 1924, the company was sued for £36 for advertisements and on March 31st, 1925, judgment was given for the plaintiffs for £36 and £38 14s. 7d. costs. The action was defended on the ground that instructions had been given to stop the advertisement. The failure of the company was attributed to efforts to obtain further capital being unsuccessful and also to the County Court judgment mentioned. The creditors resolved to appoint Mr. Theo Wm. Meldrum, C.A., of 73, Basinghall Street, E.C., as liquidator of the company.

WIRELESS EQUIPMENT, LTD.—A meeting of members is called for September 30th at Messrs. Corfield & Cripwell's offices, Balfour House, Finsbury Pavement, E.C., to hear an account of the winding up from the liquidator, Mr. W. A. J. Osborne.

Social Event.—On August 29th, the employés of Messrs. Robson & Coleman, Newcastle-upon-Tyne, and their friends spent a most enjoyable day at Ponteland. A party of about 100 accepted the invitation of the principal of the firm, Mr. R. E. Robson, to celebrate in this way the marriage of his daughter. Among the events of the day were sports and games, the prizes for which were provided by Mr. and Mrs. Robson, and presented by Mrs. Lowney.

Belgian Manufacturing Development. — A Belgian concern, Lorenz & Cie., has lately acquired a large area of land at Eupen on which to establish works for the manufacture of small electrical accessories of porcelain and copper, for which, it is stated, Belgium is still mainly dependent on imported supplies—articles coming chiefly from Germany.

Proposed Australian Tariff Changes.—Mr. H. E. Pratten, Commonwealth Minister for Trade and Customs, introducing the new Tariff Bill in the House of Representatives on September 2nd, said that there was no question that the action of Australia in giving preference to Great Britain ultimately led the Mother Country to grant a preference on some Australian products. The value of the imports last year, which would be affected by the proposed tariff increases, exceeded £30,000,000, while the value of those which would be affected by the proposed tariff reductions was £10,000,000. The 275 items and sub-items hitherto admitted free from the United Kingdom would now be increased to 311 and the ratio of British preference would be maintained or increased under the present proposals. The principal increases in the British, intermediate, and general tariffs respectively would be as follows: Machinery, including locomotives, mining machinery, and dynamos of over 75 kW, 12½, 15, and 15 per cent. respectively; other machinery, and dynamos of up to 75 kW, 17½, 20, and 20 respectively; iron and steel plate and galvanised sheets, unchanged, 27s. 6d. and 30s. per ton respectively; X-ray transformer apparatus, at present free, 10 and 20 per cent. respectively, would now be 27½, 35 and 40 respectively. Mr. Pratten said the proposals were expected to result in a considerable increase of employment throughout the Commonwealth. The value of the present wide preference to British goods was increased by over half a million. The Government was showing in a practical manner its appreciation of the Imperial Government's action in extending a further preference to Australian products. In a few cases the preference to Great Britain was abolished because the trade in these particular items was negligible. The proposals would also further stimulate *bonâ-fide* British industry.—*Reuter* (Melbourne).

German Tariff Modifications.—The following German tariff modifications are included in a list published by the *Board of Trade Journal*: "Blocks, sheets and rods for electrotechnical purposes, merely roughly stamped, graphited or not," 75 Reichsmarks per 100 kg. "Electrodes: Not graphited, weighing each 3 kg. or more, 7 Rm. per 100 kg.; graphited, weighing each 3 kg. or more, 175 Rm. per 100 kg." "Vulcanised fibre slabs, 3 mm. or less thick," 20 Rm. per 100 kg.

Book Notices.—"The Pirelli-General Cable Book" (291 pp., illustrated). Southampton: Pirelli General Cable Works, Ltd.—This handsomely produced volume is a mine of information relating to the construction and working of cables—particularly those with paper insulation. An introductory portion contains a description of the company's works at Southampton—a subject with which we deal elsewhere in this issue—and then the various processes in the manufacture of the cables are mentioned. Particulars are given of important contracts which the company and its parent company Pirelli & Co. (Milan) have carried out. The bulk of the publication is devoted to practical information concerning the testing and installation of the cables. Protective systems are described and a great mass of tables and statistics are included. Separate sections contain details of telephone cables, vulcanised bitumen and vulcanised rubber cables, as well as instrument and machine-coil wires. The book is profusely illustrated with views of the works, installations, joint boxes, &c. There is also a good deal of general data upon metals and dielectrics.

"The *Journal* of the South African Institution of Engineers." Vol. XXIV, No. 1, August, 1925. The Institution. Price, 2s.

"Alternating Current Problems," by R. E. Brown. Pp. viii + 84; figs. 16. London: Chapman & Hall. Price 6s. net.

"Circular No. 271 of the United States Bureau of Standards," "Master Specification for Rubber Gloves for Electrical Workers." Pp. 7. Washington: Government Printing Office. Price 5 cents.

"*Proceedings* of the Rugby Engineering Society, Session 1923-24." Vol. XVIII. Published by the Society. Price 10s. 6d.

"The *Transactions* of the South African Institute of Electrical Engineers." Vol. XVI, Part 6, July, 1925. The Institute. Price 2s.

"Science Abstracts" (A and B). Vol. XXVIII. Part 8. August 25th, 1925. London: E. & F. N. Spon, Ltd. Price 3s. each net.

"Electrical Engineers' Data Books." Vol. I. "Lighting, Traction, and Power Distribution," by E. B. Wedmore and D. V. Onslow. Pp. xxi+825; figs. 203. Vol. II, "Manufacture, Design, and Laboratory Work," by E. B. Wedmore and D. V. Onslow. Pp. xxi+470; 151 figs. Vol. III, "Radio Engineering," by E. B. Wedmore and J. H. Reyner. Pp. xxii+462; figs. 314. London: Ernest Benn, Ltd. Price 15s. each.

Prussian State Interests.—The State of Prussia, which recently acquired a large financial interest in the Rhenish Westphalian Electricity Works Company, is now participating in a syndicate which is taking over the undertaking of the Siemens Electrical Works Co., of Hamburg, which controls various supply undertakings. The shares purchased by the syndicate represent 4,000,000 marks, which amount is to be increased to 8,000,000 marks and to be taken over also by the syndicate. The sellers are the Siemens and Halske Company and the Swiss Electrical Industry Company, which held 1,250,000 marks of the total share capital.

Water Turbines for Norway.—The Norwegian Storting recently voted an additional sum of 5,200,000 kronor for the accelerated extension of the State hydro-electric works at the Nore, this making a total sum of 9,700,000 kr. granted this year for the execution of works. The further outlay on the works will amount to 17,000,000 kr. in 1926 and 10,000,000 kr. in 1927, it being expected that the undertaking will be completed in 1928. Tenders are now being invited for the supply of two additional turbines. The order for the first turbine was placed in Germany some time ago, a German firm having quoted a price which was 280,000 kr. below that of competitive Norwegian works. Asked whether the new orders would be allotted to German works, the Director of the State Water Power Department is reported to have stated that he was unable to give a reply. He believed, however, that the appreciation of the Norwegian krone would render it more difficult for Norwegian works to tender than on the former occasion.

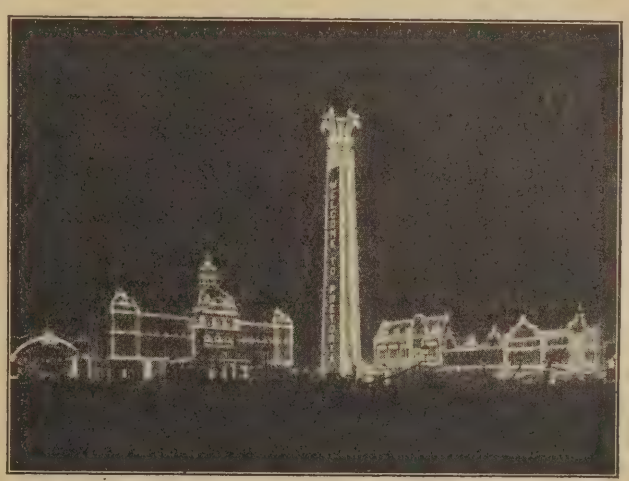
Telephone Apparatus Manufacture in Spain.—According to a Madrid economic journal, Spain is to be placed in the position of being able to manufacture all the telephone material required in order to carry out the important programme which has been formulated by the Spanish National Telephone Company. This information is said to have been confirmed by a cable received from the president of the International Telephone and Telegraph Corporation, which indirectly controls, among others, the existing telephone factory at Barcelona. It is now proposed to establish in Madrid or vicinity a large works capable of not only supplying the needs of the Spanish market, but also able to export, particularly to South America.

Patent Rights in Russia.—It is reported that the Soviet authorities have notified foreign inventors and patentees that under the new patent law adopted last year patents issued and registered in Russia under the old *régime*, or applied for prior to November 7th, 1918, should be re-submitted to the Inventions Committee, 76, Fontanka, Leningrad, for renewal. It is understood that applications for renewals may be made up to September 25th next and that they should be submitted through some representative residing in Russia.

Re-grading of Worcester Undertaking.—At a meeting of the City Council last week the Council agreed to the transfer of its electricity undertaking to Class D of the National Joint Board's schedule. The salaries affected will be increased by a total of £240.

The British Industries Fair.—A *Times* correspondent says that it is authoritatively stated that the Treasury has decided to make a grant of £20,000 to assist in the promotion of next year's British Industries Fair. The probable period of the holding of the London section will be from February 15th to 26th next.

Cuban Import Duties Increased.—The *Board of Trade Journal* reports that import surtaxes are to be imposed on all classes of goods by the Cuban authorities. "Luxury" articles are to bear a surtax of 10 per cent.; the rate in the case of all other goods is 3 per cent.



Belgian-Dutch Lamp Agreement.—It is reported from Amsterdam that the Philips Glowlampworks Co. has concluded an agreement for community of interests with La Lampe Electrique Belge. The latter has acquired the Philips' patents and will increase its output to 1,500,000 lamps per annum.

United States Radio Exports.—A review of the United States exports of radio apparatus during the first six months of the current year shows that the total value was $4,068,442, as compared with $1,826,246 in the first half of 1924, and $6,030,914 for the whole of that year. Japan became the most important customer, taking goods to the value of $1,238,030 (as against $60,415), while Canada, with $852,783 (as against $705,287), fell to second place. The principal European customer was Great Britain ($212,958, as compared with $48,074), Spain being second with $164,132. In the Latin-American market Argentina ($237,609) and Brazil ($227,399) were the leading customers. The Australian and New Zealand market absorbed apparatus to the value of $375,380, as compared with $190,665 in the first half of 1924.

The Leipzig Fair.—According to the papers, business during the first day of the Leipzig Fair was chiefly in necessary supplies. Considerably better trade was done at the technical and building fairs. The second day brought no marked change, satisfactory business being transacted in certain sections. Among foreign sales were household appliances for Australia. Home customers as a rule bought only moderate quantities and preferably the cheaper articles.—*Reuter's Trade Service* (Berlin).

Osmiridium Mining in Tasmania.—A Victorian company, with a capital of £30,000, has been formed for the purpose of mining osmiridium from rock at Waratah, in Tasmania. This is stated to be the only place in the world where osmiridium is found.—*Reuter's Trade Service* (Melbourne).

Illumination in South Africa.—During the recent visit of the Prince of Wales to South Africa many local authorities bestowed special care and ingenuity upon the decoration of their towns. One of the most interesting instances of this was

The Illumination of Church Square, Pretoria.

Pretoria, where extensive use was made of electric light. The accompanying illustration is a night view of one side of Church Square, Pretoria, the outlines of the buildings being picked out with "Osram" lamps.

Hydro-Electric Development Tax in Porto Rico.—A law has been passed by both Houses of the Porto Rico Legislature levying a tax of one-tenth of 1 per cent. on all real property in the island for a period of three years, in order to provide a fund, which it is estimated will approximate $500,000, for the development of hydro-electric power. This has not, as yet, been signed by the governor, but it is thought that he will approve the Bill.—*Commerce Reports.*

Electrical Appliances for Uruguay.—*Commerce Reports* says that there is a considerable market in Uruguay for electric reflector-type heaters rated at 1,000 W or less, as well as some market for small electric cooking stoves and self-contained cooking devices.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from September 2nd :—

Ford. No. 454,460. Class 6. Magnetos and dynamos for motor cars, electric starting and ignition machinery, &c., and parts of such goods. No. 454,461. Class 8. Electric batteries and accumulators, electric ignition coils and parts thereof, &c. No. 459,575. Class 13. Electric switches, electric lamps and bulbs, sparking plugs, electric horns, &c. No. 459,577. Class 18. Electric lighting sets for motor vehicles. No. 459,580. Class 50. Batteries, boxes of wood, &c.—The Ford Motor Co. (England), Ltd., Trafford Park, Manchester.

Frelat (lettering and design). No. 454,924. Class 8. Wireless telephonic and telegraphic apparatus.—Naamlooze Vennootschap Frelat Export MIJ. 69, Singel Amsterdam, Holland (J. W. Wilson & Co., 55, Market Street, Manchester).

Valoc. No. 457,866. Class 8. Crystal detectors and detector crystals for use in wireless telephony.—Leslie Gerald Russell, 1-7, Hill Street, Birmingham.

Radio-pal (lettering and design). No. 458,532. Class 8. Portable wireless receiving apparatus. Multistat (lettering and design). No. 458,533. Class 8. Control instruments for wireless transmitting and receiving apparatus.—Joseph A. Bower, trading as J. A. Bower, 7-8, Great Winchester Street, London, E.C.2.

Saxoflex. No. 450,687. Saxbestos. No. 450,688. Class 8. Electrical cable. —Louis Henry Euler, 54, Inchmery Road, Catford, S.E.6.

Siftron. No. 460,848. No. 460,911. Same lettering combined with design. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Edward A. Graham, trading as Alfred Graham & Co., St. Andrew's Works, Crofton Park Road, London, S.E.4.

Patent Application.—Application has been made for the restoration of patent No. 123,545 of 1917, granted to W. E. Prescott and G. R. Baker for "Electrical apparatus for subjecting articles to varying temperatures."

New French Companies.—A new company has lately been formed in Paris (9, Boulevard Denain), with a capital of one million francs and the title La Société de l'Energie Electrique d'Isère et de Drome, to establish a hydro-electric power station on the River Ebron in the Department of Isère.

La Société Electrique de Travaux Agricoles is the name of a new undertaking which has lately been organised in Paris (67, Rue de Dunkerque), with a capital of one million francs to develop the use of electrical appliances in agricultural operations.

A new company has lately been formed in Grenoble (27, Rue de Turenne), with a capital of 220,000 fr. and the title La Société du Barrage de Sechiliennée, to establish a hydro-electric station on the River Romanche at Sechilienne, in the Department of Isère.

La Société Radio-Electrique is the name of a new company which has lately been formed in Nantes (2, Rue Sully), with a capital of 200,000 fr., to engage in the wireless industry in Western France.

La Société Nord-Africaine d'Electricité is the name of a new company which has lately been formed in Paris (94, Rue de la Victoire), with a capital of 300,000 fr., to establish electricity undertakings in North Africa.

A new company has lately been formed in Paris (56, Rue du Faubourg, St. Honoré), with a capital of 500,000 fr. and the title La Société des Relais à Arc to acquire and exploit the Dunoyer and Toulon arc relay patents.

Electric Washers in America.—The *Electrical World* states that a banking firm has issued a special bulletin dealing with the American clothes-washer industry. This states that it is estimated that in 1914 there were 50,000 electric washing machines in use in the United States, valued at $5,000,000, while ten years later, in 1924, there were more than 4,000,000 such machines, valued at over $600,000,000. The average value of each machine is estimated at $150. At the current rate of consumption and allowing for wear and tear, it is estimated that in 1929 there will be over 7,600,000 washing machines in use in 22,850,000 wired homes, valued at over $1,100,000,000, or thirty-three for every hundred wired homes. If this rate is increased to even forty in every hundred, as it well might be, the total number of electric washing machines will exceed 9,000,000 or over, twice the number now in everyday use. Placing the life of an electric washer at ten years, it is obvious that the replacement requirements alone four years from the present time will reach over 700,000 machines, or more than has been produced so far in any one year by the industry. Out of about a hundred companies manufacturing electric washing machines in the United States, there are to-day three which are furnishing 46 per cent. of all the machines now on the market.

Belgian Exhibition Postponed.—According to the *Bulletin* of the Société Belge des Electriciens it has been decided to postpone until 1930 the international electrical exhibition which it was proposed to hold in Brussels next year in order not to clash with the Independence Centenary Exhibition.

New Italian Companies.—Among the new companies recently formed in connection with hydro-electric developments in Italy are the Società Idroelettrica Alpi Maritime, Milan, capital 100,000 lire, to establish plants to utilise the water power of the Rivers Nervina, Nervia, Gordali and Tenarda in the Maritime Alps; the Società Idroelettrica di San Filippo, organised at Contigliano with a capital of 50,000 lire; the Società Idroelettrica Stura, Milan, capital 100,000 lire, to establish a plant in the Lanzo Valley (Stura); the Società Forze Idrauliche del Lago di Molveno, Milan, capital 1,000,000 lire, to utilise the water power of Lake Molveno; the Società Idroelettriche Alto-Caffaro, Milan, capital 100,000 lire; the Società Forze Idrauliche del Rovico, Milan, capital 400,000 lire; and the Società per le Forze Idrauliche del Piceno, Milan, 100,000 lire.

Japanese Telephone Development.—The Japanese Department of Communications has decided to allot 5,000 new telephones a year to the city of Osaka, beginning this year. This will entail the opening of an additional exchange yearly for several years. The Japanese telephones are of the automatic type, and the system adopted is the Strowger system, which is approved by the British Post Office. Much of the equipment required will be supplied by British manufacturers.

Indian Electrical Imports. — Our Indian correspondent says that during the quarter from April to June, the total electrical imports into India amounted to Rs. 113 lacs, as against Rs. 1 crore in the corresponding quarter of 1924. Electrical machinery remained almost unchanged at Rs. 55 lacs, but electrical instruments and apparatus showed a rise as compared with the past year's corresponding quarter from 46 lacs to 59 lacs. In the case of electrical machinery, the decline was chiefly due to decreases in "Generators, alternators, &c.," from 11 lacs to 7½ lacs., and "Motors" from 12 lacs to 9 lacs. "Control and switchgear" increased from 9 lacs to 11½ lacs, and "Turbo-generating sets" from 1½ lacs to 3½ lacs. There was also an increase of two lacs in the miscellaneous items. The principal supplier was, of course, the United Kingdom, supplying 46½ lacs worth of machinery out of the total of 54 lacs, but Germany showed some progress from about one lac to 2½ lacs. The position of the United States remained the same. In the case of electrical instruments and apparatus the main increase was under "Wires and cables," from 12 lacs to 19½ lacs. "Electric fans and parts" increased from 8 lacs to 10 lacs, "Electric glow-lamps" from 3 lacs to 5 lacs, and "Electric lighting accessories" from 3 lacs to 5 lacs. The increase recorded on the whole is spread over all the supplying countries. The United Kingdom supplied 41 lacs worth of goods as against 31 lacs in April-June, 1924; Germany increased her share from 5½ to 6½ lacs; the Netherlands from about 2 lacs to about 3 lacs; and the United States remained at 4½ lacs. As new projects are maturing in India, there is reason to think that this expansion in trade will be kept up.

German Power Fuel Syndicate in Australia.—The *Melbourne Herald* says that the representative of a German syndicate which proposes to establish a factory for the production of power fuel and chemical products by a secret process is now in Australia.—*Reuter's Trade Service* (Melbourne).

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report, September 8th :—Copper (electrolytic) bars, £69, 30s. increase; do., do., sheets, no change; do., do., wire rods, £79, 30s. inc.; do., do., h.c. wire, 9⅞, 3/16 increase.

Messrs. James & Shakespeare report, September 8th :—Copper bars (best selected) sheet and rod, £93, £1 increase; English pig lead £39 10s., 10s. decrease.

Messrs. Edward Till & Co. report, September 8th :—India-rubber, Para fine, 3s., 1d. to 2d. decrease.

Trade with Western Canada.—The *Board of Trade Journal* reproduced recently a report by the Senior Trade Commissioner in Canada (Mr. F. W. Field) upon trade prospects and conditions in Western Canada. He states that United Kingdom manufacturers, as a whole, appear to possess inadequate knowledge of the conditions prevailing in Western Canada, although there are a few successful exceptions. The importance of delivery according to promise and compliance with instructions is emphasised, and it is urged that the subject of packing should be given greater attention. In this connection it is interesting to note that Mr. L. B. Beale, British Trade Commissioner at Vancouver, who has charge of the Western Canadian offices, is at present in the United Kingdom to confer with manufacturers and merchants with a view to advising them as to the Canadian market. Those desiring to meet Mr. Beale should immediately apply to the Comptroller-General, Department of Overseas Trade, 35, Old Queen Street, S.W.1.

Local Exhibition.—WAKEFIELD.—The Electricity Committee has agreed to a scheme prepared by the Electrical Engineer for an electrical exhibition during the autumn.

Cable Manufacture in Czecho-Slovakia.—It is announced from Prague that the Bratislava Cable Works Co., of that city, has just acquired a large area of land in the town of Kolin on which to establish a branch factory.

Australian Tariff Decision.—Among the recent decisions of the Australian Tariff Commissioners is the following :—"Cable, telegraph and telephone, paper insulated, lead covered and served, Item 181 (A) : free under the British preferential tariff; 5 per cent. under the intermediate tariff; and 15 per cent. under the general tariff."

German Electrical Exports.—In the course of a report upon German foreign trade in July recently forwarded to the Department of Overseas Trade by Mr. J. W. F. Thelwall (Commercial Secretary at Berlin), it is stated that the exports of electro-technical products increased by 10 million Reichsmarks as compared with the June value.

Swiss Electrical Imports.—Figures just to hand show that the exports of electrical machinery from Switzerland during the first half of the current year attained a value of £552,320, as compared with £419,320 in the corresponding half of 1924. Although France continues to be the principal market, the demand from Spain has lately considerably increased, while an improving business is being done in Norway and Poland.

Cable Manufacture at Southampton.

The Pirelli-General Cable Works.

AMONG the places of interest to which visits were paid by members of the British Association during the course of the annual meeting at Southampton, was the Pirelli-General Cable Works, one of the most important industrial establishments in the town.

This factory is situated on the Western Shore by the walls of ancient Southampton, and within a few hundred yards of the two Southern Railway stations. Being of fairly recent erection, the factory is laid out on modern lines, substantially built, and equipped with up-to-date machinery for the manufacture of every description of cable and particularly for paper-insulated, lead-covered and armoured types. An aerial photograph of the works is reproduced in fig. 1.

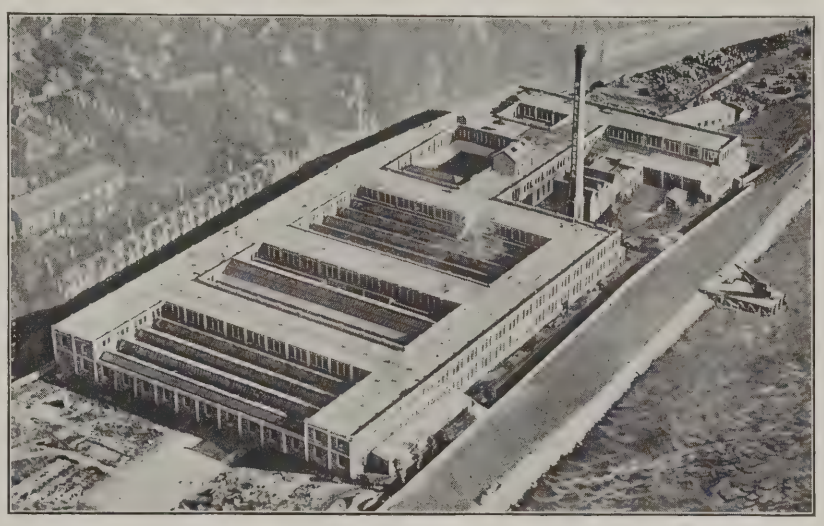


Fig. 1.—Aerial View of the Pirelli-General Works.

The works is supplied with wire by the company's Eastleigh factory situated on the Southern Railway about five miles distant. Thus the processes at the Southampton works commence with the stranding of the cable. For this purpose, a number of heavy and light stranding machines, both horizontal and vertical, have been installed; some of these are to be seen in the view of the main shop which is presented in fig. 2.

All material required in the manufacture of the cables is tested upon entering the factory. For this purpose a spacious laboratory (fig. 3) has been provided with all the necessary equipment. In addition to this testing, a great deal of research work is carried out in the laboratory.

One of the principal jobs which was in process during the British Association visit was the manufacture of a 33,000-V cable. After the wires are stranded, they pass through a paper-lapping machine and receive numerous layers of paper; the three cores are then laid up together and the spaces between them are filled up with paper twisted into the form of a cable. Further paper is lapped on to bind the cores and fillings together and give the cable a circular section. The cable is then run into a steam-heated drying chamber and later immersed in a tank of special impregnating compound under vacuum. The cable next passes to the lead press (fig. 4). Entering through a guiding die the cable is surrounded by lead in a semi-plastic state under pressure. It is then forced through dies of the dimensions necessary to give it a sheathing of the correct thickness for the particular size of cable being covered. The cable next passes through cooling troughs, after which it is wound on a steel drum. The drum and its contents are then taken to the testing tanks (fig. 5), which are situated close to the lead presses to reduce handling to a minimum, and the cable remains immersed in water for 24 hours. At the expiry of this period, the pressure tests prescribed by the British Engineering Standards Association are applied from the test room which adjoins the tanks. The test room is equipped with all the necessary instruments and appliances for testing the great variety of cables which arrive at this point in the course of their manufacture, to be proved before passing to the armouring and finishing machines. In addition to a pressure test, the insulation resistance, the capacity, and the resistance of the conductors are determined. A high insulation resistance does not necessarily imply that the cable is a good one; it very often indicates the reverse. In addition to these tests a bending test is often specified in accordance with the British Standard Specifications dealing with the testing of cables. To carry this out, a sample of the cable of a length not less than 60 times the overall diameter of the cable is bent round the barrel of a drum three times in one direction and three times the reverse way, the diameter of the barrel being twelve times the overall diameter of the cable. After this the cable is subjected to a high-pressure test, and in no case should it break down at less than the specified B.E.S.A. test pressure; Pirelli cables, we are assured, always withstand a much higher pressure. The tests mentioned above are quite satisfactory so long as the cables are for voltages within the limits for which the B.E.S.A. has issued specifications, but for higher working pressures other features assume great importance. For instance, in the case of a cable for a working pressure of 33,000 V, which is now becoming standard in this country, a very high voltage test is not considered desirable, and it is not recom-

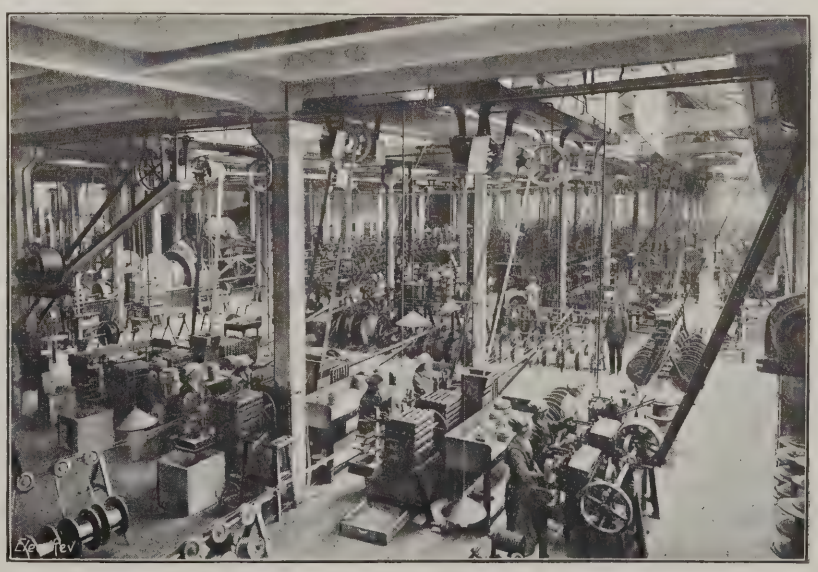

Fig. 2.—View of the Main Shop.

mended that the test shall be at more than 2½ times the working pressure. The bending test is also very important, and after carrying out the bending operations previously specified, the cable should not break down at

Fig. 3.—Chemical Laboratory.

less than four times the working pressure. A test which is recognised to be of great importance for very high voltage cables, is that of the measurement of the dielectric losses. In the technical section of the company's

Fig. 4.—Lead Presses.

handbook, to which we are indebted for these details of tests, curves appear showing the dielectric losses on various types of cables. Whilst these losses are themselves an indication of the soundness or unsoundness of the cable, too much stress should not be laid on them, as although it is true that a cable with high dielectric losses is not a good one, it can equally be true that a cable with extraordinarily low dielectric losses is not necessarily a better cable than one in which the losses are within certain defined limits. Furthermore, the actual loss of power due to normal cable dielectric losses is, to a great extent, unimportant when compared with the power transmitted by the cable. It is quite possible for a greater amount of energy to be lost in the lead sheathing than in the dielectric.

The armouring may consist either of steel tape or iron wire and after passing through this process a layer of jute is usually served upon the cable. The latter is then wound on wooden drums and delivered to the dispatching department; here the drums are battened down, marked and lifted by overhead travelling cranes on to trucks or lorries for dispatch.

A large section of the factory is devoted to the production of dry-core telephone cables in a similar continuous and progressive manner. The individual core wires are wrapped with paper of distinctive colours, and the next machine lays up the required number of pairs together, giving the correct length of lay to each layer, and the whole of the cores are then bound together with an outer paper wrapper (see fig. 6). They then follow the course of the power cables, through the drying ovens, lead presses, and testing tanks, omitting, of course, the impregnation processes. In this type of cable the paper insulation may be applied either helically or longitudinally and held in position by a cotton or flax lapping. The special feature of the construction of the cable is that it permits a third circuit to be superposed on each two-pair core, thus increasing the number of circuits by 50 per cent. In operating a cable in this manner it is important that the overhearing between the circuits shall be so small as not to interfere with the satisfactory working of the cable. This is especially important in a cable with a high transmission efficiency, both on account of the lower attenuation constant of such cables and on account of the fact that they are usually "loaded" and consequently have a higher impedance and operate at a higher voltage. To ensure that overhearing between the circuits shall be small, it is necessary that the electrical constants of the cable shall be

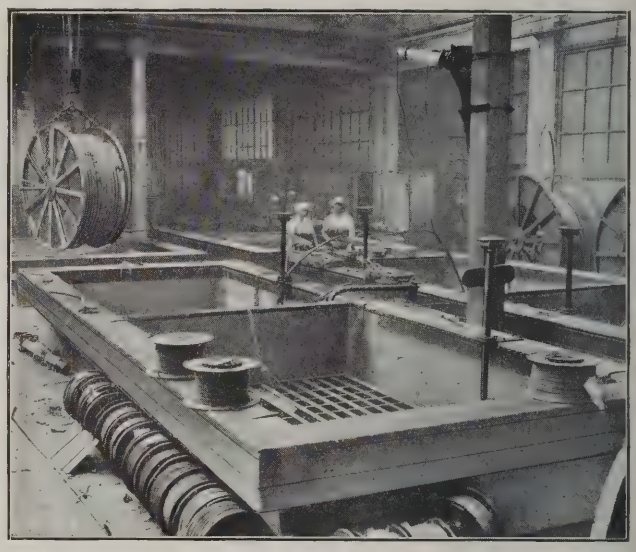

Fig. 5.—Testing Tanks.

uniform, and particularly that there shall be no resistance or capacity unbalance. These can be considerably reduced by care in manufacture, but it is also necessary

Fig. 6.—Insulating Air-spaced Telephone Cable.

to employ special methods when installing the cables to ensure that these "unbalances" are reduced to a minimum. The use of superposed circuits has considerably increased the number of circuits which can be contained in a given size of sheath. This increase in the circuit capacity of a cable has made essential a higher standard of maintenance than has hitherto been necessary. Modern methods of drying and special precautions during manufacture and installation have to be taken to enable the high insulation resistance required by the General Post Office to be obtained.

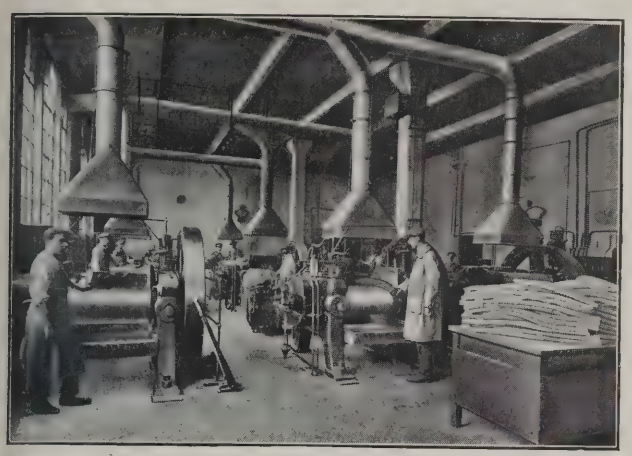

Fig. 7.—Rubber Mixers.

Another extensive portion of the works carries out the production of rubber-insulated cables, including telephone cords and flexibles. The rubber mixers are illustrated in fig. 7. A special formula is followed in the preparation of the rubber compound, but the sulphur necessary in the vulcanisation process is added in such a way that subsequent heating effects thorough and uniform vulcanisation. The wire used in these cables has, of necessity, to be tinned; this is carried out at the Eastleigh works. When the wires have been stranded, a coat of pure Para rubber is first applied, in the form of a tape about 2 in. in width. Covers of rubber compound are then applied, and the cable is subjected to heat to convert its covering into a solid vulcanised mass. One of the most interesting of the subsequent processes is the braiding. The company has a very large number of braiding machines (fig. 8), the bobbins of which wind in and out at a great speed, producing a closely-woven cover of cotton. This section gives a relieving touch to the general drabness of the factory, for cottons and silks of a variety of hues are employed in the braiding process.

Fig. 8.—Braiding Machines.

Mention must be made of the Social Club which the works staff has organised, and for which the company has provided accommodation at the western end of the works. Tennis, football, cricket, sailing, and photography are all included and catered for, and during the winter months successful dances are held.

An All-Electric Housing Scheme.

Particulars of the Glasgow Corporation's Electrically-Equipped Houses.

By R. HARDIE.

It may be recalled that as early as 1915 Mr. George Hamilton, a Glasgow builder, erected some thirty 4- and 5-apartment bungalows, equipped throughout with electric lighting, heating, cooking and water-heating apparatus. After ten years these houses and their equipment remain a tribute to the enterprise and foresight of that now almost extinct individual, the private builder. The people of Glasgow are wont to claim that Lord Kelvin's house was the first electrically lighted house in the world, and it is thought that Mr. Hamilton's electric houses in the Dumbreck suburb of Glasgow were amongst the first chimney-less houses in this or any other country. All honour to this pioneer builder who had the enterprise, or temerity as it was looked upon in those days, to provide this early object lesson on the value of labour-saving houses. To-day the local authority is usually entrusted with the erection of houses, and the 290 houses described herein are the first completed all-electric houses erected by the Glasgow Corporation. A further 510 similar houses have been authorised, and are at present in the process of erection. Each house is furnished with electric lighting throughout, an electric cooker, a wash boiler, and provision for electric fires in all rooms except the living room. The houses are 3-, 4- and 5-apartment buildings situated at Mount Florida and Possilpark. Each 3-apartment house consists of a living room and two bedrooms; the 4-apartment houses each comprise a living room and three bedrooms, while

Fig. 1.—All-Electric Houses at Mount Florida.

each of the 5-apartment houses contains a living room, a sitting room and three bedrooms. Every house also has in addition a bathroom and a "kitchenette."

A 7-kW electric cooker of the Glasgow Corporation's standard hiring type, complete with a three-pint copper electric kettle, 800 W, is part of the equipment of each house. A cast-iron wash boiler fitted with a 4-kW immersion heater is also installed, and it is interesting to note that for over a year not a single case of breakdown in the heaters has occurred, although they have in several instances been allowed to remain on circuit for many hours with the boiler not in use. Under normal conditions an abundant supply of hot water is obtained from the living-room coal fire, which, due to the rigour of the Scottish climate, is necessary throughout the greater part of the year. In several houses immersion heaters in the storage cylinders, for hot water supply when the coal fire is out of use, have been installed at the consumer's expense. Heating sockets are installed in all the rooms except the bath and living rooms to specification, but in many cases the tenants have had sockets fitted in the remaining rooms at their own expense. In fig. 4 is shown a view of one of the bedrooms equipped with the following electrical apparatus: bedwarmer, hair dryer, curling tongs and comb, violet-ray apparatus, trouser press, kettle, table lamp and fire. In addition, a socket for an electric iron is provided, usually in the kitchenette or living room. Electric fires are provided as follows: one 2-kW fire in each 3-apartment house, two 2-kW fires in each of the 4-apartment houses, and two similar fires and one of 1 kW capacity in each of the 5-apartment houses. The entire electrical equipment is provided by the Housing Authority, and there is no hire charge payable by the tenant. The electricity department undertakes the maintenance of all electrical heating and cooking apparatus in the houses. This cost has been found negligible except in the case of the cookers, but with improved types of cookers it is hoped shortly to eliminate, or at least reduce, the cost under this head.

Fig. 2.—An Electric "Kitchenette."

The tenants have the option of being charged at a flat rate of 4½d. per kWh for 730 hours' use per annum of the maximum demand, which in the case of a 3-apartment house is 70 kWh per annum; a 4-apartment house, 100 kWh; and a 5-apartment house, 150 kWh, all over this quantity being charged for at ¾d. per kWh; or a fixed service charge per month, plus ½d. per kWh for all energy consumed. The fixed charge for a 3-apartment house is 6s. 6d.; a 4-apartment house, 7s. 7d.; and a 5-apartment house, 8s. 8d. per month. The majority of the tenants take advantage of the latter scale, its simplicity appealing to them. The returns of the electricity department show that the average weekly bill for a 3-apartment house is 3s.; 4-apartment house, 3s. 6d.; and a 5-apartment house, 4s. 6d. These figures confirm the fact that electrical service has nothing to fear from close comparison on the score of cost with the older methods of lighting, heating and cooking, which it is gradually superseding.

Fig. 3.—One of the Living Rooms.

Fig. 4.—An Electrically Equipped Bedroom.

The Director of Housing estimates that the saving effected in building construction due to the elimination of fireplaces amounts in the case of a 3-apartment house to £27 10s., and in that of a 4-apartment house to £34; which means that a house to-day can be built and equipped with electrical apparatus, including cooker,

wash boiler, and electric fires, as cheaply as a house without these conveniences. An appreciation of this, coupled with the fact that the houses, when built, can be operated at a cost within the means of the average tenant, should lead to a speedy extension of this type of house in the immediate future. The latter condition is, of course, dependent upon the price of electricity in the area, but a growing number of authorities, both municipal and company, in view of the growing appreciation of the possibilities of the domestic load, are now offering electricity at terms which may be considered attractive.

As stated, there are no open fires or fixed fireplaces in any of the rooms apart from the living room, and the resultant additional wall space available in the rooms is much appreciated by the tenant. The rooms are found to be efficiently heated by the electric fires provided, and the absence of the usual accompaniments of the coal fire (ashes, dust and smoked ceilings) is very noticeable. The average height of the ceilings is 8 ft. 6 in., and each room is ventilated by means of a ventilating grating near the ceiling, leading into a ventilating shaft.

Whilst pressing for this business, the Glasgow Electricity Committee urged the desirability of demonstrating on a somewhat larger scale than had been hitherto possible, that an electric house would prove satisfactory to the occupants, and what is important, the running cost would be moderate and well within the means of those who occupied the houses. It was confidently anticipated that the bulk experience gained would confirm that previously obtained in individual cases, and do much to remove the impression generally held that electricity was expensive. More than 100 of the houses have now been occupied for twelve months, and there is no reason to doubt the accuracy of this contention. The occupants themselves, mostly from houses with gas installed, are thoroughly satisfied, and the undertaking's demonstrator, who keeps in touch with them from the date of entry, reports that they fully appreciate the change-over, and experience no trouble whatever in operating the electrical apparatus.

Fig. 2 shows a view of the kitchenette of one of the all-electric houses, from which it will be seen how conveniently spaced and wired for is the electrical equipment. A view of one of the living rooms with an electric fire installed appears in fig. 3, while fig. 1 gives a general view of the houses at Mount Florida.

Lighting and Power Notes.

Australia. — Greater Brisbane. — After conference with representatives of the Brisbane Tramway Trust, the Electric Light, Power and Transit Committee of the Greater Brisbane Council has recommended that, before proceeding with the erection of a large power house, negotiations shall be entered into with the City Electric Light Co., with regard to acquisition of the company's undertaking.—*Electrical Engineer of Australia and New Zealand.*

Basingstoke.—Loan.—The Town Council has applied for sanction to a loan of £1,600 for extending the supply of electricity to Old Basing and district by means of overhead cables.

Bexhill.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer, Mr. C. A. Frost) for the year ended March 31st, 1925, record a total revenue of £30,242, as compared with £27,325 in the preceding year. Working expenses amounted to £17,910, as against £16,808, leaving a gross profit of £12,332 (£10,517). After providing for capital charges, a net surplus of £3,709 remained, as compared with £959 in 1923-24. The capital expenditure during the year amounted to £15,066. The electrical energy sold increased from 1,244,774 to 1,470,012 kWh, and the maximum supply demanded from 965 to 1,115 kW. The Electricity Commissioners have refused to sanction the installation of additional generating plant at Ashdown Road, and an agreement has therefore been entered into with Hastings Corporation for a bulk supply. Sanction has been received to install two 750-kW motor converters with the necessary switchgear, for this purpose.

Blackburn-Preston.—Linking-up Scheme.—The linking-up of the power stations at Blackburn and Preston with a high-voltage cable has been commenced. Work was started at Hoghton, which is about midway between the two towns, and the cable is being carried in the direction of Blackburn first. The work will take about four months to complete. The Leyland cable is nearly finished, and it is expected that it will be available for service by about the beginning of November.

Colchester.—Loan.—The Town Council has decided to borrow from the Ecclesiastical Commissioners £130,000 for its new electricity works. The new works are now in course of erection at the Hythe, Colchester.

Continental.—Portugal.—The Government, having decided to encourage the construction of hydro-electric works, has granted a concession to the Companhia das Quedas d'Agua do Norte de Portugal for the development of power from the waters of the Cavado and Rabagao rivers. It is proposed to establish the first central power station at Villa Nova, where the two rivers meet, to supply 13,400 h.p. It is hoped, however, by the fuller utilisation of the two rivers, to increase the output to 42,000 h.p. Similar work is to be undertaken on the Paiva River, from which it is expected to obtain from 8,000 to 20,000 h.p., as development proceeds. The northern hydro-electric installation will be completed in five years, and the scheme will be financially supported by the Government, an influential group of French financiers and local firms. To finance the second project, a syndicate has been formed by the Companhia do Credito Predial Portuguez and the Banco Ultramarino.—*Reuter's Trade Service* (Lisbon).

Italy.—The Societa Generale Elettrica Tridentina plans to erect two new power plants, capable of generating about 230,000,000 kWh per annum. They will cost about 100,000,000 lire.—*Commerce Reports.*

Austria.—A new hydro-electric power station has recently been completed and put in operation at Gampadel, near Montafon. The plant comprises two 4,500-kVA turbo-generators, space being provided at the station for the installation of a third set of similar capacity at a later date. Energy is generated at 6,000 V and stepped up to 45,000 V for transmission purposes.

Rumania.—A scheme is under consideration for the establishment of a plant to utilise the water power of the River Jalomitza between Scopoasa and Tatinculni. Half the energy generated would be reserved for traction purposes on the Roumanian State railways and the remaining portion transmitted to Bucharest for lighting and power purposes.

Crediton.—Electricity in Bulk.—At a meeting of the Urban District Council on August 31st, a report was submitted on the negotiations with Exeter Electricity Committee relative to a bulk supply of electricity to the district. It was stated that the Committee had reduced the minimum charge to £250 for the first year, £300 for the second year, £350 for the third, and £400 for the fourth. The Council has accepted the Committee's terms.

Dorking.—Proposed Purchase of Undertaking.—The Urban District Council is considering the purchase of the local electricity undertaking, operated by Messrs. Edmundson's Electricity Corporation, Ltd., under an agreement. The present contract expires in 1928.

Elland.—Electricity Supply.—Subject to the Halifax and Huddersfield Corporations agreeing, in connection with the linking up scheme, to lay cables on brackets outside Elland Bridge, the Urban District Council has decided to withdraw opposition to the scheme.

Evesham.—Progress of Scheme.—At a recent meeting of the Town Council it was reported that the electricity scheme was making progress. The cable extended as far as Abbots Morton and it was hoped to have a supply available for the town in October.

Federated Malay States.—Electricity Supply Progress.—*Eastern Engineering* states that the report of the chief engineer of the Federated Malay States Electricity Board (Mr. J. C. M. Matthews) for the year 1924 shows that the net profit on the Board's three main installations was $104,602. The Kuala Lumpur undertaking showed an increase in the sales of electrical energy of 255,787 kWh, the total sold being 2,495,235 kWh; the sales of the Ipoh undertaking were 671,235 kWh; and the energy sold by the Seremban undertaking amounted to 352,400 kWh. The Seremban installation was taken over from United Engineers, Ltd., at the commencement of the year. The plant at this station consists of five Ruston & Hornsby crude oil engines, driving Crompton d.c. generators, with a total capacity of 580 kW.

Grays Thurrock.—Street Lighting.—The County of London Electric Supply Co., Ltd., is carrying out the street lighting of the district, and has placed an order with Messrs. Venner Time Switches, Ltd., for time switches in connection with the scheme.

Halifax.—Inauguration of New Plant.—An additional 10,000-kW turbo-generator was started by Ald. Sutcliffe, vice-chairman of the Electricity Committee, at the Corporation electricity works on September 3rd. The new set runs at a speed of 3,000 r.p.m., and has a maximum continuous output of 12,500 kW. The ceremony is dealt with in our "Notes" columns.

Hastings.—Power Station Closed.—The Corporation's electricity works at Earl Street was formally closed down by the Mayor on August 31st. All the energy required is now generated in the new Broomsgrove works.

India.—Mandi Scheme.—According to *Indian Engineering*, the Administration Report of the Buildings and Roads Branch of the Public Works Department, Punjab, for 1923-24, states that Major R. N. Aylward investigated 150 sites for developing the water power resources of the Punjab and reported that about two million horse-power is capable of economic development. Of these sites the Mandi hydro-electric scheme is the first to be taken up, and carried out in stages. In the first

stage the River Uhl will be diverted and dropped 1,800 ft., creating 26,000 kW at a cost of under five crores. At the next stage by the addition of a dam another 44,000 kW will be secured at a cost of about one crore more. The third stage will give another 48,000 kW by the construction of a fall of 1,200 ft. Further developments will bring the total up to 177,000 kilowatts. It is calculated that the Uhl water power will suffice for the area from Saharanpur to Sialkot.

Electrical Development.—*Commerce Reports* states that the Municipal Council of the city of Vellore, Madras Presidency, which has a population of approximately 225,000, has been considering the installation of plant to furnish electricity for that city. The system of Madras has been studied. The report submitted would seem to show that the capital required for this scheme would be 440,000 rupees; that the municipality should have 1,400 lights for the streets, and that there would be 1,000 private consumers. No definite action has yet been taken.

Japan.—Kobe.—According to *Eastern Engineering*, the Municipal Electric Bureau recently started up a 12,500-kW set at Minatogawa as the second stage of the electricity extensions. The principal object of the extension is, however, to provide against a breakdown in the existing supply, and it is not intended to meet the yearly increasing demand in Kobe and Hyogo. Recently the head of the Bureau and the deputy mayor considered the necessity of increasing Kobe's present electricity supply to 50,000 kW, taking the local consumption for the next ten years into consideration. For this plan 18,000,000 yen is required. The floating of a public loan is projected.

Lytham-St. Annes.—Electricity Supply Progress.—The Town Council is applying for sanction to borrow £33,000 to carry out various works in connection with the electricity undertaking. The chairman of the Electricity Committee stated at a recent meeting of the Council that the increased demand for energy necessitated this step. During the year ended March, 1925, 3,352,000 kWh was sold, being an increase of half a million on the previous year, and nearly double the output of 1921. During the last four years the consumers had increased from 2,513 to over 7,000, and the requirements of 2,000 or 3,000 more consumers were being provided for. In addition, new mains were required from Squires Gate to Freckleton, a distance of nearly eight miles.

New Zealand.—Horowhenua Power Board.—According to the *Electrical Engineer of Australia and New Zealand*, the Horowhenua Power Board reports satisfactory progress during the year ended March 31st, 1925. The Board's reticulation consists of 105 miles of 11,000-V lines, 167 miles at 400 V, 50 miles for street lighting, and 36 miles of service lines. The supply to the boroughs of Otaki and Foxton is given through outdoor sub-stations. There are 61 sub-stations in operation, with a total capacity of 2,115 kVA. In all cases the transformation is from 11,000 to 400 V. The total number of consumers now connected to the board's lines is 1,583. Mr. T. R. Overton is engineer.

Peterborough.—Loan.—The Corporation Electricity Committee is applying for sanction to a loan of £1,950 for h.p. cables and switchgear.

Peterhead.—Electricity Supply.—At a meeting of the Town Council on August 31st, it was agreed to approve of a scheme submitted by the National Electric Supply Corporation to install plant for the provision of an electricity supply for the town.

Plymouth.—Loan Sanction.—The Electricity Committee has received sanction to a loan of £7,450 for converting plant.

Salford.—Electricity in Bulk.—The Electricity Committee has passed a resolution agreeing, in accordance with the recommendation of the South-East Lancashire Electricity Advisory Board, as a temporary arrangement, to provide Eccles Corporation with a bulk supply of electricity during the forthcoming winter.

South Africa.—Fort Beaufort (Cape Province).—The Municipal Council proposes to raise a loan of £8,000 for the provision of an electric lighting scheme.

Dorarecht (Cape Province).—The Corporation has decided to expend £6,500 on an electric lighting scheme.

Hope Town (Cape Province).—A ratepayers' meeting has adopted Mr. Val Davies's electric lighting scheme at a cost of £7,000.

Wynberg (near Cape Town).—The Municipality proposes to spend £9,000 on transformers and cables.

Special Orders.—Application has been made by the Electrical Distribution of Yorkshire, Ltd., for Special Orders authorising it to supply electricity in a number of urban and rural districts in the West Riding.

Application has been made to the Electricity Commissioners by the Urban District Council of Colwyn Bay and Colwyn to amend the Colwyn Bay and Colwyn Electricity (Extension) Order, by inserting provisions authorising the Council to charge certain maximum prices for electricity supply in the areas to be added under the Order.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them for the supply of electricity by the Lancashire Electric Power Co., in parts of the rural districts of Blackburn, Burnley, and Clitheroe.

Stretford.—Electricity Charges.—The Electricity Committee has decided that the scale of the basic tariff charges for power shall be amended, and that in lieu of a fixed charge of 25s. per h.p. of measured demand per quarter, the charge shall be 13s. 4d. per h.p., plus a running charge of .35 pence per kWh for energy as metered; also that the minimum consumption required under the scale shall be abolished.

New Plant.—The Committee is to purchase a 250-kW rotary converter, at an approximate cost of £1,700, for the purpose of giving an additional supply of electricity to Messrs. W. T. Glover & Co., Ltd.

Tarporley. — Scheme Approved. — The Urban District Council has given its consent to the application of Chester Corporation for a Special Order to supply electricity in the Council's area.

United States.—Electrical Development.—Contracts for the installation of a complete generating set for the new power plant of the Comal Power Co., a subsidiary of the San Antonio Public Service Co., at New Braunfield, Texas, have been awarded to the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania. Included in the equipment is a 45,000-h.p. steam turbine and a 30,000-kW, 13,000-V generator. The plant, which will cost about $3,000,000, is expected to be completed within a year. It is designed to use powdered coal and will utilise the low-grade coal or lignite mined in the vicinity.—*Power.*

Installation of the second 30,000-kW unit of the new 200,000-kW power station of the Metropolitan Edison Co. on the Susquehanna River at Middletown, Pa., was recently commenced. The first set was placed in operation early this year, and the second is expected to be ready for service in March, 1926.—*Electrical World.*

Wakefield.—Loan Sanctioned.—The Town Council has received sanction to a loan of £15,000 for mains and services.

Wirral.—Electricity Supply.—The Electricity Committee of the Rural District Council, after considering the offer of the Birkenhead Electricity Committee to supply the whole of the parishes in Wirral with electricity at a cost of 6½d. per kWh (inclusive of the distribution charges, cables, &c.), has declined the offer and has decided to proceed with its own scheme at a cost of £180,000. Under this arrangement, the Wirral authority will obtain bulk supplies from Wallasey Corporation and the Mersey Power Co., Ltd., Ellesmere Port.

Tramway and Railway Notes.

Aberdeen.—Year's Working.—The report on the working of the Corporation tramway undertaking (general manager: Mr. W. Forbes) for the year ended May 31st last shows a total income of £189,247, as compared with £181,985 in 1923-24. Working expenses increased from £142,808 to £150,691, and there was a gross profit of £38,556 (£39,177), to which was added interest on investments of £5,290, making a total of £43,846. Capital charges absorbed £43,407, leaving a net surplus of £438 as compared with £2,875 in the preceding year. The capital expenditure during the year amounted to £30,247, of which £14,754 was spent on permanent way. The number of passengers carried increased by 1,930,554 to 43,201,580, and the car-miles run from 2,436,794 to 2,675,785. The extension of the Queen's Road route to Hazlehead was completed during the year. The fiftieth anniversary of the undertaking was celebrated on September 1st, 1924.

Blackpool.—Tramway Improvements.—The Corporation will shortly commence a road improvement scheme in connection with its Fleetwood tramway route. In Lord Street and North Albert Street, Fleetwood, the pillars carrying the overhead wires for the tramway are to be moved from the centre of the roadway to the side, and, in addition, the two sets of lines, which are now 10 ft. apart, are to be moved closer together.

Burnley.—Year's Working.—The report on the working of the Corporation tramway undertaking (general manager: Mr. H. Mozley) for the year ended March 31st last shows a total revenue of £165,620, as compared with £159,893 in the preceding year. Working expenses increased from £123,113 to £130,800, leaving a gross profit of £34,819 (£36,780). After deducting capital charges, and a loss on the motor-omnibus system of £165, there was a net surplus of £12,352, which was transferred to the relaying and renewals account. The previous year's working resulted in a surplus of £15,065. The number of passengers carried increased from 21,758,743 to 23,550,878, and the car-miles run from 1,789,406 to 1,902,058.

Continental.—Germany.—A proposal that the railways in Wurtemburg should be electrified at the same time as those in Baden and Bavaria has been submitted to the Reichstag.

Italy.—The Società dei Tramvie Elettriche Provincia di Imperia has secured a concession for the construction of an electric tramway in the town of Imperia. The steam tramway between Caldiero and Tregnano is also to be converted to electric traction.

Japan.—New Tramways.—A petition has been presented to the Hyogo Prefectural Office by Mr. K. Morimoto, of Osaka, and others for permission to lay a tramway between Koshiki, on the Hankyu line, and Uchide, *via* Kurakuen. The line would cover a distance of 2.8 miles, and the promoters intend to start a company with an authorised capital of y. 500,000. A tramway between Kurakuen and Kurakuen-guchi has already been sanctioned by the Kencho.—*Eastern Engineering.*

Leeds.—Reduction of Fares.—The City Council has decided to reduce the tramway fares from 2½d. to 2d. and 4d. to 3d., and so on *pro rata*, with a maximum through fare between the city and any terminus (except Morley) of 3d. It is estimated that the reductions are equivalent to a loss of revenue of approximately £50,000 per annum.

London.—Piccadilly Station Progress.—Good progress is being made with the construction of the new tube station at Piccadilly Circus. On the site where "Eros" stood, a working shaft has been driven down to a depth of 26 ft., and from the bottom of this, the narrow "pilot tunnel" of the main escalator shaft is already bored to a further depth of 42 ft. This shaft will house three moving stairways abreast. At the lower end of it a landing is now being constructed, and from this point two pairs of escalators will connect with the Bakerloo and Piccadilly lines. An area of 15,000 sq. ft. will be devoted to the booking hall. The reconstruction of this station is one of the biggest schemes included in the Underground Company's programme of new works. The work is not expected to be complete before the end of 1926, but then the new station will be able to handle 50,000,000 passengers annually.

One-Man Tramcars.—The Hanwell to Brentford route of the London United Tramways is now entirely operated by tramcars of the one-man type, and the service has been increased by 50 per cent. One of the principal features of interest of the new cars is the automatic doors which, being interlocked with the "steps," cause the latter to fall into position when the car stops and fold up again before the car re-starts. The driver is unable to start until the doors are closed, and it is also impossible for passengers to open the doors whilst the car is in motion.

Worcester.—Railless Cars.—A recommendation has been made to the City Council in favour of giving authority to the Streets Committee to apply for Parliamentary powers to work the tramway, to convert it to the railless-car system, and to provide a fleet of omnibuses in the city and outside on routes approved by the Ministry. A report has been prepared by Mr. Alfred Baker, manager of Birmingham Corporation tramways.

Telegraph and Telephone Notes.

China.—Radio Development.—The Japanese Foreign Office states that the Peking Government has approached Mr. Yoshizawa, the Japanese Minister in Peking, regarding the settlement of the radio question. China, it appears, proposes the raising of a joint Japanese-American loan for the purpose of constructing a Chinese radio system in conjunction with the existing Japanese system. Owing, however, to the vagueness of the Chinese suggestions, Japan does not intend to take any action until further details are received from Peking.—*Reuter* (Tokio).

Germany.—Cable Loading.—Herr Wagner, the president of the Telegraph Institute of Berlin, in the course of a recent address on "Trans-Oceanic Telegraphy," referred to the Western Electric Co.'s method of overcoming the effect of capacity by a self-induction device, surrounding the whole length of cable with a thin band of "permalloy." He said that the technical laboratory of the German Telegraphs, in collaboration with a number of electrical concerns, had produced an alloy containing only 40 per cent. nickel which could be used in substitution for "permalloy." This new alloy is, states *Elektrotechnik und Maschinenbau*, being used in the German-American cable which is being laid by the German Transatlantic Cable Co.

International Telegraph Conference.—Paris Meeting.—The International Telegraphic Conference, briefly referred to last week, was formally opened at the Sorbonne in Paris on September 1st. The French Minister for Commerce and Posts, M. Chaumet, welcomed the delegates and the commercial delegate for Portugal, where the last conference was held, replied. The leading French delegate, M. Daletete, then took the chair and the conference split itself into four committees to deal with the different subjects on the agenda, the most important of which are an increase in tariffs and code messages. As regards the latter, there are various motions on the agenda for changing the existing classifications into clear "code" and cipher; at present pronounceable non-dictionary words are classed as "code" and must not exceed ten letters, while unpronounceable words (including figures) are "cipher" and must not exceed five letters. One proposal is to class all words in letters, whether pronounceable or not, as "groups" to be treated as code and to limit cipher to figures. Another suggestion is equivalent to the abolition of "code" and the classification of all non-dictionary words as "cipher." The former course would result in a reduction of cost, while the latter would have an inverse effect. It is understood that the British and Dominions delegations are opposed to the principle of an increase of tariffs in any form, and it is expected that there will be a big fight on this matter. Another question is the priority of telegrams; at present no priority is allowed for what may be called "life and death telegrams" affecting the safety of persons, and it is proposed to award priority in this connection. International telephone rates and the relations between wireless and cables are also on the agenda. French is the only language which may be used at the Conference and no interpreters will be allowed; this will handicap delegates who are not fluent French speakers. It has been decided that cable companies and countries which are not members of the Telegraphic Union shall have a deliberating voice in the Committees, but no voting power; the Committee work is likely to occupy the Conference until next month. No decision has so far been reached as regards Press communications.—*Reuter* (Paris).

Italy.—New Telephone Cable.—A new telephone trunk line has recently been completed between Naples and Catanzaro, a distance of approximately 190 miles. New international lines have also lately been inaugurated between Milan and Geneva and between Milan and Berne. Of the latter line about 100 miles is in Italian territory, and part (nearly three miles) is laid in the bed of Lake Maggiori.

Madagascar.—Two radio-telegraph stations have recently been established by the French Colonial authorities—one at Bamako in French Africa and one at Tananarivo, Madagascar. The plant at the Bamako station, which has a capacity of 100 kW, comprises two Bethenod-Latour high-frequency alternators which are operated alternately. Messages can also be sent out by means of spark emitters, this being intended to meet the requirements of navigation and explorers. The necessary power is supplied by two Diesel engines and two steam engines. The power plant, which is adapted to use wood as fuel, is also being utilised to supply the town of Bamako with electricity for lighting purposes until this can be taken over by the hydro-electric station which is being established on the Niger. The plant at Tananarivo is similar to that at Bamako, except that it has a capacity of 150 kW, the distance from Paris being about 5,000 miles.

South America.—Telegraph Concession.—Following the arrival of Señor Francisco Becerra, a representative of the Marconi Company from Argentina, a fortnight ago, *The Times* Lima correspondent announces that the company has in mind the initiation of a series of improvements and extensions of the existing Peruvian postal, telegraph, and wireless services. The scheme, which involves an expenditure of approximately £500,000, includes the erection of a powerful beam station linking up Lima, Buenos Aires, Bogotá, Rio de Janeiro, and the United States. A proposed 25-year concession to the company is under discussion by Congress, and it is thought that the necessary approval will soon be given.

United States.—Aircraft Telephony.—Successful two-way radio telephone communication between aeroplanes and the ground was established in the anti-aircraft test manœuvres just concluded at Fort Tilden, a device having been perfected at the radio laboratories of the signal corps at Camp Vail, New Jersey. A helmet is worn by the aviator, cutting off the noise of the aero-engine and the difficulties caused by the engine's spark system, which had previously prevented successful attempts at communication. The aviators using the radio telephone could hear the land station from a distance of eighty miles, while the airman could talk with the station from a distance of thirty miles.—*Reuter* (New York).

Radio Notes.

Aerials.—Control by Public Authorities.—On Tuesday last the Public Health Act, 1925, came into operation. Section 26 of this Act empowers local authorities to make by-laws for the prevention of danger or obstruction in streets or public places by aerials used in connection with radio-telephony and telegraphy.

Interference Elimination.—Wavelength Tests.—British and European broadcasting stations are continuing their night tests of the efficiency of the newly-allotted wavelengths as a means of preventing interference between stations. So far as Great Britain is concerned, results are regarded as satisfactory notwithstanding the fact that some disturbance was experienced from unexpected sources. Equilibrium will doubtless be established by the time the test transmissions have ended, but wavelengths will probably have to be modified still further before an amicable understanding is arrived at. It is to be noted that the new wavelengths are not based on length, but on frequency, thus introducing fractions of a metre. The last test transmission will take place on Monday night, September 14th.

Radio Exhibition.—Last year's radio exhibition in Berlin showed the restrictions of the German postal authorities to have been somewhat severe. Government regulations were modified on September 1st, 1925, however, so as to permit the production of apparatus that will receive on any wavelength up to 3,000 metres, and the change was made known to manufacturers in time to allow them to prepare entirely new apparatus for the show which is being held in Berlin from September 4th to 13th. The granting of amateur transmitting licences is also under consideration.

United States.—Amateurs' Convention.—The third International Convention of the American Radio Relay League was held at Chicago, concluding on August 21st, and aroused much enthusiasm, the subjects dealt with by prominent radio authorities covering a usefully wide range. A plea was made for more attention to be given to the use of efficient transmitters, in order to reduce the power expended. Mr. J. C. Warner, of the American G.E.C., announced the completion of work that will assist the standardisation of valve bases and sockets.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Melbourne.—November 9th. Electricity Commission of Victoria. 6,600-V and l.p. lead-covered and armoured cable. 22,000-V, 3-core cable and accessories. (September 4th.)

P.M.G.'s Department. October 27th. Telephone transmitters and parts.*

November 10th. Telephone receivers and parts.

November 17th. Magneto-automatic junction material.*

Birkenhead.—September 17th. Mersey Railway Co. Stores, *viz.* :—Electrical sundries, &c., and metallic and carbon-filament lamps and fittings. Form of tender from Mr. J. Shaw, general manager and secretary, Central Station, Birkenhead.

Brentford.—September 22nd. Board of Guardians. Electric wiring, &c., at the Institution, Warkworth House, Isleworth. (September 4th.)

Croydon.—September 14th. Board of Guardians. Six months' supplies of electrical fittings and accessories. Mr. N. P. Walker, clerk to the Guardians, Mayday Road, Thornton Heath.

Dundee.—Town Council. Electric lighting work at Strathmore Avenue housing scheme. Particulars from Mr. Geo. Baxter, city engineer.

Gainsborough.—October 17th. Urban District Council. Generating plant, mains, transformers, and meters. (September 4th.)

Halifax.—September 15th. Board of Guardians. Electrical fittings (excluding electric lamps) required at several institutions during the six months ending March 31st, 1926. Form of tender from Mr. A. T. Longbottom, clerk to Board of Guardians, Union Offices, Carlton Street.

India.—India Store Department. September 15th. Accumulator and alkaline cells. (September 4th.)

Lanark.—Education Authority. Electric lighting work at school extension at Whifflet. Mr. John Stewart, master of works, 20, Albert Street, Motherwell.

London.—H.M. Office of Works.—September 15th. Supply of electrical and mechanical engineering labour-in-daywork in Cardiff. (August 28th.)

September 24th. Electric wiring installation at the White Wing, British Museum. (September 4th.)

Metropolitan Asylums Board.—October 7th. Installation of a fire-alarm system at Tooting Bec Hospital. (September 4th.)

Islington.—September 17th. St. Mary's Board of Guardians. Electrical supplies for six months. Mr. A. King, clerk, St. John's Road, N.19.

Southwark.—September 23rd. Electricity Department. Twelve months' supply of electric cables. (See this issue.)

Hammersmith.—September 23rd. Electricity Department. Construction of an underground water-tight ferro-concrete pump chamber and overhead pump house at Chancellor's Wharf, also supply of coal for the electricity works. Specifications from the borough electrical engineer.

New Zealand.—Christchurch.—January 5th, 1926. Drainage Board. Three electric sewage pumps. (AX. 2349.)*

Northampton.—The Corporation is inviting tenders for new electric lighting arrangements at the Town Hall.

South Africa.—Johannesburg.—S.A. Railways. October 15th. Incandescent lamps.*

Warrington.—September 12th. Electricity and Tramways Committee. E.h.p. and l.p. paper and lead covered cables. (See this issue.)

September 22nd. Board of Guardians. Six months' electrical supplies for the Whitecross Institution, Warrington, and the cottage homes, Padgate. Particulars from the clerk.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Battery Contracts.—The Edison Swan Electric Co., Ltd., has received contracts for inert cells from the Air Ministry, and for inert batteries from the Admiralty; for dry cells from the Metropolitan Railway Co.; and for dry batteries from the Irish Free State Army.

Bournemouth.—Bournemouth Corporation last week unanimously decided to accept an English tender for 600 tons of steel rails for tramway reconstruction, at a cost of £1,200 more than a Belgian's firm's offer. It was stated that five tenders—three English, one German, and one Belgian—had been received.

Burton-on-Trent.—Electricity Committee. Accepted:—

Two 250-kVA transformers (£478).—Metropolitan-Vickers Electrical Co., Ltd.

Extension of electricity main to Barton (£7,162).—Johnson & Phillips, Ltd.

Darlington.—Electricity Committee. Accepted:—

6,000-kW turbo-alternator (£21,021).—Fraser & Chalmers Engineering Works.

Two boilers (£19,890).—Babcock & Wilcox, Ltd.

Derby.—Corporation. Accepted:—

Erection of patent automatic floatswitch, sewage-lifting plant with automatic electrically-driven air-compressing plant, with duplicate sets of electrically-driven storm-water pumping sets, fitted with automatic control gear, for the Cowsley housing estate.—Daniel Adamson & Co., Ltd.

Dundee.—Housing Committee. Recommended:—

Electrical work at new houses:—Stirling Park: D. J. Macdonald, Ltd. (£200); Lawton: Hutton & Co. (£1,752).

Farnborough.—Air Ministry. Accepted:—

2,100-amp.-hr. battery, with charging apparatus.—Alton Battery Co., Ltd.

Fleetwood. Accepted:—

Installing electric lighting in semi-detached houses in Agnew Road.—W. Roskell and E. Swarbrick.

India.—India Store Department.

Spares for 750-b.h.p. Diesel oil engine (Rs. 18,590), English Electric Co., Ltd.; 25 a.c. ceiling fans (Rs. 2,938).—General Electric Co. (India), Ltd.—*Indian Engineering.*

Lamp Contracts.—The Admiralty has placed a contract for 99,100 "Osram" vacuum lamps, 3,161 "Osram" gas-filled lamps and 150,700 "Robertson" filament lamps with the General Electric Co., Ltd. The Southern Railway has accepted a tender for a six months' supply of "Mazda" lamps from the British Thomson-Houston Co., Ltd.; and for a six months' supply of "Osram" metal-filament vacuum and gasfilled lamps and "Robertson" carbon-filament lamps from the General Electric Co., Ltd.; it has also placed a six months' contract for vacuum and gas-filled-type lamps with the Siemens and English Electric Lamp Co., Ltd.

London.—Metropolitan Asylums Board.—Institution Committee. Recommended:—

Alterations and extensions to electric lighting at North-Eastern Hospital:—

Alpha Manufacturing & Electrical Co., Ltd. (Recommended.)	**£465**
Smethurst & Co. (London), Ltd.	521
Riddle & Goddard, Ltd.	557
Toy & Winslow	585
A. Hawkins & Sons	630
T. Clarke & Co., Ltd.	636
L. J. Godfrey	639
Berry Bros.	650
Coley & Swinnerton, Ltd.	723
H. R. Hall & Co.	804
North Metropolitan Electric Power Supply Co.	812
M. Greenwood & Son, Ltd.	821
Best & Wilson	880

Overhauling electric light engines at St. Luke's Hospital (£346).—J. Downton & Co.

Manchester.—Sewers Committee. Accepted:—

Two 25-b.h.p. motors, &c., for Withington works.—Lancashire Dynamo and Motor Co., Ltd.

Tramways Committee. Accepted:—

Steel girder rails and fishplates.—Cargo Fleet Iron Co., Ltd.

Steel clip plates—R. White & Sons.

Newport (Mon.).—Great Western Railway Co.

Five electric capstans at South Quay.—Stothert & Pitt, Ltd.

South Africa.—Durban.—Corporation. Accepted:—

Two 100-kVA 3-phase transformers (£207); two 50-kVA ditto, ditto (£129); three e.h.p. switch cubicles for Hewitt Road sub-station (£317); three tons 19/14 bare copper wire (£266).—T. Barlow & Sons, Ltd.

Eight 250-kVA transformers (£1,376).—Bartle & Co., Ltd.

Two tons No. 10 S.W.G. bare copper wire (£163); two tons No. 8 ditto (£163).—W. T. Henley's (S.A.) Telegraph Works Co., Ltd.

One 500-kW automatic rotary converter equipment (£4,090); fifteen 100-kVA single-phase transformers (£1,207); e.h.p. and h.p. switchgear for Mitchell Park and Evans Road sub-stations (£2,525).—Metropolitan-Vickers Electrical Co., Ltd.—*South African Power Engineer.*

Johannesburg.—Contracts approximating £25,000 have been placed by the Electricity Supply Commission of South Africa for a hydro-electric station at Sabie, Eastern Transvaal:—

Pipe line and accessories and transmission lines.—Dowson & Dobson.

Pelton wheels, generators, crane and lighting set.—Reunert & Lenz.

Transformers and accessories; switchgear, cables, and telephones; lighting installation and test instruments.—Siemens Bros. & Co., Ltd.

Workshop equipment.—British General Electric Co., Ltd.

—*South African Mining and Engineering Journal.*

Singapore.—Municipal Commissioners. Accepted:—

Patent automatic floatswitch sewage-lifting plant, comprising pneumatic sewage ejectors in c.i. tubing, operated by electrically-driven air compressing plant automatically controlled, at junction of Jalan Sultan and Northbridge Road.—Daniel Adamson & Co., Ltd.

Forthcoming Events.

Industrial Welfare Society.—September 11th to 16th. Annual Lecture Conference. At Balliol College, Oxford.

N.A.R.M.A.T. Wireless Exhibition.—Royal Albert Hall, S.W. September 12th-23rd.

Institution of the Rubber Industry.—Monday, September 14th. At the Engineers' Club, Coventry Street, W. At 8 p.m. Paper on "Some Rubber Compounding Tendencies," by Mr. W. B. Wiegand.

Institution of Public Lighting Engineers.—September 14th-16th. At Leeds. Annual meeting and conference.

Notes.

Gas-Men and the "Menace of Electrical Advancement."—Our readers will be interested in the following copy of a "Private and Confidential" communication which was addressed to members of the Society of British Gas Industries by the Chairman of the Council under date August 25th, 1925:—

Dear Sirs,

Our members on the Executive Committee of the British Commercial Gas Association were summoned to an emergency meeting at the offices of the Association on July 29th. I attended and Mr. Tilley also was present at a full meeting of the Executive.

The object of the meeting was to impress upon the members the urgent necessity of a special publicity campaign to be carried out in October, to counteract the activities of the British Electrical Manufacturers' Association who are proposing to run a very intensive publicity campaign in the autumn, with a view to gaining public favour to the Government scheme for subsidising and development of electrical power stations, and the industry generally.

It was suggested that an appeal should be issued to all gas undertakings for a special subscription of 2s. per million to cover the cost of the campaign, which is estimated at about £25,000. Although the B.C.G.A. have not made any special appeal to the Society for financial support they have intimated that any help and co-operation we can give will be very much appreciated.

I will not labour you in this letter with details of the expenditure suggested, or the outline suggestions which were placed before us. Briefly, however, they include:—

1. Special advertising campaign during October.
2. An essay competition.
3. Special gas week throughout the country.
4. A national function at Wembley on a large scale.

The details of the whole scheme are most excellent in every way and very comprehensive. A copy of the complete scheme may be seen at these offices by those who are interested.

The scheme was unanimously approved by the General Committee of the B.C.G.A. at the meeting in the afternoon, and an appeal is being sent out to the industry.

In view of the urgency of this matter, I called a special meeting of our Council on the 13th inst. to lay this proposal before them, at which meeting it was decided to send out an appeal to our members, and I therefore do not hesitate to ask for your assistance.

The menace of electrical advancement through what we consider unfair channels is a very live one, and we cannot allow the activities of our rivals to proceed without vigorously combating the same. This is an opportunity for our Society to show that it is alive to the situation and I therefore beg your generous support, which I shall greatly appreciate.

Would you be good enough to intimate to our secretary the amount of your subscription, which should be received before the middle of September.

Believe me, yours faithfully,
B. B. Waller,
Chairman of the Council.

Electricity v. Gas.—There were frequent references to the competition of electricity with gas at the annual meeting of the Gas Managers' Association of Scotland held at Dunfermline last week. Mr. James Campbell, gas manager, Dunfermline, in his presidential address, said it was being urged that cheap electrical power would be a cure for the evil of unemployment; and yet on the north-east coast of England, where there were the largest super-stations in this country, belonging to an electricity undertaking probably as up-to-date and efficient as any in the world, and supplying current over a large area at very low rates, the depression of industry was as great as, if not greater than, in any other part of the country. The opposition of the gas industry to the proposed subsidising of its rival was in no sense in the spirit of "the dog in the manger," but was conceived entirely from the view that the granting of subsidies to industry was wrong in principle—especially when, as in this case, one industry would be helped at the expense of another in practically the same line of business. That the electrical industry was in no need of help was shown by the dividends paid by the leading companies. All they asked was that each industry should have a fair field, and no favour, and be allowed to work out its development along lines to be decided by its administrators.

Chill Cast Aluminium.—A method of producing chill-cast aluminium articles with a high degree of tensile strength and density is, according to *Aluminium*, being developed by a German firm. It is claimed that these castings can be produced to limits of about ± 0.01 in., and that even in thin walls down to about 0.04 in. in thickness, the full density and tensile strength of the remainder of the casting can be maintained.

Italian Electrical Congress.—The Associazione Nazionale Industrie Elettriche is holding its first congress in Milan on October 2nd, 3rd, and 4th. Among the papers to be read at the meetings are one on "Tariffs, Prices and Payments for Electrical Energy," by Sig. Giacinto Motta, and one on "The Incidence of Electric Power Costs on Industrial Production," by Sig. Renzo Norsi. Visits are to be paid to the Adda power station at Paderno of the Società Edison and the hydro-electric station in course of construction at Chiavenna for the Società Disalpina.

Remagnetising Magnetos. — A correspondent asks if any reader will furnish particulars of the best apparatus for remagnetising magnetos, saying if a large current is necessary, and of the best method and apparatus for magnetising 'phones.

Educational.—London County Council School of Engineering and Navigation, High Street, Poplar, E.14.—Major and minor courses in electrical engineering (session 1925-6) will commence on September 28th (enrolment during week commencing September 21st). Prospectuses and full particulars can be obtained on application to the secretary at the school. (See our advertisement pages to-day.)

We have received the calendar of the Royal Technical College of Glasgow for the 1925-26 session. The electrical engineering department provides preparation courses for the B.Sc. engineering degree and the College Diploma. Evening-class courses are also provided in electrical engineering for students who have already attended satisfactorily a course of electricity and magnetism.

The 1925-26 session of the College of Technology, Manchester, begins on October 8th. Included in the prospectus are university courses and part-time day and evening courses in electrical engineering and allied subjects. The electrical engineering syllabus covers an extensive field of study, and the college is equipped with up-to-date electrical laboratories.

The Polytechnic. — Special courses in wireless and high-frequency engineering have been arranged for the coming session at the Polytechnic, Regent Street, London, by the electrical engineering department. The courses extend over three years and cover the technique of radio communication and testing. A licence has been obtained, and instruction will be given in the operation of a valve transmitter. Students may enrol on September 16th and onwards between 6 and 8.30 p.m. Mr. Philip Kemp, M.Sc., M.I.E.E., is head of the department, and Capt. W. H. Date, B.Sc., A.M.I.E.E., is head of the wireless section.

B.E.S.A. Specification. — The British Engineering Standards Association has issued a British standard schedule of steel for die blocks for drop forging. This schedule, which has been drawn up in co-operation with the Association of Drop Forgers and Stampers, the Alloy Steelmakers' Association, and the National Federation of Iron and Steel Manufacturers, contains specifications for four classes of steel for the die blocks, covering chemical composition, heat treatment and mechanical tests. Copies of this publication may be obtained from the B.E.S.A. Publication Department, 28, Victoria Street, London, S.W.1, price 1s. 2d. post free.

Fatalities.—On September 3rd, a gas-holder at the Rugby works of the British Thomson-Houston Co., Ltd., containing gas for use in the manufacture of incandescent lamps, exploded, causing the death of one man and injuries to three others. A number of workpeople had remarkable escapes from being injured by large pieces of metal hurled for long distances by the explosion.

Electroculture.—An increased yield of 51 per cent. has been obtained in experiments in growing potatoes with the help of electricity at Stubbington, a village near Portsmouth.

The tests were carried out by the schoolmaster, Mr. R. A. Rushforth, with apparatus of his own invention, on a piece of ground tilled by the scholars.

The *Daily Mail* states that when the potatoes which had been grown with and without electricity were dug up the yield was as follows:—

Variety.	Average yield per set. With electricity. lb.	Without. lb.	Per cent. increase.
King Edward	2.44	1.8	35.3
Sharp's Express ...	2. 0	1.2	66.6
		Net increase per cent.	51.0

The apparatus cost about 24s. and could be made by any handyman. The cost of the electricity was 7d. for the season. Mr. Rushforth is confident that the same apparatus would do for a field as well as for a small plot, the additional wire being the only extra requisite.

The potatoes electrically grown were not affected by the usual pests.

Artificial Crop-drying.—The following note appears in *The Implement and Machinery Review* for September 1st:—"The bad weather has done a good turn to the advocates of artificial crop-drying. . . . In one instance a farmer with 1,000 acres under arable, told us that he had 100 acres of corn and did not know what to do with it owing to the rain. On our advice he got in touch with the advocates of artificial crop-drying, and one day during the very unsettled spell of wet weather which marked the earlier and middle days of August, he told us that he had just dried out satisfactorily three stacks of barley and was that day turning his attention to a large stack of oats. What he would have done with the crops under the circumstances had he been denied the assistance of the artificial drier, he did not care to contemplate. Certainly until he got in touch with the makers of the plant he was in a predicament, but he had since found that the artificial drier worked fully up to expectations and had been a means of saving his crops in the wet weather. As many people have decried the artificial method of handling crops as not worth the trouble, we give the foregoing testimony for what it is worth, with the addendum that it comes from a reliable source, the farmer in question being a resourceful man farming on a large scale and employing modern implements and machinery, including steam tackle and tractors, to the full."

Electrical Dishwashers in the States.—Suddenly—almost overnight it would seem—the electric refrigerator has caught the fancy of the American public, and sales of this device are now taxing the capacity of the makers. The electric ice-box holds the imagination of the public as being a near-magic substitute for an at-best troublesome item of household equipment. But in the electric-appliance family there is another Cinderella, also destined to blossom forth at the touch of that belated prince, Popular Interest. This is the electric dishwasher, a device certainly due soon to come into its own in public favour. For the dishwasher is the one electric appliance yet little known or accepted by the public, which has an inherent strong "interest appeal" an appeal as fundamental as its own solution of the problem of 15 hours' home drudgery a week. Properly promoted before the public, the idea of "washing dishes by electricity" possesses certain of the spectacular elements of electric refrigeration and even radio—in ability to stimulate popular interest and to bring new faces into the electric shop. Several dealers we know of are building their full publicity plans about the dishwasher as the magic wand to whisk away the housewife's troubles. These merchants are putting advertising appropriations into this device as a "leader" and as a novelty which will create fresh interest in their general appliance lines—besides selling dishwashers also. Their lead in thus dramatising the dishwasher is one which electrical merchants generally should not overlook. For electrical shops everywhere can well utilise the appeal of this useful appliance as a re-creator of popular interest in the whole electrical idea.—*Electrical Merchandising.*

Appointments Vacant.—Sales engineer (£300) for the Doncaster Corporation electricity department; charge engineer for the Gravesend Corporation electricity works; shift engineer for Swindon Corporation electricity department; two plumber-jointers for the St. Helens Corporation electricity department; power station superintendent for the City of Port Elizabeth electricity undertaking; generating works superintendent (£569), for the Croydon Corporation electricity department. (See our advertisement pages to-day.)

Electric Taxicab Possibilities.—Under this title the *Commercial Motor* suggests the revival of the use of battery passenger cabs in London, considering that the improvements which have been made in the past few years have made this type of vehicle very reliable and satisfactory. Our contemporary says that one of the leading qualifications of the electric vehicle is its rapidity in traffic. This is due both to a high rate of acceleration and the extreme ease of control, and in these respects it cannot be rivalled by the ordinary petrol vehicle. There would, therefore, appear to be a very good case for the electric taxicab, particularly as its smooth running, silence, cleanliness and freedom from smell should appeal to a large class of user. The ordinary taxicab requires a trained staff for its upkeep, but the maintenance of the battery electric taxicab is one of the simplest of tasks. Occasional lubrication at only a few points and cleaning are the main items, the charging, of course, being in the hands of the officials at the power stations. Charging would take place late at night or very early in the morning, when there would be no peak loads, and operating on smooth roads with comparatively few hills (conditions which occur particularly in the Central London area), the mileage per charge should be considerable. The difficulty which was experienced years ago in securing an efficient staff for the maintenance of batteries no longer exists, while there is much fuller knowledge on the whole subject, so that the undue cost incurred under this head is a thing of the past.

New Plant at Halifax.—On the afternoon of September 3rd a new 10,000-kW turbo-alternator at the Halifax Corporation's electric power station at Foundry Street, was started officially by Alderman Sutcliffe, vice-chairman of the Corporation Electricity Committee, and Mrs. Sutcliffe. The machine was supplied by the British Thomson-Houston Co., Ltd., and runs at 3,000 r.p.m. Many visitors were present at the ceremony, including Mr. J. P. Gregory, of the British Thomson-Houston Co., Ltd., who presented Mrs. Sutcliffe with a gold wrist watch. Accompanying Mr. Gregory was Mr. J. Reid, representing Messrs. Worthington-Simpson, Ltd., builders of the condensing plant. Thanks to the "starters" were expressed by Councillors Crabtree and Barrett, who remarked that the Committee had studied very closely the different types of plant to be installed, including 30,000-kW equipment, but had realised what a vast amount of machinery would be standing in the event of such plant getting out of order, and they believed they had selected the "top line" of plant for Halifax or any other town. Alderman Sutcliffe, responding, said he fancied that if progress in the department continued on present lines they would soon have to consider a new station. The party was subsequently conducted over the works, and tea was served later at the White Swan Hotel, under the chairmanship of Alderman Hey, chairman of the Electricity Committee. Alderman Longbottom, proposing the toast of the Tramways and Electricity Committee and the chairman and vice-chairman, said the present outstanding capital on the undertaking was £466,614, and the day was not far distant when they would have to consider whether or not they were on right lines in taking money from the department for relief of rates rather than using it in quicker liquidation of capital. They were all delighted with the new scheme for linking up electricity supply between Halifax and Huddersfield, to the mutual benefit of both towns. The day had come when municipalities must set aside parochial feelings, and he welcomed the scheme. Alderman Hey replied, and Alderman Sutcliffe paid tribute to Mr. Rogerson, the borough electrical engineer, and his staff, and said that without co-operation between the chief and his staff the department could not have progressed as it had done. The Mayor proposed a toast to the contractors, and complimented them on the results of their work. Mr. J. P. Gregory, responding, said the initiative shown at Halifax was evidence that Mr. Rogerson was not only a sound practical engineer, but also a man of commercial ability—proof of which was particularly found in the showroom of the department. In reply to a toast, Mr. Rogerson said he did not think there was a nut or a split pin in the works that had been in when he came 24 years ago. The work throughout had been very enjoyable, more particularly as he had had in Alderman Hey a chairman who was keenly interested in the department, and realised his own personal responsibility.

United States Electrical Manufacturing Plant.—In tables published in the *Electrical World*, taken from the United States census of manufacturers, 1923, particulars are given concerning the numbers, types, and h.p. of the prime movers in use in the electrical manufacturing industry; and also of the coal consumed and the cost of materials, &c. The total number of prime movers in use in 1923 is shown as 52,410, representing 480,268 h.p., against 17,572 machines totalling 226,320 h.p. in 1914. In this total are included 249 steam engines and turbines, 60 internal-combustion engines, 25 water turbines, and 52,076 electric motors (totalling 297,838 h.p.), driven by purchased energy. The number of electric motors driven by energy generated on the establishments is shown as 43,575, aggregating 233,419 h.p. In 1914 the total h.p. of electric motors installed was 262,119, representing 39,568 machines. The amount of coal consumed in the industry during 1923 is shown as 1,417,929 tons, compared with 844,122 tons for 1914. The cost of materials for 1923 is recorded at $548,626,673, against $154,728,076 for 1914. The value of the products is shown as $1,293,001,771 for 1923, as compared with $335,170,194 for 1914.

The Institution of Structural Engineers.—The Council of the Institution has decided that from January 1st next admission to membership of the Institution will be gained by examination only. In the meantime a final opportunity is to be given to those who have some years of practical experience in the profession and who wish to make application for direct admission.

Thermo-Electric Generator.—Experiments are proceeding at Sheffield University with a view to testing the possibility of a new means of generating electricity. According to the *Daily Mail*, Dr. T. F. Wall, head of the Electrical Engineering Department of the University, claims to have obtained, by means of a new process, a form of thermo junction capable of developing about 0.05 volt per junction when heated to the requisite temperature.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

On leaving Croydon to take up his duties as borough electrical engineer at West Hartlepool, Mr. J. H. Parker was presented by the staff and employés of the Croydon Corporation Electricity Works with a gold watch and fitted suit-case. In making the presentation, Mr. A. C. Cramb, engineer and manager of Croydon Electricity Department, referred to the valuable services Mr. Parker had rendered to the undertaking, and wished him every success in his new position.

The Times reports that Mr. C. J. McKenzie, assistant engineer-in-chief of the New Zealand Public Works Department, who is now visiting London, spent five months in Canada and the United States inspecting highways, railroads, marine, hydro-electric, and irrigation works, and will pursue similar investigations in Great Britain and afterwards in France and Italy.

The marriage took place, on September 1st, of Mr. H. W. Tompkins, assistant engineer at the Grays Electricity Works, and Miss N. R. Hills.

Mr. E. E. Smeeton has been appointed power station superintendent in the Cheltenham Corporation electricity department.

Mr. A. B. Blakey, A.M.I.E.E. (manager of the Birmingham office of the Lancashire Dynamo & Motor Co., Ltd., and of the Crypto Electrical Co., Ltd., for 18 years), who has recovered from his illness, has started in business on his own account at 4, Valentine Road, King's Heath, Birmingham.

Mr. W. R. Montgomery, A.M.I.E.E., has resigned his position as resident Midland representative for Messrs. Richard Garrett & Sons, Ltd., to join the Alton Battery Co., Ltd., as manager.

Obituary.—Mr. M. R. Lawrence.—We regret to record the death, which occurred on August 29th, of Mr. Maximilian Robert Lawrence, works manager of the Sterling Telephone and Electric Co., Ltd., Dagenham. Mr. Lawrence was 53 years of age. Previous to taking up his position with the Sterling Company three years ago, he had held managerial posts with well-known engineering concerns, including the Wolseley Tool

and Motor Car Co., Messrs. Vickers, and Burton, Griffiths and Co., Ltd. He was a frequent contributor to the engineering Press and was prominently associated with several engineering institutions.

Will.—The late Mr. A. E. WELLS, managing director of Messrs. Edgar Allen & Co., Ltd., and the Imperial Steel Works, Sheffield, left £49,553 gross, and £46,140 net personalty.

New Companies Registered.

Detex, Ltd. (208,129).—Private company. Registered August 29th. Capital, £600 in 500 8 per cent. cumulative preference shares of £1 each and 400 ordinary shares of 5s. each. Objects: To carry on the business of manufacturers of, agents for, and dealers in wireless apparatus of all kinds, &c. The directors are:—E. L. Conradi, 23, Priory Court, West Hampstead, N.W.6; G. Mellor, 78, Montpelier Road, Hove, Sussex. Solicitors: H. L. Lumley & Co., 35, Piccadilly, W. Registered office: 59, New Oxford Street, W.C.1.

Spectrome, Ltd. (208,134).—Private company. Registered August 29th. Capital, £1,000 in 900 7 per cent. cumulative participating preference shares of £1 each and 2,000 deferred shares of 1s. each. Objects: To carry on the business of engineers, advisers, experts, consultants and contractors in connection with wireless telephony or telegraphy, also tele-optical and any allied or other sections of science, &c. The directors are:—H. S. Taylor, 39, Hillmarton Road, N.7; A. E. Cooke, 53, Graham Road, E.8. Qualification, £50 shares. Remuneration as fixed by the company. Secretary: S. H. Taylor. Registered office: 39, Hillmarton Road, N.7.

Red Seal Products, Ltd. (208,196).—Private company. Registered September 2nd. Capital, £1,000 in £1 shares. Objects: To adopt agreements (1) with Sexton-Barnes, Ltd., (2) with C. Cassell, and (3) with L. B. Tickle and G. F. Pickering, and to carry on the business of merchants, dealers, factors and sales agents of radio instruments, fittings, apparatus and accessories, and articles particularly of the Red Seal loud speakers. The directors are:—C. Cassell, 30, Torrington Square, W.C.1, merchant; L. B. Tickle, 58, Gonville Road, Thornton Heath, engineer; G. F. Pickering, 33, Cranbourne Gardens, N.W.11, engineer. Qualification, £1. Remuneration, £5 each per annum. Secretary: R. J. Boning. Registered office: 32-34, Theobalds Road, W.C.1.

Telephos (1925), Ltd. (208,225).—Private company. Registered September 3rd. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers, importers or exporters of and dealers in gas and electrical fittings and appliances, and apparatus for wireless telephony, &c. The directors are:—R. H. Bye, 116, Bellingdon Road, Chesham, engineer; Agnes M. Bye, 116, Bellingdon Road, Chesham, secretary; H. L. Down, 6, Sunningfields Crescent, Hendon, N.W., engineer. Qualification, 50 shares. Registered office: The Gardens, Vaughan Road, Harrow.

Roto-Sign Co., Ltd. (208,281).—Private company. Registered September 7th. Capital, £25,000 in £1 shares. Objects: To acquire the business of electric sign manufacturers, electrical and general engineers, illuminating and decorating contractors and general merchants and importers carried on by W. A. McMullen and S. Jarratt at 122, Shaftesbury Avenue, W., as the "Roto-Sign Company." The permanent directors are:—S. Jarratt, 5, Harvard Court, West Hampstead, N.W.6, electrical engineer; and W. A. McMullen, 122, Shaftesbury Avenue, W., electrical engineer. Qualification, £100. Remuneration as fixed by the company. Solicitors: Cooper, King and Co., 6, New Court, Lincoln's Inn, W.C.2.

Avenue Motor Co. (Hull), Ltd. (208,127).—Private company. Registered August 29th. Capital, £1,000 in £1 shares. Objects: To acquire the business now carried on at 84, Prince's Avenue and Henderwell Street, Hull, as the Avenue Motor Co., and to carry on the business of motor garage proprietors, motor hire contractors and motor manufacturers, repairers and dealers, electrical engineers, dealers in all kinds of electrical goods, including wireless, telegraph and telephone apparatus, &c. The directors are:—C. S. Mason, 84, Prince's Avenue, Hull; J. C. Townsley, 105, Park Avenue, Hull. Qualification, £100 shares.

Battery Plates, Ltd. (208,100).—Private company. Registered August 28th. Capital, £500 in £1 shares. Objects: To carry on the business of manufacturers of battery plates, magneto spare parts, magnetos, ignition apparatus, wireless and all classes of electrical apparatus and appliances, &c. The directors are:—P. Forrester, Ballochingle, Blundellsands, Liverpool; J. Myles, 15, Lichfield Drive, Sedgley Park, Manchester, accountant; and W. H. Hodgson, 61, Eccles Old Road, Pendleton, Manchester, electrical engineer. Qualification, £25. Secretary: H. H. Venables. Solicitors: Doughty & Fraser, 17, Market Street, Manchester.

Manchester Magneto Co., Ltd. (208,221).—Private company. Registered September 3rd. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of, and dealers in magnetos and spare parts, ignition, and all classes of electrical apparatus, electricians, electrical engineers, manufacturers of, and dealers in electrical equipment used on motor vehicles, wireless equipment, &c. The permanent directors are:—F. E. Waring, 48, Parrs Wood Avenue, Didsbury, Manchester, engineer; H. V. Barker, 48, Parrs Wood Avenue, Didsbury, Manchester, engineer. Qualification, 100 fully-paid shares. Remuneration as fixed by the company. Solicitor: F. O. S. Leak, 6, John Dalton Street, Manchester. Registered office: 29, Liverpool Road, Manchester.

Official Returns of Electrical Companies.

Edwards & Armstrong, Ltd. — Mortgage dated August 11th, 1925, to secure £1,500, including £950 advanced by the company's predecessor in title, charged on "The Lawn," Cainscross, Glos. Holders: Trustees of the Stroud Holloway Original Benefit Society.

Acme Electric Wire and Cable Co., Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital dated August 18th, 1925, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Robert Crust, Ltd. (184,087).—Return dated December 31st, 1924 (filed February 26th, 1925). Capital, £1,000 in £1 shares. 999 shares taken up. £698 paid. £301 considered as paid. Mortgages and charges, nil. Return of allotments, made up to April 7th, 1925, shows the remaining share allotted for cash.

Pickvance, Ltd. (183,595).—Return dated December 1st, 1924 (filed March 2nd, 1925). Capital, £5,000 in 2,000 preference and 3,000 ordinary shares of £1 each. 1,002 ordinary and 600 preference shares taken up. £650 paid on 200 ordinary and 450 preference shares. £952 considered as paid on the remainder. Mortgages and charges, £1,650.

Gayton Park Electricity Co., Ltd. (184,208).—Return dated April 6th, 1925. Capital, £3,000 in £1 shares. All shares taken up. £3,000 considered as paid. Mortgages and charges, nil.

Energy Syndicate, Ltd. (184,206).—Return dated March 9th, 1925. Capital, £15,000 in 8,250 preference and 6,750 ordinary shares of £1 each. All shares taken up. £15,000 paid. Mortgages and charges, nil.

Excelsior Magneto and Ignition Co., Ltd. (183,735).—Return dated December 31st, 1924 (filed March 26th, 1925). Capital, £1,000 in £1 shares. All shares taken up. £1 per share called up on 870 shares. £720 paid, leaving £150 in arrears. £130 considered as paid. Mortgages and charges, £300.

Highfield Electrical Co., Ltd. (184,119).—Return dated August 13th, 1925. Capital, £2,500 in £1 shares. 1,802 shares taken up. £1,800 paid. £2 in arrears. Mortgages and charges, nil.

Friend, Wintle & Co., Ltd.—F. J. Alban, of 84, Queen Street, Cardiff, was appointed receiver on August 21st, 1925, under powers contained in debenture dated June 29th, 1923.

E. Saunders (Margate), Ltd. (183,719) (formerly the Margate and District Electrical Co., Ltd.).—Return dated May 3rd, 1924 (filed February 21st, 1925). Capital, £3,000 in £1 shares. 20 shares taken up. £20 paid. Mortgages and charges, nil.

Wickford and District Electricity Supply Co., Ltd. (183,455).—Return dated December 31st, 1924 (filed February 27th, 1925). Capital, £5,000 in £1 shares. 2,051 shares taken up. £2,051 paid. Mortgages and charges, nil.

Cullompton Electric Supply Co., Ltd. (183,058).—Return dated July 16th, 1925. Capital, £6,000 in £1 shares. 3,848 shares taken up. £3,248 paid. £600 considered as paid. Mortgages and charges, nil.

British Electrical Maintenance and Insurance Co., Ltd. (182,942).—Return dated December 5th, 1924 (filed February 28th, 1925). Capital, £1,000 in £1 shares. 999 shares taken up. £999 paid. Mortgages and charges, nil.

Radiant Electrical Co., Ltd. (182,866). — Return dated January 14th, 1925. Capital, £100 in £1 shares. 100 shares taken up. £100 paid. Mortgages and charges, nil.

John Richards & Co. (Electrical Engineers), Ltd. (183,000).—Return dated December 19th, 1924. Capital, £6,000 in £1 shares. 4,802 shares taken up. £2 paid. £4,800 considered as paid. Mortgages and charges, nil.

Power Securities Corporation, Ltd. (184,817).—Return dated March 3rd, 1925. Capital, £2,000,000 in 1,000,000 preference and 1,000,000 ordinary shares of £1 each. 500,000 preference and 500,000 ordinary shares taken up. £1,000,000 paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Scarborough Electric Supply Co., Ltd.—At the annual meeting on August 31st, formal approval was given to the proposed sale of the undertaking to the Scarborough Corporation as from December 31st next. The chairman (Mr. A. A. C. Swinton) said the terms of actual purchase were in accordance with the conditions of the original deed of transfer of the undertaking. The negotiations to date had been conducted amicably. It was unfortunate that the company was to be wound up when the undertaking had become prosperous, but that could not be helped. Obviously the Corporation was anxious to acquire it because it was prosperous.

Ferranti, Ltd.—The report for the year ended June 30th last records a gross profit of £165,982, as compared with £134,569 in the preceding year. After meeting all charges, including the transfer of £15,000 to depreciation reserve (against £10,000), there was a net profit of £67,644, as compared with £55,545. It is proposed to place £40,000 to reserve (against £35,000); to pay a dividend of 20 per cent., free of tax (as compared with 15 per cent. in 1924); and to carry forward a balance of £33,313. The meeting is to be held to-day (Friday).

Stratford-on-Avon Electricity Co., Ltd.—At the recent annual meeting it was stated that, with the incorporation of the parish of Alveston in the area of supply, additional plant had become necessary to cope with expanding business. It was intended to issue £10,000 first mortgage debentures bearing interest at 6½ per cent. The recommendations were approved, and at an extraordinary general meeeting, which followed, a resolution was adopted empowering the directors to borrow £10,000.

Stewarts & Lloyds, Ltd.—The following dividends have been declared in respect of the half year to June 30th:—At the rate of 6 per cent. on the preference shares; and at the rate of 10 per cent. on the preferred ordinary shares. Similar dividends were paid last year.

North American Light and Power Co.—The whole of the company's first lien 6 per cent. gold bonds, maturing normally in 1937, have been called for redemption at 102½ per cent. and accrued interest.

Hurst, Nelson & Co.—A final dividend of 2s. 6d. per share has been declared, making 3s. 6d. for the year. Last year the dividend was 4s., but the capital has since been increased.

Western Telegraph Co., Ltd.—The directors have declared a final dividend of 5s. per share, making 10 per cent., free of tax, for the year, as in 1924.

Hendon Electric Supply Co., Ltd.—An interim dividend of 1s. per share, free of tax, has been declared on the ordinary shares.

British Electric Transformer Co., Ltd.—A dividend of 3½ per cent. has been declared in respect of arrears on the preference shares.

Mississippi River Power Co.—A dividend of 1½ per cent. on the preferred stock is announced.

Stocks and Shares.

MONDAY EVENING.

THE principal changes in the Stock Exchange lists since a week ago are rises which reflect the satisfaction felt with the recognition that is being accorded to Mexico by the British Government. On the top of the substantial recoveries to which reference was then made here, further improvements have occurred, ranging from 1 to 5 points, the latter gain being secured by Mexican Light & Power common and preferred shares alike. Mexico Tramway 5 per cent. bonds are a point down, which seems a little anomalous in view of the strength shown by the other Mexican issues. Doubt is not altogether satisfied, even yet, as to whether this recognition will automatically bring in its train the improvement in Mexican conditions that will assuredly restore British industries in Mexico, to profitable working conditions. Each day, however, adds to the assurance that the British Government and the Mexican Government are both in earnest, and that the preliminaries are definitely settled.

Other foreign traction utility stocks are better. British Columbia preferred at 80½ shows a rise of 3 points, and the deferred holds its gain of 3½ secured a week ago. Anglo-Argentine Tramways 5 per cent. debenture stock at 76½ is 1 better. Brazilian Tractions shot up to 74½, thanks to the strength of the milreis. The company is now regarded as being upon a 5 per cent. dividend basis.

Electricity supply shares show few movements. London Electrics, after their rise of 4s. 6d., have shed 6d., going back to 35s. middle. Charing Cross ordinary are better at 2½. Charing Cross City undertaking is thought likely, as already mentioned here, to receive slightly more favourable treatment in the reorganisation proposals than the other members are, though the difference is not likely to be material. County ordinary have dropped back to 57s., a reaction of 1s. 9d. Midland Counties at 22s. 9d. are 6d. lower. St. James's gained ⅛ at 14¼. Urbans at 18s. 3d. are 1s. 3d. higher. There is a steady demand for the debenture stocks and the preference shares of the various companies, and the supply on offer diminishes week by week.

Amongst the Electricity Supply ordinary shares, which can be bought are 500 City Lights at 48s. 6d. x.d., to yield 6¼ per cent.; 500 Counties at 59s. *cum* dividend, paying £5 1s. 6d. per cent., and 1,000 Westminsters at 44s. 6d. x.d., where the yield is 6¾ per cent. There are also on offer 1,000 Electric Supply ordinary at 31s. 9d., to yield £6 18s. 6d. on the basis of the last dividend of 11 per cent. English Electrics at 19s. 3d., of which a few hundreds are available, yield 5¼ per cent., and Edmundsons at 22s. 6d., at which price there are 1,000 shares offered, give 6¼ per cent., taking the 7 per cent. dividend, paid annually for the past three years, as the basis of calculation. Midland Counties ordinary at 23s. 3d. yield £5 3s. 6d. per cent., and Newcastle ordinary at 23s. 6d., *cum* the recently-declared dividend, return just under 6 per cent. on the money; Llanelly ordinary at 20s. x.d. offer the level 7 per cent. Clyde Valley ordinary at 30s. give £5 6s. 8d. per cent., and Yorkshire ordinary at 30s. return a similar sum. There are also obtainable 500 Brompton ordinary at 36s. x.d., where the yield is £5 11s. per cent. net, the dividend being paid free of tax. The prices are given as a rough guide. Purchasers will probably find they can buy more cheaply when they come to deal.

Marconis are beginning to look up again. It has been contended for some time past in the market that Marconis have distinct attractions at anything like 25s., and this view seems to have aroused a little following, with the result that the price, although nominally unchanged at 25s., is, actually, rather better. Canadian Marconis came in for attention at the same time, and the price rose 7½d. to 5s. 1½d. middle. The latest invention of Signor Marconi in the shape of wireless "lighthouses" may have something to do with the greater interest which is being taken in the shares of the company which bears his name, and which, after all, pay 8 per cent. on the money, with future prospects that are difficult to estimate.

The Home railway market is as heavy as ever. Most of the steam stocks are substantially lower in price on the week. Underground Electric income bonds at 96 are ex the 3 per cent. net dividend deducted from the price last Tuesday. The public are taking no interest, however, in Home Railway stocks, the reason being the continual disturbances which occur in labour circles and which all appear to extend into the railway world by one path or another.

Great Northern Telegraphs are a feature of strength at 32½. Otherwise, the cable group is uninteresting. Automatic Telephones jumped to 45s., thus showing a gain of 3s. The market in the shares is now so limited as to render any demand liable to have a disproportionate effect upon the price of the shares. International Telephones are 26s. buyers. Cuba Telephone 5 per cent. bonds at 93½ have risen 2 points.

The manufacturing shares retain their strength, and Edisons have spurted a shilling to 9s. per share. General Electrics lost 6d. of their florin rise, and English Electrics are a little easier at 19s. 3d. British Electric Transformer preference strengthened to 18s. 9d., but the other preference shares in this group are exceedingly well held. Babcocks, amongst the engineering shares, receded to 2½, the iron and steel market being heavy. Rubber shares, after a slight depression due to a fall in the price of the commodity to 3s. 2d. per lb., hardened up again as buyers came forward to take stock for the new Stock Exchange settlement which started on the Tuesday in this week.

The Study of Wireless Wave Fronts by Directional Methods.

By R. L. SMITH-ROSE.

Abstract of Paper read before Section A.—Mathematical and Physical Science.)

The directions of the electric and magnetic forces in a simple ave are at right angles to each other and mutually perpen- icular to the direction of propagation of the wave. The lane containing these forces is known as the wave-front. All ıe existing types of wireless direction-finders operating by ·ception of the desired signals make use of the fact that for simple wireless wave propagated along the earth's surface the ıagnetic force is horizontal and perpendicular to the vertical lane of propagation of the wave. Such direction-finders use, ı principle, a closed loop in a vertical plane capable of being ›tated about a vertical axis; the loop is turned to the posi- on of minimum or actually zero e.m.f. when the plane of ıe loop is parallel to the horizontal component of the magnetic eld. Various circumstances may, however, contribute to an ›parent deviation in the direction of travel of the wave as ıdged from the direction of the horizontal component of the agnetic field. For example, various objects, such as metal- ork, whether above or below ground, trees, tuned aerials ıd long stretches of overhead wires may cause an error in the ›parent direction, which may be as much as 50 deg. The nall residual errors which are experienced are taken into ·count by calibrating the direction-finding station on various ·xed transmitting stations; this is found to be sufficiently con- ant for practical use, but when the source is an aerial or a ·stem of overhead wires, the errors are sometimes dependent ›on the electrical circuit constants of these, and more care or equent repetition of the calibration is necessary for accurate orking. In the cases of steel ships and aircraft the error in ›parent direction varies in an approximately sine-wave form ith the direction of the incoming waves relative to the fore- ıd-aft line of the ship. In such installations, either a cor- ·ction curve is prepared from observations taken while the ip is swung on a fixed transmitting station, or sometimes the ·ror is approximately compensated for by some suitable cir- it arrangement. With regard to diurnal variations, when e range of transmission in which a direction-finder is used ·ceeds certain minimum values, the apparent direction of ·rival of the waves is subject to somewhat erratic variations, e frequency and magnitude of which are dependent to a nited extent upon the wave length employed, the distance the transmission, and also upon the time of year and part the day. The apparent bearings of a fixed station on a ·rection-finder are in general continually varying at a rate ·nich is roughly inversely proportional to the wave-length ›ployed.

Discussing land and sea effects, and the application of wire- ss direction-finding to navigation, the author said that when le path of transmission is entirely overland, the difference in ıriations by day and night becomes apparent at distances of ›out 30 miles. When, however, the path of transmission is ·tirely oversea, this minimum distance for serious variation i trebled. This is fortunate, since ranges at which wireless ·rection-finding is required in marine navigation are seldom ›ater than 50 and never more than 100 miles, and a suitable ·oice of the land station ensures that this range is entirely ·ersea. Under such conditions, about 95 per cent. of the ·served bearings fall within a 2-degree limit of error, which ifound to be adequate for most navigational purposes. When t› line of transmission is almost parallel to a coast there is ·liability of errors due to a coastal refraction effect, and it ıll probably be customary in the future to mark all charts ıth "arcs of good bearings" for the various land stations ›d for direction finding. The above facts have been estab- ›ed almost entirely for damped wave transmission on a ve-length of 450 metres, but there is as yet no definite ·dence that they will need modification by the employment undamped waves or of any other wave-lengths within ·sonable limits. When using a direction-finder it is some- ›es necessary to rotate the coil for some 5 to 20 deg. before v change in the signal intensity can be detected. This is ›· to the fact that the horizontal component of the magnetic ·ce of the arriving waves is no longer strictly linear, but of ptical rotating form, probably due to the arrival of two ·ves differing in phase and amplitude. It is evident that · apparent direction of arrival of the waves as given by the ·ating force will be perpendicular to the major axis of such ellipse. An extreme case of this phenomenon is sometimes ·ained in the form of circular polarisation. This results in · signal received on the closed coil direction-finder being of ıiform intensity for a complete rotation of 360 deg. While › waves of from 2,000 to 13,000 metres, the occurrence of ·h circular fields is comparatively rare, on the shorter waves ›from 450 to 1,000 metres it is so frequent during the night ›iods that no definite bearing can be ascertained in from ·to 50 per cent. of cases.

f a closed loop receiver is provided with a horizontal as well a vertical axis of rotation, a means is provided for the ·rmination of the angle of inclination of the magnetic force ·the horizontal plane. To do this, the position of the coil to give a minimum of signal strength with its plane vertical is first determined. It is then rotated through 90 deg., so that the horizontal axis is perpendicular to the horizontal component of the magnetic field. By then rotating the coil about its horizontal axis, the inclination of the magnetic force is determined. In the case where the horizontal force is not linear, it is necessary to repeat this last rotation for a second position of the horizontal axis at right angles to the first. If, as may occur under certain conditions, the resultant magnetic force being examined is elliptically or circularly polarised in space, the above methods enable only the components on three mutually perpendicular planes to be determined, two of these planes being vertical and the third horizontal. In the case of such of these components as are not linearly polarised, only the direction of the major axis can be determined. With regard to the electric force, instead of a closed coil for reception, a straight open wire aerial may be used in the form of a Hertzian rod. In this case the e.m.f. induced will depend upon the component of the electric force parallel to the rod. Hence, if such a Hertzian rod be supported at its midpoint, coupled to suitable receiving apparatus, and rotated about a horizontal axis, a position of zero or minimum signal strength will be found when the rod is perpendicular to the electric force if it is linearly polarised, or to the major axis if it is elliptically polarised. If the horizontal axis of rotation is parallel to the direction of propagation of the wave, the rotation should be repeated about a perpendicular horizontal axis to give a determination of the directions of the components of the electric force on two vertical planes at right angles to each other. When these methods are used it is found that the magnetic force is horizontal and at right angles to the direction of propagation, and the electric force is found to be nearly but not quite vertical, being actually tilted forward by a small amount in the vertical plane of propagation of the wave. It is also found that in this plane the electric force is of slightly elliptically polarised form. The experiments show that the forward tilt of the electric force increases with a reduction in the wave-length employed. The values actually measured in this country range from about 0.5 deg. on 6,900-metre to nearly 3 deg. on 350-metre wave-lengths. From these angles the effective conductivity of the earth at the wireless frequencies employed can be obtained, and has been shown to lie between 0.6 by 10^8 and 4.0 by 10^8 in e.s.u. for various sites in the south of England.

The author said that one of the most promising theories of wireless wave propagation over the earth's surface implies the reception of one or more waves from the upper atmosphere in addition to the wave propagated directly along the earth's surface. It might be thought at first that the detection of the existence of such a down-coming wave would be a comparatively easy matter by determining the directions of the electric and magnetic forces which result at the receiver. It must be remembered, however, that with the above value of conductivity the earth's surface will act as a moderately good reflector, and the incidence of a downcoming wave will give rise to a reflected wave which may have an amplitude nearly equal at its maximum to that of the incident wave. The combined effect of these two waves is to give a resultant electric force which has no horizontal component, and a resultant magnetic field which has no vertical component. Such a wave, therefore, becomes difficult to distinguish from a horizontally propagated wave by directional measurements. This has been partly confirmed by experimental observations made during the last 18 months. Employing the waves from various transmitting stations using wave-lengths between 2.6 and 12.4 km., the maximum departure of the directions of the electric and magnetic forces from their normal values has been about 1 deg., which was considered to be scarcely greater than the possible error of the apparatus employed. Many of these experiments were carried out at night and for distances of transmission known to give rise to the well-known night effects, these being instanced by variations in apparent bearings ranging up to 23 deg. On the shorter wave-lengths the practical difficulties increase considerably, but some recent measurements made on 385 metres have shown that under suitable night conditions the resultant electric force may depart as much as 12 deg. from its normal day value, while the resultant magnetic force may be inclined at 5 deg. to the horizontal. Experiments are being carried out at the Radio Research Board's station at Slough, in which these observations are made simultaneously with the measurement of various other parameters of the forces of the arriving waves, the results of which will probably produce valuable evidence on the problem of the propagation of wireless waves over the earth's surface, which has recently become, perhaps, the most important scientific subject in radio research.

The Efficiency of Marine Auxiliary Machinery.

By STANLEY S. COOK, B.A.

(*Abstract of Paper read before Section G.—Engineering.*)

In the course of this paper the author said that a review of the history of the steam turbine in marine propulsion disclosed the fact that during the past 20 years there had been

an increase of practically 100 per cent. in overall efficiency, made up of improvements in turbine and propeller efficiency, principally through the introduction of gearing between turbine and propeller, and an increase of available energy due to the use of superheat. Since economy in total fuel consumption was the ultimate aim, whilst the highest efficiency of conversion of heat into power was necessary on the part of the main engines which propelled the vessel, consideration must be given to the question of auxiliary machinery wh with the improvements that had been made to reduce the consumption of the main machinery, was now responsible in a complete installation for a very appreciable percentage of the total fuel consumption. Wasteful auxiliary machinery, either through unsatisfactory provision in the first place, through want of care in its maintenance and management, had not infrequently in the past been the cause of a poor overall performance for which the propelling machinery had been blamed.

Taking a typical case of a vessel with high-efficiency turbines developing 5,000 shaft h.p., the author discussed the estimated consumption of the auxiliary plant which comprised air pump, ejector, circulating pump, feed pump, fans, oil pump, steering gear, electric lighting set, &c. Four different methods of driving the auxiliaries were considered, *viz.*, (1) Entirely by steam; (2) by electric motors with energy supplied by turbo-generators; (3) by electric motors with energy supplied by Diesel generators; and (4) mechanically from the main engines. In proposal (1) the steam consumption of the auxiliaries, including the ejector steam, the make-up feed, and the steam used for the evaporator, was calculated at 8,960 lb. per hour. Of this 1,500 lb. was condensed in the evaporator coil and 250 lb. in the oil-fuel heater, leaving 7,210 lb. available for feed heating. To heat the remainder of the feed water from 70 to 215 deg. F. required 5,800 lb. of steam, leaving 1,410 lb. unutilised, which might either go to the winch condenser or be led to the low-pressure turbine. The total steam consumption for all purposes, in this case, was therefore 44,960 lb., per hour, or 8.99 lb. per shaft-h.p.-hour. With a feed-water temperature of 215 deg. F., 13.2 lb. of steam at 500 lb. per square inch and 700 deg. F. could be generated for each pound of oil consumed in the boiler furnace. This figure was based on a calorific value of 18,500 B.th.u. per pound and a boiler efficiency of 84 per cent., which could be attained with efficient pre-heating of the furnace air. On that basis, a steam consumption for all purposes of 8.99 lb. per shaft-h.p.-hour corresponded to an oil-fuel consumption of 0.681 lb. per shaft-h.p.-hour. By utilising steam tapped off from the turbines to raise the feed temperature to 310 deg. F., whilst slightly more steam was required, this was generated at a higher evaporative rate, and the oil consumption per shaft-h.p. was reduced to 0.667 lb. That was the case with proposal (1) with the auxiliaries steam driven. The total brake-h.p. required for the auxiliary machinery was 118.5.

In proposals (2) and (3) that power was supplied by electric motors, absorbing, with a reasonable allowance for motor and transmission losses, 110 kW. In proposal (2) the 110 kW was supplied by turbo-generators taking steam at the same pressure and temperature as the main turbines, but exhausting to a back pressure of 10 lb. above atmosphere. For the consumption of 45 lb. per kW, they required 4,950 lb. of steam per hour. With the same supply of steam as before for ejectors, make-up feed and evaporator, *viz.*, 2,700 lb., the total auxiliary consumption in this arrangement was therefore 7,650 lb. per hour, giving a total consumption for all purposes of 43,650 lb. per hour, or 8.73 lb. per shaft-h.p.-hour. With 1,500 lb. per hour condensed in the evaporator coil and 250 lb. in the oil-fuel heater, there remained 5,900 lb. per hour of auxiliary exhaust steam which was sufficient to heat the feed water to 215 deg. F. The steam consumption of 8.73 lb. per shaft-h.p.-hour for all purposes then corresponded to an oil-fuel consumption of 0.662 lb. per shaft-h.p.-hour, on the same basis of boiler efficiency, &c., which was further reduced to 0.648 lb. per shaft h.p.-hour by using tapped-off steam to heat the feed water to 310 deg. F.

In proposal (3) the 110 kW required for the motors was supplied by Diesel generators. The additional steam for ejectors, make-up feed and evaporators was, in this case, 2,450 lb. per hour, with only 850 lb. per hour available for feed heating. Since, however, in this case, 4,950 lb. per hour was required to heat the feed to 215 deg. F., this 850 lb. must be supplemented by 4,100 lb. of steam tapped off from the low-pressure turbine belt, at the expense of a reduction of the power developed in that turbine by 285 s.h.p. At a consumption of 0.75 lb. of oil per kW, the Diesel generators consumed 82.5 lb. of oil per hour, which, at an evaporative rate of 13.2 lb. per pound of oil, was equivalent to 1,090 lb. of steam per hour. So that, finally, for this proposal, 4,715 s.h.p. was obtained for a total equivalent consumption of 39,540 lb. of steam for all purposes, or at the rate of 8.39 lb. per s.h.p.-hour. The oil consumption was 0.635 lb. per s.h.p.-hour with a feed temperature of 215 deg. F., and 0.62 lb. with a feed temperature of 310 deg. F., using steam tapped off from the turbines.

In proposal (4) the 118.5 brake-h.p. required for the auxiliary machinery was assumed to be supplied mechanically from the main turbines. With allowance for mechanical losses, it was assumed that the output of the main turbines would thereby be reduced by 132 s.h.p. As in proposal (3) it would also be necessary to bleed 4,100 lb. of steam from the low-pressure turbine for feed heating, involving a loss, as before, of 285 s.h.p. So that with this arrangement steam consumption was increased by 2,450 lb. per hour and output reduced by 417 s.h.p., or a total consumption of 38,450 lb. per hour for an output of 4,583 s.h.p., or 8.39 lb. per s.h.p.-hour. This was the same as for proposal (3), and the oil fuel consumed pe s.h.p. was also the same as for proposal (3).

Summarised the results were as follow: For proposal (1 with steam-driven auxiliaries, 0.667 lb. oil per shaft h.p.-hour for proposal (2), with motor-driven auxiliaries and turbo generators, 0.648 lb.; for proposal (3), with motor-driven auxi liaries and Diesel generators, and for proposal (4), with auxi liary machinery mechanically driven from the main engine 0.62 lb. Thus with steam-electric auxiliaries the total fue consumption might be made 2.85 per cent. less than when the were steam-driven, and with Diesel-electric or mechanically driven auxiliaries 7.6 per cent. less.

In proposal (4), for the sake of simplicity, it was supposed that all the auxiliaries were driven from the main engines This might not be considered desirable in the case of all o them, even with the provision of adequate stand-by units The result, however, as regarded fuel consumption being th same as when these auxiliaries were motor-driven from Diese generators, one could make it apply equally to any combina tion of the two systems; that was to say, with as many o the auxiliaries as was considered practicable driven mechanic ally from the main turbines and the rest motor-driven fro Diesel generators.

The Rôle of the Atmosphere in Wireless Telegraphy.

By Prof. E. V. Appleton.

(*Abstract of a "Citizens' Lecture."*)

In the course of this lecture, which was delivered at th Avenue Hall on August 29th, Prof. Appleton said that it wa nowadays very generally recognised that the atmosphere ha a very profound influence on the transmission of electric wave through it, and thus on wireless communication generally Usually, but not always, the influence of the atmosphere wa favourable to communication, and it was now quite certai that long-distance communication was brought about solel by the influence of the ionised layers in the upper atmosphere In short-distance communication, *e.g.*, up to 100 miles, broad casting listeners were familiar with another effect which mus now be regarded as of atmospheric origin. Most listener with valve sets were aware that at distances approachin 100 miles from a broadcasting station the signal intensity a night often underwent pronounced fluctuations varying fro a loud-speaker intensity down to inaudibility in a minute c so. This "signal fading," as it was called, had been a puzzl for a long time, but experiments recently carried out at th Cavendish Laboratory, Cambridge, by Prof. Appleton and M Bagnett had shown that the effect in such cases was due to th interaction of two sets of waves which reached the receivin station. One set of waves travelled straight along the groun from transmitter to receiver, while the other set was reflecte by the upper atmosphere back to the receiver. Sometime these two sets of waves reached the receiver in step, an their effects were additive, but sometimes they were out c step and tended to neutralise one another. The actual chang were due to the variability of the upper atmosphere, whic altered the phase of the waves reflected thence. Theory ind cated that fading should be more pronounced on a loop s than on a set with a vertical-wire aerial, and when an exper mental test of this point was made at Cambridge with accura instruments the theoretical prediction was verified. Loo fading was found to be greater than aerial fading, and fro the results the angle at which the waves reflected by th upper atmosphere reached the ground again could be measure The angle was found to be 60 deg. at Cambridge for th signals from 2 LO. From this figure it was clear that th height of the layer could be estimated. This crucial test larger loop fading than aerial fading might be regarded the experimental proof of the existence of the "Heavisi Layer," which had been strongly contradicted by Germa and American radio engineers. At greater distances fro broadcasting stations (150-200 miles) the train of wav travelling along the ground was highly attenuated and only th waves reflected from the upper atmosphere reached the r ceiver, and then only at appreciable intensity at night. Th atmosphere was also responsible for the troublesome naturall occurring signals known as atmospherics. In recent exper ments the intensity, duration, and wave-form of these di turbances had been determined, and they had been shown be due to electrical discharges (*e.g.*, lightning strokes) in th atmosphere. Fortunately the effects of atmospherics we not as marked on the shorter broadcasting wave-lengths on the longer commercial wave-lengths, and recent exper ments in Cambridge showed that the only atmospherics whi gave real trouble to listeners could usually be attributed actual lightning strokes within the British Isles. With longe range sets of longer wave-length the lightning strokes in th tropics were detectable in England as atmospherics.

The Seat of the Electromotive Force of the Galvanic Cell

By J. A. V. Butler.

(*Abstract of paper read before Section B.—Chemistry.*)

The discovery of the production of an electric current galvanic action gave rise to two distinct views of its origi resulting in a controversy which was waged with considerab zeal for a century, without a decision being reached (cf. S Oliver Lodge's comprehensive report, *B.A. Report*, 1884). the one hand, physical theorists regarded as the chief fact a contact p.d. between the metals, identified with Volta's co

act force and an intrinsic property of the metals. On the ther hand was the chemical view that the current had its rigin in chemical effects at the electrodes. In the course of ne nineteenth century, the chemical theory received convinc- ng support from the work of Davy and Faraday, which estab- shed the quantitative relation between quantity of electricity nd chemical action; the discovery of the relation between lectrical energy produced and the energy of the reaction going n in the cell [Kelvin (1851) had postulated the equality of nese. The exact thermodynamical relation was given later y Helmholtz and Gibbs]; and the Nernst conception of the rocess at metal electrodes which accounted for the effect of con- entration. The chemical theory thus appeared to be established d all points. The Volta effect itself was explained as due to nemical action at the surface of the metals. For thirty years ne metal junction was practically overlooked as an important ntributor to the e.m.f. of the cell. Recent work on the ermionic and photoelectric properties of the metals (Richard- n, Compton and Millikan) has, however, conclusively demon- rated the existence of large metal contact p.d.'s. How are nese to be reconciled with the chemical theory? The author's neory, based on statistical considerations, includes as different spects of the whole truth (1) the existence of metal contact .d.'s between metals, approximately equal to the difference of eir thermionic work functions; the relation between e.m.f. nd the energy of the chemical reaction expressed in the Gibbs- elmholtz relation; and the Nernst relation for the effect of ncentration.

After the reading of the paper the President (Prof. C. H. esch) said the paper threw a new light on a very old sub- ct. It was over 40 years ago that Sir Oliver Lodge drew up is statement of our knowledge of the subject at that time nd it would therefore be interesting to hear his views now.

Sir Oliver Lodge, F.R.S., referring first to the presidential ddress to the Section by Prof. Desch, said that the relation etween physics and chemistry was of the utmost interest and hatever might have been the case in the past there was no ason now for any antagonism between the two. With re- ard to Mr. Butler's paper, although he had had this matter at is fingers' ends 40 years ago he had not looked into it for the ast 30 years. He knew that Mr. Butler was taking it up at wansea and was applying the newer knowledge acquired since hen. In 1884 we knew nothing about electrons and it was bvious that the views held then by himself and others, not- bly the late Lord Kelvin, with whom he had discussed it, ust be revised. A very different state of affairs had been own to exist in the light of our comparatively recent know- dge of electrons and the whole subject required to be pulled it by the roots and put on a proper basis.

Some Technical Problems of Broadcasting.

By Capt. P. P. Eckersley.

(*Abstract of a "Citizens' Lecture."*)

In the course of this lecture Captain Eckersley indicated an interesting manner the early difficulties of the British roadcasting Co., and outlined the policy and aims of the mpany as the result of this early experience. He said that first it was thought that eight stations would be sufficient cover England and Scotland and give good crystal reception erywhere. It was soon evident, however, that this would ot be the case and so the present policy was to have numerous ations or relay stations all over the country with the ideal providing good crystal reception for everyone within a radius 20 miles. This in itself, however, would not give that ser- ce to the community which it was sought to give, *viz.*, a oice of programme, and so the next ideal was to arrange r stations of higher power which would cover a wider area an the "crystal areas," and in that way make alternative ogrammes available. Dealing with complaints of interfer- ce with the broadcasting by ships, Captain Eckersley re- inded his audience that wireless in the working of ships d the saving of life at sea was of much greater moment an broadcasting, which was merely for amusement. He ex- essed his sympathy with the Postmaster-General in the task hich was placed upon him of deciding upon wave-lengths and on in order that not only might the commercial and other ireless business be carried on but also that the whole of the mmunity might have the benefits of broadcasting. Refer- ng again to the aim of the B.B.C., Captain Eckersley said at the object was to enable every listener to adjust his set at e beginning of the evening once for all and for there then be no further necessity to tinker with the apparatus any ore that evening. One of the difficulties which prevented is at the moment was fading, and he explained in non-tech- cal language how fading was caused and how many curious fects in wireless were produced. It was possible, of course, r certain enthusiasts to be able to pick up stations many iles away, and it was not uncommon for the B.B.C. to re- ive letters asking why it was not generally possible for this be done. Such people, of course, knew nothing about the chnical side of wireless, and he expressed the hope that ople would endeavour to understand that such results, in the esent state of our knowledge, were more or less in the nature "freaks." When the B.B.C. first started something like per cent. of listeners had crystal sets; later the number had en to 65 per cent., and to-day something like 85 per cent. d crystal sets. In an appeal to the public generally to ap- eciate the work which the B.B.C. was carrying out, Captain ckersley assured his audience that the company had ideals sed on the idea of service which, however, could only be carried out if there were a due appreciation of obsolescence in the plant used. It was only possible to make due progress if it were realised that development in the art was so rapid that there must be scrapping of plant at more or less frequent intervals in order to keep pace with modern practice. An interesting account was given of the manner in which what has come to be known as simultaneous broadcasting through- out the country is carried on and a picture was drawn of the possibility of extending this to all parts of the Empire and the world in the not far-distant future. In this the "beam station would play an important part. Finally, Captain Eckersley just mentioned the problem which faced wireless engineers in giving out at the loud speaker exactly what was put in at the transmitting station. There were the problems of the microphone, transformers, transmitters, the valves on the receiving sets, and the high- and low-frequency magnifi- cation, the transformers on the sets, the telephones and, finally, the human ear. Reference was made to the efforts at the London studio to control echo and to how experience was beginning to teach that different types of transmission such as chamber music, orchestral music, speech and so on, required to be treated differently as regarded transmission if the best results were to be obtained in the final telephones and loud speakers. Whatever were the defects of broadcasting as it was to-day, the public was asked to have patience and to appre- ciate that even if only it was the means of bringing the out- side world into close touch with those who had to live in parts far removed from large towns, or if it were only to bring relief and amusement to invalids and aged people, it would still be a wonderful thing. It was doing that, and a great deal more already, whilst it could be looked to for providing communica- tion in the future not only throughout the Empire but through- out the world. The speaker paid a high tribute to the manner in which the Post Office telephone authorities co-operated with and assisted the B.B.C. in the matter of telephone lines for the purpose of simultaneous broadcasting.

The Chairman, in proposing a vote of thanks to Captain Eckersley, pointed out that although the efficiency of the tele- phone was only 10 per cent., the efficiency of radio-telephony was at present only one-tenth of one per cent. This indicated the scope that there was for improvement.

Some Thermionic Valve Problems.

By Prof. E. V. Appleton.

(*Abstract of Paper read before Section A.—Mathematical and Physical Science.*)

In this paper three typical problems were discussed:—

(1) *The Internal Action of Thermionic Valves.*—An attempt was made to explain the shape of the static characteristics of thermionic valves and the electronic relations necessary for amplification. It was shown that to explain the characteristics it must be assumed that all the electrodes (filament, grid and anode) emit electrons and that under certain conditions the anode emission, due to electronic bombardment, may be almost as high as the filament emission. The amplification factor of a valve was defined as the ratio of the number of lines of elec- tric force ending on the grid to the number ending on the anode when the grid and anode were maintained at the same potential. From this it could be seen that if the electrons fol- lowed the lines of force, the ratio of the grid current to the anode current, for equal grid and anode potentials, should be equal to the amplification factor. But since the measured ratio was always less than that value, it was concluded that the electrons did not follow the lines of force and that they shot through the interstices of the grid to be caught by the anode. For marked amplification, therefore, the grid should be very effective in attracting the electrons but very ineffective in catching them. An experimental bridge method of measuring the amplification factor of any type of valve was outlined. This consisted in filling the space between the electrodes with badly conducting material, *e.g.*, dilute copper-sulphate solu- tion, and measuring the ratio of grid current to anode current when the grid and anode were maintained at the same poten- tial with respect to the filament.

(2) *The Lag in the Action of Thermionic Valves.*—The in- ternal resistance of a thermionic valve was measured for dif- ferent times of applied voltage and it was found that as the time of applied voltage was increased the internal resistance increased, reaching a constant value for a steady potential. This indicated that for a sudden increase of grid or anode potential, the electron current always jumped first to a value somewhat higher than its final value. The time required to get to equilibrium value might be as long as half a second. The phenomenon was not due to the lag in the response of electron motion to applied voltage, which must be nearly in- stantaneous, but was due to the alteration of the thermal condition of the filament consequent on the closing of the anode circuit. The true electron emission of the filament was re- duced when the anode circuit was closed and space current flowed. The filament was then cooled, due to latent heat being required for the evaporation of the electrons. The effect of the anode current on the filament was to make the negative end hotter than the positive end, the emission of the negative half being 50 per cent. greater than that of the positive.

(3) *Oscillation Hysteresis (or "back-lash") in Valve Gene- rators.*—It had been found that the limiting conditions for starting and stopping oscillations in the valve generator were often not the same. A valve oscillator might have zero ampli- tude (non-oscillating condition) and yet a sudden electrical impulse might make it burst into oscillation. This phe- nomenon was of importance in broadcasting reception when

it often happened that listeners worked with too strong reaction, and the set, though naturally stable when left undisturbed, was caused to oscillate violently by a strong atmospheric. This oscillation-hysteresis (first type) was shown to be due to the shape of the valve characteristic. Another kind of oscillation-hysteresis (second type) had also been found. It was possible to make a set oscillate with one of the possible and stable amplitudes for the same operating conditions. Which of the two amplitudes was obtained depended on the method of approach to the set of conditions in question. To make oscillation jump from the smaller amplitude to the larger, it was only necessary to move a magnet rapidly near the valve. This second kind of oscillation-hysteresis was shown to be due to the damping in the grid circuit due to the grid current which affected the dynamic characteristics of the valve so as to give the required type of decrement to the oscillating circuit.

Electrical Trade Prospects in Central America.

An American View.

Mr. R. A. Lundquist, Chief of the Electrical Equipment Department of the United States Department of Commerce, has recently completed a tour of what he calls "near-by Latin markets," and has contributed some notes on his investigations to the *Electrical World*. Mr. Lundquist's itinerary included Venezuela, Colombia, Costa Rica, Nicaragua, Panama, San Salvador, Guatemala, and Mexico. He points out that although the standard of living and the level of electrical development are lower than in the United States, conditions are steadily improving. Individually, the countries are not large in population, but their potentialities are great in the aggregate, and with the development of their resources they will undoubtedly become better and better markets in all respects.

Venezuela has a population of only 2½ millions, but there are great oil resources which enhance the country's purchasing power. Electrical service is available in practically all the principal towns, but there is a lack of generating facilities, and the owners of local plants are very backward, and make no effort to extend their undertakings. As a consequence, the service is very poor, and suffers frequent interruptions. The sale of wiring devices and the like has been practically confined to the cheaper classes; there has been apparently little effort to sell higher-class manufactures even among those who are able to buy them.

Conditions in Colombia are very similar, although this country has a larger population (about 5,800,000) and greater oil resources, which, however, have not been developed to such an extent as those of Venezuela. Here, again, the supply authorities are not endeavouring to extend their business, and the rates charged generally preclude the use of domestic appliances.

In Panama there has been a fair amount of electrical development, practically wholly on American lines. The other foreign material is confined to lamps, a few cheap fans, and some low-priced wiring devices of European manufacture. Electric fans are not generally popular, although it is thought that the population could be educated up to them.

Costa Rica, although only having a population of 450,000, is a consistent buyer of American products. With two hydro-electric companies competing for business in the capital, San José, there has been considerable selling activity, and the electrical development of the city has been very good. The standard of illumination is high, and there is a fair use of electrical appliances in spite of high charges. Electric cooking has made great progress, and washers are also used.

Nicaragua is very backward, and the United States' exports of electrical goods have declined considerably. A hydro-electric system was recently initiated in Leon, but for the most part the supply undertakings give a very poor service, the distribution systems being badly constructed. Although American manufacturers obtain the bulk of the orders for electrical equipment, there is an increasing entry of German goods.

One of the most progressive of the countries visited is San Salvador. This has a population of 1,300,000 in a comparatively small area. There is abundant water power, and practically every supply system is hydro-electric. Public electrical utilities are more advanced than in the countries mentioned above, but wiring practice is not on a very high plane. The only electrical appliance that is in use to any great extent is the flat-iron; there is also a small number of electric fans in use. San Salvador has been a fair field for manufacturers of farm-lighting plants; those without batteries are preferred.

The principal central stations in Guatemala are in the hands of an American holding company, and the business is developed on American lines. There is a regular commercial department, with a showroom, and very good results are being obtained. The use of appliances is extending, and, through the influence of the power company, new wiring regulations are coming into force, and electrical contractors in Guatemala City are being licensed, which will naturally result in a higher standard of work. The standard of shop lighting is very high, and high-grade lighting fittings have found a good market. Electric signs are also in extensive use in the city.

Mexico is the most important of the countries visited. This country, which has a population of about 13 millions, has heavy investment of American capital, and the central-station practice generally follows American methods. Generally speaking, the electrical business in Mexico is fair at the present time, but purchasers are buying in limited quantities according to local dealers. German manufacturers are very active in Mexico, the Siemens-Schuckert Company having a very large establishment in Mexico City, with branches in the more prominent distributing centres. The Swedish A.S.E.A. is also active in the apparatus field, while Mr. Lundquist also observed "Heemaf" (Dutch) motors. American manufacturers appear to be holding their own, but Germany has taken business on the basis of extraordinary terms in a few instances. In the motor field German competition has only been felt in sizes up to 25 h.p., in which range German manufacturers have a considerable price margin; the quality, however, is not equal to that of American motors. Germans are offering fair quality wiring devices at extremely low prices, and are taking a good deal of the business; in some cases American lines have been closely copied. Appliances have a fair sale in Mexico, but the bulk of the purchases are apparently made by foreigners, except in the case of electric irons.

The general impression gained by Mr. Lundquist from his tour is that in spite of the privileged position which the United States enjoys, American manufacturers are hardly taking full advantage of the possibilities of these adjacent markets. He realises that a good deal of business is lost through a lack of long-term credit facilities, and he thinks that some arrangements could be made to provide these. "It must be realised, of course, that not all of the long-term business is sound, but there must be a worth-while proportion that is safe."

Russian Electrical Notes.

Production of the Manufacturing Works.—During the three months ended with June, which comprised the third quarter of the current Soviet financial year, the total production of the Russian electrical manufacturing works was valued at 25,800,000 roubles, an increase of 13 per cent. over the preceding quarter. The output was divided as to 11.3 millions of roubles among the works of the Central Electrical Trust, 9 millions among those of the Electrical Machine Trust, 3.8 millions among those of the Telephone and Telegraph Trust, 472,000 roubles among the Accumulator Trust, and 272,000 roubles among the "syndicated" works. As compared with the second quarter the value of the production in the June quarter was 37 per cent. greater in the case of machines, 16 per cent. in the case of cables, and 16 per cent. in that of telephone and telegraph appliances. The production of lamps remained on the same level as in the second quarter, while some reduction took place in the glass, accumulator and carbon branches of production, within the limits of from 6 to 16 per cent. The personnel increased by 8 per cent. during the quarter, at the end of which the number of workpeople employed throughout all the branches totalled 21,391, together with a staff of 3,569. The average efficiency of the workmen advanced by 4 per cent. over the preceding quarter or 2 per cent. more than had been expected under the productive programme.

Telephone and Radio Apparatus.—The turnover of the Telephone and Telegraph Trust, which also produces radio apparatus, is reported to have considerably increased owing to the development of wireless telegraphy. During the six months ended with March the value of the turnover averaged 730,000 roubles per month, since when it has risen to 1,100,000 roubles per month. As to the actual growth in the business it is mentioned that the value of the uncompleted orders on April 1st, 1925, amounted to 9,000,000 roubles, while orders for 8,000,000 roubles will have been booked by the end of September. The working funds available to the Trust, however, will only allow of the execution of orders representing a total of 11,000,000 roubles by that date unless further financial assistance is received from State funds. An application for this assistance has already been made, and at the same time permission is being sought for greater freedom in the fixing of the sale prices of a number of manufactures. The prices realised for radio apparatus are said to be unprofitable, and the Trust asks for the right to import such appliances so as to regulate the average prices on sales. It is also suggested that the State should assume at least part of the expenses incurred by the Trust in the carrying out of scientific research.

The Donetz Coal Basin.—Dealing with the proposed extension of the electricity supply system in the Southern coal mining region of the Donetz, the Electrification Section of the State Planning Commission points out that the contemplated development is of great significance having regard to the growth of the metallurgical, chemical and other industries in that district. The section has therefore decided to ask the Supreme Council of National Economy to prepare a general scheme for the development of all the industries in the region, including the Donetz Coal Trust, the Southern Steel Trust, the chemical industry and other large undertakings, and to commission the General Electrical Commission to prepare a plan for the construction of new generating stations and a high-pressure network for the distribution of the load as between the industrial works and the stations. So far as concerns the erection of new transmission lines in 1925-26 the section considers it necessary to proceed with the following lines and sub-stations: (1)

ine between Artem and Rostof with a sub-station; (2) a line rom Bokovo to Rovenetskoe with a sub-station; (3) a line rom Pervomainsk to Karfaren; and (4) a sub-station at the)umo works. It is considered necessary to ascertain what ums would be provided by the interested works to assist in he erection of the lines.

The Shteroff Station.—The engineer in charge of the contructional works in connection with the Shteroff Station in he coal basin of the Donetz states that the erection of the ransmission lines and five sub-stations has begun, as well s the installation of the boilers and one 10,000-kW turbo-enerator. A second set of the same size is shortly expected rom England. It is intended to set the station in operation n January 1st, 1926, a sufficient load having already been uaranteed. As new industrial works are being brought into ervice it is proposed to increase the capacity of the station to 6,000 kW in the year 1926-27.

The Supreme Council of National Economy is considering he question of the establishment of a works for producing luminium in the area of supply of this station.

An E.h.p. Transmission Line.—A successful trial of the 15,000-V line between the Shatur station and Moscow has re-ently taken place in connection with the experimental work-ng of this station which is to begin this month.

The Republic of Georgia.—The State Planning Commission f Georgia has prepared a five years' scheme of works of elec-rification, having regard to the prospective demands of in-ustry, transport and improvement works. Besides the hydro-lectric works which are in course of construction at the pre-nt time the scheme provides for the erection and equipment f a large hydro-electric works on the river Rion in Kutais, nd a second on the River Alosani in Kacheti. It is proposed o proceed with the former in the first place so as to be able o afford a supply of energy in the manganese ore district of hiaturi (the area of the Harriman ore concession). An in-estigation is also being made into the possibility of construct-ng a third hydro-electric works on the River Kumistani in .bchazin.

Central Asian Resources.—The Electric Planning Commis-ion has made application to the higher authorities for the as-gnment of the sum of 2,000,000 roubles for the purpose of con-ucting an investigation of the sources of energy in the Central siatic regions of Uzbekistan and Tadjikistan, so as to ascer-ain the possibility of the establishment of new branches of ndustry and the preparation of a detailed plan of electrifi-ation.

Electric Port Railways.—The Leningrad Port Administra-on has prepared a scheme for the construction of electric ap-roach railways to assist in the loading of timber. Negotiations n the question are reported to have already been opened with rms in America, Germany, England, and Italy. The ap-roach lines will have a length of 7.44 miles and a handling apacity of over 1,000 tons per hour. Foreign firms will be llotted orders to the extent of 15 per cent. of the estimated xpenditure upon the works; the bulk of the work will be arried out in Russia.

Moscow Works Extensions.—The Electric Planning Com-ission has confirmed the supplementary estimates of the Mos-ow supply authority (Moges) for 1924-25. This increases the mount on capital reconstruction and re-equipment to 4,200,000 oubles, and that for new construction to 3,600,000 roubles.

Extensions in the Ural.—On a report from the Ural section he Electric Planning Commission has confirmed a scheme of evelopment of the Kizeloff regional station to 26,000 kW, with he installation of transmission lines to Perm and Chusov. he expenditure is estimated at 8,472,000 roubles, of which 335,000 roubles will be required next year. Approval has lso been given by the Commission to a scheme for the con-truction of the proposed Chelyabin regional station at a cost f 8,100,000 roubles, including transmission lines, of which 770,000 roubles will be needed in 1925-26. It has also been ecided to grant a loan of 500,000 roubles to assist in the com-letion of the Sverdloff station by the beginning of 1926.

A Palace of Electrical Engineering.—A committee under he chairmanship of Mr. L. D. Trotsky has been formed to pre-are a scheme for the establishment in Moscow of a "palace of ectrical engineering" for the housing of all electrotechnical affs—administrative, economic, technical, and scientific—and he creation of a permanent museum of electrotechnics.

The Dnieper Hydro-Electric Works.—The question of this roposed large works again came before the State Planning ommission on June 30th, when a report was presented point-ng out that the solution of the problem was closely connected ith many economic matters, as, for instance, the reconstruc-on of the mining industry in this region, transport, &c., and hat the estimated expenditure on the works in the next six ears would amount to 130,000,000 roubles. The Planning ommission decided to ask the Supreme Council of National conomy to prepare a report on the subject. At the same eeting consideration was given to a scheme for the construc-on of a hydro-electric works on the Boz-Su, which is esti-ated to require the sum of 3,345,000 roubles.

New Radio Stations.—The Weak Current Trust has de-vered to the Radio Transmission Company the equipment for 2 radio stations which are to be erected in Kharkof, Sverd-vsk, Odessa and other towns. Next year a further 30 stations ill be established in other towns for broadcasting purposes.

Trade Statistics of South Africa.

The following statement, showing the imports of electrical and similar goods into the Union of South Africa during the year 1924, has been compiled from the recently-issued official trade statistics. The figures for 1923 are added for purposes of comparison, and notes of any increases or decreases are made. It should be observed that the large decreases under "Other electrical material" are due to a more detailed classification :—

Corrosion at Switch Terminals.

A Research into the Causes of Corrosion.

Investigations have been made recently by the Resear Laboratories of the General Electric Co., Ltd., into the cau of the corroding of tumbler-switch terminals, &c. report of the work carried out in making the investigati and the conclusions arrived at will prove of considerable terest. Visits to installations and laboratory tests prove th corrosion only occurs where the installation is wired on t negative side of a 3-wire d.c. system. The experiments a show that corrosion only becomes evident when the switch are located in a damp situation, and that the moisture drawn to the switch terminals by the capillary action of t

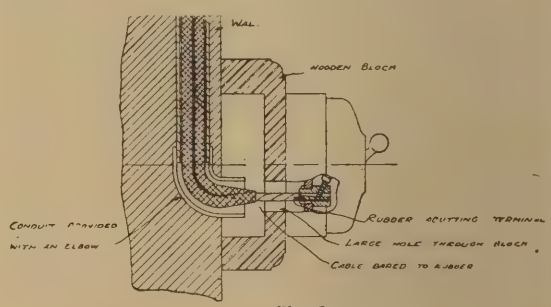

Fig. 1.

outer braiding of the cable. Leakage is set up and electroly action takes place, with the result that copper is deposited the negative terminal, which in air, turns to copper carbon and thus forms a porous covering of a salt, which tends alw to keep the surface wet, thus spreading the trouble. As t blades of the switch become wet the solution is splashed to the cover of the switch when the switch is operated. periments were conducted with the bare ends of the cab well greased before insertion in the switch terminals, and o

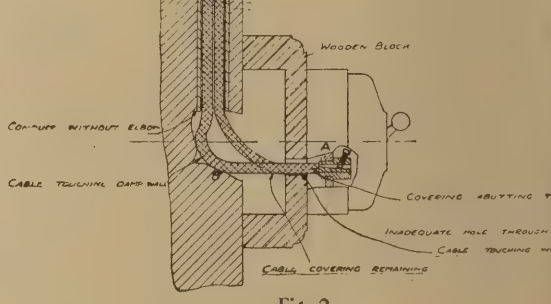

Fig. 2.

slight corrosion was observable. Further experiments we carried out under exactly similar conditions, with the excepti that the outer covering of the cable was bared down to t rubber insulation for some distance before insertion in t switch, so that it could not possibly touch the metal of t switch terminals. It was then found that corrosion did n occur. Switches mounted on the positive side of the syste are not subject to this trouble. A film of high resistance formed on the metal of the positive pole which speedily caus

the cessation of the leakage current, hence the absence of corrosion.

To summarise the matter, it is apparent that the trouble is caused by the wiring of the switches in such a way that the outer braiding, in contact with water from the damp wall (B, fig. 2), is brought right up to the base of the switch terminal (A, fig. 2).

The only remedy is good and careful installation. If the position of the switch is such that the wall and surroundings are damp, the following precautions should be taken: Cables should not touch the damp wall on their way from the conduit to the switch, and a large enough cavity or the protection afforded by an elbow joint in the conduit should be provided behind the switch in order to ensure this; they should be bared down to the rubber for some inches before entering the back of the switch; and the ends of the cable should be covered in thick grease before being inserted into the switch.

This subject is of considerable importance, especially in view of the large number of new houses being erected to-day, and it is hoped that the suggested precautions for overcoming the corrosion trouble will be adopted.

Although tumbler switches only are dealt with, it will be evident that exactly the same conditions may be met with in such other accessories as fuseboards, wall plugs, cutouts, &c., and although these are not called upon to give a mechanical performance as is the case with switches, it is important that for the sake of their lasting properties and electrical efficiency similar care in installing them should be exercised.

The two diagrams given show the correct and incorrect methods of installing a tumbler switch.

We are reminded of the necessity for protection against the creeping of moisture along the conductor itself, and it will be remembered that we drew attention to the importance of this in our issue of February 20th last when we advocated the sealing of cable ends.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Adjustable Wire Stripper.

What should prove of value to the electrical wireman is a wire stripper, described in *Electrical Merchandising*, which is being manufactured by Mr. A. LAUBSCHER, 77, Fort Pleasant, Avenue, Springfield, Mass., known as the Acme electric cord

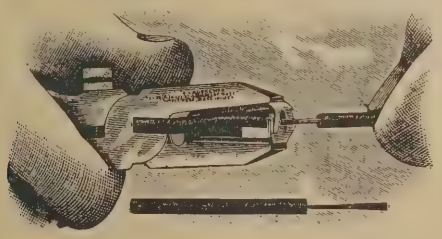

Fig. 1.—Cord and Wire Stripper.

and wire stripper, fig. 1. It is claimed that it will strip double or reinforced cord as well as single. It is possible to set the stripping opening to the size necessary to accommodate the wire. All the parts are interchangeable, and may be easily removed and replaced.

A New Ironclad Switch.

The MIDLAND ELECTRIC MANUFACTURING CO., LTD., Barford Street, Birmingham, has introduced a new series of switches under the trade name of "Memrex." It is claimed that it is the first commercial ironclad switch to comply with No. 67 of

Fig. 2.—The "Memrex" Switch.

the new I.E.E. Regulations, which specifies tests of 50 per cent. excess current at 50 per cent. excess pressure over rating. The switch is fitted with the M.E.M. quick-make-and-break movement, and special attention is drawn to the complete shrouding of the live parts, which enables the switch to comply with the strictest interpretation of the Home Office Regulations. Standard "Memrex" switches have been tested at the Birmingham University Electrical Laboratory under the following conditions, with satisfactory results: a 15-A switch was tested on a load of 22.5 A, a 30-A switch on 45 A, and a 60-A switch on 90 A, all at a pressure of 750 V. Fig. 2 shows the "Memrex" switch, which can also be supplied as a combination switch and fuses.

A Fusible Cartridge for use with an Electric Iron.

A somewhat ingenious device, designed for use in conjunction with their "Safe Economy" electric iron, has been marketed by MESSRS. IMPROVED APPLIANCES, LTD., 43-4, Fetter Lane, London, E.C.4, in the form of a collapsible cartridge designed to hold the switch of the iron "on" for a given period and then release it automatically. It consists of two cylindrical metal tubes, one inside the other, fixed, when cold, at a

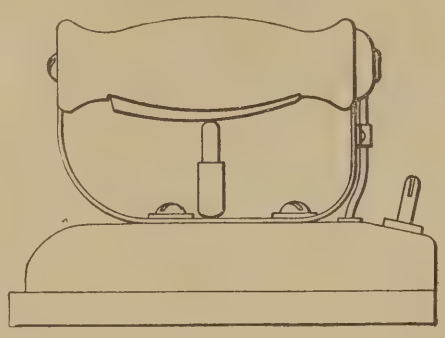

Fig. 3.—Fusible Cartridge in Position.

point giving the required length to hold the switch "on." The cartridge is placed vertically between the switch handle and the element case, as in fig. 3. At a certain temperature or after a period of about 10 minutes the grip between the two portions is released, with the result that the device collapses and the switch is released from the "on" position by its own mechanism.

A New Portable Electric Cylinder Boring Machine.

A description is given in the *Railway Gazette* of a recent product of MESSRS. BEYER, PEACOCK & CO., LTD., 15, Dean's Yard, Westminster, London, S.W.1, in the form of a portable electric cylinder-boring machine, fig. 4. This device consists of a mild steel bar of 4¼ in. diameter, carrying the boring head and mounted in bearings in the main frame. This is designed as an oil-tight gear-box and is fitted with a 2-speed gear for driving the main worm wheel mounted on the bar which can be started, stopped and varied in speed by means of an operating

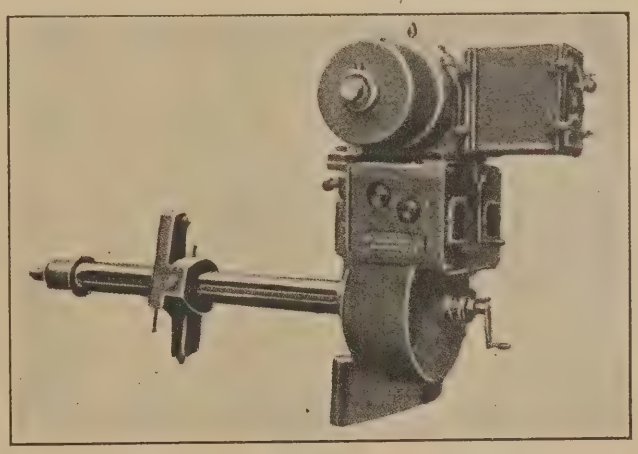

Fig. 4.—A New Electric Portable Boring Machine.

lever without stopping the motor. The machine is driven at constant speed by a 1-h.p. motor mounted on the main frame and carrying the starter on the side. An isolating switch is also provided, together with the necessary plugs, sockets and cable. The equipment comprises two boring heads and sets of tools, one pair of sample adaptors for bolting to the cylinder cover face and the necessary adjusting tools.

By bolting the machine to the adaptors and fitting the boring bar with the bush in the stuffing box of the rear cylinder cover, the machine is rendered self-centring.

A Combined Electric Towel Airer and Radiator.

The accompanying illustration, fig. 5, is of the "Gee-Gee" combined towel airer and radiator, a recent product of MESSRS. GEO. GREEN & CO., 40, Aybrook Street, Manchester Square, London, W.1. It is designed to give efficient service in the bathroom in both of the directions indicated, and is claimed to take up no more room than an ordinary towel rail. The

radiator is of the electrically-heated-water-type, and is equipped with a "Gee-Gee" immersion heater; this is arranged for 3-heat regulation. The maximum loading of 750 W is claimed to be sufficient to heat a bathroom of the

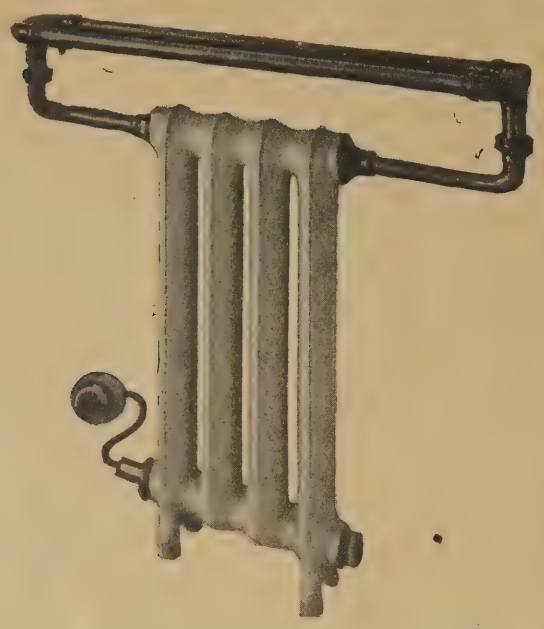

Fig. 5.—Combined Electric Towel Airer and Radiator.

usual dimensions, medium or low switching being used for airing purposes during warm weather.

The combination is finished with polished gun-metal rails and white enamelled radiator.

A Wiring System for Fume-laden Atmospheres.

The "Helsby" Ebonite-Enclosed Wiring System.

The advent of a system of electrical wiring that offers protection against the corrosive conditions obtaining in chemical factories, bleach yards and similar establishments will be welcomed by engineers whose work brings them in touch with conditions where lead or rubber sheathed cables, metal boxes and fittings will not stand up to the action of fumes, &c.

That ebonite is the strongest resistant to corrosive action commercially marketed is the basis on which the British Insulated & Helsby Cables, Ltd., has introduced the "Helsby" ebonite-enclosed wiring system. This consists of a range of cables and fittings completely enclosed in ebonite. The cable is supplied as single, two or three core, Association 600-megohm

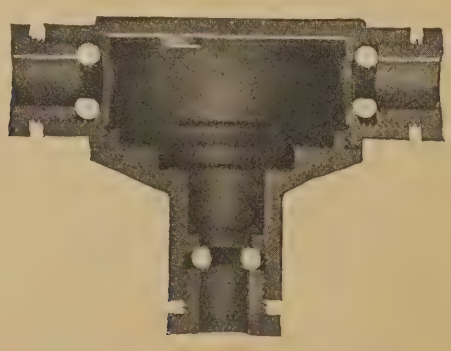

Fig. 1.—Section of Ebonite Case for Ceiling Rose.

grade, insulated with pure and vulcanised rubber and sheathed with a substantial tube of ebonite, all sizes, whether single or multi-core, being built up to an external diameter of half an inch. Only one size of gland is therefore necessary, although the makers have produced a smaller gland for use with flexible suspension lamp fittings, where cab-tire-sheathed twin flexibles may be used. The finished ebonite-sheathed cable is very strong and rigid when erected, and it is claimed that the ebonite sheathing affords mechanical protection to the insulated cores almost comparable to steel conduit.

The fittings, such as connectors for making joints, switches, fuse boards, &c., are enclosed in cylindrical ebonite boxes, in such a way that no metal parts are exposed to the atmosphere. The boxes are provided with screw glands, with rubber packing washers, making gas and watertight joints with the cable surface. The joint boxes are made in two, three and four ways, and gland plugs can be supplied for closing the ways not required. The ceiling rose embodies the same type of gland and screw-on cover as the joint boxes, an internal device preventing the weight of the pendant cable and lamp-holder from straining the joint.

In fig. 1 is shown a section of an ebonite fitting in the form of a ceiling rose.

Two types of lamp holder are provided suitable for vacuum lamps. One of these is intended for use with cab-tire-sheathed pendant cable, where it is desired to have flexible pendants. It comprises a standard brass bayonet socket cord grip lamp-holder enclosed in an ebonite shroud; the shroud is in two parts, enabling the holder to be easily wired. The other type of holder has an arrangement similar to the ceiling rose for taking the weight of the fitting.

Distribution boards or boxes are built up in a similar manner to the other fittings, the fuse elements being enclosed in an ebonite box fitted with cable glands. Fig. 2 shows a 4-way d.p. board, approximately a quarter of the actual size. The other necessary fittings including watertight rotary snap switches are all built up on the same principle.

By virtue of the property of ebonite of softening under heat, the sheathed cable is wound into coils of about 3 ft. 6 in. external diameter. It is, of course, necessary to again heat the cable before it can be uncoiled, a convenient method of doing this being to immerse the coil in hot water for a few minutes. When the sheathing becomes soft enough the cable is straightened out into the lengths required and as it becomes cold it hardens again. During erection it may be easily bent to any radius by heating locally at the required point; when set it permanently retains the curvature it has been given. It is claimed that the cutting of the cable and the preparation of the ends is quite simple. A slight incision made with a knife completely round the circumference enables the ebonite to be cracked on being sharply bent, when the cable inside

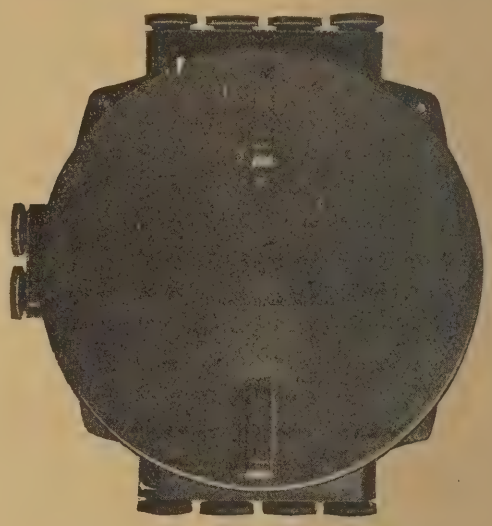

Fig. 2.—Ebonite Case for Distribution Board.

may be severed in the ordinary way with cutting pliers. To prepare the ends the sheath is cracked in the same manner and the piece drawn off.

The system has been subjected to severe practical tests, and some particulars from a report on an installation wired with the system are of great interest. The installation is at the works of a firm of bleachers, mercerisers and dyers. The mills were wired with the ebonite-enclosed wiring system in 1922 and no trouble has yet arisen on the installation, consisting of some 20 h.p. and over 100 lighting points. All departments are wired, including the various dyehouses, bleaching, mercerising, and stoving rooms, where the moisture-laden atmosphere is charged with chemical fumes, and water spraying, splashing, and dipping (slightly acid or alkaline) takes place, rendering the ordinary systems of wiring unsuitable. The whole of the wiring is said to be in as good condition to-day as when it was erected. The connections to the motors are run down the walls, along the floors and in some cases along the dyeing machines themselves, where they are continually subjected to hot and cold chemically charged liquors.

Electrical Train Shunting.—A new car retarding device to eliminate "car riding" and "switching tending," two of the most hazardous kinds of railroad work, was recently demonstrated at Gary, Ind., railway officials representing several roads being present. The new contrivance enables a tower operator to regulate the speed of a car and guide it to the correct track by electric lever switches. The invention was designed jointly by Messrs. George Hanhaner, vice-president of the Indiana Harbour Belt Railroad, and E. M. Wilcox, master technical engineer, and is controlled by them. The Illinois Central Railway has contracted to install the appliance in its yards at Harvey, Ill., and the New York Central Railroad had a representative at the demonstration, with the view of using the invention in its yards near Albany, N.Y.—*Reuter's Trade Service* (Chicago).

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Regulations for Rural Overhead Lines.

Recently, the chairman of a British electric power supply company stated that the cost of connecting a farm to its lines was £300. Just about that time, an Italian engineer complained to the writer that he could not get the cost of switchgear for tapping a 33,000-volt line below £14. These cases are obviously extreme, but there must be a reasonable intermediate solution, preferably rather nearer the lower figure.

Many engineers complain about the present overhead line regulations that exist in this country. However, looking at them from the point of view of absolute safety and uninterrupted continuity of service between central stations and important towns, it would seem that they are not really very far wrong. For a rural service, periodical brief cessations of supply for inspecting and repairing purposes can be permitted. In fact, it is the usual practice on the Continent to close down all overhead networks for a few hours each Sunday morning even though it may stop a few electric church organs, and put out a few cellar lights.

In your editorial for August 28th, in commenting upon the recommendations of the Electricity in Agriculture Committee of the Institution of Electrical Engineers, you expressed the hope that no further obstacles would be placed in the way of rural electrification. With this hope I am in entire agreement. My difficulty is, however, to see how best the end can be attained of installing suitable rural lines in a safe and economical way in this country, without offending official regulations. Further, very few engineers here seem to have studied this work in detail, hence considerable guidance is needed in addition, or else overhead lines that err too much on the side of cheapness and nastiness may be erected. Perhaps some of your readers could put forward suggestions as to the best way to solve the problem of stipulating minimum reasonable requirements, as a matter entirely apart from the present overhead-line regulations.

R. Borlase Matthews.

East Grinstead, *September 2nd*, 1925.

Legal.

S. G. Brown, Ltd., v. The National Association of Radio Manufacturers and Traders.

This case came before Mr. Justice Finlay in the Vacation Court on September 1st. Mr. Jowitt, K.C., Mr. Haydon, K.C., and Mr. Jacobs appeared for Messrs. Brown, and Sir H. Slesser, K.C., and Mr. Steinham for the Association.

Mr. Jowitt stated that the matter was a very serious one. In the first place, plaintiffs were asking for an injunction restraining the Association from including the plaintiffs' name in the Association's "stop list." Secondly, the plaintiffs sought a sequestration order on the ground that the Association had failed to comply with an injunction granted by Mr. Justice Acton restraining it from excluding the plaintiffs from the Wireless Exhibition to be held at the Albert Hall this month. Counsel declared that the Association had so manœuvred as to make it unnecessary for it to grant Messrs. Brown any space at all. The Association was a trade union and Messrs. Brown were well-known manufacturers of all sorts of wireless instruments. Among the rules governing the relationship of the members *inter se* and of the members with the corporate body were rules that the Association was to support and uphold any "stop list" issued by the manufacturers' section; and that there should be 21 days' notice and an opportunity of being heard given to any member before his expulsion from the Association. On May 14th last the plaintiffs received a notice that an emergency meeting of the manufacturers' section would be held on May 20th. There was nothing in the agenda of that meeting to indicate that the business would in any way affect the plaintiffs, although there was one item marked "Price-cutting, to receive correspondence." On the day before the meeting the plaintiffs' secretary was informed by the secretary of the Association that charges would be made against Messrs. Brown. The plaintiffs' secretary said he could not attend and asked for particulars of the charges. These were refused. At the meeting a resolution was passed that the executive was satisfied that Messrs. Brown had committed a breach of the Association's by-laws in giving irregular discounts to retailers and that Messrs. Brown were to be fined £525. It was also resolved that if a satisfactory explanation was not given by a certain date Messrs. Brown would be put upon the official "stop list." Counsel contended that such a resolution could not possibly have any validity in the circumstances for it was made in the absence of the plaintiffs and before they had been given any opportunity of being heard. Plaintiffs refused to recognise the validity of the resolution and their solicitor wrote demanding that the fine be rescinded. Unless this was done he refused to give the plaintiffs' explanation. Ultimately the Association gave some particulars of the irregularities alleged. These the plaintiffs considered "trumpery," and they gave notice of their intention to withdraw from the Association. The manufacturers' sectional executive met again on July 17th and on July 23rd the plaintiffs' name was put upon the Association's official "stop list" for the first time. The Association's secretary also sent a circular to the members pointing out the fact. Counsel said he had evidence showing that the damage done to the plaintiffs by the "stop list" was a continuing one.

Sir H. Slesser said his submission would be that the proceedings were altogether bad. The Association had not in fact acted upon the resolutions of the meeting in May. The fine had not been pressed and a fresh start in the matter was made by a fresh resolution properly in order on July 17th.

Mr. Jowitt argued that subsequent events could not be divorced from the earlier steps. The conduct of the Association was throughout tainted with the illegality of the proceedings on May 20th.

The hearing was continued on September 3rd, when Mr. Jowitt, proceeding with his opening statement, said that he had now received some documents from the other side which, in his submission, proved that the resolution of July 17th could not stand on its own legs, but owed any validity it had to the meeting of June 22nd. At the meeting of June 22nd the sectional executive body resolved, as Messrs. Brown had failed to comply with the resolution of May 20th, to place them on the "stop list," and appointed a special "disciplinary committee" from the executive to meet on June 30th and hear whatever explanations Messrs. Brown, who were requested to attend, should make with regard to the charge made against them of granting irregular discounts. Messrs. Brown refused to attend or make any explanations unless the resolution of May 20th, imposing the fine, was rescinded and the *status quo ante* was restored. Counsel contended that in order to have a reasonable opportunity of explaining, Messrs. Brown wished to go before the Committee as innocent persons and not as persons who had been prejudged and fined. The special Committee adjourned until July 17th, when the resolution in question was passed, which, counsel urged, the Committee had no power to pass.

Sir Henry Slesser said there was a meeting of the whole executive body on July 24th, when the action of the Committee in placing Messrs. Brown on the "stop list" was approved and confirmed.

His Lordship said that, subject to anything Sir Henry Slesser had to say, he thought the real date with which they had to deal was June 22nd.

Sir Henry Slesser said he would deal with the two matters of injunction and sequestration separately, as they were fundamentally different. In the case of the injunction he submitted with confidence that this was really an attempt to reopen a matter which had been fully considered by Mr. Justice Acton. Nothing had happened since that time to justify the Court in doing so. It was a very serious request to make, and entirely contrary to the practice of the Court.

His Lordship: I am disposed to agree if nothing new has happened, and Mr. Justice Acton had all the materials before him.

Sir Henry Slesser said that nothing new had happened, except the publication in a trade paper of the addition of Messrs. Brown to the "stop list." The plaintiffs alleged that the breaches of the Association's rules complained of were trumpery and easily explained. The Association, on the other hand, thought that what was done by Messrs. Brown constituted serious breaches of the rules and seriously menaced the standard rates which the Association existed to protect.

His Lordship said he could not decide that.

Sir Henry Slesser said that Mr. Justice Acton had before him not only evidence of general financial damage as the result of placing Messrs. Brown on the "stop list," but also evidence of specific financial damage. The most, therefore, that the plaintiffs could say was that they had now adduced more evidence on that point. Until July 17th there was no operative resolution to put Messrs. Brown on the "stop list," and quite apart from whether that resolution might be connected with the previous fining resolution, he submitted that on July 3rd the plaintiffs received adequate notice to attend the meeting and full particulars of the charges to be made. Consequently there was nothing here contrary to natural justice because the plaintiffs did not choose to attend.

His Lordship: They had been fined for the very things that were to be inquired into at the meeting.

Sir Henry Slesser: No, I submit not. In May it might have been said that there was no power to fine at all. Secondly, it might have been said that no notice had been given of the charges, and therefore the proceedings were contrary to natural justice. He did not attack or defend what was done in May. That was the subject of further litigation. The point was that at the meeting in June there was no longer any attempt to fine Messrs. Brown, but to put them on the "stop list." Therefore, the first criticism of the May resolution disappeared and the second criticism went by the board also immediately it was seen that adequate notice of the June meeting had been given. In any case an injunction would not be effective as the Association could convene another meeting and properly place the plaintiffs on the "stop list" if they were not properly there now. With regard to sequestration, Sir Henry declared that the Association had not disobeyed the order of Mr. Justice Acton, and had not the least desire to do so. It had done what the Judge intended it to do, and nothing more nor less. It was not to exclude the plaintiffs from the Wireless Exhibition. That did not mean that it was to allot them a stand. The Association was to grant the plaintiffs an equal

opportunity with other members to make an application for a stand, that was all.

His LORDSHIP said that the wording of the order was singularly inoperative, but he felt that it was the intention of Mr. Justice Acton that the plaintiffs should have a stall at the Exhibition. He suggested that there should be no order with respect to the alleged contempt, but that he should now direct the Association to provide the plaintiffs with a stall.

Sir HENRY SLESSER said that the members had no right at all to any space at the Exhibition. Such space allocation was contingent upon the acceptance of a contract. There was no obligation upon the Association to provide space for anybody in particular.

After a lengthy consultation the parties arrived at a settlement of the whole dispute.

Mr. JOWITT stated that the terms were that the defendants agreed to reinstate the plaintiffs forthwith as full members of the Association, the plaintiffs' resignation to stand, but not to be operative until September 27th; the defendants withdrew all charges against the plaintiffs on the plaintiffs' agreeing that the defendants' action in placing them on the "stop list" was taken in good faith; the plaintiffs admitted the moral obligation to abide by the rules of the Association; the defendants agreed to allot a stand to the plaintiffs at the forthcoming exhibition; the defendants agreed to withdraw plaintiffs' name from the "stop list" and delete the resolution with regard to the fine; the record of these proceedings to be withdrawn, and all claims by the plaintiffs to be abandoned, each party paying its own costs. Beyond the publication of these terms both parties agreed not to make any public announcement with regard to the matters in dispute; and the defendants agreed not to place the plaintiffs on the "stop list" by reason of their ceasing to be members of the Association.

His LORDSHIP considered that the parties had taken a very wise course.

British Broadcasting Co., Ltd., v. Wireless League Gazette Publishing Co., Ltd.

THE British Broadcasting Co., Ltd., on September 2nd, in the Vacation Court, applied for an interim injunction restraining until the trial of the action the Wireless League Gazette Publishing Company, Ltd., from infringing its copyright in the *Radio Times* by publishing on Saturdays the substance of the coming week's broadcasting programmes. For the defendants it was contended that there was no copyright and that there was nothing in the contract between the Postmaster-General and the British Broadcasting Company which entitled the company to exploit the programmes for its own profit.

Mr. JUSTICE FINLAY said he was not satisfied that the defendants were right and would ultimately succeed, but he was satisfied that there were serious and difficult questions of copyright to be tried. In the circumstances there would be no order on the motion except that the costs should be made costs in the action and that facilities would be given for an early trial of the action.

Globe & Sampson, Ltd., v. T. W. & R. C. Globe.

AT the Sheffield County Court recently, Globe and Simpson, Ltd., magneto specialists, of Cambridge Street, Sheffield, sued Thomas Wilson Globe and Reginald Cocking Globe, car electrical factors, of Broad Lane, Sheffield, for £50 damages for alleged breach of contract in connection with the sale and purchase of a business of magneto specialists and accumulator and starting battery engineers, and also for an injunction to restrain the defendants from carrying on or being connected with such business within 25 miles of Sheffield, and in particular from continuing to carry on or be connected with such business under the title of "Globe & Co.," at Broad Lane, Sheffield, as being contrary to an agreement entered into by the defendants on April 21st, 1921.

For the defendants, Mr. F. J. O. CODDINGTON said that the agreement had been cancelled at a meeting held on March 24th, 1924.

In cross-examination, REGINALD GLOBE admitted that only one clause of the agreement had been cancelled on the occasion referred to.

After a long summing up, the Judge gave judgment for the plaintiffs, awarded £2 damages, and granted an injunction. His Honour allowed a stay of execution for 14 days pending an appeal.

Japanese Electrical Exhibition.—His Majesty's Consul at Osaka (Mr. W. B. Cunningham) reports that arrangements are being made by the Kwansai (Western Japan) Branch of the Electric Association of Japan for an electrical exhibition on a considerable scale, which is to be held at Osaka from March 20th to May 31st, 1926. The promoters of the exhibition, which will be the largest of its kind as yet held in Japan, state that exhibits from foreign countries will be welcomed, although it is only in the case of Japanese goods that any awards will be offered. Applications for space are to be sent in by December 30th next and should contain full particulars of the nature of the goods to be exhibited, the space and current (if any) required, &c. They should be addressed to the office of the Exhibition, c/o Denki Kyokwai Shibu, Dojimanaka 2 chome, Kita-ku, Osaka.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

6,227. "Wireless receiving circuits." J. Robinson and T. H. Kinman. March 11th, 1924. (238,261.)

9,034. "Thermionic generators of high-frequency electric oscillations." E. W. B. Gill and E. Green. April 9th, 1924. (Addition to 201,585.) (238,265.)

9,347. "Apparatus for recording and reproducing sound." J. R. Robertson. April 12th, 1923. (214,274.)

11,284. "Alternating-current rectifiers." L. J. Hancock and Hancock and Co. (Engineers), Ltd. May 7th, 1924. (238,276.)

11,622. "Electrical apparatus for delivering a constant output when energised by a variable alternating input." W. J. Brown and Metropolitan-Vickers Electrical Co., Ltd. May 10th, 1924. (Cognate Application, 6,381/25.) (238,281.)

11,792. "Variable inductances for wireless telephony and the like." F. Noble. May 13th, 1924. (238,250.)

12,307. "Sound reproducers." P. G. A. H. Voigt. May 20th, 1924. (Cognate Application, 1,578/25.) (238,310.)

12,722. "Inductance coils." Igranic Electric Co., Ltd., A. H. Curtis, L. E. Currah, and W. K. Alford. May 23rd, 1924. (238,318.)

12,939. "Apparatus adapted for wireless reception." E. A. Graham. May 26th, 1924. (238,323.)

13,098. "Electric heaters." J. Schoenfeld. May 28th, 1924. (238,325.)

14,242. "Reproducing amplifiers for sound or like waves." T. W. Case. June 12th, 1924. (238,333.)

14,714. "Electrical heating unit." O. Kitzinger, J. Pickl, M. Moser, and A. Kraus. June 18th, 1923. (217,904.)

15,272. "Electrodes for discharge tubes." British Thomson-Houston Co., Ltd. July 24th, 1923. (219,663.)

15,464. "Radio receivers." N. Lea and Radio Communication Co., Ltd. June 26th, 1924. (238,338.)

15,731. "Electric contact-makers for use on the steering wheels of vehicles." G. Rose. June 30th, 1923. (218,330.)

15,834. "Electric generator and battery protector." T. W. Sampson and W. C. Chappell. July 1st, 1924. (Addition to 215,346.) (238,339.)

16,004. "Wireless receiving apparatus." C. L. Edwards. July 3rd, 1924. (238,342.)

17,497. "Pilotless aircraft for use in war." R. E. Bozon. July 22nd, 1924. (238,352.)

17,904. "Electromagnetic interrupters for the intermittent illumination of electric lamps." British Thomson-Houston Co., Ltd. (General Electric Co.). July 26th, 1924. (238,358.)

18,747. "Wireless apparatus." R. French and C. French. August 6th, 1924. (238,366.)

19,129. "Extra high-tension junction boxes for multi-core electrical cables." Forges & Ateliers de Constructions Electriques de Jeumont. May 13th, 1924. (234,038.)

19,494. "Electric switches." W. Edwards. August 16th, 1924. (238,376.)

20,274. "Heat-responsive electric circuit controllers." British Thomson-Houston Co., Ltd. August 27th, 1923. (221,213.)

20,979. "Electrical switches, particularly for high-tension systems." Electric Control, Ltd., and W. J. Gilson. September 5th, 1924. (238,384.)

23,690. "Sound-reproducing apparatus." British Thomson-Houston Co., Ltd. March 27th, 1924. (231,420.)

24,157. "Damping circuits for alternating-current machines." Siemens-Schuckertwerke Ges. October 13th, 1923. (223,250.)

24,233. "Taping machines." Western Electric Co., Ltd. December 31st, 1923. (Addition to 203,297.) (227,082.)

25,164. "Electric discharge apparatus." British Thomson-Houston Co., Ltd. October 23rd, 1923. (223,921.)

26,421. "Combined manual and automatic switches for electric heaters." M. Klettner. November 5th, 1924. (238,419.)

26,513. "Electrotherapeutic appliances or apparatus." E. R. G. Greville and F. W. Read. November 6th, 1924. (238,420.)

28,783. "Starting and short-circuiting devices for induction motors." J. W. Kirkland (Allgemeine Elektricitats-Ges.). December 1st, 1924. (238,433.)

29,812. "Tuning coils for wireless apparatus." A. M. M. Poole and H. C. Poole. December 11th, 1924. (238,439.)

30,134. "Electric lift machines and the like." J. B. M. Knutsen. December 15th, 1924. (238,441.)

30,357. "Methods of sheathing electrical conductors and like cores." Western Electric Co., Ltd. (Western Electric Co., Inc.). December 17th, 1924. (238,442.)

30,647. "Intermittent electric light fitting." A. Shaw and F. Fairer. December 20th, 1924. (238,443.)

1925.

844. "Overload electric relays." British Thomson-Houston Co., Ltd., and J. Sugden. January 10th, 1925. (238,453.)

1,840. "Combined wireless valve holder and rheostat." E. Dixon and C. J. E. Dixon. January 21st, 1925. (238,459.)

2,851. "Variable resistance devices." P. C. Rushen (Pacent Electric Co., Inc.). January 31st, 1925. (238,462.)

3,751. "Electric switches." International General Electric Co., Inc. February 11th, 1924. (229,297.)

4,053. "Electrical relays." H. J. Fitzpatrick. February 13th, 1925. (238,468.)

5,684. "Electric insulators." Porcelainfabriken Norden Aktieselskabet. March 5th, 1924. (230,446.)

7,632. "Automatic or semi-automatic telephone systems." Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. May 16th, 1924. (Divided Application on 12,136/24.) (238,477.)

7,776. "Process for electrical gas purification." Lodge-Cottrell, Ltd. (formerly Lodge Fume Co., Ltd.) (Metallbank und Metallurgische Ges. Akt.-Ges.). March 23rd, 1925. (Addition to 177,117.) (238,480.)

8,038. "Relays for the protection of alternating electric current systems." International General Electric Co., Inc. March 25th, 1924. (231,505.)

13,953. "Ignition coils for internal combustion engines." R. Bosch Akt.-Ges. June 26th, 1924. (236,181.)

15,012. "Illuminating appliances." A. J. Stephens (W. A. Dorey). June 9th, 1925. (238,498.)

17,657. "Electrical heating elements." E. L. Wiegand. March 11th, 1924. (Divided Application on 221,180.) (238,502.)

The

Electrical Review

VOL. XCVII. SEPTEMBER 18, 1925. No. 2,495.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone Nos.: Central 8260 and 8261.

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

The Wireless Exhibition.

THE exhibition of wireless apparatus—mainly for use in connection with the broadcasting service—which is in progress at the Albert Hall affords an opportunity to take stock of our position with regard to this application of electricity to the use and convenience of mankind. Considering that broadcasting was unheard of until 1920, and was only practised on a very limited and purely experimental scale during the first year or so, the development which has taken place since a national service was undertaken by the British Broadcasting Company in 1922 is nothing less than astounding. The United States, taking its cue from the achievements of the Marconi engineers and private experimenters in this country, plunged into an orgy of unrestricted broadcasting from which it does not appear to have yet recovered; we, fortunately, were more cautious, and established a controlled monopoly of broadcasting which has proved highly beneficial, both to the public and to the trades concerned: to the former, by ensuring the sane and efficient use of the ether, without interference between conflicting programmes, and to the latter by providing them with an assured market for their products and enabling them to manufacture apparatus to comply with clearly defined conditions.

The success of the policy adopted was well illustrated at the luncheon given to Senatore Marconi last week by the N.A.R.M.A.T., when the speakers bore witness to the fact that British broadcasting and British apparatus were the best in the world, and were in great demand beyond our borders. That the number of licence-holders is already close upon 1½ millions is in itself convincing testimony to the merits of the system, and an amazing record for a period of less than three years; and to that number must be added, we believe, quite a large number of unlicensed listeners who have not thought it incumbent upon them to bear their share of the cost of the programmes which they enjoy.

The early days of the automobile were marked by the numbers of untutored amateur mechanics who plunged into the mysteries of the internal-combustion engine with a zest unquenchable by oil and grime, but there is no precedent for the extraordinary enthusiasm with

which the wireless field has been invaded by hundreds of thousands who previously could not have adjusted an electric bell, but who essayed to capture Hertzian waves with an ardour that was rewarded by an incredible measure of success, aided by a specialist Press that now comprises no fewer than 18 periodicals and innumerable popular handbooks. The exhibition is a rallying-point for this army of would-be electricians, but it is also well worth visiting by the minority who are professionally interested in electrical engineering; whilst they will find there few striking innovations, they will be enabled to gauge the progress that has been made in the perfecting of detail and the evolution of improvements in design, and to appreciate the fact that the exhibits, taken all round, bear testimony to the very high standards of quality that are maintained by the manufacturers. Out of a chaos of complicated connections a few comparatively simple circuits are becoming more or less standard practice, and whilst it is possible to ring the changes indefinitely (perhaps that is the secret of the wireless craze) there is no need to stray far from the paths of simplicity and economy in order to secure perfectly satisfactory results.

Nevertheless, it must be admitted that so long as the overall efficiency of the receiving apparatus is far below one per cent. there is immense scope for invention. The telephone is essentially unchanged from its earliest form. If it made use of even five per cent. of the energy put into it, every headphone would become a "loud speaker." Here is a splendid opening for the experimenter!

Fabians and Farming.

UNDER the chairmanship of Captain Basil Hall, R.N., the fourth and last week of the Fabian Summer School was devoted to the consideration of rural problems. It was quite appropriate to this subject that the school was housed this year at the Bradley Agricultural College, Mitcheldean, Glos.

It is a sign of the times that an evening was allotted to the uses of electricity in agriculture, when Mr. R. Borlase Matthews read a paper on the subject, and a very animated and interesting discussion followed, in which the principal points raised were a demand for more technical information concerning certain of the farming applications; the cost of power; the comparison of hydro-electric and steam-generated power; electric ploughing; making hay without sunshine; the matter of distribution; and overhead lines *versus* cables. Naturally also, as might be expected of such an Association, the subject of economics and the question whether labour would be dispensed with or increased on farms were discussed. The opinion of the author of the paper was that the output per acre and per man would be increased and employment improved generally in rural districts, for the experience of other countries was that much work at present carried out in the towns was transferred to the country when electric power was available there.

A summary of the principal points of the paper will be found elsewhere in this issue.

Japanese Electrical Industry.

THE depressed condition of affairs in Japan has, not unnaturally, led to an agitation for the support of Home industries. It is reported that, consequent upon the great decrease in its revenue and in order to relieve the dullness of trade, the Imperial Government Railways Department has resolved to purchase all requisites from Japanese manufacturers, excepting small products which cannot be made in the country. Further, Japanese industrial concerns are stated to have a predilection for foreign electrical machinery and apparatus, and those interested in the future well-being of Japanese electrical engineering industry are very much exercised by this tendency. The Electrical Association is understood to have decided to make extensive and thorough investigations regarding the weak and defective points in Japanese products, through a committee that has been set up. This committee consists of representatives of 36 electrical machinery manufacturers, including several well-known companies, also of the Tokyo Municipal Electrical Bureau, while the Departments of Communications, Railways, and of the Army and Navy are to be asked to co-operate in the inquiry.

The subject was recently touched upon in an article in the *Electrician's Friend*, written by Mr. S. Mayebara, the chief of the Engineering Section of the Electric Bureau of the Communications Department. Though he was able to give figures showing that the Japanese electric power supply industry was making steady progress, and that a large amount of new generating plant was in course of erection, he had to deplore the Japanese inclination to indiscriminately favour foreign production, especially at a time when it was claimed that Japan produced hydro and steam plant "not so inferior to the foreign products" as a correspondent expresses it in a communication to ourselves. Mr. Mayebara is reported to have urged Japanese engineers to use as much Japanese product as possible, even at the sacrifice of convenience, in order to develop the Japanese electrical machinery and apparatus industry.

With regard to new work in contemplation, we understand that the Imperial Government Railways Department has decided to commence upon the construction of the Shinano-gawa hydro-electric power station in the fiscal year 1926-27. The Osaka municipality has large extensions to its electric power system in prospect. Mr. Amenomiya, the chief of its Electricity Department, has been indicating vast expansion ideas for the next seven or eight years both in respect of power supply and in electric transportation. The 10,000-kW generators for the Kujo power station, which is part of the scheme, were recently obtained in England. Further additions of 20,000 to 30,000 kW per year are contemplated for some years to come, subject to the approval of the loan scheme by the Department of Finance.

Trade Opportunities in Egypt.

THE report of Mr. E. Homan Mulock, Commercial Secretary at Cairo, which we review in this issue, indicates that Egypt is in a position shared by few countries at the present time. The cotton industry is prosperous, and this has had a beneficial effect upon the general economic position of the country. In many quarters attention is being directed to the advantages of electricity, resulting in the placing of a fair quantity of orders for machinery and plant. Unfortunately, the bulk of this business went to our Continental competitors, Germany having been very successful. The reason is plain: the British quotations were 50 per cent. above the German tenders. Mr. Mulock says: "It is to be regretted that, with one exception only, United Kingdom manufacturers do not appear to have submitted tenders for provincial electrical undertakings." In view of the wide price margin, this is not to be wondered at. Nevertheless, in spite of what the report says, Great Britain supplied the second largest share of the imports of electrical machinery during 1924, although France led by a substantial amount, and this share was an improvement upon the previous year's value.

Referring to the supply of smaller appliances and materials, the report states that if British manufacturers had extended their advertising and trade propaganda they would have obtained a larger share of the business. We think that greater efforts are worth while in this market which shows every sign of continued expansion. Hitherto the political uncertainty has handicapped foreign enterprise, but there is reason to believe that stability is now in sight and the position should be easier.

It is worth noting that, *mirabile dictu*, nothing is said about long-term credits, which are proving a difficulty in so many markets just now.

High-Voltage Cables.

Dielectric Loss and Temperature Rise under Working Conditions.

By E. A. BEAVIS, B.Sc.(Eng.), A.M.I.E.E., A.C.G.I.

Introduction.

The economical need for transmission of electrical energy at increasingly higher voltages has in recent years created many problems in connection with the design and manufacture of super-tension cables.

The question of dielectric losses has received universal attention: experience with the earlier paper-impregnated h.v. cables testified to its importance; in fact, the dielectric heating seemed likely to prove a serious limitation from the practical point of view.

A great deal of experimental investigation and research work has already been accomplished in this respect, and although the results available so far appear to be somewhat conflicting, much improvement is evidenced by the lower losses that characterise the more modern h.v. cables. With dielectric loss a matter of secondary consideration, it would seem that the present data in respect of current ratings available for voltages up to 11,000 V can be made applicable for much higher voltages with little or no modification.

In view, however, of our lack of definite knowledge or explanation of many of the dielectric phenomena occurring with high voltages, any conclusions drawn from isolated experiments on cable samples or impregnating compounds must necessarily be of somewhat tentative nature, and in practice allowance should be made for an appreciable factor of safety on the score of reliability.

Characteristics of Impregnated Paper Dielectric.

The losses occasioned with alternating current appear to be due mainly to the combined effects of hysteresis and current leakage,* the former varying with frequency, the latter independent and of electrolytic nature. The magnitude of each component varies rapidly with the temperature, hysteresis decreasing and current leakage increasing with rising temperature, so that the loss-temperature curve has a minimum point which usually coincides with the melting temperature of the impregnating material (between 90 deg. and 100 deg. F.).

At the lower temperatures where hysteresis loss entirely predominates, the effects produced are somewhat inconsistent; appreciable variations with voltage sometimes occur, and in many cases results are modified by past treatment which the particular cable may have undergone. Such changes generally decrease with rising temperature; beyond the minimum point results show more stability and the loss tends to become independent of frequency. The hysteresis effect gradually fades away as the impregnating compound gets more fluid, and at some temperature where current leakage alone prevails, the losses for a.c. and d.c. of equivalent voltage will correspond.

Fig. 2 represents some characteristic temperature curves for impregnated paper dielectric. The direct-current resistivity varies exponentially in a fairly regular manner; the value at any temperature T can be approximately expressed by the equation—

$\rho_T = \rho_0 / \alpha^{T-60}$; ρ_0 is the resistivity at 60° F. and α the coefficient per degree F. (about 1.05 to 1.06).

For comparative purposes the quantity S/K is the most important with regard to the conditions under a.c., and determines the power factor (usually signified as S/pK, where $p = 2\pi f$), and the loss at the temperature, frequency, and voltage concerned.

The general relation between a.c. resistivity and temperature is not capable of simple expression, the slope of the curve changing gradually on either side of the maximum, and finally merging at the higher temperatures into the equivalent d.c. curve. For a given voltage and frequency, however, between definite limits, the a.c. resistivity can be approximately represented by an equation of similar form to that for d.c.

In practice we are concerned chiefly with the conditions at maximum load when the loss is most important. For moderate voltages the permissible maximum conductor temperature is usually specified as 150 deg. F.; the temperature range in the dielectric will normally lie, therefore, between 100 deg. and 150 deg. F. Between these limits the a.c. resistivity can be expressed by the relation—

$\rho_T' = \rho_n' / \beta^{T-N}$; ρ_n' represents the value at minimum loss temperature N°F, and β the coefficient per degree F. (about 1.02 to 1.03).

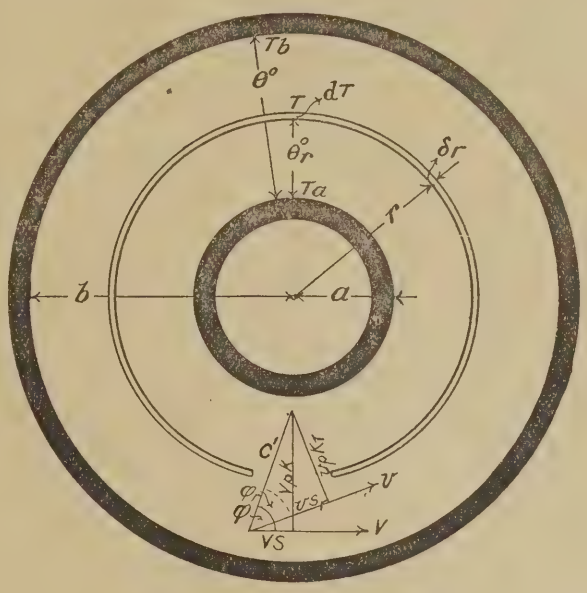

Fig. 1.—H.V. Single-Core Cable.

Resistivity and Temperature Gradient.

(*a*) *With Direct Current.*—Under working conditions a temperature gradient exists in the cable dielectric, and from the core (T_a °) to the sheath (T_b °) there is an appreciable drop in temperature (θ° F.). Now, if H is the heat passing through unit length of cable—neglecting losses and end effects—and k is the thermal resistivity of the material (in the required units)—

$$\theta = T_a - T_b = (Hk/2\pi) \log_e b/a.$$

If T be the temperature at any radius r, then

$$\theta_r = T_a - T = (Hk/2\pi) \log_e r/a.$$

For an elemental concentric ring of unit length, thickness δr, and radius r (fig. 1), the dielectric resistance is given by—

$\delta R = \rho_r \, \delta r / 2\pi r = (\rho_a \, \delta r / 2\pi r) \, a^{\theta r}$; ρ_a is the resistivity at T_a.

Hence $R = (\rho_a/2\pi) \log_e b/a \times (a^\theta - 1)/\theta \log_e a = (\rho_m/2\pi) \log_e b/a$ ... (1)

ρ_m is the true mean resistivity and equals $\rho_a \cdot f$ where f is a temperature factor, $(a^\theta - 1)/\theta \log_e a$, and if R_a is the resistance at uniform temperature T_a, then

$$P_a = (\rho_a/2\pi) \log_e b/a \text{; and } R = R_a \cdot f.$$

(*b*) *With Alternating Current.*—In the same way for the a.c. resistance, between the prescribed limits—

$$R' = (\rho_a'/2\pi) \log_e b/a \times (\beta^\theta - 1)/\theta \log_e \beta = R_a' \cdot f'.$$

* Höchstädter. *E.T.Z.*, April 27th, 1922.

In practice, the power-factor equation is better adapted for calculation purposes, *i.e.*—

$$S/pK = 1/pR' = (S/pK)_a \times 1/f' ; (S/pK)_a$$ is the power factor at T_a ... (2)

In order to gain some idea of the magnitude of this factor, let us consider a fairly general case in which the rise in temperature of the lead sheathing at maximum load is 50 per cent. of the total rise; then presuming T_a is 150 deg. F., with a ground temperature of 60 deg. F., T_b will be 105 deg. F. In this case $f=4.9$ (for $a=1.06$), and $f'=2.1$ (for $\beta=1.03$).

Potential and Temperature Gradient.

*With Direct Pressures.**—When a steady leakage current c is flowing through the dielectric, then by Ohm's law—

$dV = -\rho r(dr/2\pi r)\,c$, *i.e.* $-dV/dr = V/(r \log_e b/a) \times \rho r/\rho m = P_r\, a^{\theta r}/f$ (P_r is the potential gradient with uniform temperature) ... ... (3)

The potential gradient is modified by a temperature factor $a^{\theta r} \log_e a^\theta / (a^\theta - 1)$, and it will be seen that if there is much of a temperature range in the dielectric, the stress on the outer wall will be much greater than with uniform temperature; in fact, the maximum stress may revert to the layers next the sheath.

If we assume that $V/(a \log_e b/a)$ represents the maximum stress that the dielectric may be permitted to withstand for continuous working, then in order that this value shall not be exceeded under load conditions, the factor $a^{\theta r}/f$ must not be greater than r/a. In general with h.v. cables, the most economical ratio $b/a=\epsilon$, and in this case the maximum value a^θ/f must not exceed ϵ. If the factor $a^{\theta r}/r$ is a constant, the cable will have an equal potential gradient throughout;

i.e. $a^{\theta r}/r = 1/a$, and $a^\theta = b/a$,
$\theta = (\log_e b/a)/\log_e a = 1/\log_e a$.

With $a=1.06$, the following values for θ are obtained:—

(*a*) Maximum potential gradient not to be exceeded, then θ must not be greater than 43 deg. F.

(*b*) For equal gradient throughout, $\theta=17$ deg. F. Under normal conditions these figures give about 150 deg. F. as the maximum conductor temperature, and 100 deg. F. for constant gradient. In the case of direct-current cables it would therefore seem that the potential gradient factor is a most important consideration with regard to the permissible temperature rise of the conductor.

With Alternating Pressures.—In this case the voltage across any part of the dielectric is dependent upon the power factor, and if c' is the current flowing, then—

$c' = V\sqrt{(p^2K^2+S^2)} = Vp K \sqrt{(1 + \tan^2\theta)}$; where $\tan\theta = (S/pK)_m$, the true mean power factor.

The potential gradient can be obtained at once from the d.c. equation (3) by substituting the equivalent impedance in lieu of resistivity—

$$-\frac{dV}{dr} = \frac{V}{r \log_e b/a}\cdot\frac{i_r}{i_m} = \frac{V}{r\log_e b/a}\cdot\sqrt{\frac{(1/\rho m)^2 + (p K_m)^2}{(1/\rho r)^2 + (p K_r)^2}}$$

$$\text{Hence: } -\frac{dV}{dr} = \frac{V}{r\log_e b/a}\cdot\frac{\lambda m}{\lambda r}\cdot\frac{\sqrt{(S/pK)_m^2 + 1}}{(S/pK)_r^2 + 1} \cong$$

$$P_r\cdot\frac{\lambda m}{\lambda r}\cdot\frac{(2 + \tan^2\theta)}{(2 + \tan^2\theta_r)}. \qquad (4)$$

The change in the dielectric coefficient is almost negligible, and it is observed that the temperature gradient has little effect on the potential gradient with alternating current.

Dielectric Loss and Current Rating.

The effect of the dielectric losses upon the temperature gradient has not so far been considered; as, however, the transmission voltage is increased, the heat generated in the dielectric by the losses becomes of greater importance in the consideration of the maximum conductor temperature allowable for continuous practice.

When a steady state is reached under load conditions, with applied voltage V, there is a small leakage current flowing, c, and the heat generated in an elementary ring of the dielectric is $c^2 \rho\, dr/2\pi r$. Since the temperature remains constant, then—

$$\frac{d}{dr}\left(\frac{dT}{dr}\cdot\frac{2\pi r}{k}\right) = \frac{c^2\, dr}{2\pi r}\rho :$$

i.e. $\left(\frac{dT}{dr}\cdot\frac{2\pi r}{k}\right) = -\left(c^2\frac{\rho_1}{2\pi}\log_e r + H,\right)$;

and $\therefore T_r = \frac{k}{2\pi}\left(c^2\frac{\rho_2}{2\pi}\cdot\frac{\log_e^2 b/r}{2} + H.\log_e b/r\right) + T_b$.

Hence— $T_a = T_b + \frac{k}{2\pi}\cdot\left(H.\log_e b/a + \frac{c^2 R}{2}\log_e b/a\right)$.

T_b is the sheath temperature, H the heat flow due to the load; then if s represents the thermal resistance of the cable, G the thermal resistance of the soil and cable covering, and t the soil temperature, we have the following relations:—

$T_a = T_b + Hs + V^2 s/2R$; $T_b = t + (H + V^2/R)G$;
i.e., $T_a - T_b = \theta_1 + V^2 s/2R$; $T_b = t_b + (V^2/R)G$.

Since θ_1 is the range of temperature in the dielectric with load current only, we have $\theta_1 = t_a - t_b$; and the rise (x) in the conductor temperature due to the dielectric loss is then—

$$T_a - t_a = x = V^2(s/2 + G)/R.$$

R, the dielectric resistance at the final temperature T_a, can be expressed as $R_a f/a^x$, R_a being the resistance at uniform temperature t_a;

i.e., $x = \frac{V^2}{R_a\cdot f/a^x}(s/2 + G)$, and $\therefore \frac{x\cdot f}{a^x} = \frac{V^2}{R_a}(s/2 + G)$.

The temperature factor f, as previously given, is $(a^\theta - 1)/\theta \log_e a$; θ, *i.e.* $(T_a - T_b)$, can be expressed as $\theta_1 + dx$, where $d = s/(s + 2G)$; and thus $f = (a^{\theta_1 + dx} - 1)/(\theta_1 + dx)\log_e a$.

The complete equation for the temperature rise due to the dielectric loss is then—

$x(a^{\theta_1 + dx} - 1)/a^x \log_e a\,(\theta_1 + dx) = V^2(s/2 + G)/R_a$. (5)

For alternating current the power-factor equation will be:—$x f'/\beta^x = V^2(s/2 + G)\,pK\,(S/pK)_a$; $(S/pK)_a$ is the power factor at uniform t_a . . . ... (6)

The rise in temperature produced by the losses can be calculated in this way; in practice, however—unless the loss be abnormal—it will have little effect upon the dielectric resistance, which, assuming a final maximum conductor temperature of 150 deg. F. in all cases, will practically equal that given by current loading alone, *viz.*, $R f$ (R is the value for a uniform temperature t_a, of 150 deg). Under these conditions the equation for the temperature rise with dielectric loss becomes—

$x = W(s/2 + G)/f = W_m(s/2 + G)$; W is the watts lost, ($V^2/R$ or $V^2 S$) at 150° F uniform.

Allowance has to be made in respect of current rating; if C is the maximum current—neglecting losses—for a final conductor temperature of 150 deg. F., and C_1 the permissible current, including all losses, then—

$C_1/C = \sqrt{[(t_a - t)/(T_a - t)]} = \sqrt{\{[T_a - t - W_m (S/2 + G)]/(T_a - t)\}}$

i.e., $C_1 = C\sqrt{[1 - x/(T_a - t)]}$; (normally $T_a - t$ is about 90° F).

High Voltage and Cable Design.

Although the relative values of the test and breakdown pressures have important bearings with regard to the question of design, in general we can consider that for h.v. cables* $a=V/v$, where a is the conductor radius and v the maximum allowable stress for continuous working at voltage V. If the same dielectric constitution is used in the manufacture of cables for increasing voltage and v remains constant (between 40 and 50 kV/cm. rms); since $v=V/(a \log_e b/a)$, the $\log_e b/a=1$, and the mean gradient $V/(b-a)$ is also constant. The same maximum and mean stresses therefore exist in cables for various voltages under these conditions

* A. Russell: "The Dielectric Strength of Insulating Materials, &c." I.E.E. *Journal*, Vol. 40, 1908.

* C. T. Beaver: "Cables," I.E.E. *Journal*, Vol. 53, 1914.

tions, and the characteristic curves will be similar—assuming the dielectric to be homogeneous—in which case there will be the same value of resistivity and power factor to contend with at the working pressures.

Example.—Fig. 1 represents a cable designed for 40,000 volts a.c., with a maximum stress of 40,000 V/cm., in which case a is equal to 1 cm. and b to e cm. The same cable for d.c. will, on the max./rms ratio, be suitable for 60,000 volts approximately, at a maximum stress of 60,000 V/cm. The thermal resistance of this cable is 80, and that for the soil and covering is calculated to be about 60 (watt Centigrade units), as representing fairly normal conditions with a ground temperature of 60 deg. F.

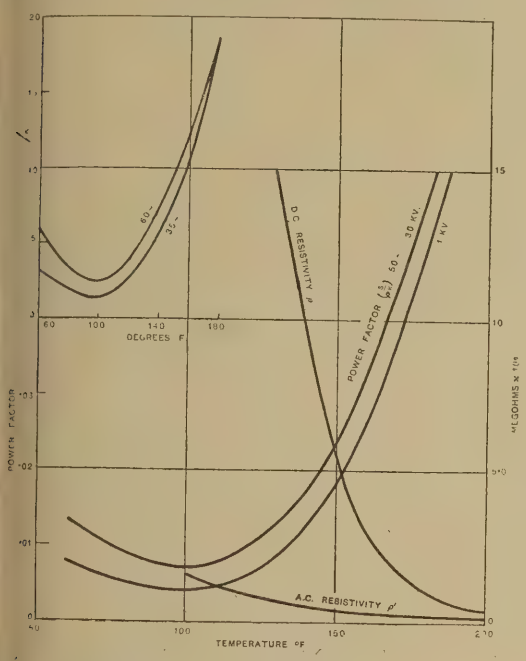

Fig. 2.—Characteristic Curves—Impregnated Paper Dielectric.

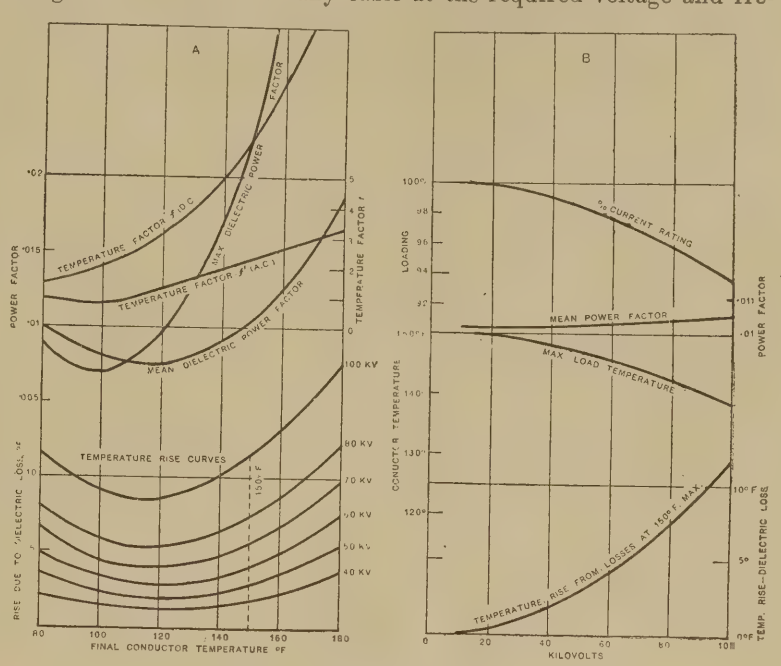

Fig. 3.—Voltage and Current Rating.

It is assumed that such a cable can be run at 150 deg. F., and in fig. 4 curves are given showing the variations in some of the characteristics with changing temperature gradient. In the case of the d.c. curves (A), it will be observed that the potential distribution is greatly altered and the maximum stress entirely reversed by the temperature range prevailing in the dielectric. In this particular example the maximum potential gradient is 70 kV/cm. on the outer layers of the dielectric with the given conditions. With a.c. the potential distribution is practically unaltered by variations of temperature. The effect of dielectric loss in the case of d.c. is immaterial at a maximum temperature of 150 deg. F.; in regard to a.c. there is a rise of about 2 deg. F. with 40 kV, with consequent slight increase in the dielectric power-factor curve (B).

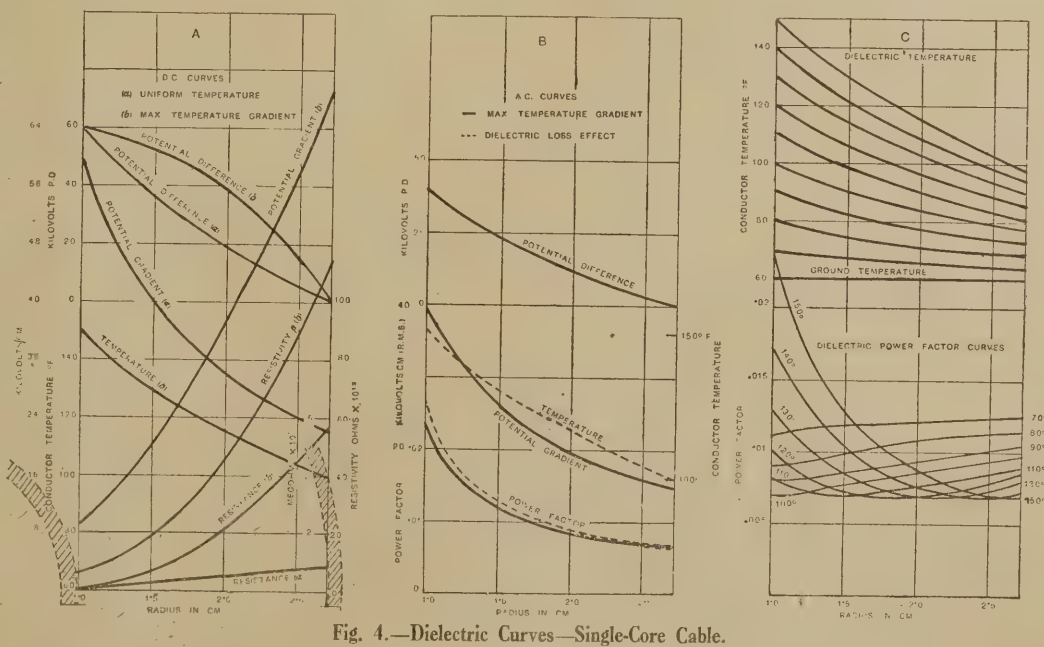

Fig. 4.—Dielectric Curves—Single-Core Cable.

Fig. 3 (A) shows the increasing rise due to dielectric loss with higher a.c. voltages, the rise being plotted against final conductor temperature; and (B) gives the necessary reduction in current rating to allow for the losses, in attaining a final temperature of 150 deg. F., for the various voltages.

These results will only be strictly applicable provided the same conditions in respect of potential gradient are observed, as the question of resistivity in relation to voltage has not been considered. That the dielectric resistance changes with the applied pressure—even at the higher temperatures—is evident from the two power-factor curves given in fig. 2, and under these circumstances the value obtained for the resistivity at any voltage is that corresponding to the mean potential gradient, and is the one contained in the various equations.

Hence, if the resistivity or power-factor curves are obtained for any cable at the required voltage and frequency with uniform temperature, the variations taking place within the dielectric for any conditions of loading can be ascertained as in fig. 4 (c), and the approximate mean value calculated for current rating purposes.

With a.c. cables for extra-high-tension, however, it seems probable—owing to difficulties in respect of size both as regards manufacture and general handling—that for voltages much above 60 kilovolts it will be necessary to increase the permissible value for the maximum potential gradient. If such be the case, the loss will be greater and the consequent temperature rise much increased, since in general the dielectric power factor will be higher in comparison with the figures given here. The matter is even more important in connection with the design of 3-core cables, which for pressures above 33,000 volts are almost out of the question unless greater dielectric stresses are to be brought into more

general use. A departure such as this is much to be deprecated, and it would seem to be attended by a certain amount of risk, so much is as yet unexplained in the behaviour of highly-stressed dielectrics. In particular, there is the debatable question of ionisation, which would appear to be present in some cables, but not in others—no doubt depending upon the degree of perfection attained in manufacture. No difficulty of this description appears to be experienced with well-filled cables having a maximum stress of about 40 kV/cm., but above this limit there seems a likelihood that ionisation may be present, although to what degree it is detrimental to the functioning of the cable, or what its ultimate effect upon the life of the cable will be, time and experience alone can tell.

Conclusions.

An investigation into the effects of temperature gradient upon the characteristics of impregnated paper dielectric leads to the conclusion that the dielectric loss of cables under working conditions can be represented by that produced at some uniform temperature, which for most cases of single-core cables in practice is approximately equivalent to the mean value.

With direct-current cable the dielectric loss is of little importance, but the maximum conductor temperature is limited by the value of potential gradient permitted in the outer layers of the dielectric, owing to the redistribution of potential taking place with temperature gradient.

For alternating-current cables the permissible temperature rise must depend upon the effect of dielectric loss; with 40 kV and over this cannot be ignored—even in single-core cables—and due allowance must be made in determining the current rating. In general, for single-core cables of normal design, a maximum temperature of 150 deg. F., including losses, does not seem to be excessive; this figure, however, to admit of reasonable factor of safety, must depend upon the question of the maximum potential gradient.

It is necessary for practical purposes to be able to foretell what the dielectric losses will be on h.v. cables under working conditions at temperatures corresponding to certain states of loading. In the factory attempts are often made to imitate running conditions—principally at maximum load when the losses are of chief importance—by means of current heating the cable conductors. Such a method, as a rule, can only be partially successful, since it is not possible to entirely create the varied conditions encountered in practice, and due allowances for this have to be made in the results obtained.

It is necessary both from the point of view of cable design and research work, that the characteristics of the impregnating materials should be obtained from time to time over a wide range of temperature, with varying frequency and voltage, and from the results some idea can be gathered of the probable behaviour of cables in practice. There is, however, a vast difference between materials as prepared under ideal conditions in the laboratory and those emerging as the finished cable after having passed through a host of manufacturing processes; and for a really accurate determination of the effects of voltage and temperature gradients on cables, it is essential to deal with the characteristics of a number of actual manufactured lengths—somewhat on the lines suggested in this article. A comparison of these methods affords useful indications with regard to the imperfection factor introduced by various impurities in the course of manufacture.

The Measurement of Electrical Service.

Some Suggestions for its Application.

By E. GRAHAM.

How can electrical service be measured?

The problem is uppermost in many minds. One of the most difficult things to do is to get hold of an idea of just how much service is being given by any stated person or firm. The customer has *his* ideas about it, and to him these are much more clearly defined than to the person giving the service. Were the reverse to hold, perhaps a better state of affairs might exist commercially, but then such conditions must change but slowly. To which end it must be noted that service can only be measured, to begin with, qualitatively. But it will be seen from what follows that the qualitative measurement soon becomes quantitative in a very real sense, and that, as a consequence, another industrial problem is offered a long-wanted solution, *viz.*, the satisfactory payment by results of staffs as distinct from manual workers.

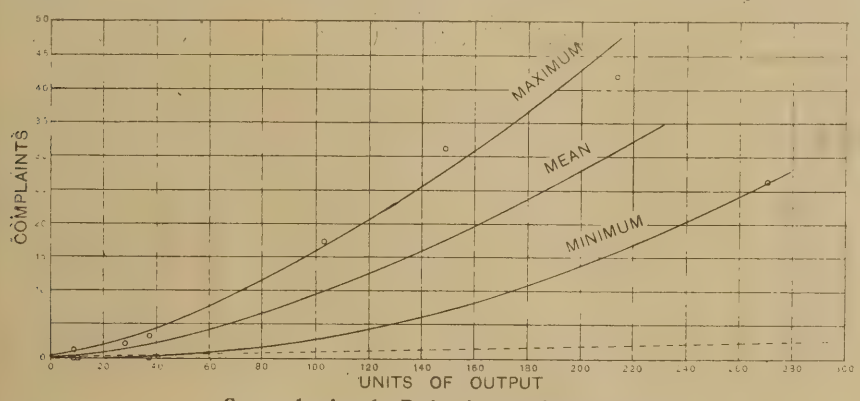
Incidentally, it is possible, as a result of service measurement by the method to be outlined, to institute a means of tracing with some accuracy the effect of certain given circumstances, external to the servant firm, upon its activities. It is well known, for instance, that certain buyers, for reasons only surmised, are definitely prejudiced against certain makers' goods. The makers themselves are aware of the prejudice, would like to overcome it, but are unable to locate the source of it with any degree of accuracy. The sources of such trouble, it is thought, can be located fairly accurately as a result of the measurement of service given.

It is necessary to consider which portion of the electrical trade is most directly affected by service conditions. For plant above 200 kW in size, the maker deals only either with a consulting engineer or with a highly technical customer, this following, as a natural consequence, upon the amount of money involved, which may be anything from £600 upwards per driving (or driven) unit installed, and/or the responsibility attached should a serious hitch arise with the plant ordered. The semi-technical, or non-technical buyer here rarely trusts himself to deal directly with the maker; he wants to be sure in his own mind that he is getting a full and proper return for his heavy outlay. Hence he employs a skilled consultant to look after his affairs. The highly technical buyer, on the other hand, knows exactly what he wants and understands what the maker will supply, and is, therefore, well able to serve himself. So that, commercially, the condition of service, in the ordinary accepted sense, may be said not to apply to plant above 200 kW.

Again, considering plant below 1 h.p. size, the applications of this are more or less of a universal nature. Standardised production combined with the small amount of money at stake in individual instances has led to the marketing of small machinery designed for heavy mechanical service, and therefore usable with little adaptation for practically any kind of work. At the worst, the customer is hardly ruined if his plant should prove to be a "frost." Any service given here lies more in the sphere of the retailer than in the sphere of the maker, although the latter is, of course, the servant of the retailer to some extent.

The limits of practical service, then, may be said to be realised in the medium-powered section of the trade, *i.e.*, that part of the industry dealing with plant of from 1 h.p. up to 200 kW capacity, and the service there given affects (*a*) the maker, (*b*) the middleman, or middlemen (sometimes there are two, or even three), and (*c*) the user. Either (*b*) and (*c*) can be customers

of (*a*). Hence it will be best to consider, for the sake of the principle involved, how the medium-powered maker can measure his service. With suitable modification, the principle can be applied to the middleman.



The medium-powered domain covers plant from simple units to the most complex arrangements of machinery, for almost every known industrial purpose; from coal cutters to cream separators, from mincing machines to printing presses and calenders. It is therefore necessary to make an analysis of sales to show a relationship between the type of customer and the mechanical power units (not the £ s. d.) manufactured, and the following analysis of a certain electrical manufacturer's sales of medium-powered dynamos and motors over the year 1924 gives a fair idea of the proportion of skilled, semi-skilled, and non-skilled minds involved in the aforementioned applications of the plant. The sales have been reduced to units of 25 h.p. output (or the equivalent kW), this unit being found to be the nearest to the result: total h.p. manufactured/total customers.

Sales to non-technical customers ...	493 units
Sales to semi-technical customers ...	270 units
Sales to highly-technical customers	167 units

These figures are now further sub-divided as follows:—

	Non-technical.	Semi-technical.	Highly-technical.
Users direct	270	149	28
Middlemen other than contractors ...	214	102	37
Consulting engineers	—	9	66
Contractors	9	10	36

The next step is to make a precisely similar analysis of *complaints of all kinds*, and in the present instance a collateral examination of letter, telegram, and telephone message records gave the number of complaints confirmed as 123.*

Curves showing the Ratio of Complaints to Output.

These dealt with anything from trivialities, such as "the pulley is one-eighth too large in diameter" to complaints of real breakdowns, prices, and demands for more suitable plant. They were apportioned as follows among customers:—

Non-technical	69
Semi-technical	48
Highly-technical	6

Actually, in addition, a few complaints were unconfirmed. Hence the figures for non-technical and semi-technical customers may be actually a little more evenly balanced. However, since the principle only is at stake, this is of no moment. Clearly, with other firms different figures must hold.

The sub-division gave:—

	Non-technical.	Semi-technical.	Highly-technical.
Users direct	26	31	2
Middlemen other than contractors ...	42	17	—
Consulting engineers	—	—	1
Contractors	1	—	3

If the foregoing figures now be plotted—complaints against units of output, as in the accompanying figure—using corresponding figures in the tables, two curves may be drawn through the limiting points so obtained, thereby giving a picture of the limiting numbers of complaints over the year. The value of these limiting curves will be referred to later. Meantime, as the figures themselves must vary from year to year, a mean curve drawn is sufficiently representative to serve two purposes, *viz.*:—

1. It shows, *by its shape*, whether complaints are increasing or decreasing in, or out of proportion with increase or decrease of output.
2. It serves as a means of obtaining a fair average value of the ratio complaints/customers applying to the *types* of customers among whom the sales were divided.

To consider these purposes it is necessary to draw a tangent to the curve at the lowest point.

1. If the slope of the curve continually increases, as in the example, then it clearly indicates that trouble with customers as a whole is increasing at a greater rate than the increase of output. That is to say, customers are less satisfied, *i.e.*, the *service* of the firm is falling off. Hence it is high time for the works' manager or managing director literally "to examine himself" and his organisation. Conferences may be needed to educate the staff in better pulling together; to teach them that unless they do so, and simultaneously pull with customers, the firm's reputation will not be saved. for the decrease in reputation is directly proportional to the distance between the curve and the tangent drawn. The further apart the two lines are, with the curve above, *the less the service being given.* The organisation is then such that conditions are not conducive to the giving of the best service, *e.g.*, there may exist discontent among the staff caused by sundry means, or it may be that delivery dates are not being adhered to, and therefore the progress side of the organisation may require looking into, which would cover an examination of order department, drawing office, foundry, stores, main shops, and dispatch department. If the slackness is not inside, is it outside? Are the agents, travellers, and outside technical men doing their bit to please the customers? If not, why not? and so on.

If the curve follows a straight line the service conditions are much more satisfactory. The same attention is then being given to each and every customer, whether that attention be wholly pleasing or not. Should the curve then make a decided angle with the horizontal axis, the service is *not* wholly pleasing. Yet it is sufficiently good to be classed as fair. There is, however, room for improvement, and an overhaul of the organisation would very likely prove to be an advantage. The greater the angle the greater the need for the overhaul. The ideal condition is that the curve will lie either on, or parallel to, the horizontal axis. Were this so, truly the manufacturer's life would be a happy one, as would also the lives of his customers and staff. However, human nature being as it is, it is to be feared that few firms are able to record a perfectly horizontal line.

The curve further provides a means of applying a satisfactory system of payment by results to the staff as a whole, on the basis of the amount of service done. It is possible to fix a definite percentage increase or decrease in salary dependent upon the shape of the curve. This percentage can be easily enough fixed, for the curve will be of some general order, say, in the present instance, $y = ax^n + b$. A calculated curve can be drawn so near the actual average curve as to make any difference negligible. Hence it is possible to reckon actually the *quantitative improvement* in the firm's service, as distinct from the qualitative one, and so fix a "gang bonus" system of payment by definite results, which will be far more accurate and satisfactory than the usual "bonus on output." The latter does not meet the service condition at all, since it only affects the inside and purely personal part of the business. The

* In obtaining these data, confidential information called for an alteration of the true number of complaints. The number, therefore, has been altered, but the *proportion* of them among the customers has been adhered to.

service bonus (or penalty, as the case may be), on the other hand, takes into consideration *all* the firm's activities. The counter hand dealing with a difficult caller is placed on exactly the same footing as the secretarial man replying to a particularly nasty letter, and *vice-versa*. By giving bad service any employé is penalising the whole staff, who, when working as a team, soon become able to look after such matters exclusive of managerial intervention. Both internal and external conditions, therefore, are properly catered for, since, if the service improves the output will improve, which is really the ultimate end of every system of payment by results. The actual percentage payable, or to be deducted, as the case may be, would, of course, depend upon the oncost and production conditions of individual concerns, but the main thing to be noted is that the *basis* of the system can be found by an earnest consultation of records to be found in any concern. If no records of complaints have been previously kept, it is feasible enough to start off by keeping careful note over three months, say, and correct the curve every three months until a sufficient amount of data is available to give a more authentic graph.

It should be noted, too, that the bonus is practically independent of either trade depression or boom, and is therefore fair in operation. In times of depression staffs generally are reduced, the service payment (total amount) being reduced in proportion to the staff reduction only, thus still leaving the *same incentive* to the remainder to keep on exerting their energies, and not increasing the cost per unit of output. With the purely output bonus, the amount paid decreases independently of the number of staff hands, thus killing the incentive to work hard at the time when hard work is most required.

Before passing on to the consideration of 2, it should be observed that the limiting curves are of use in another manner. It is customary for auditors, when checking books, to permit a firm to charge back on to the previous year any work done in the following year under guarantee or otherwise free of charge to meet customers' complaints respecting plant despatched in the year just closed. The amount to charge back is very difficult to estimate at the time the books are being audited, and in many instances a figure is "jumped" which is likely to contain a serious error. Now any such work will, because of its nature, be largely proportional to the mean curve drawn, but the nature of the year's complaints will indicate broadly whether, in terms of £ s. d., it is more nearly proportional to either of the limiting curves. Hence an estimate of the coming year's probable output will be referred to whichever curve is thought to apply, and a figure obtained with reference to which a fair back charge can be reckoned. The difficulty is generally to know the limits between which to fix the back charge, but if the charges for, say, three or four previous years be averaged and referred to the mean curve, the limits are fairly accurately obtained.

2. The curve provides a means of obtaining a good idea of the effect upon a firm's transactions of the type and class of customer dealt with. If the ratio, complaints/customers be reckoned from corresponding figures in the tables, the following results hold:—

Semi-technical direct user	.208
Non-technical middleman	.196
Semi-technical do.	.1665
Non-technical contractor	.111
Do. direct user	.0964
Highly-technical contractor	.0835
Do. direct user	.0714
Do. consulting engineer	.0151

Corrected to meet the average curve these become:—

Semi-technical direct user	.141
Non-technical middleman	.155
Semi-technical do.	.109
Non-technical contractor	.031
Do. direct user	.130
Highly-technical contractor	.053
Do. direct user	.045
Do. consulting engineer	.031

These figures are very useful in affording a means of locating approximately, in certain circumstances, sources of certain adverse conditions, such as, say, definite negative propaganda. Suppose that in a given district continual complaints arose showing strong similarity. Adding them and reading along from the total to the curve, provides a figure from which a ratio can be calculated, thereby giving an indication of the *type* of customer to whom the plant was sold. Then, since the complaints come from one general district, activities are immediately concentrated upon keeping a strict observance on all such typical customers in the district. Local agents and others are warned to keep ears and eyes open particularly with respect to those customers, and to report the least thing at all suggestive. Meanwhile, another curve is made out in the same way by dealing solely with the complaints and plant distributed among the typical customers concerned, these folks being sub-divided, in their turn, into certain classes or types as accurately as possible. (Thus it would be insufficient here to use the designation "contractor." The customer must be designated more definitely, as "plumber-wireman," "motor engineer," and so on, as all these people label themselves as "contractors" whether entitled to do so or not.) The *shape* of this second curve will then point out the source of the trouble almost right away. If the slope increases, the trouble is located among the larger buyers in the district; if the slope decreases, then among the smaller buyers. A careful scrutiny of the agents' and travellers' reports will confirm almost exactly where the trouble originates. The process is simply a detective one involving logical stages of elimination of conditions not affecting the general adverse one, and other applications of the principle will suggest themselves to individual readers. It is not claimed to be infallible, far from that; but it is thought to have a useful sphere in circumstances similar to that indicated. An actual instance wherein it would have proved useful was concerning many complaints received by a firm supplying ball-bearing motors. Only by chance it was discovered, long after, that the motors complained of were all supplied through a shady middleman who had replaced the original ball bearings by inferior ones. Had some such curve as has been suggested been employed, it is likely that the trouble would have been located within a very short time of receiving the complaints.

A further typical application of the process is where a maker supplies only through a large number of recognised agencies. His output would be divided per unit area of territory, and records would show whence complaints came and their number. The plotted curve would then show with fair accuracy where, among the agents, something existed which required looking into.

Thus, consideration of the principle involved in these remarks will show that it may be put to many uses distinct from, but yet directly dependent upon the measurement of service, and if, in virtue of its versatility, the principle can of itself offer a real service to the electrical trade (as well as to any other trade), why should not use be made of it? Measuring service, it measures quality; measuring quality, it measures status, and as a measure of status it is a definite measure of market pulling power.

Electric Automobiles in France.—As a result of the trials which have been held during the last few years, a steady increase is taking place in the use of industrial electric automobiles in France. The Société pour le Développement des Véhicules Electriques—an association of electricity-supply and other interested undertakings—is also assisting the movement by improving the battery charging facilities in France. As a result of its activities it is stated that there are now fifteen stations in Paris alone where the charging of vehicle batteries for private owners of electric trucks is undertaken.

Water-Power Development in Uruguay.—The *Review of the River Plate* says that the Uruguayan Minister of Public Works was interviewed recently by representatives of J. G. White & Co., who stated that that firm would be interested in financing the projected development of the Rio Negro for hydro-electric purposes.

The Wireless Exhibition, 1925.

An All-British Display of Radio-Telephone Apparatus and Accessories.

The third exhibition of radio-telephone receivers and component parts organised by the National Association of Radio Manufacturers and Traders, and the second to be staged in the Royal Albert Hall, was opened to the public on September 12th for a period of ten days. Since the last show the words ". . . and Traders" have been added to the Association's name, thus enlarging its scope when but little more than two years old, and it is therefore only natural that the number of exhibitors of apparatus should show an increase of 50 per cent. on last year's total of 44. Being the largest and most important function of the year in the radio world, the show may be regarded as an index of the development and progress of the past 12 months.

The fact that it is just 30 years since Guglielmo Marconi made his first successful wireless signals adds interest to the occasion, and to celebrate the event the N.A.R.M.A.T. gave a luncheon in honour of Senatore Marconi at the Savoy Hotel on Friday last. The chairman, Mr. W. W. Burnham, chairman of the Association, proposed the health of the principal guest, who, he said, had more than held his place in the ranks of wireless inventors. British broadcasting was the best in the world, and a large amount of capital had been invested in the British wireless trade, employing many thousands of workers. The Association desired to keep the trade in British hands, to promote British trade, and to keep foreign wireless wares out of the country.

Senatore Marconi responded, expressing his great satisfaction at the progress that had been made since he made his first experiments. He at first followed on the lines of Hertz, Lodge, and Righi, using very short waves and metallic reflectors, with which in 1895 he succeeded in telegraphing over a distance of 1¾ miles; the waves, less than one metre in length, could not overpass obstacles such as houses and hills, but he tried the effect of connecting his oscillator to a vertical wire and an earth-plate, and was then successful in obtaining reliable transmission quite unaffected by intervening obstacles. This was essentially a broadcasting system, and became the basis of all systems of long-distance radio communication. Describing further developments, he expressed his gratitude to the late Sir W. H. Preece, and to the Post Office authorities, for the help and encouragement that he had received from them. The wonderful progress that had since been made was rendered possible by the patient work of a host of investigators the world over, including his own assistants and the great radio and manufacturing companies.

Mr. R. Ferguson, proposing prosperity to the British Broadcasting Company, said the Association was proud of its sister organisation, and, referring to the Committee of Inquiry that had been appointed, he expressed the hope that there would be continuity of policy.

Mr. J. C. W. Reith, managing director of the B.B.C., responded, and pointed out that whatever was done by the B.B.C. in the interests of the public was bound, in the long run, to benefit the trade also. A new trade-mark for British goods was to be registered shortly, for use by members of the company. He heartily welcomed the Committee, and promised the fullest co-operation of the B.B.C.

Mr. W. H. Goodman proposed the health of the guests, and stated that not only British broadcasting, but also British apparatus, was the best in the world, judging by the foreign demand, which could not always be fully met owing to the heavy internal demand.

Capt. Ian Fraser, responding, said that when he was abroad recently he found that British stations were listened to very generally, and that it was held that the best musical programmes were received from Daventry and other stations in this country.

The Exhibition was opened on Saturday last by Viscount Wolmer, Assistant Postmaster-General, and has been visited by a large number of people during the past week.

Mullard Radio Valve Co., Ltd.

Amongst the comprehensive collection of the products of this company over a dozen types of receiving valves are displayed and h.f. and l.f. and the dull-filament power valves are the most recent additions to the firm's series. A dull-filament power amplifier of special interest is the P.M.4, illustrated in fig. 1. It has a filament of high emissivity which needs only 0.1 amp. at from 3.5 to 4.0 volts to heat it. The low temperature at which the filament works reduces the microphonic noises often obtained when using dull emitter valves with very thin filaments. The range of transmitting valves shown is even larger; a 5-watt pattern is available for the novice and

Fig. 1.—New Mullard Dull Power Valve.

Fig. 2.—New Mullard Anode Resistance.

a 30,000-watt valve as used in large stations is to be seen, whilst a dozen valves of intermediate powers are available. The transmitters from the 5-watt up to the 500-watt size have glass bulbs and those of higher-power valves are silica; the 30-kW valve is a metal-glass one and glass, silica, and metal-glass rectifier valves, of which 12 types are available, are made to work in conjunction with the transmitters. A new anode resistance recently developed by the company is also on view, fig. 2; it is entirely wire-wound and is claimed to be absolutely constant under all conditions of reasonable use. The substitution of wire for the usual carbon resistance element greatly increases the current carrying capacity of the resistance and also eliminates the noises usually associated with carbon anode resistances. Condensers to work in conjunction with these resistances for detector valves are also on view.

Radio Instruments, Ltd.

This exhibit is divided into two sections, *viz.*, complete sets and accessories. The new receivers are now all enclosed in mahogany cabinets, all the terminals being at the back with a door at the rear of the instrument to give access to the valves. Reaction is employed in every case, and dual rheostats of the pattern recently illustrated in our pages are fitted to all receivers so as to give the user the choice of either dull or bright valves, as desired, without the set needing modification.

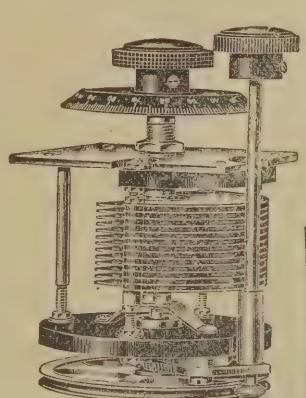


Fig. 3.—"R.I." Geared Condenser.

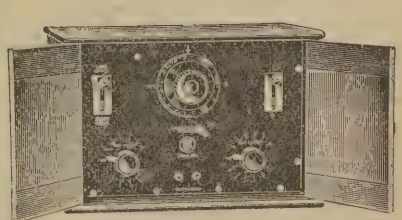

Fig. 4.—"R.I." Crystal and 2-Valve Amplifier.

In addition to "R.I." components, such as transformers, loudspeakers, &c., which have been on view before, there is to be seen a new geared condenser for very fine adjustment, having a gearing ratio of 11 to 1 (fig. 3). The method of gearing is new and obviates backlash; a small fibre pinion presses against a large grooved aluminium wheel and the friction between the two ensures a positive movement and precision tuning. The plates are of hard brass sheet. The firm's super-heterodyne components comprise two forms of oscillation couplers, one being complete with its variable condenser; the other, a somewhat less expensive unit, is for use with a separate variable condenser. A filter unit is made which gives efficient

results on about 6,000 metres, and the company also shows super-heterodyne transformers tuned broadly to the same wavelength as the filter unit. The company is now producing several different types of crystal sets, each including the permanent mineral detector which has been described in our columns. In addition to a comparatively cheap set with crystal detector only, two new instruments are being placed on the market, the permanent detector being used in conjunction with single and double-stage note magnifiers. These instruments are designed with a view to simplicity in operation; both crystal and valves are contained in the back of the instrument as shown in fig. 4 and are accessible by means of a hinged door. A switch is provided for cutting in or out the station at Daventry, and the cabinets are of polished mahogany. Valve detectors are made in three types and enclosed in cabinets very similar to the crystal-amplifier unit. One type comprises a valve detector in conjunction with a single-stage note amplifier; another has a two-stage note amplifier, and each possesses a range of from 300 to 4,000 metres. A pedestal base is provided for housing dry batteries and a third type is fitted with a more elaborate cabinet and has the advantage of an additional stage of h.f. amplification. In all three instruments where valve detectors are used, limited variable aerial reaction is provided by means of the "R.I." retroactive tuner. Note amplifiers are made in two sizes, one having a single stage and the other two stages.

A. J. Stevens & Co. (1914), Ltd.

This firm's productions include two, three, and four-valve receivers in walnut cabinets, and amongst the pedestal cabinets is a new Louis XIV. Renaissance model. The use of multi-valve switches enables some of the valves to be dispensed with. Amongst the amplifiers shown is the "Concert" model with tone, grid bias, and volume controls. In the loud speaker range are included new models of the pedestal,

Fig. 5.—"A.J.S." Cabinet-type Loud Speaker.

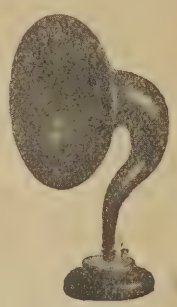

Fig. 6.—"A.J.S." Loud Speaker.

cabinet (fig. 5) and "Junior" speaker (fig. 6). Components are exhibited and an "A.J.S." headphone is now put on the market for the first time. The firm is also showing its new tubular steel telescopic masts in two sizes, measuring respectively 35 and 50 ft. when erected, and 18 ft. 3 in. and 19 ft. 6 in. nested for transit. No erecting gear is required, climbing is obviated, and the whole structure is complete with base plates, angle-iron ground pegs, guy wires fitted with strainers and insulators, aerial pulley, &c. Amongst the components exhibited were plug-in coils encased in ebonite, making a very solid job, a low-loss condenser, and a new choke unit.

Radiax, Ltd.

This exhibit consists of complete receiving sets of various patterns and a multitude of accessories, including sets of super-heterodyne components. A small condenser which is variable over a large proportion of its capacity should be very serviceable, and a new "low loss" loop aerial was shown which

Fig. 7.—Radiax Loud Speaker.

provided with tappings to enable ready adjustment to be obtained and to permit the use of capacity-controlled reaction. The non-resonating horn of the "Radiax" loud speaker, fig. 7, has a crystalline finish and the magnets are of cobalt steel. The diaphragm is adjustable by a method which is claimed to maintain parallelism between it and the magnet poles, and the terminals are mica insulated. The speaker illustrated is 19 in. high, the "Baby" pattern being 12½ in. high. The latest novelties on this stand were the "Cartrodenser" components—a new series of fixed condensers and grid leaks ("cartroleaks"), in the form of cartridges. Low-loss coils were also shown.

British Thomson-Houston Co., Ltd.

Amongst the newer developments of the company's crystal, crystal-valve, and multivalve sets, is the receiver shown in fig. 8, which is housed within a polished walnut case, the two valves being sunk beneath the panel. The circuit embodied is that of a detector valve followed by one stage of low-frequency amplification, reaction being provided by means of a

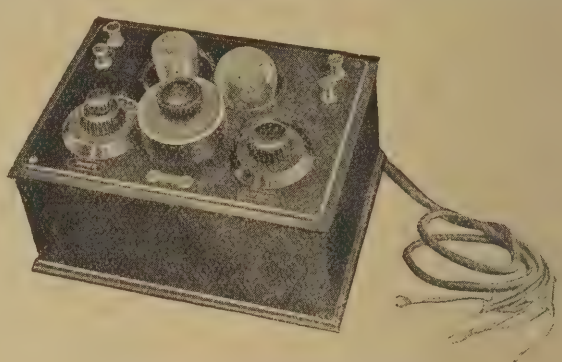

Fig. 8.—B.T.-H. 2-Valve Receiving Set.

specially designed form of plug-in aerial-loading coil and reaction unit. One feature is that no re-adjustment of the aerial-tuning condensers is required when the amount of reaction is varied. The tuning condenser enables fine adjustment to be made and all the battery connections are brought out from the back of the receiver in the form of a braided cable, duly tagged to facilitate connecting up. A variety of valves, loud speakers, and amplifiers, is shown with headphones and other

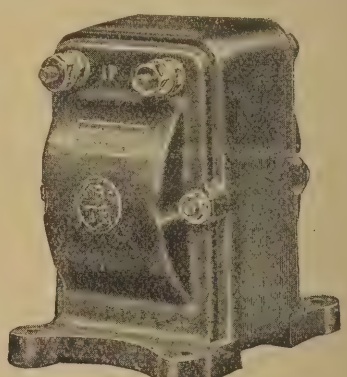

Fig. 9.—New B.T.-H. l.f. Transformer.

components, whilst a new product of interest is the l.f. transformer illustrated in fig. 9. Characteristic curves of this transformer are reproduced in fig. 10. The new component is protected by a casing of brown moulded insulation material, giving it a neat appearance; although comparatively small in size, it is robust, and is obtainable in two ratios—4:1 and 2:1—the former being recommended for use in the first and the latter in succeeding stages. It is essential, the

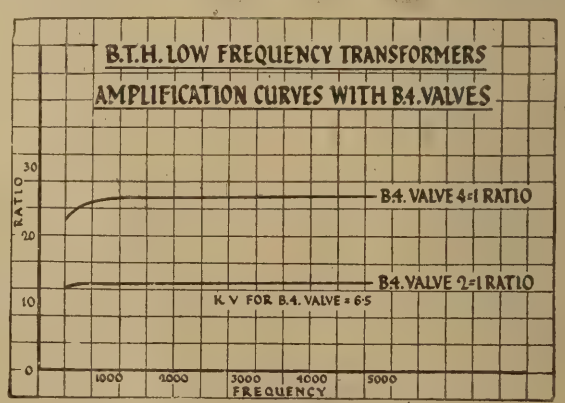

Fig. 10.—B.T.-H. l.f. Transformer Characteristic.

makers point out, that the correct battery voltages be used; if very loud reproduction is desired, a negative grid bias of 4.5 V and an anode voltage of about 120 V should be employed. A new hornless loud speaker, having a diaphragm 10 in. in diameter, of non-hygroscopic material and free at the periphery, is a specially interesting exhibit.

(To be continued.)

The Municipal Tramways Association—I.

Annual Conference at Brighton.

The annual conference of the Municipal Tramways Association was held at Brighton on September 9th, 10th and 11th, under the presidency of Alderman C. Higham (chairman of the Blackburn Tramways Committee). The usual practice of holding the conference in the town with which the president is connected was not followed this year, owing to the lack of hotel accommodation in Blackburn. Some 350 members and 140 ladies were present, and an informal reception, followed by dancing, was held on the Tuesday evening at the Hotel Metropole.

The conference was held in the Music Room of the Royal Pavilion, and on Wednesday, September 9th, the members and visitors were welcomed by the Mayor of Brighton (Alderman C. J. Teasdale, J.P.), who was accompanied by the Mayor of Blackburn (Councillor J. Stanworth, J.P.). In the course of his remarks, the Mayor of Brighton referred to the question of the tramcar *versus* the 'bus. In a pleasure town such as Brighton, he said, they could probably do without the tramways, but they could not scrap them owing to the large amount of money invested in them. Both the 'bus and the tramcar had their advantages, but for each tramcar scrapped, two or three 'buses would be needed.

A vote of thanks having been accorded to the Mayor for the cordial welcome he had extended to the conference, Alderman C. Higham delivered his presidential address, of which an abstract is given below.

Alderman J. S. Pendleton, J.P. (member of the Nottingham Tramways Committee), who proposed a vote of thanks to the President for his address, supported him in his attitude of protest against the unfair competition which tramways had to meet, not only from outside people on the road, but very often from the Ministry of Transport, who ought to be out to help municipal tramway authorities in their public activities. He criticised the officials of the Ministry for their attitude of mind in the Parliamentary committee rooms when municipalities were seeking further powers, and said they seemed to seize every opportunity of curtailing the activities of the municipalities. That was not what the Ministry of Transport was for, and he considered it was time a protest was made against it. He also criticised the indiscriminate granting of omnibus licences by Watch Committees. The Tramways Committees did not get the help from Watch Committees which they ought reasonably to expect.

Alderman Sir Peter Peacock, J.P. (chairman, Warrington Tramways Committee), seconded the vote of thanks, which was duly accorded.

Afterwards a paper was read, "Municipal Tramways and Motor Omnibuses," by Mr. A. R. Fearnley, general manager, Sheffield Corporation Tramways and Motors, and the discussion was carried on until the conference adjourned for luncheon in the Dome, at the invitation of the Mayor of Brighton.

The President proposed the health of the Mayor, and again expressed the thanks of the Association for the manner in which the Corporation and its officials had worked to make the conference a success. The Mayor of Brighton, responding, said that even the inhabitants of Brighton did not know what a valuable undertaking they had in their tramway undertaking, because they did not take enough interest in it. A sum of £300,000 had been invested in the undertaking, and half that sum had been paid off, leaving a debt of £145,000 outstanding. Since the war £50,000 had been spent on track renewals, and scrapping the system was out of the question. The gross profit last year was £27,000, out of which interest and sinking fund charges had to be paid, but if the undertaking had been in the hands of a company, it would have been able to pay a dividend of 13 per cent. on ordinary shares, 6 per cent. on preference shares, and 4 per cent. on debentures.

After luncheon the discussion on Mr. Fearnley's paper was concluded, and a paper was read on "Tramcar Stopping Places," by Mr. Jas. Dalrymple, general manager of the Glasgow Corporation Tramways.

(*To be continued.*)

Presidential Address

By Mr. Ald. Charles Higham.

(*Abstract.*)

In spite of the splendid enterprise of the "Safety First" Association, and the activities of others in warning the public of traffic dangers, there is a most alarming increase in the number of street accidents in this country—both fatal and non-fatal—and an amazing reluctance to take drastic remedial measures. The mechanically-operated road traffic of this country is now slaying yearly as many persons as form a large village community, and maiming or injuring more than dwell in the largest non-county borough in the country. The increase during recent years of mechanical vehicles, and especially those of high speeds, is entirely responsible for this terrible tale of sacrifice.

For some time this Association has called attention to it, and requested that there should be more effective regulation of street traffic, especially at tramway stopping-places. Even the Ministry, whose sole concern is with the supervision of transport, refuses to move. We must rely on an informed public opinion to take up this pressing question.

For the congestion of streets by traffic, especially in the centres of cities and towns, it has been suggested that the remedy may be found in excluding tramways from central areas. Some of these traffic experts have not yet noticed that considerable street congestion arises from rows of motor-cars on each side of the road.

The luxury motor-car has much to answer for, no doubt. Every petrol machine that displaces an electricity-driven one provides more employment for the workers in the oil-fields, but inevitably diminishes employment for the British miner, and accentuates industrial depression at home. We must persist in resisting any proposals for adding unnecessary vehicles to the streets.

Many municipalities which provide an adequate passenger service have been occupied during the year in defending their undertakings from mere exploiters. The time has arrived for a calm survey of the whole field of road passenger transport agencies and the relation that tramways bear to them. Whatever may be the means employed for the conveyance of those who must travel by road, local authorities will never hand over that great public service to private hands. Local authorities can be depended on to adapt the means to the end, and if inter-urban services are required they will be under public control. Recurring attacks are made on tramways by a section of the Press, which is not very scrupulous and has little regard for veracity. In July last, it was twice stated that Leeds and Walsall had decided that tramways were obsolete and had replaced them with other methods of transport. At the moment that was written Leeds had decided to spend about £400,000 on new tramcars and was extending the system. There was no truth in the statement that Walsall had decided to scrap tramways.

The Ministry of Transport has informed the Council that it does not share the opinion that tramways are obsolete. It is certain that the public does not share that view. Some motorists may think that tramways are a nuisance to them, but they forget that they themselves are a much bigger nuisance and danger to the public.

The tramways last year carried more than 4,443,000,000 passengers. The average receipt per passenger was 1.53d. compared with 1.05d. in 1913-14, or an increase of 46 per cent. only. They provide the cheapest and most constant means of transport. Moreover, they are, when taken in the aggregate, a sound commercial proposition.

The London and Home Counties' Traffic Advisory Committee has made its position clear. At a public inquiry as to omnibus traffic in restricted streets in London, on June 22nd, the Chairman, Sir Henry Maybury, said:—"I am desired by the Committee to state, with a view to conserving time, that they have decided that the intention of the Act of Parliament, Section 7 (1), (b), is that protection should be given to tramways and they propose to give such protection. Accordingly, they do not desire to hear evidence upon the question of this policy which, in their view, is not before them. It is an instruction of Parliament; it is an Act of Parliament, and the Committee are instructed to have regard as you know, to the services already provided on every route, and they must so consider."

It has been stated that not one of the London daily papers reported this important pronouncement.

The decision and report of the Special Tribunal appointed by the National Council to deal with the Employés' application of

May 16th, 1924, for a substantial increase in wages was issued on November 1st, 1924. The report was accepted unanimously by both sides, and has been in operation since November 18th, 1924.

In July last, the terms of the constitution of a new Workers' Alliance were published. The Unions representing the employés on the National Council were said to be parties to it. Clause 9 laid it down that:—"The conditions of membership of this alliance shall involve the allied organisations in definitely undertaking, notwithstanding anything in their agreements or constitutions to the contrary, to act as directed by the general conference of this alliance." It would appear, therefore, that agreements within an industry will no longer provide any effective security for the peace of that industry, and that on the employés' side they may be flung among the mere scraps of paper at any moment.

Annual General Meeting.

The annual general meeting was held on Thursday afternoon, September 10th.

It was announced that Mr. A. L. C. Fell, late general manager of the London County Council Tramways, had been elected an honorary member of the Association.

Mr. Fell, who was present and was accorded a very hearty welcome, addressed the meeting, and after expressing his thanks for the honour that had been done him, said that he agreed with Mr. Fearnley that tramways hitherto had been ill-treated, and he believed that if they were only given a chance and were relieved of some of the unjust burdens which were now imposed upon them, there would be no better means of transport in the world.

The resignation of Mr. A. Baker, of Birmingham, as one of the Association representatives on the Joint Industrial Council, was announced, with regret, and a hearty vote of thanks was accorded him for his services ever since the Joint Industrial Council was formed.

The annual report of the Council was then taken.

The meeting confirmed the Council's recommendation to change the name of the Association to the Municipal Tramways and Transport Association (Incorporated).

Mr. E. H. Rayner (General Manager of the Hull Corporation Tramways) moved a resolution to the effect that the Council should consider the advisability of itself promoting a Bill giving local authorities the wider powers with regard to the running of motor 'buses which had been mentioned several times during the Conference.

The President explained that although some members of the Council thought the Council had power to promote such a Bill, the matter would have to be thoroughly investigated.

The proposal that the Council should inquire into the position with a view to the promotion of such a Bill was carried by a large majority.

The election of President and Vice-President for the ensuing year resulted in Mr. P. Priestley (General Manager of the Liverpool Tramways) and Mr. R. L. Horsfield (General Manager of the Cardiff Corporation Tramways) being chosen for the respective positions. Mr. A. R. Fearnley (Sheffield) was elected honorary treasurer. Alderman Canby (Huddersfield) was elected to the Council, as well as Messrs. J. K. Bruce (L.C.C.), J. F. Cameron (Northampton), C. Furness (Blackpool), R. S. Pilcher (Edinburgh), Owen Silvers (Wolverhampton), and N. J. Young (Newport, Mon.).

Votes of thanks to the retiring president and members of Council and the Corporation of Brighton concluded the meeting.

Municipal Tramways and Motor Omnibuses.

By Mr. A. R. Fearnley, M.Inst.A.E.

(*Abstract.*)

The relative position of motor omnibuses in connection with tramways, in the road passenger transport systems in the country, is the most important question before municipal transport operators at this date. The claim of the municipalities is that the control of this traffic must remain in their hands, and that the question of the type of vehicle to be used for the purpose provides no justification, nor even a flimsy excuse for the attempts which have been made to take from them the control and handling of this public service.

The provision of public transport service is to-day equally as important as the provision of electricity, gas, water and other public services, which enter so largely into the every-day lives of the people. A public transport service must make provision for the people who live in the urban and rural districts, to have regular and ready means of access to the towns, so that they may get to and from their work and also have the benefit of the many valuable facilities provided in such areas. Having provided for these, there is a still further duty and responsibility upon the public authority, which is to see that the people who reside in the thickly populated areas have provision made for them so that when time and opportunity offer they can with ease, regularity and certainty, and at reasonable cost, get out of such areas into the healthy country districts and heights surrounding the towns and there enjoy the freedom and freshness of the country. It is obvious that these requirements cannot be adequately met by a system of transport which is tied to a rail or tied to a wire; both such systems have their proper spheres of operation.

Tramways have not suddenly developed any serious defect or weakness—the present cost of construction, renewals and repairs is a handicap, but one which could be met and overcome if nothing more serious required to be dealt with. The defect, that is, lack of mobility, was not so obvious a handicap prior to the great increase in all forms of motor traffic, but it is now a point which is being put forward and magnified on every possible occasion as a serious disability and one that cannot be got over. On occasion, apparently, the tramcar may obstruct other traffic, but when rightly considered it can be demonstrated that really it is assisting such traffic, as statistics for almost any district will readily show. Tramways are still the premier form of street transport for the large industrial areas. No one is yet able to demonstrate anything to the contrary, and one's own daily experience proves beyond question the correctness of this assertion. That other services, however, are required and that other forms of transport can best give such service, does but lead us to the declaration that it is vitally necessary in the public interest that such additional services should be retained under the public control, and provided by the tramway authority which, by co-ordinating the newer and more mobile vehicle with the well-established and still necessary public tramway service, can best meet all the requirements just outlined.

It should be readily granted that every municipality which has accepted the responsibility for street passenger transport operation should have powers to operate, develop and extend motor omnibus services. Where such a system can join up with the systems of other municipalities, arrangements should be made for the joint operation of through services between the various centres, and, if necessary, joint boards or committees appointed and the various systems operated and co-ordinated under their control. By such an arrangement the people will ultimately obtain better services and facilities than in any other way.

Can tramways exist alone on the central and short-distance runs? Their competitor is improving and becoming more efficient every year, and in time even the comparatively short routes will be attacked. The advent of the double-deck top-covered motor omnibus has changed the position of affairs so far as the comparison with tramway operation is concerned. This type of vehicle seats 52 passengers in an excellent manner, provides easy and comfortable riding, and maintains a high average scheduled speed. At the Conference in Dundee in 1919, figures were given showing the comparative costs of operating tramways and motor omnibuses, and these are now supplemented by the figures for the present year. The decrease in cost per seat provided on the motor omnibus is worthy of special attention. The figures are taken from a route on which the 52-seater type of motor 'bus has replaced a tramway.

Comparative Costs of Operating Tramcars and Motor Omnibuses.

Figures given at the M.T.A. Conference, 1919:—Working expenses, per seat per mile run: tramways, 0.230d.; omnibuses, 0.532d.; excess of omnibuses over tramways, 0.302d., or 131.3 per cent.

Service of debt: tramways, 0.031d.; omnibuses, 0.027d.; difference, 0.004d., or 12.9 per cent. less. Total: tramways, 0.261d.; omnibuses, 0.559d.; excess of omnibuses over tramways, 0.298d., or 114.1 per cent.

Figures based on four months ended July 18th, 1925:—

Working expenses: tramways, 0.195d.; omnibuses, 0.248d.; excess of omnibuses over tramways, 0.053d., or 27.2 per cent.

Service of debt: tramways, 0.033d.; omnibuses, 0.042d.; excess, 0.009d., or 27.3 per cent. Total: tramways, 0.228d.; omnibuses, 0.290d.; excess, 0.062d., or 27.2 per cent.

At the coming exhibition of commercial motor vehicles (which should be visited by every tramway operator in the country) more efficient engines, improved low frame chassis, wide track, improved brakes, provision for higher speeds, and good coachwork, with comfortable seating accommodation, are to be put forward for our acceptance. It is to be hoped that a great improvement in springing will also be available, otherwise the advantages outlined will be seriously discounted. People in the dense traffic areas will in time find systems thus equipped highly attractive and press for such services, maybe as supplementary to existing tramways. It is apparent to everyone taking observations that the demand is clearly for transport facilities to go much farther afield than formerly, and as tramway owners and operators we have attempted to overcome the opposition and serious difficulties placed in our way, in order that we may meet this obvious requirement. The reliability of the vehicle cannot be questioned. We have not been limited in our views and observations by what has taken place in our own localities. We bear in mind the lesson taught in the early days of electric traction which, in numerous instances, has only been put right by expensive purchases out of municipal funds. We also profit by the astounding confusion that has been allowed to grow up under close and constant observation in the great metropolitan area of London. The best results are being obtained by those municipalities which have taken a long view of their responsibilities, and have seen that, having got the right to operate in thickly populated areas, they have not cleared themselves of their responsibilities, but must also provide for the more thinly populated districts, not merely for profit making, but with a view to providing what is now an obvious public necessity. Every town should have the clauses giving it the right to enter into through-running agreements, and those towns which have such clauses might profitably consider the advisability of at once acquiring and operating the small independent services which have been started in their neighbourhood. Unless this is done the trouble, difficulties, and great expense brought about by allowing big companies or combines to get hold of such services, as in the early days of electric traction, will be repeated.

In what way can this loss of attractiveness be countered? Cars can be speeded up; nothing less than 50-h.p. motors fitted on all cars which it is intended to retain in regular service for any length of time; power brakes fitted which can control the cars under the increased speeds with ease and without objectionable shocks to, or the throwing of, passengers; ventilation, which in numerous cases is insufficient, might have immediate attention; and clean, comfortable, well-lighted, attractive, and up-to-date cars provided. It may be advisable for employés to be reminded that having entered municipal service, smartness, alertness, promptness, and courtesy are required; that every pedestrian is a possible customer, and that we are all out to sell car sides; that the title of municipal tramways and transport undertaking is "The Sign of Good Service" and that we intend to exist as transport undertakings on our merits in serving the public.

Motor omnibuses should to-day be in general use by all tramway systems for:—

(1) The provision of services in thinly populated areas. The traffic from many such districts is astonishingly good at week-ends, and sufficient to bring up the total receipts to a point covering all operating expenses. When any such services are taken over from small owners by the Corporation, the traffic quickly improves as the reasonable charge and regularity of the municipal service become known.

(2) Providing services in extension of tramway routes and over the tramway routes, thus bringing long-distance passengers through into the centre of the town. Whatever may be the feeling against this proposal, it is evident that if it is not done by the tramway authority strong attempts will be made to do it by other people.

(3) On any routes which might under normal circumstances have been scheduled as tramway routes. If in certain districts the opinion is held that the whole area is provided for, a re-examination of the question will probably show room for some additional service.

(4) Provision of through services over lengthy tramway routes heavily used for short-distance passengers. This question is likely to be brought forward in a more pronounced manner in the future, and is one in which the question of finance will need careful attention. Is it likely that the long-distance tramway passenger will continue to be satisfied with a service making 20 to 30 stops on his run into and out of town—what interest has he in such wasteful machinery?

(5) Linking up adjacent towns where tramways do not cover the whole length of route. A great traffic is to be picked up on routes of this description despite the fact that there may be a frequent service of trains between the towns. There should be little difficulty in neighbouring municipalities amicably arranging such services.

(6) For meeting night trains and excursions. Cars for each route would result in serious loss, but one 'bus can serve two or three routes with a small number of passengers for each. Good experience has been obtained from the Wembley railway service in regard to this class of traffic, and it has been found that passengers landed at town stations in the early hours of the morning eagerly take advantage of a 'bus service of this description, and are willing to pay a fare sufficient to cover the expenses of operation. Punctuality of such railway services on the part of the companies requires their urgent attention, and the public are beginning to take an interest in the matter.

(7) What might be termed "Health and Recreation Routes." A great work can be done in this direction, and it would undoubtedly be a source of surprise to any committee which has not catered for this class of traffic. It is a good thing to see the people of the industrial areas joining the 'buses for a half-day's outing in the country under healthy and comfortable conditions. Advise them to "make the open country their playground." Experience has shown that by attractive advertising sheets in the cars, and advertising in the Press, calling attention to the motor services and pointing out the attractiveness of the districts served, a great amount of traffic is awaiting us, the difficulty being to meet the demands at the week-ends and at holidays. Sufficient traffic can be obtained at these times to make the service remunerative for the whole year, a minimum service being provided on the quieter days in the week and in winter time.

Tramways alone may have been inclined to get somewhat rusty. Speed them up and with the assistance of motor omnibuses improve them in every way possible. There are clear cases where poor tramway routes have been enormously improved by a service of motor 'buses as feeders. Improve the health of the people in the towns by taking them out into the country.

Brighten the lives of the people in the country districts by giving them the opportunity of visiting the towns whenever they desire to do so. Improve the trade of your district by bringing the people in from the out districts. Protect and supplement your tramways in every possible direction by your own 'bus services. With initiative and enterprise such work can be made intensely interesting. Threatened competition should be resolutely faced and with courage and vision may be rendered unnecessary. These notes are written as the result of the writer's experience of a combined service of tramways and motor omnibuses over a considerable number of years, and with the one desire of benefiting the industry and ensuring the continuance of its successful operation.

Steel-Concrete Poles for Transmission Lines.

The Manufacture and Installation of the "Stobie" Pole.

Probably the principal consideration in providing for an overhead transmission scheme for the supply of electrical energy is the question of the poles for supporting the conductors. The choice of wooden or steel poles has always been a controversial point in many parts of the world where the overhead system of transmission has been adopted to a greater extent than in England, and in view of the growing interest in this country in the question of supplying electrical energy to the rural areas, the consideration of overhead transmission and hence transmission poles will engage the minds of supply engineers at home.

The invention of Mr. J. C. Stobie, a member of the staff of the Adelaide Electric Supply Co., may prove a means of solving many of the difficulties met with in the employment of wooden and all-steel poles. It takes the form of a transmission pole of combined steel and concrete construction, and has been used extensively in Australia by the Adelaide Electric Supply Co., 150 miles of h.p. overhead lines with "Stobie" poles having been constructed. The essential feature in the design of this pole is the use of two light standard rolled-steel joists or channel sections, forming the main outside tension and compression members. These are held at the correct distances apart, tapering from the base to the top, by means of bolts passing through the webs of the sections at carefully determined intervals. The space between the steel sections is filled with concrete, which acts as a continuous web, the embedded bolts taking a portion of the shear stresses. This filling also gives to the completed pole the necessary rigidity and resistance to torsion, which may arise from an unbalanced pull.

Fig. 1.—Manufacturing "Stobie" Steel-Concrete Poles.

The process of manufacture is a very simple one, call-

ing for neither special machinery nor skilled labour, and has the great advantage of rendering the construction of poles possible near where they are to be installed, as shown in fig. 1. The joists are first laid out on greased steel slides at right angles to their length and fixed with clamps, and a wooden form acting as a spacer is placed between the flanges at the bottom, forming a trough, fig. 2. This is then filled with a stiff-concrete mixture, when another form is placed similarly between the steel members at the top and clamped down. For a few feet at the narrow end of the pole where the joists are close together, the forms are

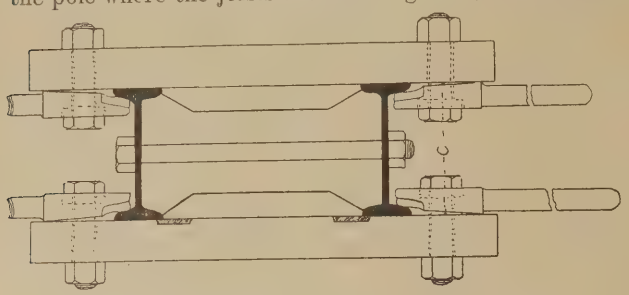

Fig. 2.—Section of "Stobie" Pole and Forms.

not recessed into the concrete, and allow it to run flush with the joist flanges. As soon as the concrete begins to set, the through bolts are tightened up. After 24 hours the forms are removed, and the concrete is allowed to season for from 14 to 21 days. The poles are erected with the cross arms in position; the bolts used for securing the arms to the poles are placed in position before the concrete is set. When completed, the pole has a light and not unsightly appearance. Fig. 3 shows a guyed transposition pole on a cross-country line. Many of the poles manufactured in this way in Australia were

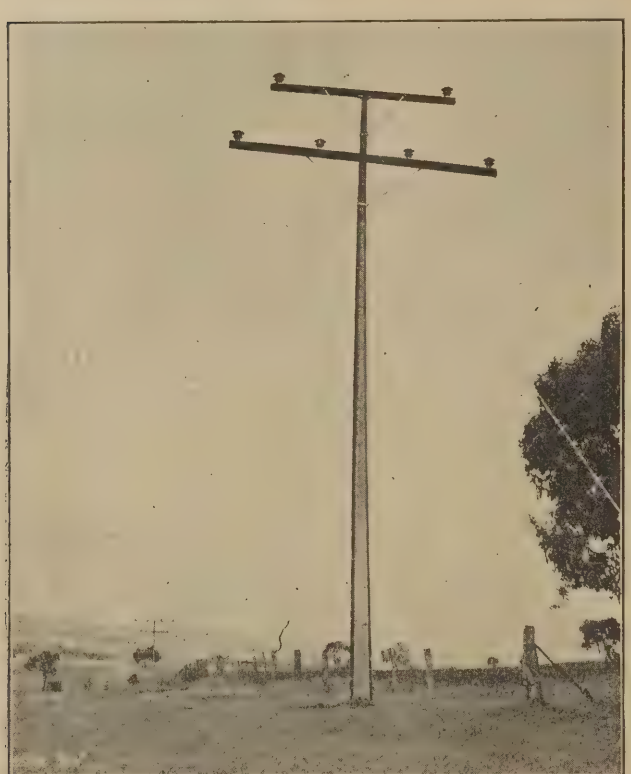

Fig. 3.—A Steel-Concrete Pole in Position.

transported for 20 miles on timber jinkers over rough "bush" tracks, and not a single pole was damaged by the severe handling and jolting it received. The particular claims made for the "Stobie" pole are that by correct section and disposition of the members to withstand the stresses usual in overhead lines, it is for equal strength no heavier than the hard-wood one; while the cost, taking into consideration its longer life, is substantially less than that of wooden poles, and compares favourably with that of fabricated steel structures. Also, as before mentioned, the pole can be made with facility on the site of the transmission line itself.

The "Stobie" pole has been built in 30- to 36-ft. lengths for local low-pressure distribution, and in 42- to 50-ft. lengths for 33,000-V transmission, but the design provides for lengths much in excess of these. A series

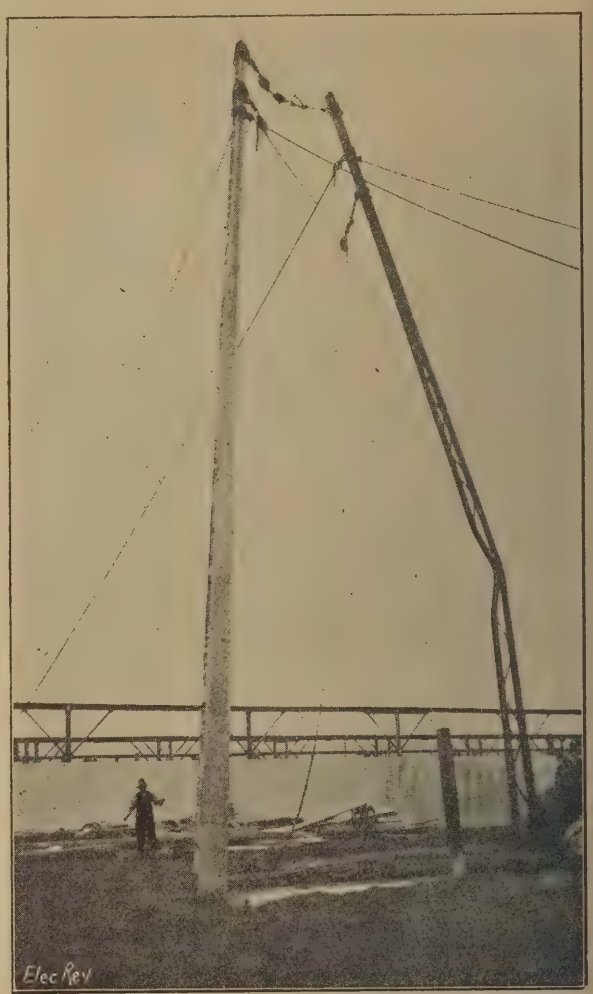

Fig. 4.—Result of Test on a "Stobie" Pole.

of tests have been carried out on poles of this type by an Australian operating company. In one case a steel-concrete pole was tested against

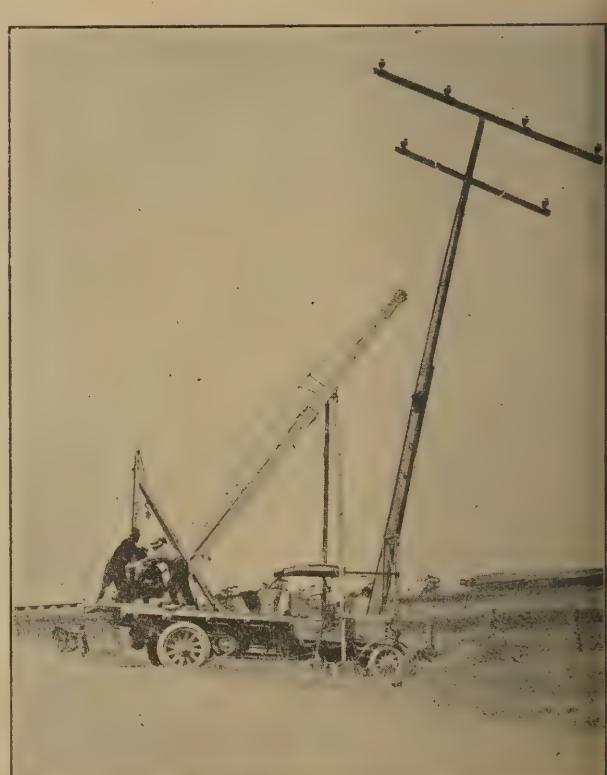

Fig. 5.—The Erection of a 42 ft. 6 in. "Stobie" Pole.

a steel fabricated one, both designed for the same side pull. While both poles showed similar deflections at a 500-lb. pull, the fabricated steel one com

pletely collapsed at a pull of about 1,300 lb., but the "Stobie" pole only showed a heavy permanent set without fracture (fig. 4). Other tests showed that the "Stobie" pole has a factor of safety of 3 for loads at right angles to the line, and that its strength in the direction of the line is ample for ordinary contingencies. The question of possible corrosion of the steel members at the ground line is receiving careful attention. It is considered that in dry climates, such as that of Australia, little more protection than a coat of paint is necessary. For moister conditions, a coat of bitumastic enamel applied to the base, hot, either with or without the usual weathered concrete footing carried 12 in. above and below the ground, will afford sufficient protection to ensure the pole a very long life.

During erection the poles are easily handled by means of an ordinary jib crane. Fig. 5 shows a 42 ft. 6 in. pole in the course of erection.

We are indebted for the foregoing particulars to Mr. F. W. H. Wheadon, M.I.E.E., chief engineer and manager to the Adelaide Electric Supply Co., who is paying a visit to this country.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The Bakers' Exhibition.—The 29th annual Confectioners', Bakers', and Allied Trades Exhibition was held at the Agricultural Hall from September 5th to 11th. A marked feature of these exhibitions has been the gradual growth in the use of electrically-driven machinery, and this year's show was notable for a great advance in this respect. It is not possible to enumerate all the firms which displayed this type of machinery; we must be content to mention that the bulk of it comprised dough and cake mixers of various patterns and sizes. Another prominent feature, from our point of view, was the demonstration of electric baking ovens. Three companies showed these—the General Electric Co., Ltd., the Metropolitan-Vickers Electrical Co., Ltd., and the Artofex Engineering Works, Ltd. We hope to give further details of this apparatus in a later issue. The Hobart Manufacturing Co., Ltd., exhibited a great deal of electrically-operated food-preparing equipment, including coffee mills, dough and cake mixers, food cutters and mincers, sausage machines, &c., each with the motor incorporated in the design of the machine. This firm also showed the "Crescent" dishwasher. This machine has a sheet-metal body with a glass front. Two sets of water-jets are employed; one set revolves and performs the washing action while the other set is fixed and is designed to rinse the cleansed plates or dishes. The water-heating arrangement *can* be electrical, but gas or steam is usually employed. The General Electric Co., Ltd., in addition to the baking oven already mentioned, showed a 4-kW restaurant grill, a doughnut fryer, and a fish-fryer. Autochrome Signs, Ltd., had a display of coloured illuminated signs, with various kinds of flashing and flickering effects, and Mr. E. Duncan Doring exhibited a number of ingenious electro-mechanical advertising devices.

Shannon Scheme Strike.—Labour trouble has occurred at the inception of the Siemens-Schuckert scheme for the harnessing of the River Shannon. It is reported that the contractors endeavoured to make the labourers upon the initial excavation work accept 8d. per hour for a 54-hour week, whereas the union rate for a 47-hour week is 1s. 3d. an hour. The work was delayed for a settlement of the question.

An All-Electric Hire-Purchase Suggestion.—In the September issue of *Electrical Merchandising* it is pointed out that while automobiles and complete bath-room equipments as well as other modern conveniences are sold to the American public by means of "easy-payment" systems, electrical dealers are content to sell a single appliance at a time. At this rate, says our contemporary, complete electrical equipment will never become the standard of the American home. Accordingly the bold suggestion is advanced that the whole of the electrical equipment necessary in a house should be supplied at once on a hire-purchase basis—or against a mortgage. Installations costing from $1,000 to $1,500 are suggested.

"Underfeed" Contracts.—Among the recent orders received from electricity supply authorities by the Underfeed Stoker Co., Ltd., are the following:—Travelling grates: Scottish Central Power Co., Ipswich Corporation, and Gravesend Corporation; ash conveyors: St. Pancras and Hull Corporations; Murray tubes: Glasgow Corporation (Dalmarnock); pulverised fuel plant: Brighton Corporation; "Underfeed" stokers and air heaters: Moghalseria, Gya and Bedawatta power stations; air heaters: Gravesend Corporation; and arches: Eastbourne and Maidstone Corporations.

Reconstruction Work at Paddington.—The Great Western Railway Co. has decided to undertake the reconstruction of Paddington Goods Station and the installation of up-to-date equipment, including electrically-operated labour-saving appliances.—*Financial Times.*

For Sale.—By order of the Receiver, *re* Wakelins Engineering, Ltd., Vicarage Road, Hampton Wick, Messrs. H. Butcher and Co. will sell by auction on the premises on Tuesday, September 22nd, and following day, the lease of the premises, plant, machinery, stores, stock, and goodwill. For full particulars see our advertisement pages to-day.

Trade Commissioners.—Mr. AINSCOUGH, H.M. Senior Trade Commissioner in India, is taking new office premises at Fairlie House, Fairlie Place (P.O. Box 683), Calcutta, from November 1st.

H.M. Trade Commissioner in Western Canada has removed from Winch Building to 18, Commerce Building, Vancouver, B.C.

Free Telegraphic Addresses.—Arrangements have been made by the Postmaster-General, in order to assist foreign trade, enabling any firm with representatives abroad to obtain a telegraphic address for oversea communication free of charge, provided that the applicant is already a holder of one paid registered address. Messages sent "*via* Imperial," by the Anglo-Russian cable, or by the Oxford-Cairo radio service, will be allowed a free registered address without the condition attaching to other routes.

Trade Announcements.—On September 10th, the new show and demonstration rooms in London of Messrs. A. J. STEVENS & Co. (1914), LTD., of Wolverhampton, were opened, the event being marked by a reception and luncheon at which Mr. Lamb presided. The latest models of the company's apparatus were displayed. Mr. Lamb, in the course of a speech, reviewed the development of the business, and said that the staff and workpeople of the company would have passed the one thousand mark before they were many weeks older. He also referred to the wide ground covered by them in manufacturing radio apparatus and accessories. The speaker read a communication received from Sir Oliver Lodge, and other speeches followed. The new premises are situated at 122-124, Charing Cross Road, London, W.C.2.

MESSRS. STUART TURNER, LTD., of Henley-on-Thames, have opened an office at 63, Queen Victoria Street, London, E.C.4, with Mr. B. C. Rhodes in charge, where the Stuart country-house lighting and pumping plants can be seen. 'Phone No.: "City 7381."

INTERNATIONAL COMBUSTION, LTD., has transferred its Commercial Pulverising Department from Africa House to 11, Southampton Row, London, W.C.2.

MESSRS. S. EVANS & SONS, electrical and wireless contractors, have opened premises at 16a and 18, King Street, Maidenhead.

CRYSELCO, LTD., has opened a branch at 35, Duke Street, Brighton, where it will carry stocks of its lamps and all makes of V.M.A. valves. Phone: "Brighton 5512."

Mr. W. H. STONE, agent for South Wales for the Yorkshire Electric Transformer Co., Ltd., and the Wardle Engineering Co., Ltd., who was for many years with Messrs. McWhirter and Sons, Ltd., Cardiff, has removed his office to 63, Rhiwbina, Cardiff.

THE IRON & NICKEL BATTERY CO., LTD., has removed to 17-19, Cockspur Street, Pall Mall, London, S.W.1. Telephone:—"Regent 7187."

Large Canadian Plant Order.—The *Electrical News* (Toronto) states that the Aluminium Company of Canada, which is constructing a large plant at Chute-a-Caron, Quebec, has placed an order for the electrical plant required with the Canadian General Electric Co. The order covers 18 synchronous converters, each of 3,600 kW capacity; 12 transformers of 25,000 kVA each for a primary pressure of 154,000 V; and 10 transformers of 7,500 kVA capacity. The converters will embody automatic starting arrangements.

Catalogues and Lists.—PHILIPS LAMPS, LTD., 60, Wilson Street, Finsbury Square, E.C.2.—An illustrated and priced folder advertising the "Philips" rectifier.

THE CARRINGTON MANUFACTURING CO., LTD., 18-20, Normans Buildings, Central Street, E.C.1.—An illustrated price list of cabinets for radio receiving sets, &c.

MESSRS. FORUM & CO., LTD., 7 & 9, Pershore Street, Birmingham.—Illustrated price lists of radio components and accessories.

MESSRS. A. J. DEW & CO., 33-34, Rathbone Place, Oxford Street, W.1.—Wholesale catalogue for 1925-26 of radio apparatus and accessories of all descriptions. The publication, which has over 200 pages, is fully illustrated and priced.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—September stock list of dynamos and motors.

RADIO INSTRUMENTS, LTD., 12, Hyde Street, New Oxford Street, W.C.1.—A descriptive, illustrated catalogue of radio receiving sets and components; priced. Also a showcard advertising "R.I." apparatus.

MESSRS. I. CALVETE, LTD., 11, Little St. Andrew Street, W.C.2.—An illustrated and priced catalogue of electro-medical apparatus, including violet-ray generators and equipment, hair-waving appliances, &c.

THE METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester.—Leaflets Nos. 783/1-1 and 783/2-1, dealing,

respectively, with the company's arc-welding equipment and its applications.

THE LANCASHIRE DYNAMO & MOTOR CO., LTD., Trafford Park, Manchester.—List No. 445, illustrating and describing the "Crypto" commutating rectifier; and List No. 700, dealing with "Lancashire Maxtorq" induction motors, and describing their manufacture.

MESSRS. T. HARDING CHURTON & CO., LTD., Atlas Works, Water Lane, Leeds.—Circular 660, containing particulars and prices of two- and three-phase induction motors.

WESTERN ELECTRIC CO., LTD., Connaught House, Aldwych, W.C.2.—An illustrated price list of radio receiving sets, components, and accessories.

MESSRS. S. G. LEACH & CO., LTD., 26-30, Artillery Lane, E.C. —An illustrated pamphlet describing "SBIK" automatic oil switches for a.c. motors.

Bankruptcy Proceedings.—JOSEPH BENSON, 18, Ivy Crescent, York Road, Leeds, lately an electrical engineer.—The receiving order in this matter was made recently on debtor's own petition. The statement of affairs shows liabilities of £173, and there are no assets. The first meeting of the creditors was held on August 27th at the Official Receiver's office, Leeds, when the case being a summary one was left with the Official Receiver as trustee. The following are creditors :—

	£		£
Russell, Ltd.	73	Priestman, R.	87

THOMAS BARTON, Ainsworth Street, Blackburn, electrical engineer.—The first meeting of creditors was held recently at the Official Receiver's offices, Preston. The statement of affairs showed liabilities of £3,813, and net assets of £5,794, leaving an estimated surplus of £1,981. Debtor stated that he commenced business at his present address in his own name in 1886 with £600 capital, provided by his wife. He made no profits in the business, but was not aware that he was insolvent. On June 29th last he executed a deed of assignment, and on July 7th a meeting of creditors agreed to accept the deed. The assignment trustee had carried on the business, and paid over to the Official Receiver a sum of £44, being the balance stated to be in his hands at the date of the receiving order. The creditors decided to appoint Mr. A. T. Eaves as trustee.

L. W. PULLMAN, Orchardleigh, Golders Green Road, N.—The first meeting of creditors was held recently at Bankruptcy Buildings, W.C., before Mr. D. Williams, Official Receiver. The debtor, who described himself as an electrical engineer, has carried on business first as a motor-car manufacturer and later as a dealer in wireless goods. According to statements made at his preliminary examination, the debtor in 1921 entered into partnership with three others and they started business as car manufacturers at Richmond under the style of the Globe Manufacturing Company. The debtor put in a capital of £1,250 and retired from the concern, having lost about £2,000. At the end of 1923 he joined the Warren-Lambert Engineering Co., Ltd., at Richmond, it then being in voluntary liquidation. Having a considerable knowledge of radio, gained since 1910, the debtor in January, 1924, obtained a post as wireless salesman and later in the year he joined the Radio Supplies, Ltd., which went into voluntary liquidation the same year. Since March last he has bought and sold radio goods for cash on his own account. No statement of affairs was lodged, but the debtor roughly estimates his liabilities at £1,490 and returns in the shape of assets, doubtful book debts of the face value of £639. He attributes his position to loss incurred in the Globe Manufacturing Co., failure to obtain substantial employment, and inability to perfect his various inventions. The estate was left in the hands of the Official Receiver.

ARTHUR KITSON, electrical engineer, &c., 1, Central Hall Buildings, S.W.1.—A receiving order was made against this debtor at the London Bankruptcy Court on August 26th upon the petition of creditors and on September 14th the first meeting of creditors was held before Mr. Wheeler, Assistant Official Receiver. Having dealt with the proofs of debt the chairman reported that it appeared from the debtor's statements in his preliminary examination that he went to America in 1879 and obtained employment with various electrical firms. He started on his own account as the Kitson Lighting Company, which business was afterwards formed into a limited company with offices in Philadelphia. The debtor acted as president and managing director of the concern until it was merged into the United Lighting & Heating Co.; he sold his interest in the company in 1899 and in the following year came to England with considerable capital invested in American securities. He next formed Kitson's Lighting Co. of Great Britain, but withdrew from that business after a year or so in order to work certain patents for lighting which he had in hand. In 1902 he started the Kitson Light Foreign Supply Company with works and offices at Willesden, and five years later converted that undertaking into the Kitson Empire Light Co., Ltd., which company went into voluntary liquidation in 1910. Assisted by certain friends the debtor purchased the assets from the liquidator and the company was revived and carried on under the same name until 1922, when the title was changed to the Kitson Engineering Co. (London), Ltd., with offices and works at Stamford. A receiver for the debenture holders was appointed recently. The debtor acted as chairman and managing director for some years, but had received no remuneration for two years past, and in consequence got into debt, apart from personal liability upon guarantees given on behalf of the company. He had stated that he saw a good prospect of raising funds with which to discharge the receiver, in which event his holding in the company would again become valuable. No statement of affairs had been lodged but the debtor roughly estimated his liabilities at £15,000 and he had in the shape of assets various shares to the nominal amount of £20,000, but having no present marketable value, and a sum of £4,000 due from the Kitson Engineering Co. He attributed his failure to the company's inability to pay the moneys owing to him. In the absence of a quorum the meeting was adjourned for a week.

S. SCARFI (Scarfi Bros.), cycle, gramophone and wireless agent.—Last day for proofs for dividend, September 30th. Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C.

C. W. A. ASHWORTH, electrical engineer, West Street, Oundle, Northampton.—Last day for proofs for dividend, September 26th. Trustee, Mr. J. L. Poland, Official Receiver, 5, Petty Cury, Cambridge.

J. KINGSTON (Cromwell Engineering Works), electrical and general engineer, 176, Romsey Road, Shirley, Southampton.—Last day for proofs for dividend, September 23rd. Trustee, Mr. C. Hoult, Official Receiver, Midland Bank Chambers, High Street, Southampton.

W. T. ROBINSON and H. ATTERBY (J. T. Beckett & Co.), electrical engineers, 134, Victoria Street, Grimsby.—First and final dividend of 8s. 5d. in the £, payable at 1, Town Hall Street, Grimsby.

F. J. NORTH, electrical engineer, 13a, Midland Road, Wellingborough.—Last day for proofs for dividend, September 25th. Trustee, Mr. D. Helliar, Official Receiver, The Parade, Northampton.

J. E. LOCKING, dealer in cycles and wireless goods, 14, Fish Street, Kingston-upon-Hull.—First and final dividend of 2s. in the £ payable at the Official Receiver's office, 37, Scale Lane, Hull.

V. G. BAINES, electrician, 2, West Street, Wellingborough.—First and final dividend of 4s. in the £ payable at the Official Receiver's office, The Parade, Northampton.

Company Liquidations.—CARTER & MITCHELL, LTD., wholesale electrical suppliers, 24, Allsop Street, Upper Baker Street, N.W.1.—A meeting of creditors was held at the above address on September 8th, when the liquidator, Mr. J. V. Higson, of Bradford, reported that the liabilities amounted to £1,237, while the assets, after allowing £61 for preferential claims, totalled £407, leaving a deficiency of £830. The company was formed in July, 1923, with a nominal capital of £2,000, of which £1,000 had been issued. The accounts to June 30th, 1924, showed sales of £3,378, with a gross profit of £577, and a net loss of £802. During the 14 months to the date of liquidation, sales had been £3,507, with a gross profit of £686, and a net loss of £587. After some discussion, Mr. Higson intimated his willingness to resign his position as liquidator, and to request the shareholders to pass another resolution appointing Mr. Charles Latham, 78, New Oxford Street, W.C., as joint liquidator with himself, to obviate the expense of going to the Court. A resolution to that effect was carried. The following are creditors :—

	£		£
Davis, Kent & Stewart	24	Hogan & Wardrop	76
Stewarts, Ltd.	62	Mitchell, T.	376
Planet Stamping Co.	24	Welsbach Lighting Co.	103
Lighting, Heating & Glass, Ltd.	271	Wettern Bros.	51

JOHN R. KINSEY & CO., LTD., Croydon.—The winding-up order herein was made on a creditor's petition. The statement of affairs showed gross liabilities of £4,691, of which £3,422 was expected to rank, against assets of £1,824, from which had to be deducted preferential creditors £350 and loans on debenture bonds £919, leaving net assets of £556, or a deficiency of £2,866. The issued share capital of the company is £3,636, and there is a total deficiency as regards the shareholders of £6,502. The failure of the company is attributed by the directors to losses arising out of a transport service; heavy working expenses; and a judgment and damages obtained against the company. The company was incorporated in January, 1922, to take over the business of motor repairers and electrical engineers previously carried on by the promoters in partnership at Croydon. In the terms of the agreement the company agreed to purchase the assets, including the goodwill, of the business, the consideration for the purchase being £2,686, satisfied as to (*a*) £1,518 by the allotment of fully-paid shares, and (*b*) £1,168, by the due discharge by December, 1922, of the partnership liabilities as existing on August 31st, 1921. There was no professional valuation made, but the purchase consideration, £2,685, is stated to have been based upon the book value of the net assets, the goodwill being taken at £300. Mr. Kinsey stated that the company soon after its incorporation in January, 1922, commenced to develop, on a larger scale than previously, its film transport service, working it as a separate section. Owing, however, to the heavy working expenses and bad debts incurred, this section was not successful and was closed down. As a result the electrical and automobile sides of the business were seriously handicapped and losses in working them also were made throughout. In April, 1924, the company, requiring further working capital, raised £200 by the issue of debentures. In October, 1924, judgment for £600 with taxed costs (£250) was obtained against the company by the petitioning creditor as damages for personal injuries received by him from one of the company's vans. The company's own legal charges amounted to £200, and being unable to satisfy these and another similar judgment for £129, voluntary liquidation was commenced on November 19th, 1924, and on November 20th, 1924, the liquidator was also appointed by Court as receiver and manager for the debenture holder, and thereupon entered into possession of the assets. The receiver for the debenture holder stated that he had realised practi-

cally the whole of the company's assets, but it was doubtful whether the proceeds, after payment of the outgoings, would be sufficient to satisfy the debenture holder.

NORTHUMBERLAND AND DURHAM RADIO ENGINEERING CO., LTD., Newcastle-on-Tyne.—A meeting of the creditors of the above was held recently, when the chair was occupied by the liquidator of the company, Mr. John Mitchell. The latter explained that he was unable to prepare a deficiency account owing to the state of the company's books, but an approximate statement of affairs disclosed liabilities of £204, all due to unsecured creditors. The net assets were estimated at £84, leaving a deficiency of £120. The company was formed in February of this year with a nominal capital of £1,000, and the total issued capital was £275. The matter remains in the hands of the present liquidator.

J. SPRINGER, LTD., 158, Wardour Street, W., kinema furnishers and electrical engineers.—At a recent meeting of creditors, Mr. C. B. Holland, the liquidator in the voluntary liquidation, presented a statement showing a deficiency as regarded the creditors of £110,750. An advisory committee was appointed to assist the liquidator. The following firms appear in the list of creditors :—

	£		£
Albany Engineering Co.	29	S. G. Leach & Co., Ltd.	34
British Thomson-Houston Co., Ltd.	32	Mickelwright, Ltd.	78
Condor Lamps, Ltd.	81	Manufacturing Engineers, Ltd. ...	36
Hendon Electric Lamp Co. ...	36	North British Rubber Co., Ltd.	404
K. F. M. Engineering Co., Ltd.	72	Sloan Electrical Co.	55
R. A. Lister & Co., Ltd. ...	45	Wilkins & Wright	22

CONTINUOUS REACTION CO., LTD.—Winding up voluntarily. Liquidator, Mr. E. C. G. Clarke, Nobel House, Buckingham Gate, S.W. A meeting of creditors was called for September 15th, at Nobel House.

STEARN ELECTRIC LAMP CO., LTD.—A meeting of members is called for October 12th, at 12, Grosvenor Gardens, S.W., to hear an account of the winding up from the liquidator. The business was sold to the Stearn Electric Co., Ltd., a new company, a year ago.

ELECTRICAL ENGINEERING (WEST BROMWICH), LTD.—A meeting of members is called for October 12th at 5, Waterloo Street, Birmingham, to hear an account of the winding up from the liquidator, Mr. J. D. Kerr.

Private Arrangements.—S. E. BLAND, trading as S. E. BLAND & Co., Queen Street, Cheapside, E.C., electrical engineer.—The creditors interested herein were called together on September 9th, at the offices of Mr. P. S. Booth, Holborn Viaduct, E.C. The statement of affairs showed ranking liabilities of £1,487 and net assets of £641, leaving a deficiency of £846. The deficiency was more than accounted for by the depreciation written off the assets, whilst law costs of £25 had been incurred. Mr. Booth reported that the debtor was previously an estimating clerk with an electrical company. In February, 1923, he started trading on his own account. He had a capital of £70, and borrowed £500 from his father. During the first year there was a net profit of £79. Last September he acquired a five-years' lease of another shop in Queen Street. During the year to February last there was a net profit of £168. The drawings in the first year were only £61, and in the second year they were £112. Since February last the turnover had been £2,509. Three assistants were employed who received salaries and commission. The debtor had suffered through lack of capital. Recently an execution was levied and as other creditors were pressing a deed of assignment was executed, the trustees being Mr. Booth and Mr. C. Latham, of 78, New Oxford Street, London, W. The debtor's father would like his son to continue the business, and it was possible that an offer would be submitted. It was decided to confirm the deed already executed, whilst a committee of three of the principal creditors was also appointed. The following are creditors :—

	£		£
Barclay's Advertising Co., Ltd. ...	31	Lee, Albert, & Co. (1923), Ltd.	60
Chloride Electrical Storage Co., Ltd.	28	De Leew & Co., Ltd.	37
Duke & Nedermeyer	36	Merchants & Agencies, Ltd. ...	30
Dickeson, C. R., & Son, Ltd. ...	42	Manhattan Electrical Supplies Co. (New York)	203
Electrical Manufacturing & Plating Co.	40	Stella Lights, Ltd.	20
Houghtons Ltd.	22	Siemens & English Electric Lamp Co., Ltd.	73
Ironmonger	24	Siemens Bros. & Co., Ltd. ...	61
London Electric Wire Co. and Smiths, Ltd.	20		

New French Company.—A new company has lately been formed in Paris (134, Avenue Malakoff), with a capital of 800,000 fr. and the title La Société pour la Fabrication des Projecteurs Electriques Marchal, to manufacture headlights for motor vehicles in accordance with the Marchal patents.

New Italian Companies.—Among the lighting and power undertakings recently formed in Italy are the Società Impresi Elettriche Sicule-Lombarde, Milan, with a capital of 100,000 lire, to take over the undertaking previously known as the Società Imprese Elettriche Nuvolari Angelini; the Società Elettrica Salentina, Bari, 100,000 lire; the Società Elettrica Latronichesé, Latronico (Lagonegro), 200,000 lire; the Società per la Produzione Elettrica, Polizzi Generosa, 360,500 lire; and the Società per le Imprese Elettriche del Gizio, Rome, 100,000 lire.

Italian Loan in the United States.—The Milan correspondent of the *Financial Times* reports that the Cia. Electrica Edison has been successful in its negotiations for placing a $9,000,000 debenture issue in New York.

Dissolution of Partnership.—AMOS & COLEMAN, electrical and motor engineers, 25, Thomas Street, Liverpool.—Mr. E. Amos, Mr. E. C. Wright, and Mr. S. R. Coleman have dissolved partnership. Messrs. Amos and Wright will attend to debts.

The A.E.G. in Argentina.—The *Review of the River Plate* records the formation of the A.E.G. Cia. Argentina de Electricidad, with a capital of $2,000,000 m/n, to take over the assets and liabilities of the A.E.G. Cia. Sudamericana de Electricidad, established in Buenos Aires for the "importation, buying and selling of merchandise, electrical machinery and installations."

Electricity at the Birmingham Building Exhibition.—The Building and Allied Trades Exhibition at Bingley Hall, Birmingham, which was opened on September 7th, by Sir H. Kingsley Wood, M.P., Parliamentary Secretary to the Ministry of Health, and closes to-morrow (Saturday), has been well attended by representatives of trade organisations, and particularly by those associated with local housing and road construction schemes. The exhibition, which was organised by the Birmingham Chamber of Commerce, covers practically the whole field of building work and material, and the internal equipment of houses, prominence being given to electricity in the home. The Birmingham Corporation Electric Supply Department has a stand which in its character is extremely comprehensive. This stand, which is illustrated in the accompanying figure, includes an attractive selection of modern lighting fittings and electrical apparatus, to show the comfort and convenience gained by the installation of electricity for lighting, cooking, heating and other domestic purposes. In addition to the cookers which are being demonstrated, a number

The Birmingham Corporation's Stand at the Building Exhibition.

of electric grills, toasters, coffee percolaters and kettles, are shown. There is also a wide variety of electric fires and heating apparatus; a dish washer; an electric wash boiler; and a clothes washer. Another useful article on view is a small domestic type motor, which can be used to drive a grinder to sharpen knives, and a buffer to polish silver and plate, to drive a small fan, or to work a sewing machine. A few drills and other small portable electric tools are also exhibited. Lectures have been given dealing with such subjects as lighting, heating, and cooking, and also on the use of electricity in the home. Mr. W. E. Bush, of the E.L.M.A. Lighting Service Bureau, and Mr. J. W. Beauchamp, of the Electrical Development Association, were jointly responsible for an interesting contribution. Mr. Bush declared that more progress had been made in the last 14 years in the development of artificial light sources than was made in the preceding 2,000 years. The greater use of electric power in industry was urged by Mr. Beauchamp. Discussing the subject of lighting in industry, Mr. W. J. Jones, of the Electric Lamp Manufacturers' Association, declared that the advent of artificial light had contributed considerably to the stability of industry.

Stoker Contracts.—Riley stokers, constructed by the Riley Stoker Co., Ltd., have been exclusively adopted by the Union Cold Storage Co., Ltd., for its new power plant. Each boiler has a single stoker, direct driven by an electric motor, and provided with its individual fan. The Luton Corporation has placed a further repeat order with the company for Riley stokers to replace stokers of another type, and six more large Riley stokers have been ordered for the latest extension of the Buenos Aires central power station.

Unemployment.—During the week ended August 31st, for the fifth successive week, there was a serious rise in the number of registered unemployed, the total at that date being 1,354,100. This was 10,362 more than a week earlier and 191,220 more than at September 1st, 1924.

Battery Vehicle Aids Hospital.—A lorry belonging to the D.P. Battery Co., Ltd., fitted with "Kathanode" batteries, obtained first prize in a carnival organised in aid of the Bakewell War Memorial Cottage Hospital. It was arranged as a "mobile fair" and collected over £18 for the hospital funds.

Our Foreign Trade.—AUGUST FIGURES.—The Board of Trade returns for August show the following values of electrical imports and exports:—

	August, 1924.	Inc. or dec.	8 months, 1925.
Imports.—	£	£	£
Electrical goods and apparatus	324,272	+ 80,733	+ 808,299
Machinery	1,002,104	+163,252	+1,131,408
(Electrical machinery)	106,132	+ 25,094	+ 37,240
Exports.—			
Electrical goods and apparatus	777,764	− 33,452	+1,423,531
Machinery	4,165,375	+700,996	+3,502,793
(Electrical machinery)	488,406	+111,324	+ 604,005
Re-exports.—			
Electrical goods and apparatus	10,866	+ 672	+ 64,394
Machinery	170,398	+ 87,579	+ 227,120
(Electrical machinery)	4,203	− 1,138	− 21,697

Book Notices.—"Mechanical Draught for Boilers" (48 pp.; 32 figs.). Belfast: Davidson & Co., Ltd.—Although this publication is described as "Catalogue No. 18," it is more of a treatise than mere "publicity matter." The advantages of mechanical over natural boiler draught are considered, and particulars follow of the various forms of mechanical draught. Naturally the firm's "Sirocco" apparatus is given prominence, but this does not detract from the general usefulness of the publication.

"Talks About Wireless," by Sir Oliver Lodge. Pp. viii+251. London: Cassell & Co., Ltd. Price 5s. net.

"Scientific Paradoxes and Problems," by A. S. E. Ackermann, B.Sc., A.M.Inst.C.E. Pp. viii+131. London: Old Westminster Press. Price 5s. net.

"British Wire-Drawing and Wire-Working Machinery," by H. Dunell. Pp. xv+188; figs. 181. London: Constable and Co., Ltd. Price 21s. net.

"Scientific Papers of the U.S.A. Bureau of Standards."—No. 503, "A Flow Calorimeter for Specific Heats of Gases." (20 cents.)

Meter Approved.—The Electricity Commissioners have approved of the construction and pattern of, also the means provided for fixing and connecting the meter known as the Ferranti single-phase watt-hour meter, Type F.C.b., rated from and including 2.5 amp. to 20 amp., 100 V to 500 V, at a frequency of 50 cycles per second.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from September 9th, 1925. In the case of foreign applications, the names and addresses of the British representatives are also given:—

Dabritte. No. 458,941. Class 6. Mechanical and electrical advertising signs.—Dorothy J. Davis, 1, Park Mansions, St. Paul's Avenue, N.W.2.

Accurect. No. 455,678. Class 8. Rectifiers for charging automobile batteries and discharge tubes for X-ray purposes.—Philips' Gloeilampenfabrieken, Eindhoven, Holland. (Boult, Wade & Tennant, 112, Hatton Garden, E.C.1.)

Wates Bros., Kingsway (lettering and design). No. 455,776. Electrical apparatus included in Class 8.—Wates Bros., Ltd., 12-14, Great Queen Street, W.C.2.

Uniplex. No. 458,405. Class 8. Amplifiers for use in radio telegraphy and telephony.—Burndept Wireless, Ltd.

Holcos (lettering and design). No. 458,492. Class 8. Sound wave detectors for use in radio-telephony.—Holmes, Wilson & Co., Bolton Road, Pendleton, Manchester.

Atlas. No. 456,676. Class 8. Electric batteries (not for medical purposes).—O. Ruhl (1922), Ltd., 85, City Road, E.C.2.

Plastographe. No. 459,271. All goods in Class 8.—Rignon, 1, Rue Blanche, Paris. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

Kay Ray (lettering and design). No. 460,285. Class 8. Instruments and apparatus for use in radio telegraphy and telephony and parts thereof.—Kate Raymond, trading as K. Raymond, 1, Grape Street, W.C.2.

Triotron (lettering and design). No. 460,449. Class 8. Valves, instruments, and apparatus for use in radio telegraphy and telephony.—Roysentul, 36, Camomile Street, E.C.2.

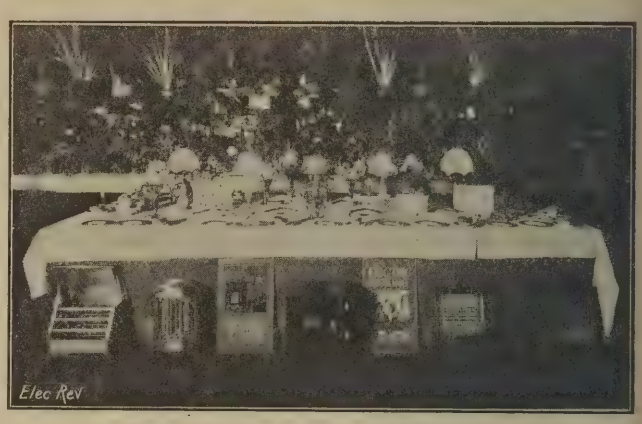
Andia. No. 460,832. Class 8. Radio telephone apparatus, &c.—Andia, Ltd., Sentinel House, Southampton Row, W.C.2.

Jedson. No. 460,890. All goods in Class 8.—John E. Dallas & Sons, Ltd., 8 and 10, Betterton Street, Drury Lane, W.C.2.

Maxtrip. No. 460,144. Class 13. Incandescent electric lamps (ordinary).—British Electric Lamps, Ltd., 13a, Tabor Grove, Wimbledon, S.E.19.

Nitraglas. No. 459,857. Class 14. Globes and shades used for illuminating purposes.—General Electric Co., Ltd.

Kalioko. No. 457,109. Class 40. India-rubber prepared in strip form for electrical insulating purposes.—Callender's Cable & Construction Co., Ltd.



Local Exhibitions.—SALFORD.—The Electricity Committee is holding an exhibition of electrical appliances at the Pendleton Town Hall, to commence on September 21st. An electric-cooker hiring scheme is to be instituted on October 1st.

SALE.—Alderman W. T. Dagnall, the chairman of the Manchester Corporation Electricity Committee, recently opened a comprehensive exhibition of electrical appliances at the Sale Town Hall. The exhibition marked the introduction of the Norwich system of charging for electricity. Leading apparatus manufacturers in the country demonstrated their washing, cooking, and other domestic apparatus.

LIVERPOOL.—A radio exhibition opens at Liverpool to-day for a period of nine days. Every phase of wireless progress is to be represented, and many Liverpool radio firms have taken stands, as well as firms from London and other important centres. Demonstrations of the building of sets are to be given by the Liverpool Wireless Society and by Mr. J. E. Kemp (chairman of the Manchester and District Association of Radio Societies). The components for these sets are presented by exhibitors and at the close of the exhibition the sets will be sold in aid of a local charity. There are two competitions, the first is for the best two-valve amplifier, for which 30 guineas is offered in prizes, and the other for a portable one-valve set, total prizes 25 guineas.

BERMONDSEY.—An electrical exhibition, under the auspices of the borough electricity department, was inaugurated by the Mayor on September 14th. The Corporation stand was divided into two sections—a sitting room and a kitchen—and was wired and fitted for lighting, cooking, heating, &c. Other stands were occupied by leading electrical firms exhibiting domestic electrical apparatus. These included the Cable Accessories Co., Ltd., Credenda Conduits, Ltd., the General Electric Co., the Hotpoint Co., Ltd., Holophane, Ltd., the Jackson Electric Stove Co., Ltd., Metro-Vick Supplies, Ltd., and the Wholesale Fittings Co., Ltd. Electrical apparatus was also loaned for the occasion by the London Electrical Co., Messrs. Siemens Bros. & Co., Ltd., and the Edison Swan Electric Co., Ltd. The City Electrical Co., Ltd., exhibited electrically-driven machines, and Messrs. Barton & Gillette showed an electrical horse-clipper. A finishing machine used for boot repairing was demonstrated by Messrs. Keats & Bexon, and the Hobart Manufacturing Co.'s exhibits included a cake-mixer and a sausage-making machine. The chairman of the Electricity Committee announced that the charge for lighting was to be reduced from 6½d. to 5½d. per kWh.

Electricity at a Horticultural Show.—One of the attractions of the recent annual show of the Royal West Renfrewshire Horticultural Society was a stand arranged by the Greenock Corporation Electricity Department (engineer and manager, Mr. F. H. Whysall). As will be seen from the illustration herewith, the display had a floral background and was arranged as a tea table with appropriate lighting standards and small appliances. Four types of fire and a "Creda" cooker represented the larger domestic appliances. The Department secured an award of merit for this stand.

Electricity at the Greenock Horticultural Show.

Irish Free State Electrical Imports.—The Irish Free State Ministry of Industry and Commerce has now issued detailed figures of imports for the first quarter of 1925 as compared with the corresponding period of last year. From these we have compiled the appended table showing the value of the total imports of electrical machinery and apparatus into the Free State and the amount attributed to the United Kingdom as ports of consignment but not necessarily as the country of manufacture.

	Total.		U.K. Share.	
	January to March.		January to March.	
	1925.	1924.	1925.	1924.
	£	£	£	£
Electric wires and cables	21,935	14,077	15,873	12,128
Teleg. and telegraph instruments and apparatus	5,832	10,511	5,791	10,407
Electric lamps and parts	12,569	8,352	12,364	7,572
Batteries and accumulators	6,879	3,578	6,631	3,160
Radio sets and parts ...	14,483	29,637	13,988	29,589
Other elec. goods and apparatus	11,706	34,738	11,034	33,182
Electric generators ...	4,438	2,189	4,504	2,145
Electric motors	8,488	5,476	8,453	5,371
Other electrical machinery	27,337	9,476	26,447	9,399
Total ...	£113,667	£118,034	£105,085	£112,953

It will be seen that while wide variations are shown in the different classes of goods, the 1925 imports are within £4,500 of those of last year. All but £8,582 of the goods came from the United Kingdom, and of the balance £5,719 is attributed to Belgium, £1,683 to Germany, and £1,180 to other countries.

New Indian Companies.—The Battery Service Co. is the name of a new concern which has lately been formed at 5, New Queens Road, Bombay, with a capital of 25,000 rupees, to deal in batteries for motor vehicles.

STEWART JACKS, LTD., has recently been formed in Bombay (Wodehouse Road), with a capital of 1,00,000 rupees, to carry on business as electrical engineers.

Electricity Supply in Nottingham and District.

The New North Wilford Power Station.

The official opening of the North Wilford power station by Mr. Alderman Edmund Huntsman, the chairman of the Nottingham Electricity Committee, yesterday, marks an important epoch in the history of electricity supply in the City of Nottingham and the surrounding district.

The first public supply of electricity within the City was provided by the Corporation in 1894, under the powers of an Order granted in 1890; by the Nottingham Corporation Act, 1923, the area of supply was extended to its present dimensions.

Up to the present time the supply has been generated at four stations, one at Talbot Street, established in 1894; one at St. Ann's Well Road, established in 1902; the refuse destructor station at Eastcroft Depôt, established in 1902; and the North Wilford temporary station, established in 1922. With the exception of four 3-phase, 6,600-V turbo-alternators, two at St. Ann's Well Road, and two at the temporary North Wilford station, the whole of the generating plant consisted of Willans non-condensing engines and Siemens d.c. dynamos working at about 400 V pressure. The total plant capacity, before certain of the Willans-Siemens machines were recently removed, was 17,730 kW.

The Corporation had been aware for a long time that its existing generating plant was out of date and uneconomical, and in December, 1918, a conference of local authorities instructed Mr. J. H. Rider, M.I.E.E. (of the firm of Preece, Cardew & Rider, consulting engineers) and the late Mr. C. H. Wordingham "To consider and report fully upon the question of the supply of electricity in the district and to advise as to the course which should be followed by the municipalities." These gentlemen presented a report in August, 1919, the chief recommendations of which were the erection of the first section of a large power station on the Trent, at Long Eaton, a system of primary transmission mains between Long Eaton and the principal towns in the district, and a system of secondary transmission mains radiating over the whole district. The Electricity (Supply) Act, 1919, seriously curtailed the financial possibilities, and led to a modified scheme being proposed.

Fig. 1.—Exterior View of Station.

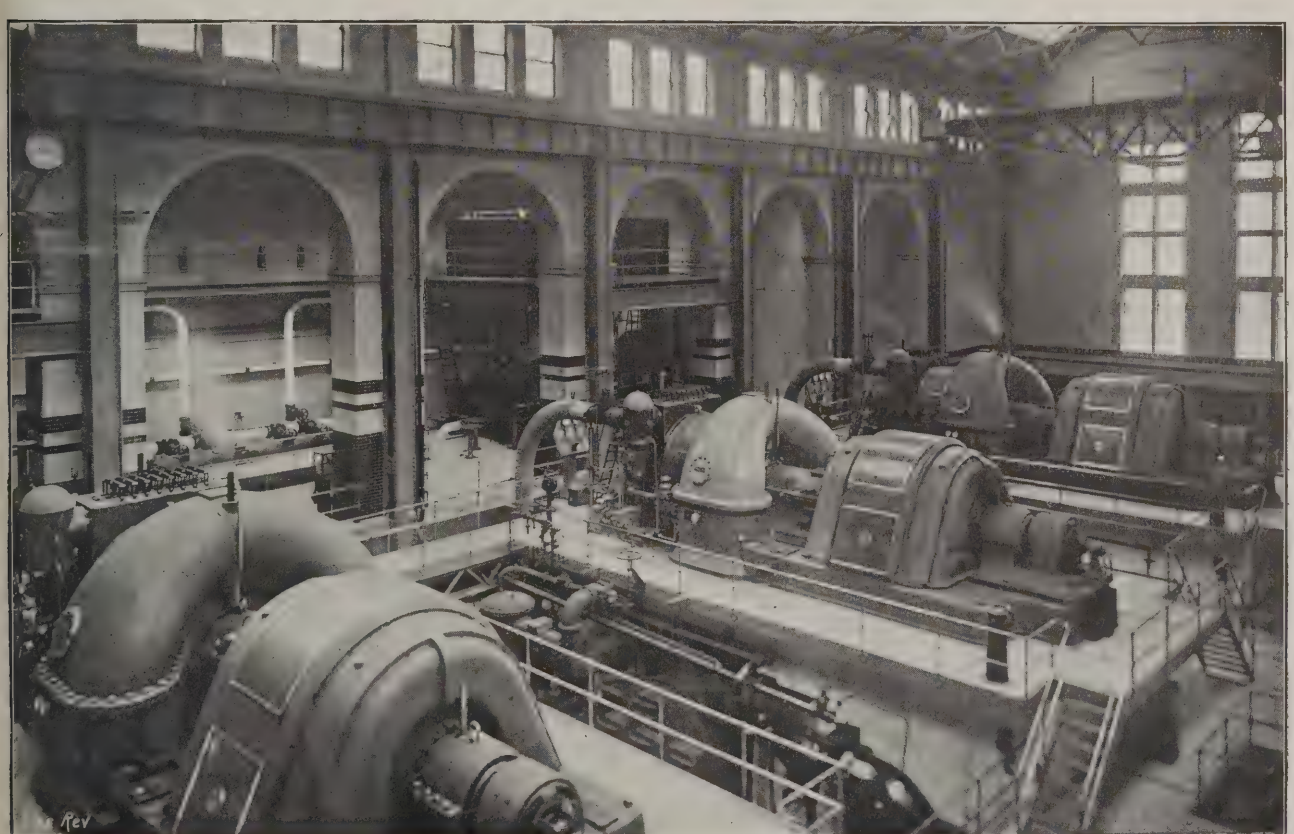


Fig. 2.—Interior of Turbine Room.

E

In December, 1919, Mr. Rider was retained by the Nottingham Corporation as its consulting engineer and instructed to report as to a site in the neighbourhood of the city suitable for the erection of a new power station. After a careful investigation he advised the acquisition of the North Wilford site, and an application was forthwith made to the Electricity Commissioners for permission to build a generating station on it. This was granted in September, 1920.

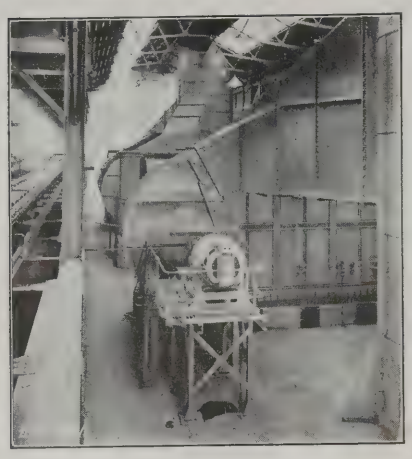

Fig. 3.—Induced-Draught Fans.

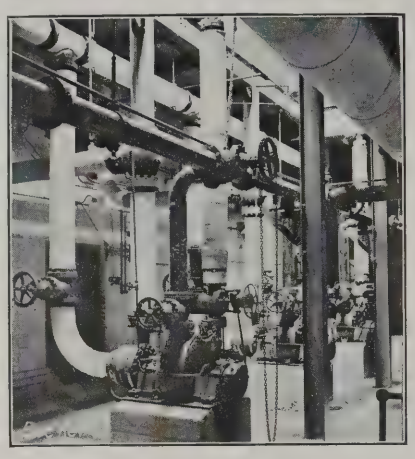

Fig. 4.—Boiler Feed Pumps.

The site at North Wilford, almost an ideal one for a large power station, extends from the River Trent to the L.M. and S. Railway, and adjoins the Clifton Colliery. It has an area of about 80 acres, and sandstone rock is found at a depth of about 15 ft. below the surface. Water for condensing purposes is available for a load of about 200,000 kW.

The general layout of the station is such that the turbine room, with the condensing plant and the switchgear, lies parallel to the river, and will be extended in the same direction. The boiler house is at right angles to the turbine room, and additional boiler houses will be erected as the turbine room is extended. A separate external coal silo, holding about 5,000 tons, has been provided for each boiler-house section, and the various silos will be supplied from a row of receiving hoppers, with two lines of railway tracks. There are four receiving hoppers for each boiler-house section, and each hopper holds about 40 tons. As the line of hoppers is extended with additions to the plant, longer trains will be accommodated. Crushing plant, fig. 7, is provided below the receiving hoppers, and the crushed coal is conveyed by duplicated gravity bucket conveyors to the external silos. Each line of conveyors will carry 40 tons per hour. A similiar duplicate line of conveyors, fig. 6, takes the coal from chutes below each silo to the service bunkers over the centre of the boiler house. One bunker, holding about 140 tons, is provided for each pair of boilers, and each bunker is divided into three compartments.

The boiler house, which is 150 ft. long and 85 ft. wide, is designed for two rows of four boilers, with a central firing gangway. Six boilers are at present installed; each has a normal evaporation of 55,000 lb. per hour at a pressure of 250 lb. per sq. in., and a superheat temperature of about 650 deg. F. Each boiler is provided with three mechanical stokers of the chain-grate type, and a coal meter is fitted to each grate. The ashes are received in hoppers at the backs of the grates, and fall directly, through sealed chutes, into a water trough conveyor for each line of boilers. The conveyors lift the

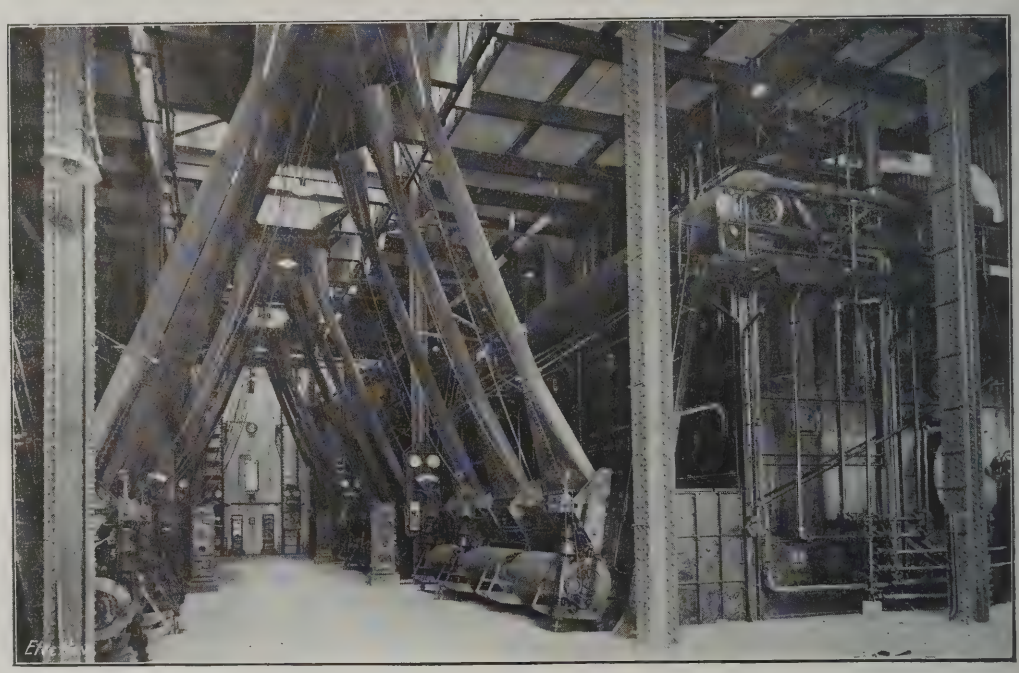

Fig. 5.—Interior of Boiler House.

Fig. 6.—Coal Conveyor.

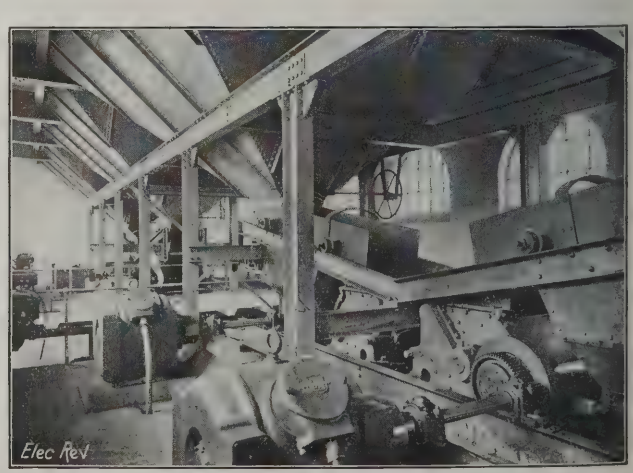

Fig. 7.—Coal Crusher.

ashes to external silos, from which they can be removed in carts, tubs, or railway wagons. For many years to come the ashes will be deposited over the low-lying land behind the power station, until this has been brought up to the final site level. The gases from each boiler pass up, through a short vertical flue, to a fuel economiser on a gallery floor above, and thence to a steel chimney, 9 ft. in diameter and 96 ft. above the ground level. One chimney is provided for each pair of boilers. The boiler furnaces are worked on the balanced draught system, with atmospheric pressure above the fires. A separate forced-draught fan in the basement delivers the air under pressure below the grates of each boiler, and a separate induced-draught fan, fig. 3, between the economiser and the chimney, draws the gases from the combustion chamber and discharges them up the chimney. The fans for each boiler are controlled from the firing floor. A complete system of dust- and soot-removing plant has been provided. Steam jet blowers are used for the boiler and economiser tubes, and a vacuum pump removes the flue dust and soot to a container in the yard, whence it is readily taken away.

The boiler feed-water plant is located in an annexe between the turbine room and the end of the boiler house. Three turbine-driven feed pumps, fig. 4, have been installed in the basement, each capable of dealing with 250,000 lb. of water per hour, against the full boiler pressure. Duplicate feed pipes run down each side of the boiler house, with connections to the various economisers and boilers.

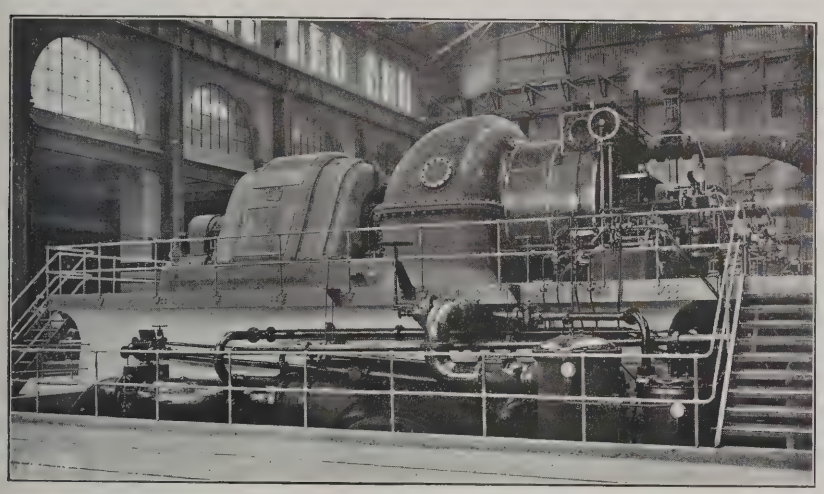

Fig. 8.—One of the Main Turbo-generators.

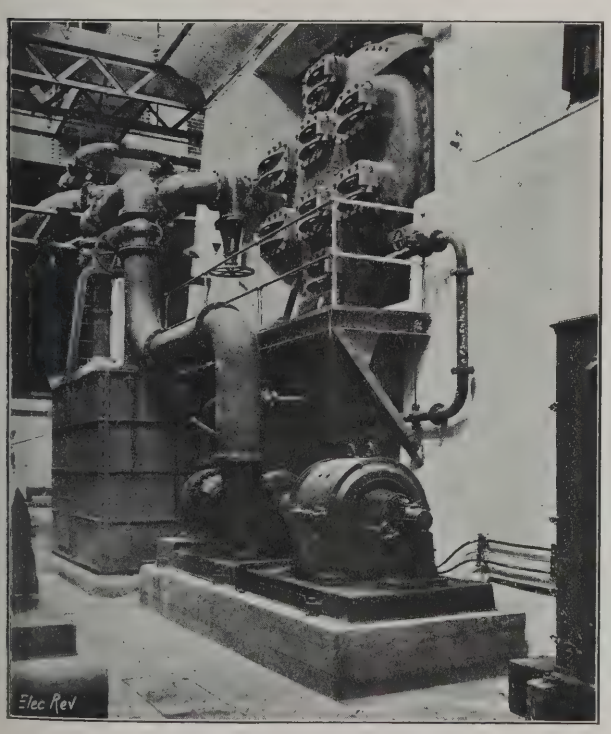

Fig. 9.—Condensing Plant.

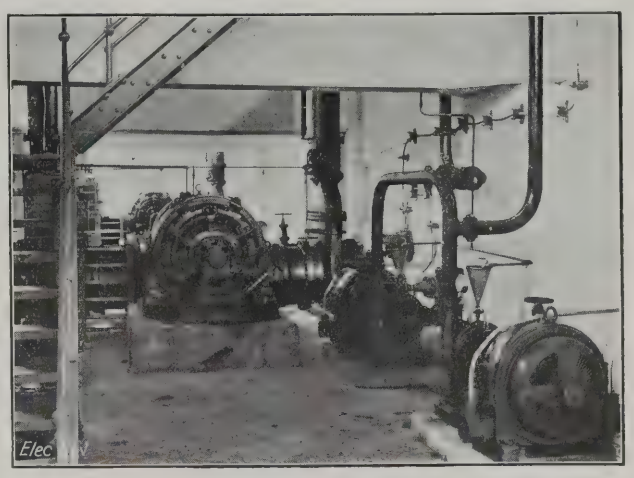

Fig. 10.—Circulating Pumps.

The exhaust steam from the boiler feed pumps is led to closed hotwell tanks, where it passes through exhaust heaters. The overflow pipes from these and the closed storage tanks are sealed in subsidiary tanks, the overflow from which goes to the drainage system. The boilers and economisers are emptied or blown down into a large steel tank, with an 18-in. atmospheric pipe to relieve all pressure. The blowdown tank is drained to a sump pit and thence to the river, *via* the discharge tunnel of the condensing-water system.

The turbine room, at present 112 ft. long and 75 ft. wide, exclusive of a railway bay and space for unloading 50 ft. long, contains three 12,500-kVA, 1,500-r.p.m. turbo-alternators, mounted on monolithic concrete foundations, and one auxiliary 1,000-kW turbo-alternator-dynamo. The last-named set is geared, the turbine running at 3,000 r.p.m., and the alternator and direct-current generator at 750 r.p.m. The three main alternators generate 3-phase energy at 11,000 V between phases, and 50 cycles per second. The 200-kW auxiliary 3-phase alternator generates at 420 V, and the 800-kW generator at 490 V. Separate surface condensers are provided for each turbine, with duplicate air and condensate pumps for the 12,500-kVA machines. One of the former in each case is of the hydraulic type, and the other of the steam ejector type. The condensing plant is designed for a vacuum of 29 in. with the barometer at 30 in. The feed-water heaters are fed with steam bled from the high- and

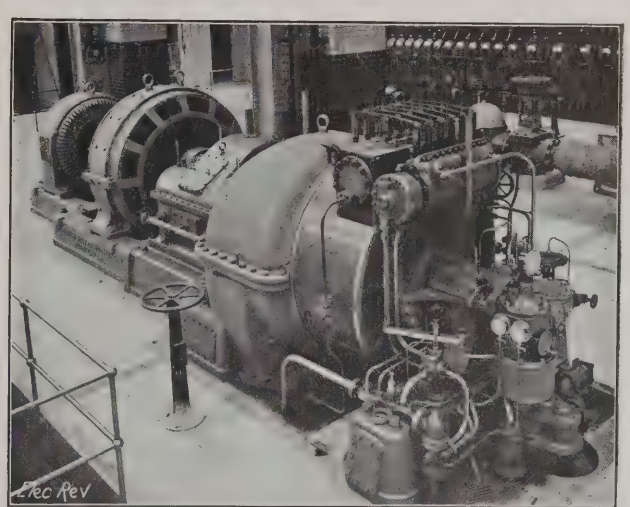

Fig. 11.—Auxiliary Turbine Set.

low-pressure stages of the 10,000-kW turbines, so that the condensate is heated in stages, up to 212 deg. F., before passing to the hotwells. The auxiliary turbine is provided with single air and condensate pumps, but not with feed-water heaters. A closed system of air ventilation with water-tube coolers is used with each 10,000-kW alternator. The cooling water is taken from the main circulating system. The auxiliary alternator and generator are cooled by natural ventilation. A 75-ton electric crane spans the turbine room and railway bay.

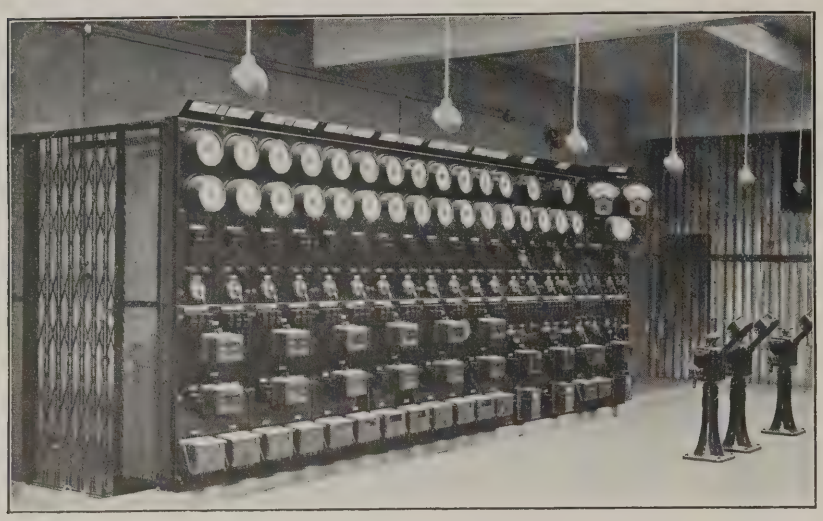

Fig. 12.—Control Chamber.

With the exception of the boiler feed pumps, the whole of the auxiliary plant is motor driven, either by 3-phase, 415-V, or by 480-V d.c. machines. The auxiliary power supply is normally obtained from static transformers for the 3-phase motors, and from rotary converters for the d.c. machines. The auxiliary turbo-alternator-dynamo may be used in parallel with either or both services, and is of sufficient capacity to start up the auxiliary motors of one complete (40,000 kW) section of the station, in the event of a total shut-down of the main plant. A storage battery is used in parallel with the d.c. auxiliary service, and is accommodated in a separate room.

The condensing water is pumped from and returned to the river, for which operations two open and parallel water channels, 10 ft. wide, have been constructed.

Four screens of the continually-moving-band type are provided at present, and similar arrangements will be made as further sections of the station are built. The condenser pumps for the 10,000-kW machines are each of 870,000 gal. per hour capacity, and the one for the auxiliary turbine has a capacity of 102,000 gal. per hour. A 5-ton hand crane serves the pump chamber.

The switchgear is divided into three sections: E.h.p. main switchgear, 11,000 V; e.h.p. auxiliary switchgear, 11,000 V; and l.p. auxiliary switchgear, for 245 and 490 V d.c., and 420 V a.c. The main switchgear is erected on two floors above the centrifugal pump room. The upper floor contains the oil switches and reactors, fig. 13, while on the lower floor, fig. 14, are the bus-bars, isolating switches, instruments, relay transformers, &c. The switchgear is divided into sections, with independent sectional bus-bars, continuous transfer bus-bars, and continuous tie bus-bars. Duplicate oil switches are provided for each alternator and single oil switches for each feeder. The section bus-bars will normally be coupled through reactors to the tie bus-bars. The transfer bus-bars will be used when it is desired to clean or examine any individual set of section bus-bars, by making the necessary change-over through the medium of the link switches. A separate set of reactors connects the transfer bus-bars to the tie bus-bars. In cases of emergency two or more sets of section bus-bars can be coupled together, independently of the

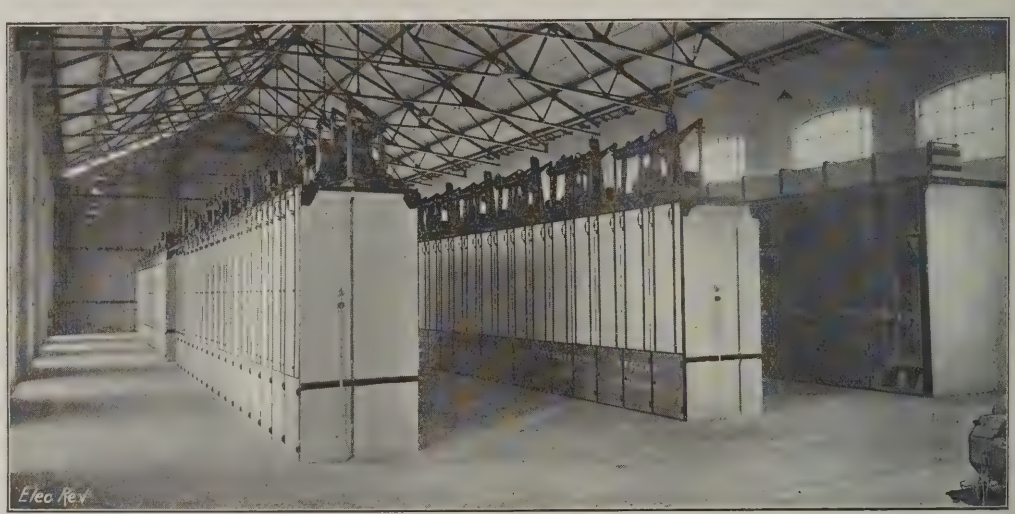

Fig. 13.—Oil Switches.

Fig. 14.—Bus-bar Room.

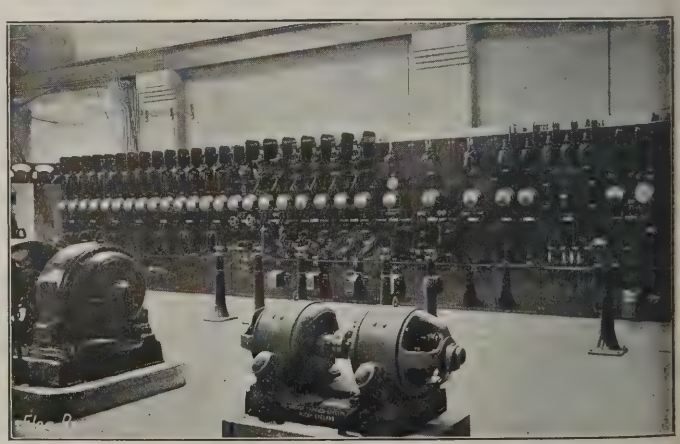

Fig. 15.—Auxiliary Switchgear.

tie bus-bars, by means of the section coupling switches. The alternator oil switches are designed for 2,000 A per phase, and the feeder oil switches for 500 A per phase, in each case at 11,000 V. Each oil switch will, with the current-limiting reactors suitably arranged, safely open under short-circuit conditions, with an ultimate station working capacity of 200,000 kW. The whole of the main oil switchgear is operated electrically from a control switchboard, fig. 12, erected on a gallery above the auxiliary-plant bay, which commands a complete view of the turbine room. The operation is by d.c. at 240 V. The control gallery is laid out for the future accommodation of alternator and feeder control switchgear for 230,000 kW. An electric signalling apparatus is provided on the control gallery, by which independent signals can be given to the starting platform of each main turbine. When the alternator has been switched in, the switchboard attendant takes control of the speeds and the division of the load, by electrical control of the governors of the turbines.

An iron grid resistance, erected in an expanded metal enclosure between the turbine room and the auxiliary plant bay, is used to earth the neutral star point of the stator of one or other of the running alternators.

The low-pressure auxiliary switchgear, fig. 15, is mounted on slate panels, erected on the floor of the auxiliary plant bay. It controls the low-pressure sides of the station transformers and rotary converters, the accumulators, the booster, &c., and also the whole of the direct- and alternating-current motor and lighting services of the station. Separate starting and control switchgear is mounted close to each individual motor throughout the power station. The motors operating the coal- and ash-conveyor lines can be instantly stopped, from a number of points, by pressing special trip switches.

(To be concluded.)

Lighting and Power Notes.

Barrow.—LOANS SANCTIONED.—The Town Council has received sanction to the borrowing of £23,500 for mains, and £1,090 for the erection of a cooling tower.

Birkenhead.—ELECTRICITY CHARGES.—The Corporation has decided that from the September quarter the price of electricity to the out-townships shall be fixed at 25 per cent. above the rates charged in the borough, *viz.*: Lighting, 6¼d. (borough 5d.); heating and cooking, 1¼d. (borough 1d.); there will be special rates for large consumers.

Brecon.—AMENDMENT OF ORDER.—Application has been made by the Corporation to the Electricity Commissioners to amend the draft of a Special Order, so as to include the parishes of Castle Inn and Christ's College, as well as the urban district of Brecon.

Burton-on-Trent.—ELECTRICITY SUPPLY.—The Town Council, following an application from the Hartshorne and Seals Rural District Council for a supply of electricity to the pumping station at Smisby at an approximate cost of £2,000, has applied for consent to carry out the extension. The mains are to be extended forthwith to Barton-under-Needwood at an estimated cost of £2,500.

Carlisle.—LOANS.—The City Council has received from the Electricity Commissioners sanction to a loan of £7,000 for mains. A further loan of £11,108 has been applied for in connection with the laying of mains under an unemployment scheme, and a grant towards the cost is to be sought from the Unemployment Grants Committee.

Chichester.—LOANS.—The Town Council is applying for sanction to loans of £2,000 for electrical apparatus to be let out on hire, and £2,000 for feeder cables.

Denholme.—OPPOSITION TO SCHEME.—The Urban District Council is to oppose the proposal of the Electrical Distribution of Yorkshire, Ltd., to supply electricity in the district under the Queensbury and District Electricity Order, in view of the proposal that the Council shall supply electricity itself.

Felixstowe.—ELECTRICITY IN BULK.—The Urban District Council has entered into an agreement with Ipswich Corporation for a bulk supply of electricity for a period of 21 years.

Fylde.—ELECTRICITY AGREEMENT.—At a meeting of the Rural District Council on September 2nd, reference was made to the supply of electricity to Marton and Carleton. The deputation appointed at the previous meeting had met representatives of the Poulton Council, and the draft form of agreement for the supply of current to Carleton and Marton by the Blackpool Corporation was approved subject to slight alterations.

Hove and Aldrington.—YEAR'S WORKING.—The report of the borough electrical engineer, Mr. C. B. Smith, on the working of the electricity undertaking for the year ended March 31st shows a total income of £64,454, as compared with £58,949 in the preceding year. Working expenses amounted to £33,812, as against £30,395, leaving a gross profit of £30,642 (£28,554). After providing for capital charges, a net surplus of £9,707 remained, as compared with £7,715 in 1923-24. The amount spent on capital account during the year was £36,344, and was chiefly incurred on mains and machinery. The electrical energy sold increased from 2,456,258 to 2,883,308 kWh. Reductions in the charges for electricity were made during the year, and the engineer has recommended the following further reductions as from September 30th:—Lighting: From 6½d. to 6d. per kWh. Power: From 2½d. to 2d. per kWh. Meter rents: A reduction of 1s. per quarter per meter.

India.—MYSORE HYDRO-ELECTRIC EXTENSION.—The total supply now being generated at Sivasamudram is about 32,000 h.p., and the whole of this power has been already taken up. The immediate demands for additional power aggregate to about 10,264 h.p. Proposals were accordingly called for to utilise the additional supplies that could be made available from Krishnarajasagara, for some time to come, and the chief electrical engineer has submitted the seventh installation proposals and estimates amounting to Rs. 87 lacs, providing for the generation of 14,000 h.p. at Sivasamudram and 10,000 h.p. at the Krishnarajasagara-Dam site, together with the necessary transmission line, and the remodelling and extension of the receiving stations and distribution system in Kolar Gold Fields, Bangalore and Mysore cities. After consideration of the matter, the Government has sanctioned the scheme for the development at the Sivasamudram generating station and for the subsidiary works to transmit and distribute the additional 14,000 h.p. to the Kolar Gold Fields, Bangalore and Mysore, at a total approximate cost of Rs. 45½ lacs, postponing the development of the Krishnarajasagara station for the present, and the chief electrical engineer has been requested to submit detailed estimates and specifications for the plant and machineyr. It is expected that the first unit of the extensions will be put into service 18 months from the commencement of the work, and the whole work will be completed in 36 months.

Motherwell.—LOANS SANCTIONED.—The Town Council has received sanction to the borrowing of £2,841 and £428 in respect of mains and services required in the Coltness and Gerviston housing areas.

ELECTRICITY IN BULK.—The Electricity Commissioners, having considered the question of installing additional plant at the power station, or alternatively, taking a bulk supply from the Clyde Valley Electrical Power Co., are of opinion that the Council should arrange for taking bulk supply from the company. It is estimated that modern plant required at the station would cost £35,000.

PRICE REDUCTIONS.—The Town Council has reduced the charges for electricity for private lighting from 4½d. to 4d. per kWh, and the combined rate for domestic purposes from 1d. to ¾d. per kWh.

Mynddislwyn (Mon.).—ELECTRICITY EXTENSIONS.—The Urban District Council has received sanction to the borrowing of £19,700 for extension of its electricity supply, and it is proposed to include Ynysddu, Cwmfelin, and Brynwel in the scheme.

Northern Ireland.—WHITEHEAD (CO. ANTRIM).—At the recent meeting of the Town Commissioners, the proposed electricity scheme for the district was considered, and it was resolved to advertise for quotations as soon as the necessary maps and valuations had been obtained.

Oldham.—NEW STATION SANCTIONED.—At a recent meeting of the Electricity Committee, a letter was received from the Electricity Commissioners consenting to the establishment of a generating station in the urban district of Chadderton. Mr. R. Blackmore, consulting engineer, reported upon the result of an interview which the engineer and himself had with representatives of the Unemployment Grants Committee with regard to the Electricity Committee's application for assistance in connection with the establishment of the new generating station, and submitted an estimate of the expenditure which would be incurred in the event of the committee's deciding to proceed with the installation of two 12,500-kW sets and four boilers instead of the complete first section of the station as originally intended. The estimate was adopted, and the Town Clerk was requested to apply to the Unemployment Grants Committee for a grant in respect of the sum of £207,375, which represents the difference between the scheme as originally submitted and the cost of the section which it is now proposed to put in hand.

Portsmouth.—LOAN SANCTIONED.—The Electricity Commissioners have sanctioned a loan of £65,000 for the extension of plant and buildings at the Corporation generating station.

Sheffield.—MAINS EXTENSIONS.—The Electricity Committee is to carry out mains extensions at a total cost of £6,516.

ELECTRICAL DEVELOPMENT.—The Finance Consultative Committee has approved new capital expenditure of £82,321 on the electricity supply account for the ensuing half year. The Electric Supply Commitee has approved during the past month extensions of mains involving a total expenditure of £9,737.

Southend-on-Sea.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer: Mr. R. Birkett) for the year ended March 31st last show a total income of £158,953, as compared with £138,341 in the preceding year.

Working expenses amounted to £84,876, as against £85,014, leaving a gross profit of £74,077 (£53,327). To this was added a balance of £18,883 brought forward from the previous year, and other small items making a total of £93,196. This was distributed as follows: Interest loan charges, &c., £46,491; capital expenditure charged to revenue, £22,814; house property at Boston Avenue and Thorpe Bay, £114; removal of No. 1 engine, £42; balance carried forward, £23,563. The capital expenditure during the year amounted to £61,132, and included £41,626 for mains and services, and £11,074 for engines, boilers and other machinery. The sales of electrical energy increased from 9,908,874 to 11,591,812 kWh, and the maximum supply demanded from 5,510 to 6,236 kW.

Sunderland.—LOANS SANCTIONED.—The Corporation has received sanction to the borrowing of the following amounts:—Sub-station buildings, £1,731; house services, £10,000; sub-station on the Barley Mow estate, £1,260.

Tregaron.—ELECTRICITY SCHEME.—The Town Development Committee is to carry out an electric lighting scheme for the town. It is proposed to utilise hydro-electric power.

Truro.—ELECTRICITY SCHEME.—The Town Council has accepted the offer of Edmundsons' Electricity Corporation, Ltd., to supply the city with electricity at 10d. per kWh for lighting and 5d. per kWh for power without any financial liability to the rates.

Ulverston.—LOANS.—The Urban District Council has received sanction from the Unemployment Grants Committee to a grant of 50 per cent. of the interest on a loan of £9,793, and also the sanction of the Electricity Commissioners to a loan of £11,675 for electricity purposes.

Walton-le-Dale.—ELECTRICITY SUPPLY.—The Urban District Council has approved a draft agreement with the Lancashire Electric Power Company and consented to its application for an Order to supply electricity in the district.

Wirral.—OPPOSITION TO SCHEME.—On the ground that the electricity scheme of the Wirral Rural District Council would saddle the district with a heavy liability, a public meeting of Moreton ratepayers has raised opposition to the scheme. The meeting was in favour of the offer of the Birkenhead Corporation which amounted to a supply of electricity at a cost of 25 per cent. less than under the Wirral Council's scheme. Mr. C. R. St. John, consulting engineer to the Wirral Council, stated that Birkenhead having been definitely refused any extensions by the Electricity Commissioners, could not get the necessary powers to supply Wirral. The chairman of the Birkenhead Electricity Committee said that if his authority were given powers, it could guarantee a bulk supply to Moreton within four to six weeks.

York.—ELECTRICITY EXTENSIONS.—The Electricity Committee is expending large sums on extensions and new machinery at the generating stations at Foss Island and Linton-on-the-Ouse, and in order to inspect the two stations and the progress of the work, members of the Corporation recently visited the sites. The Committee is installing a new Oerlikon turbine of 6,000-kW capacity, the condensing plant for which is being fitted by Messrs. W. H. Allen, Sons & Co., of Bedford. This will be the third Swiss generator to be included in the equipment. A new converter of the La Cour type is being placed in the station on the site of the Diesel engines, which have been removed. A new gallery is being erected to receive a h.p. switchboard, and four new water-tube boilers are being added to the equipment, making twelve in all. Further extensions are contemplated. The Chairman stated that as soon as the new 6,000-kW turbine at Foss Island was completed another would be installed.

"ALL-ELECTRIC" HOUSES.—The Town Council is to fit up four experimental houses, which are to be "all electric," on the lines of those at Gateshead. The estimated cost of fitting up each house with electrical apparatus is £50.

Tramway and Railway Notes.

Continental.—THE TYROL.—Plans are being prepared by an Innsbruck syndicate in connection with a proposed electric mountain railway between Langen, *via* the Flexen Pass to Zurs on the Arlberg in the Tyrol.

AUSTRIA.—Negotiations are reported to be in progress regarding the financing of the work of electrifying the Semmering section of the State railways.

ITALY.—A concession has recently been granted for the construction of an electric railway between Penne and Castellammare Adriatica.

Glasgow.—FARES.—A sub-committee of the Tramways Committee has decided in favour of the re-introduction of halfpenny fares on the tramway.

Grimsby.—RAILLESS CARS.—The Corporation contemplates the introduction of a system of railless cars to replace the local tramway which it has acquired.

Heywood.—TRACK RENEWALS.—According to the *Electric Railway and Tramway Journal*, at a recent meeting of the Town Council it was reported that a double tramway track is to be laid along Middleton Road for the Manchester trams from Middleton to Heywood. Application has been made to the Unemployment Grants Committee for a grant towards the cost of the scheme.

London.—TRAMCAR FIRE.—A fire, believed to have started in a fuse-box, caused flames to envelop part of a tramway-car in Vauxhall Bridge Road, opposite Regency Street, on September 13th. The passengers rapidly got out, and the driver smothered the flames with sand until the fire brigade arrived. Some of the body-work of the car was badly damaged before the fire was put out.

Morocco.—RAILWAY ELECTRIFICATION.—Work is well in hand on the electrification of the Casablanca-Khourigat, Casablanca-Rabat, and Casablanca-Marrakech sections of the Morocco Railway. The necessary electrical energy will be supplied from two power stations—a steam-operated one at Roches-Noires, Casablanca, and a hydro-electric plant on the Oum-Er-Rbia at Sidi-Said-Machou. Four transformer stations, to which current will be transmitted at 60,000 V, are being established at Casablanca, Skerat, Sidi-el-Aidi, and Mrizig. The first-named station will be manually controlled, while the other three will be automatic. Each sub-station will comprise two sets of 60,000/5,500-V transformers and 1,500-kVA synchronous converters.

Southend-on-Sea.—YEAR'S WORKING.—The report on the working of the Corporation tramway undertaking (manager: Mr. R. Birkett) for the year ended March 31st last records a total revenue of £126,979, as compared with £128,780 in 1923-24. Working expenses increased from £103,141 to £106,325, leaving a gross profit of £20,654 (£25,639), to which was added a balance of £12,090 brought forward from the preceding year, and bank interest of £339, making a total of £33,182. After deducting interest and other charges, there was a net surplus of £8,282. The amount spent on capital account, which included £16,289 for cars, was £30,353. The number of passengers carried increased from 17,891,287 to 21,732,269, and the car-miles run from 1,999,437 to 1,363,620. The total revenue per car-mile fell from 25.63d. to 22.426d.

Telegraph and Telephone Notes.

Australia.—PACIFIC CABLE.—The carrying capacity of the Pacific cables is being increased by the laying of a new loaded cable on the route Suva-Fanning-Bamfield, and, according to a correspondent of the *Daily Telegraph*, official circles in Australia regard it as essential to raise the capacity of the Atlantic connections to the same working speed; otherwise the traffic will be delayed in the "Atlantic bottle-neck." It is suggested that the best course would be for the Pacific Cable Board to lay a new loaded cable in the Atlantic.

China.—WIRELESS CONCESSIONS.—It is reported that the American Minister at Peking has demanded confirmation of a concession granted to the American Federal Wireless Company in 1921, and that the Japanese Minister demands similar confirmation for a prior concession to the Mitsui Company, dating from 1918. A third concession, it is said, similar to these two, was negotiated for in 1914 by the British Marconi Company. It is understood that the British Government favours the establishment of a joint working arrangement.

Czecho-Slovakia. — LONG-DISTANCE TELEPHONY.—Contracts have recently been let for the establishment of a long-distance telephone line between Prague and Kolin.

Italy.—THE NEW ITALO-ARGENTINE CABLE.—It is reported from Rome that the new cable between that city and Buenos Aires, *via* Madeira and St. Vincent, is nearing completion. The cable is to be formally inaugurated by the King of Italy on October 12th (Columbus Day).

Persia.—MILITARY RADIO INSTALLATION.—A recent report on Persia by Mr. R. H. Hadow, M.C., of the British Legation at Tehran, states that the Persian Army is engaged in constructing near that city a long-range radio installation with which it is hoped to communicate with Moscow and Beirut. Russian engineers are being employed, but Persians are to be trained to take their places. Similar but minor installations are projected at the various divisional headquarters of the Army, the places mentioned being Meshed, Shiraz, Tabriz, Hamadan, and possibly others.

Spain.—ANGLO-SPANISH CABLE.—A new cable between this country and Spain, 500 miles in length, was landed at Bilbao on Sunday by the cable-ship *Colonia*, which took only a week to perform the service. The new cable belongs to the Direct Spanish Telegraph Co., Ltd., which forms one of the undertakings which make up the Eastern Associated group.—*The Times*.

Switzerland.—UNDERGROUND TELEPHONE LINES.—In conjunction with the work of electrifying the Swiss Federal Railway system, the Swiss Telegraph Department has for some time been engaged in substituting underground for overhead telephone lines along the railway. The work of conversion has just been completed between Geneva and Winterthur and between Olten and Basle, while that between Winterthur, St. Gall, and Rorschach is well in hand.

Radio Notes.

Birmingham.—NEW PLANT.—New transmitting plant has been installed at the Birmingham station (5 IT), and is now working. The new apparatus embodies all the latest improvements, and it is claimed by the B.B.C. engineers that this station is now equipped in a manner which will bear favourable comparison with any broadcasting station in Europe. The new transmitter is built on lines similar to the plant at the Daventry high-power station, and a notable feature is the water-cooling system employed for one of the four valves which are used, a gallon of water per minute being kept in circulation round this valve in order to keep it at the right temperature.

Reports from listeners in many parts indicate that with the new plant considerable improvement in the quality of the transmissions has been effected. The input power has been increased from 0.5 to 1 kW. The old transmitting aerial at Summer Lane power station will continue to be used, but the studio controls will shortly be transferred to new premises in Broad Street, where a new method of draping is to be used which is expected to improve still further the quality of transmission.

International Broadcasting. — WAVELENGTH TESTS. — The tests conducted during the past two weeks relating to the effectiveness of the new schedule of wave-lengths provisionally allotted to British and European stations have been concluded for the present, and the results are being examined. Great improvements were effected by slight alterations after the earlier tests. The new station of the B.B.C. at Keston has been particularly useful in this connection; it is situated on a site of 30 acres, several hundred feet above sea level, on the border of Kent and Surrey. Besides checking wave-lengths and identifying transmissions which cause interference, it will be used for receiving and relaying foreign programmes.

Italy.—BROADCASTING STATIONS.—A broadcasting station which is being erected for the Italian Broadcasting Co. at Milan by the Marconi Co. will have a type "Q" transmitter with a power of 6 kW. The new broadcasting station at Rome, which is also being erected by the Marconi Co., will be of the same type as the new 2LO, and will have a power of 12 kW.

Spain.—BROADCASTING DEVELOPMENT.—In connection with the Union Radio broadcasting station at Madrid, which was inaugurated in June, it is proposed to work out an elaborate relaying system. According to a recent report, relay stations are to be built at Barcelona, Seville, Valencia, Cadiz, Santa Cruz de Tererife, Coruña, Oviedo, Santander, Bilbao, Palma de Mallorca, Granada, Salamanca, Pamplona, Logrono, Valladolid, and Malaga. By this means it is hoped to cover the whole of Spain and the Balearic and Canary Islands.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—November 9th. Electricity Commission of Victoria. 6,600-V and l.p. lead-covered and armoured cable. 22,000-V, 3-core cable and accessories. (September 4th.)

P.M.G.'s Department. November 10th. Telephone receivers and parts.

November 17th. Magneto-automatic junction material.*

Belgium.—ANTWERP.—October 19th. Port Equipment Department. One 30-ton electric travelling crane. (A.X. 2,380.)*

Bournemouth.—September 24th. Tramways Committee. 20 bogie electric tramcars. Specifications from Mr. I. Bulfin, general manager, Tramway Offices, Wootton Gardens.

Brentford.—September 22nd. Board of Guardians. Electric wiring, &c., at the Institution, Warkworth House, Isleworth. (September 4th.)

Dublin.—September 29th. Port and Docks Board. 28 pairs of tramway-type switches (chilled iron with manganese steel tongues). Specifications from the Engineer's Office, East Wall, Dublin.

Gainsborough.—October 17th. Urban District Council. Generating plant, mains, transformers, and meters. (September 4th.)

India.—India Store Department. October 14th. L.p. turbine-driven d.c. generating set, condensing plant, and accessories. (See this issue.)

Leeds.—September 23rd. Board of Guardians. Electric lighting installation at the Institution, 3, Green Hill Road, Armley. Form of tender from Mr. J. H. Ford, clerk to Guardians, Poor Law Offices, South Parade.

London.—H.M. OFFICE OF WORKS.—September 24th. Electric wiring installation at the White Wing, British Museum. (September 4th.)

METROPOLITAN ASYLUMS BOARD.—October 7th. Installation of a fire-alarm system at Tooting Bec Hospital. (September 4th.)

SOUTHWARK.—September 23rd. Electricity Department. Twelve months' supply of electric cables. (September 11th.)

HAMMERSMITH.—September 23rd. Electricity Department. Construction of an underground water-tight ferro-concrete pump chamber and overhead pump house at Chancellor's Wharf; also supply of coal for the electricity works. Specifications from the borough electrical engineer.

LONDON COUNTY COUNCIL.—Highways Committee. October 12th. H.p. and l.p. switchgear for Shoreditch L.C.C. tramway sub-station. (See this issue.)

New Zealand.—CHRISTCHURCH.—January 5th, 1926. Drainage Board. Three electric sewage pumps. (AX. 2349.)*

WELLINGTON.—Post and Telegraph Department. October 27th. Rubber insulated wire.*

Public Works Department. November 24th. Neutral earthing reactors.*

Portsmouth.—September 30th. Board of Guardians. Three months' supply of electrical fittings and lamps. Forms of tender from the Guardians' Offices, St. Michael's Road, Portsmouth.

Richmond, Surrey. — September 24th. Board of Guardians. Installation of electric lighting, including wiring and fittings, at the Grove Road Institution, Richmond. Specifications from Mr. T. J. R. Kiernan, consulting engineer, 17, Victoria Street, S.W.

South Africa.—JOHANNESBURG.—S.A. Railways. October 15th. Incandescent lamps.*

October 29th. Electric cables and wires.*

CAPE TOWN.—October 14th. Electricity Department. Electric motors.*

Spain.—March 10th, 1926. Spanish General Direccion de Obras Publicas, Madrid. Supply of electricity for the operation of the Spanish section of the Ripoll-Aix-les-Thermes railway, which is at present being electrified.

Stoke-on-Trent.—October 12th. Electricity Supply Department. Two sets of steam air ejectors, and one centrifugal oil purifier. (See this issue.)

Warrington.—September 22nd. Board of Guardians. Six months' electrical supplies for the Whitecross Institution, Warrington, and the cottage homes, Padgate. Particulars from the clerk.

Workington.—September 15th. Corporation. L.p. cables and services. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barnes.—Urban Council. Accepted:—
Additional distributor cable (£386).—Macintosh Cable Co., Ltd.

Barnsley.—Electricity Committee. Recommended:—
Ash elevator and storage bunker (£880).—W. J. Jenkins & Co.

Birkenhead.—Electricity Committee.
One 100-kVA transformer (£455).—Metropolitan-Vickers Electrical Co., Ltd.

Bradford.—Electricity Committee. Accepted:—
Unit-type switchgear for the Valley Road generating station.—Parmiter, Hope & Sugden, Ltd.

Dewsbury.—Town Council. Accepted:—
Re-wiring the Town Hall buildings for electric light (£969).—Ward & Co., Ltd.

Dover.—
Electrical installation work (including wiring, &c.) at shop and private residence, 93, High Street, Dover.—J. S. Etheridge & Co.

France.—The Relay Automatic Telephone Co., Ltd. (Paris branch), has received a contract for a new 3,000-line automatic public telephone exchange for Fontainebleau. The apparatus will be of the same type as that supplied by the company to the British G.P.O. for public exchange service.

Glasgow.—Baths Committee. Accepted:—
Electrical installation at Pollokshaws baths (£610).—Johnston, Park and Co.

Markets Committee. Accepted:—
Renewal of electrical work at markets (£187).—Johnston, Park & Co.

Tramways Committee. Accepted:—
D.c.c. wire.—W. T. Henley's Telegraph Works Co., Ltd.
Street poles.—Bromford, Ltd.
Trolley wire (cadmium).—R. Johnson & Nephew, Ltd.
Trolley wire (h.d. copper).—F. Smith & Co., Ltd.

Heywood.—Electricity and Tramways Committee. Accepted:—
Single-phase house-service meters.—Ferranti, Ltd.

Lamp Contracts.—H.M. Office of Works has placed contracts for nine months' supplies of electric lamps with Siemens & English Electric Lamp Co., Ltd., and the General Electric Co., Ltd.; the British Thomson-Houston Co., Ltd., has received contracts from the Admiralty and the Office of Works for supplies of "Mazda" vacuum and gasfilled electric lamps.

Northampton.—Town Council. Accepted:—
Installing electric lighting fittings at the Town Hall (£465).—Northampton Electric Light Co.

Ramsbottom.—General Purposes Committee. Accepted:
Electric light installation at Technical School.—T. Kay.

Weymouth.—Electricity Committee. Accepted:—
Dismantling and re-erecting battery and supplying new positive plates for cells, &c. (£786).—Tudor Accumulator Co., Ltd.

Forthcoming Events.

N.A.R.M.A.T. Wireless Exhibition.—At Royal Albert Hall, S.W. September 11th to 23rd.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, September 19th. At the South Wales Institute of Engineers, Park Place, Cardiff. At 6 p.m.

Cycle and Motor Cycle Show.—At Olympia, W. Opens Monday, September 21st.

Salford Technical and Engineering Association.—Wednesday, September 23rd. Visit to Messrs. Ferguson, Pailin, Ltd.

Radio Society of Great Britain.—Wednesday, September 23rd. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 6 p.m. Address on "The Mechanism of Radiation," by Sir Oliver Lodge, F.R.S.

Notes.

The London Traffic Inquiry.—On October 19th, the London and Home Counties' Traffic Advisory Committee is to commence its first inquiry into the lack of transport facilities in certain parts of the area which comes within its terms of reference. This initial inquiry will concern the North-Eastern suburbs from which numerous complaints have been received. The evidence of a number of public bodies and private individuals will be heard and suggestions for improvement will be considered.

Legal.—THEFT OF ELECTRICITY.—Convicted at Edinburgh for stealing 132 kWh of electricity, a man was fined £2. It was stated that the supply to his house had been cut off, but an engineer who called later found that the cables had been reconnected, the connection being so made that the current did not pass through the meter. The man pleaded that he was unaware that a disconnection had been made.

Individually Driven Textile Machinery.—The author of the article which appeared under this title in our last issue (Mr. A. Haigh) asks us to insert the following correction to the first paragraph on p. 410:—The saving by the use of "high performance" motors in place of ordinary machines should be £600 per annum and not £60, showing a return on the extra capital outlay of 240 per cent., and not 25 per cent.
The error occurred in the original MS.

Educational.—WILLESDEN POLYTECHNIC.—An exhibition of students' work is being held at this Institute during next week. The exhibition will be opened on Monday evening next by the Rt. Hon. T. J. Macnamara, P.C.; admission will be by ticket only. On the other evenings admission will be without tickets. The work shown by the Electrical Department will be one of the many special features of the Institute's activities.
UNIVERSITY COLLEGE, LONDON.—We have received the syllabus and particulars of the general arrangements for the 1925-26 session of the University College, London, Faculty of Engineering. The session commences on October 5th. The department of electrical engineering provides for university degree and diploma courses besides special training courses, &c.
THE POLYTECHNIC.—A two-years' course has been arranged for at the Polytechnic, Regent Street, in illuminating engineering. The course provides lectures in light and optics, electrical engineering and practical mathematics.
BRADFORD MUNICIPAL TECHNICAL COLLEGE.—A special course has been arranged in the Electrical Engineering Department for fitters engaged in electrical machine shop work. The Bradford branch of the Electrical Contractors' Association awards prizes to the most successful indentured apprentices in the evening classes in electrical installation work.

New Underground Railway Link.—The London underground railway companies have placed a contract with Messrs. Walter Scott and Middleton for the construction of a short tunnel connection between the Piccadilly and City lines at King's Cross. This new link will enable the rolling stock of the latter line to reach the tracks of the former and proceed to Lillie Bridge Depôt for overhaul. This work is done at present at the Golder's Green depôt, where some relief is necessary owing to the additional strain thrown upon it since the Edgware extension was opened. Work on the new link line, which will be 400 yards long by 12 ft. 6 in. in diameter, is to begin almost at once. The tracks of the Piccadilly line are 73 ft. below the street level at King's Cross, and those of the City railway are 88 ft. below. The new tunnel will thus have a fall of 15 feet between the two railways. To facilitate the conveyance of material, &c., a working shaft will be driven at Midland Road to a depth of 90 ft. and a temporary tunnel will be constructed from this point to the City line. It is not anticipated that any part of the work will be done under compressed air. The construction of the physical connections with the existing tunnels of both the Piccadilly and City lines will be undertaken at night time to prevent any interruption of the traffic.

Fatalities.—Patrick Gallagher, employed at the Wheatley Hide Brickworks, Co. Durham, received a fatal electric shock on September 7th. He was carrying an iron rail upon his shoulder when it came into contact with an overhead wire.
ALLEGED PRACTICAL JOKE FATALITY.—A charge of culpable homicide has been preferred against Daniel Gray, who was remitted from the Glasgow Eastern Police Court to the Sheriff on Tuesday last week. The case is a sequel to what it is understood was intended as a practical joke in a works. A wire is alleged to have been attached from an electric switch to the handle of a door, which was caught by a labourer, who received a shock from which he died.

Electrical Association for Women.—Members of this Association will visit the St. Helens Cable and Rubber Co., Slough, to-morrow (Saturday). After the works have been inspected, tea will be provided by the company.

Crystal Sets in Hospitals.—The claims of the crystal set have to a large extent been overlooked in the movement for providing radio in hospitals. The multi-valve set, involving as it does high initial expense, does not fulfil all the requirements of the receiving set in a hospital, for it needs more or less skilled supervision if it is to be kept in continuously good working order. The crystal set, on the other hand, is cheap, it involves no extra cost in maintenance, and the set can be left permanently adjusted to the wave-length of the local station, thus giving the patients the pleasures of broadcasting with the same regularity and dependability as that which attaches to the use of electric light.
There is one noteworthy scheme which illustrates the possibilities of the crystal set in this direction. It is at the Birmingham General Hospital, where Doctor J. R. Ratcliffe, a well-known Birmingham medical man who combines professional knowledge with long experience as a wireless amateur, has wired one of the large wards for the use of crystal sets. The most interesting feature of the scheme is the fact that outside aerials are not used. There are four sets, installed inconspicuously in the corners of the ward, and each set is operated off an aerial consisting of rubber-covered wire which is suspended from a picture rail near the roof. All four aerials run close to each other and are therefore not unsightly, and the sets are connected to one common earth lead which is taken to the nearest water pipe. The output terminals of each set are connected to twin flex which is carried round and over the beds, a "bayonet" plug and socket joint being provided above each bed. The plug is fitted to the end of the 'phone leads, so that they can be inserted at will. The plugging-in of the 'phones is all that is necessary for the patient to be able to listen.
In many hospitals the likelihood of nails or screws having to be put into the walls, or holes made in the roofs or window frames, is offered as an objection to the provision of wireless, but this has been overcome in Doctor Ratcliffe's scheme. Where it has been necessary to attach the wire to the wall, it has been done by means of little rubber suction pads which cling tenaciously to the wall, the wire being passed through a small loop in the rubber.
It has been found that each of these four crystal sets will operate six pairs of 'phones quite effectively upon reception from the Birmingham station. The hospital is in an advantageous position, being within very close range of 5IT, but there can be little doubt that a similar arrangement of crystal sets and indoor aerials would prove quite successful up to a range of five or six miles from the transmitting station. There are many hospitals and similar institutions within this range of a main or relay broadcasting station which could be equipped throughout with radio, cheaply and effectively, on this crystal-set basis.

Railway Electrification in South Africa.—According to a special correspondent of *The Times*, the electrification of 287 miles of main-line railway in Natal has been carried out without disturbance to the ordinary traffic, which during the process exceeded all previous records. The outlay originally authorised by Parliament was £3,318,000, excluding the cost of electric locomotives, and the matter was treated as urgent, so that close estimates could not be made, with the result that the cost was under-estimated by £535,000, largely due to the severe curves and gradients. The Daimana-Mooi River section is in full electric operation, and the service between Glencoe Junction and Maritzburg will be at work early next year.

The Electrification of Palestine.—According to *Science*, a new engineering scheme which will use the sun's energy to provide electrical power for all Palestine, make water available for the irrigation of thousands of dry acres, and provide a new interior port for ocean shipping and canals for inland transportation, has been suggested by a French engineer, M. Pierre Gandillion, and accepted for execution by several French business men.
The project consists in utilising the falls that can easily be created between the Mediterranean and the Dead Sea by carrying the water of the Mediterranean over a 260-feet ridge by means of canals, pumps and a great siphon and then letting it drop to the Valley of the Jordan and from there down into the Dead Sea, a total vertical distance of more than 1,500 feet. The Dead Sea is an inland lake, and only as much water as the sun can easily evaporate will be thrown into it.

M. Gandillion estimates that the sun now evaporates all the water that the Jordan carries into the Dead Sea at the rate of about 92 cubic yards a second. That it used to evaporate much more is shown by a series of terraces at different levels on its borders, formed when the water was higher and the surface exposed to evaporation by the sun's heat therefore greater. The new plan will raise the level of the Dead Sea and evaporation by the sun will take care of the additional and regulated inflow. It is believed that an evaporation of 135 cubic yards a second is easily possible and the inflow from the Jordan is to be augmented by that amount.

The scheme will necessitate the building of a sea-level canal from the port of Haiffa to a point about four miles inland. It will end in a great basin where ocean steamers can turn. From there on, either navigable canals with locks or ascensional water pipes will be built to reach the ridge at Afoule, a way station. At that point a 1½-mile tunnel will be bored through the rock and the water will run into chambers at about 262 feet above the level of the Mediterranean and about 1,125 feet above that of the Jordan, where a hydraulic turbine will be installed. Another drop of 394 feet is available between the Jordan and the Dead Sea, making a total drop of over 1,500 feet.

In all, 617,000 horse power will be generated, says M. Gandillion. Of this, 190,500 horse power will be used to lift the 135 cubic yards of water a second from the Mediterranean over the 260-foot ridge, leaving enough power for the electrification of the entire Holy Land with its railroads, industries and agriculture.

The fresh waters of the Jordan and the Sea of Galilee need not be poured into the Dead Sea with the salt water of the Mediterranean, but can be diverted and used to irrigate thousands of acres of dry land.

B.E.A.M.A. Annual Dinner.—The annual dinner of the B.E.A.M.A. will be held at the Connaught Rooms on Thursday, November 19th, when the Rt. Hon. the Earl of Derby, K.G., president of the Association, will be in the chair.

Storage-Battery Locomotive Competition: The Prize Awarded.—Colonel G. R. Lane-Fox, M.P., Secretary for Mines, announces that the judges appointed to adjudicate on this competition for a prize of £1,000 which was offered by Mr. Charles Markham for the best type of locomotive for use underground in coal mines, have arrived at their decision. They award the whole of the prize to Messrs. Joseph Booth and Bros., Ltd., engineers, Union Foundry and Ironworks, Rodley, Leeds, whose design fulfilled the conditions of entry and was, in their opinion, the best that was submitted to them. The judges propose to present in due course a report of the competition and a summary of the technical results obtained at the trials under working conditions. This will be published as soon as it is available.

Appointments Vacant. — Electric workshop foreman (Rs. 575 per month), for the Eastern Bengal Railway (Indian State Railways); mains foreman, for the Stoke Newington Borough Council electricity department. (See our advertisement pages to-day.)

World Power Conference.—INTERNATIONAL EXECUTIVE COMMITTEE.—Meetings of the International Executive Committee was held on July 27th to 30th in London, at which it was provisionally agreed to hold the Second World Power Conference in Rome in 1930. A Sectional Meeting is to be held at Basle in 1926. Further particulars of the proceedings will appear in our next issue.

Electrical Looms at a College.—Two electrically-driven looms have been installed in the cotton department of the Wigan Mining and Technical College, for the practical training of students.

Modern Demonstration Methods for Electric Lighting.—The call for efficient methods of demonstrating the advantages of lighting by electricity increases as progress is made and competition in the lighting services becomes more keen. To bring itself up-to-date during the coming season, the Lighting Service Bureau has made considerable developments and improvements to its demonstrating rooms at 15, Savoy Street, London, W.C.2. The two main features in these improvements are the equipment of one room to demonstrate shop-lighting systems, and a revolving tower for the demonstration of domestic lighting. In the former four sections of the room are each equipped to represent an independent class of shop and thus create a proper atmosphere for the audience. At the time of a recent visit by us to this room, its sections were representing a confectionery, a grocery, a draper's, and a boot shop. Flap doors are arranged in the ceiling, which are opened to allow lighting fittings to pass to and from the false roof, where they are concealed when not required for demonstration purposes. The opening and closing of the doors and the raising and lowering of the fittings are controlled from a position outside the room by small winches. The revolving tower is an ingenious arrangement for contrasting the good and bad systems of domestic lighting. Except that the floor also revolves, the arrangement is similar to an installation of ordinary revolving entrance doors, the doors in this case representing the walls, which are divided into two sections, top and bottom, each section revolving independently of the other. Each compartment of the bottom section is suitably furnished to represent a portion of a room, while the top sections are equipped to show the good and poor methods of lighting the room, so that by one setting of the bottom half, two or more turns of the top half will allow the demonstration of that number of lighting systems for the one setting. Many new devices for demonstrating the uses of special fittings and lamps, &c., have been added to the rooms.

The Late Sir Adam Beck.—Writing editorially on the late Sir Adam Beck's career, the *Electrical World* says:—"Up to the time of his death Sir Adam remained the guiding genius of the Hydro-Electric Power Commission of Ontario. During the twenty years of his incumbency he was oftentimes a storm centre around whom waged many a heated controversy. 'Dictator' and 'tyrant' his opponents called him; yet, without adverting to the conditions under which Sir Adam worked his will, it can be said that throughout all his career he showed great resourcefulness, and to his dying day he retained the confidence and admiration of the people of the province. He popularised and increased the use of electricity in Ontario and created one of the greatest superpower systems in the world. Whether or not his work will endure time alone can tell. He was stricken in the height of his power, and it remains to be seen how Ontario's hydro system will get along now that its master mind is dead."

Institution Notes.

Institution of Public Lighting Engineers.—ANNUAL MEETING.—During the past week the Institution has been in conference at Leeds. On Monday evening the Lord Mayor and Lady Mayoress held an informal reception in the Art Gallery, and after dark the visitors made a tour of the city in charabancs to inspect the street lighting. The Conference commenced on Tuesday morning, with an address by the Lord Mayor, to which the president, Mr. S. B. Langlands, responded. The chairman of the Leeds Street Lighting Committee (Councillor E. J. Clarke) congratulated the incoming president, Mr. Shapley, who delivered his inaugural address, after which the members were entertained at luncheon by the Lord Mayor and the Street Lighting Committee. In the afternoon they went on a long excursion to Templenewsam and Harrogate. On Wednesday a paper was read by Mr. Lennox and one by the Distribution Department of the South Metropolitan Gas Co.

The Faraday Society.—A general discussion on "Photochemical Reactions in Liquids and Gases" is to be held at Oxford on October 1st and 2nd, 1925, Prof. F. G. Donnan, president, being in the chair. On Thursday, October 1st, from 3.30 to 5 and 5.30 to 7.30, Einstein's "Law of Photochemical Equivalence" will be discussed, Prof. A. J. Allmand (London University) reading an introductory paper. On Friday, October 2nd, from 10 to 1 and 2.30 to 5, the subject of discussion will be "The Mechanism of Photochemical Reactions," the introductory paper being read by Prof. M. Bodenstein (Berlin). Many papers will be read or communicated, and copies will be sent to all who have signified their intention of being present, and to those who specially apply.

The Röntgen Society.—The officers elected for the session 1925-6 are as follows:—President: Dr. F. W. Aston, F.R.S. Vice-presidents: Dr. Robert Knox, M.I.E.E., Dr. N. S. Finzi, and Prof. A. W. Porter, F.R.S. Hon. treasurer: Mr. Geoffrey Pearce. Hon. editor: Dr. G. W. C. Kaye, O.B.E. Hon. secretaries: Dr. E. A. Owen and Dr. R. J. Reynolds.

Diesel Engine Users' Association.—At the next meeting, which is to be held on Friday, October 9th, a paper by Mr. Edwin M. Bailey, on "The Scottish Shale Oil Industry" is to be read and discussed.

The Junior Institution of Engineers.—The opening meeting of the Winter Session will be held on Friday, October 2nd, at 39, Victoria Street, when a lecturette, "Problems of Broadcasting," will be delivered by Mr. H. Bishop, B.Sc. Further meetings will be held every Friday at the same place and time. The inaugural meeting of the 45th Session will be held at the Royal Society of Arts on Friday, December 11th, when Mr. J. S. Highfield, M.Inst.C.E., M.I.E.E., will be inducted president of the Institution by Dr. Alexander Russell and will deliver his presidential address.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

The Walsall Corporation has appointed as tramway manager Captain W. VANE MORLAND, M.Inst.T., the general manager and engineer of the St. Helens Corporation tramway and motor-'bus undertaking. The salary is £800 a year, rising by £50 per annum to £900.

The Leigh Council last week decided to congratulate the borough electrical engineer and his staff upon their great success. It was stated that, with the exception of Stepney, Leigh was at the head of the electricity undertakings in the country with regard to low fuel consumption and thermal efficiency, and was the first so far as the Lancashire district was concerned.

MR. F. E. CHILTON has resigned his position as London sales manager to the Wellman Smith Owen Engineering Corporation, Ltd., and has joined the Perfecta Seamless Steel Tube and Conduit Co. (1923), Ltd., as manager of its London office, 66, Victoria Street, Westminster, S.W.1.

On leaving his post at the Willesden works of the North Metropolitan Electric Power Supply Co. on August 29th to take up the position of boiler-house superintendent at the North Wilford generating station of the Nottingham Corporation, Mr. L. MARSHALL JOCKEL, A.M.I.Mech.E., A.M.I.E.E., was presented by the staff and employés with a handsome silver salver as a token of the esteem which he had earned during the past five years.

MR. HUMPHREY F. FOSTER, of Messrs. Foster Bros., Ltd., Wednesbury, has just returned from a visit to the United States, where has has been studying the latest developments in high-pressure steam pipe practice.

MR. H. C. BABB, general manager of the Lothians Electric Power Co., celebrated his silver wedding on September 4th. On behalf of the departmental heads, he was presented with a silver tantalus.

It is announced from Toronto that Mr. CHARLES A. MAGRATH, chairman of the International Waterways Commission, has been appointed to the post of chairman of the Hydro-Electric Power Commission of Ontario, rendered vacant by the recent death of Sir Adam Beck. Mr. A. MAGUIRE, formerly Mayor of Toronto, has also been appointed to the Power Commission.

M. F. A. C. MAGNIER, director of the Société de Production et Distribution d'Energie Electrique, of Paris, has been appointed a Chevalier of the Légion d'Honneur.

MR. L. JESSOP, head of Messrs. Jessop & Boydell, Ltd., electrical contractors, of Bradford, has accepted nomination as the Liberal candidate for the Great Horton Ward in the forthcoming municipal elections at Bradford.

MR. W. R. SMALL, founder and late managing director of the Armorduct Manufacturing Co., Ltd., has resigned his position as managing director of the Anglo Electric Co., Ltd.

MR. ERNEST E. BRIGGS, M.I.Mech.E., A.M.I.E.E., has been appointed sales manager to Messrs. Thomas Cass & Co., Ltd., Bolton, Lancs., and will devote himself to the sales development of their new "Falcon" sprinkler stoker and self-cleaning furnace and other manufactures.

Mr. JAMES DUNCANSON, A.M.I.E.E., has recently resigned his position on the staff of the Glasgow Corporation Electricity Department, where he has been for over twelve years, to take up an appointment with Messrs. Caldwell & Co., Glasgow, makers of steering gear, cranes, and steam- and electrically-driven auxiliaries.

The Swansea Educational Committee has appointed Mr. REGINALD RICHARDS as lecturer on electrical engineering at the Swansea Technical College.

Barnes Urban Council has increased the salary of the electrical engineer, Mr. C. S. DAVIDSON, by £200 per annum.

Mr. R. F. PROCTOR, B.Sc., A.M.I.E.E., has been presented with a dinner service as a wedding present by the staff of the Research Laboratories of the General Electric Co., Ltd. Mr. Proctor was formerly at the National Physical Laboratory.

Obituary.—HERR F. HAFFERL.—The death recently occurred, at Linz, at the age of 68 years, of Herr Franz Hafferl, one of the chief directors of the Stern-Hafferl Gesellschaft, of that city, which owns a number of hydro-electric stations in Upper Austria.

Will.—The late Sir ADAM BECK, chairman of the Hydro-Electric Power Commission of Ontario, left estate valued at $600,000.

New Companies Registered.

Super Electric Carpet Beating and Cleaning Co., Ltd. (208,315).—Private company. Registered September 9th. Capital, £450 in 5s. shares. Objects: To acquire (1) the business of carpet cleaners and beaters carried on as the Imperial Carpet Beating and Cleaning Co. at 29, Hubbard Street, West Ham, and (2) the subsidiary business of the Re-Echo Electrical Manufacturing Co., Ltd. The directors are:—A. L. Leaver, 482, High Street North, East Ham, wholesale confectioner and tobacconist; R. G. Harley, 87, Woodford Road, Forest Gate, E.7, caterer; C. E. Harley, 149, Plashet Grove, East Ham, E.6; C. W. Martin, 823, Romford Road, Manor Park, E.12, grocer; W. E. Thorpe, 179, Bredmore Road, Goodmayes, corporate accountant; W. B. Pearson, 151, Plashet Grove, East Ham, E.6, corporate accountant (all permanent). Secretary: W. B. Pearson. Solicitor: W. H. Lane, 17, College Hill, E.C. Registered office: 5, John Street, Bedford Row, W.C.1.

Loveland & Co., Ltd. (208,332).—Private company. Registered September 10th. Capital, £1,000 in £1 shares. Objects: To adopt an agreement with H. F. Loveland for the acquisition of provisional specification of letters patent No. 5,605, dated March 2nd, 1925, for an "improved collapsible carrier for electric accumulators and the like," and to carry on the business of wireless, electrical, mechanical, motor and general engineers, manufacturers of and dealers in motor accessories, wireless instruments, parts and goods, transformers, radiators, motors and radio instruments of all kinds, &c. The directors are:—H. F. Loveland, 440, High Road, Streatham, S.W.16; G. E. Spencer, address not stated; H. W. Killick, address not stated; F. W. Knight, 41, Norbury Court Road, Norbury, S.W.16. Solicitors: T. H. Goodwin, 14/15, Coleman Street, E.C.

Ultra Electric, Ltd. (208,298).—Private company. Registered September 8th. Capital, £5,000 in £1 shares. Objects: To adopt an agreement with E. E. Rosen and A. I. Cornberg, trading as E. E. Rosen and Co. to acquire the registered trade mark "Ultra," and to carry on the business of electrical engineers, manufacturers of and dealers in goods appertaining to the wireless, electrical and engineering trades and industries, &c. The directors are:—E. E. Rosen, 288, Cricklewood Lane, N.W.10, radio engineer (chairman and managing director); A. I. Cornberg, 145, The Vale, N.W.10, merchant; Dr. G. Seibt, Haupstrasse 11, Schonberg, Berlin, merchant. Solicitor: H. S. Baron, 16, Fenchurch Street, E.C.3. Registered office: 661/663, Harrow Road, N.W.10.

Fleet Electric Co., Ltd. (208,352).—Private company. Registered September 11th. Capital, £1,000 in £1 shares. Objects: To carry on business as electrical, mechanical and general engineers, to acquire the right to use or manufacture and put up telephones, telegraphs, phonographs, accumulators, lamps, &c. The subscribers (each with one share) are:—M. Haar, 42, Queen's Road, Finsbury Park, N.4, electrical engineer; P. J. Quin, 125, Beaufort Street, Chelsea, S.W.3, company secretary. H. Haar is permanent managing director. Secretary: P. J. Quin. Registered office: 5, Hind Court, Fleet Street, E.C.4.

Brandwood, Ltd. (208,348).—Private company. Registered September 11th. Capital, £1,000 in £1 shares. Objects: To acquire the business of a manufacturer of and dealer in baby carriages, toys and cycles carried on by W. O. Brandwood at 1 and 1a, Priory Road, Anfield, Liverpool, as the "County Bassinette Co.," and to carry on the same and the business of electrical and mechanical engineers, makers of and dealers in wireless apparatus and electrical goods of all kinds, &c. The permanent directors are:—W. O. Brandwood, 2, Breck Road, Anfield, Liverpool, manufacturer; Mrs. M. N. Brandwood, 2, Breck Road, Anfield, Liverpool; L. Brandwood, 2, Breck Road, Anfield, Liverpool, bookkeeper; H. Brandwood, 2, Breck Road, Anfield, Liverpool, bookkeeper. Qualification, £10. Remuneration as fixed by the company. Secretary: L. Brandwood. Registered office: 1 and 1a, Priory Road, Anfield, Liverpool.

C. K. Hanbury, Ltd. (208,350).—Private company. Registered September 11th. Capital, £1,000 in £1 shares. Objects: To carry on business of dealers in wireless receiving and transmitting apparatus and all component parts used in connection therewith, &c. The directors are:—C. K. Hanbury, 20, Padiham Road, Burnley, electrician (permanent managing director and chairman); H. Hankey, Garrison Hotel, Padiham Road, Burnley, licensed victualler. Qualification, 100 shares. Remuneration as fixed by the company. Registered office: 20, Padiham Road, Burnley.

Official Returns of Electrical Companies.

Trust Electrical Accessories Manufacturing Co., Ltd.—A. R. Atkins, of 31, Twyford Street, N.1, ceased to act as receiver or manager on June 3rd, 1925. (Notice filed September 8th.)

W. J. Tough & Partners, Ltd.—E. J. Barnes, of 24, Cambridge Road, Gunnersbury, W.4, was appointed receiver and manager on August 24th under powers contained in debenture dated August 4th, 1925.

Fuller's United Electric Works, Ltd.—Prior lien debenture, constituting a first charge on the company's land, building and hereditaments, goodwill and uncalled capital, and a first floating charge on the company's other assets, dated September 1st, 1925, to secure £75,000. Holders: National Bank of Scotland, Ltd., 37, Nicholas Lane, E.C.

Archibald J. Wright, Ltd.—Debenture dated August 19th, 1925, to secure £1,000, charged on the company's undertaking and property, present and future. Holder: A. J. Wright, 66, Canonbury Park South, N.1.

Lancashire Telephone Systems, Ltd. — Deposit of deeds, without instruments, dated August 9th, 1925, to secure £500, charged on moneys due or to become due to the company in respect of certain contracts for the rental of automatic telephone instruments. Holders: C. S. Ashworth, The Homestead, Poynton, Cheshire, and others.

Continental Automatic Telephone and Electric Co., Ltd. (184,764).—Return dated December 31st, 1924 (filed April 8th, 1925). Capital, £10,000 in £1 shares. 1,302 shares taken up. £302 paid. £1,000 considered as paid. Mortgages and charges, nil.

L. W. Douthwaite & Co., Ltd. (185,649).—Capital, £7,000 in £1 shares. Return dated August 14th, 1924 (filed March 7th, 1925). 5,519 shares taken up. £1,321 paid. £4,198 considered as paid. Mortgages and charges, nil.

Scott Insulated Wire Co., Ltd. (183,890).—Return dated January 14th (filed February 13th), 1925. Capital, £14,000 in 4,000 preference and 10,000 ordinary shares of £1 each. 2,075 preference and 10,000 ordinary shares taken up. £12,075 paid. Mortgages and charges, nil.

Thames Valley Electric Supply Co., Ltd. (185,597).—Return dated April 16th, 1925. Capital, £100 in £1 shares. All shares taken up. £100 paid. Mortgages and charges, nil.

Weldrics (1922), Ltd. (185,661).—Return dated February 12th, 1925. Capital, £25,000 in £1 shares. 14,000 shares taken up. £1 per share called up on 12,500 shares. £12,425 paid, leaving £75 in arrears. £1,500 considered as paid on 1,500 shares. Mortgages and charges, nil. Return of allotments, made up to March 18th, 1925, shows 1,000 ordinary shares allotted for cash.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Ferranti, Ltd.

The annual meeting of the company was held in London on September 11th; Mr. A. W. Tait, C.B.E., chairman, presided. In submitting the report, he said that the net profit for the year, after making provision for general establishment charges, repairs and renewals, bad debts, taxation, and interest on debenture stock, and making the usual substantial allocation to depreciation reserve, was £67,644. The net profit for the previous year on the same basis was £55,545. The turnover for the year to June 30th, 1925, again showed a substantial increase over that of the previous year, to which increase all departments had contributed. The trading profit of £161,960 showed an increase of about £30,470 over that of the previous year. In the Meter Department there had been an increase both in quantity and value, and satisfactory progress had been made in the Power Transformer Department. The Instrument Department had also shown encouraging progress, and there was every reason to believe that the company's sales of radio apparatus would show still further increase during the current year. The sum of £15,000 had been transferred to the credit of the depreciation reserve account, as against £10,000, which had been the usual allocation for some years, and the amount standing at the credit of that

account was now £91,912. That was approximately equal to 35 per cent. of the total value of the fixed assets of the company. The balance-sheet was very satisfactory and showed the strong financial position of the company. As to the liabilities, the first mortgage debenture stock outstanding showed a decrease of £6,100, being the amount of stock redeemed during the year. They had also transferred to the credit of general reserve account the sum of £40,000, increasing the amount to the credit of that account to £165,000. The dividends on the preference shares had been paid, and the directors recommended the payment of a dividend on the ordinary shares of 20 per cent., free of tax, requiring £12,000, leaving £33,312 to be carried forward to the current year, which was an increase of about £6,124 on the amount brought into the account.

The chairman said that the position of the company was very sound. The liquid resources were ample for the company's present requirements, and, in addition, over £80,000 invested in War Loan and Treasury Bonds was available for the further expansion of the company's business. He did not propose to make any forecast with regard to the current financial year, except to say that they had started the year with a satisfactory order book, and the orders which had been received since that date showed an increase over the same period of the previous year. While business, particularly in the export markets, was difficult, and competition very keen, he believed that the company would obtain its share, and with the expansion of the electrical industry both at home and abroad, it would be able to continue the progress which it had made during the last four years, and, unless unforeseen difficulties arose, it would be possible to present an equally satisfactory account next year. The report and accounts were adopted.

Manila Electric Corporation.—A dividend of 62½ cents per share has been declared on the common capital stock in respect of the quarter ending September 30th.

It is reported that the board of the Associated Gas and Electric Co. has extended the time for the exchange of certain Manila Electric securities for the company's gold bonds to September 24th.

Alabama Traction, Light and Power Co., Ltd.—The South-Eastern Power & Light Co. has made an offer to exchange its 6 per cent. gold debentures, series "A," for the Alabama company's 5 per cent., first mortgage, 50-year gold bonds. A meeting of bondholders to consider the proposal is to be held in Montreal on October 7th.

British Aluminium Co., Ltd.—A dividend at the rate of 8 per cent. per annum has been declared on the ordinary shares in respect of the half-year ended June 30th last. This compares with an interim dividend at the rate of 5 per cent. last year.

Direct Spanish Telegraph Co., Ltd.—The board has decided to pay, in addition to the dividend for the half-year to June 30th, 1925, at the rate of 10 per cent. per annum on the preference shares, an interim dividend of 4 per cent., free of tax, on the ordinary shares.

British Electric Transformer Co., Ltd.—The accounts for the first half of the current year show a profit of £25,827, as compared with £1,236 for the first six months of 1924, and a loss of £19,959 for the equivalent period of 1923.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under rule 159:—

Aluminium Corporation.—£250,000 8 per cent. "B" debentures (registered) of £100 each, Nos. 1 to 2,500.

Oxford Electric Co.—£10,000 new 6 per cent. debenture stock.

Eastern Telegraph Co., Ltd.—The directors have declared a dividend at the rate of 3½ per cent. on the preference stock, less tax, and one of 2½ per cent., free of tax, on the ordinary stock, in respect of the quarter ending September 30th.

British Insulated & Helsby Cables, Ltd.—An interim dividend of 5 per cent. has been declared on the ordinary shares, as in 1924.

Globe Telegraph and Trust Co., Ltd.—Quarterly dividends of 3s. per share, less tax, on the preference shares, and 5s. net on the ordinary shares, have been declared.

Lisbon Electric Tramways, Ltd.—A dividend has been declared on the cumulative preference shares in respect of arrears from July 1st, 1917, to December 31st, 1919, less tax.

Newcastle-upon-Tyne Electric Supply Co., Ltd.—An interim dividend of 2½ per cent. has been declared on the ordinary shares.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—The directors have declared a dividend for the three months ended June 30th last of 5s. per share, free of tax.

Isle of Thanet Electric Supply Co., Ltd.—The dividend for the half-year ending September 30th on the 6 per cent. cumulative preference shares has been announced.

Midland Electric Corporation for Power Distribution.—An interim dividend at the rate of 10 per cent. per annum has been declared on the ordinary shares, as in 1924.

International Telephone and Telegraph Co.—The usual quarterly dividend (1½ per cent.) has been declared by the directors.

Bromley (Kent) Electric Light and Power Co., Ltd.—A dividend of 9 3/5d. net per share has been declared.

Mackay Companies.—A quarterly dividend of 1¾ per cent. has been declared on the common stock.

Stocks and Shares.

MONDAY EVENING.

THE feature this week in the markets which deal with electrical and allied industries, is the strength that has developed amongst wireless shares. There has been a decided increase in the amount of interest taken by the public. After a long period of inattention, people have begun to buy Marconi shares again, and those of the parent company are up to 28s. 9d. Marines strengthened to 18s. 3d. Canadian Marconis, on the circulation of a variety of rumours, hardened to 5s. 9d. The amount of business passing in the group has quickened remarkably. It is difficult to point to any special reason for the revival. No doubt it was merely a coincidence that this happened to start immediately after the thirtieth anniversary of the invention of wireless, which was celebrated last week by a luncheon given to Senatore Marconi. The famous inventor humorously maintained that wireless existed when the prehistoric man first understood, or felt, the meaning of a smile of encouragement from the pre-historic girl, and, very modestly, all that he claimed to have done was to discover that electric waves were capable of travelling and being received across great distances.

The electricity supply market continues very firm. Various deductions from the prices were made last Thursday on account of dividends, and these have all been recovered. Chelseas, for instance, are 1⅞ x.d., County 57s., and the preference 23s. St. James's rose 5s. to 14½. London Electrics remain dull, falling another shilling to 34s. The floating supply of stock is being steadily absorbed, but there remain 1,000 Westminsters on offer at 44s. 6d., 500 Countys at 56s. 6d., and the same number of City Lights at 47s. 6d. Westminsters pay the best in the London list, but St. James's still yield about 6 per cent. and Chelseas return 6⅜ per cent. on the money.

The Isle of Thanet Electric Supply Company announces the usual dividend of 6 per cent. on the preference shares, but no dividend is yet forthcoming on the ordinary. The price of the latter, which is 17s., indicates the expectation of a distribution at the end of the current year. The Bromley (Kent) interim dividend is to be at the rate of 4 per cent. free of tax, the same as it was a year ago, and the price of these shares, which seldom varies, is 34s. 6d. middle. No bargain has been recorded in the shares since the early part of June, when they changed hands at 34s. The full dividend for last year was 10 per cent. free of tax.

Yorkshire Electrics at 29s. 6d. are rather better, and a good deal of business is passing in the preference as well as in the ordinary shares of the provincial power, lighting and tramway companies.

Home Railway stocks make an indifferent showing. Metropolitans have eased off to 67, and the £10 shares of the Underground Electric Railways have gone back to 2⅜. There is nothing of interest to report in the London traction descriptions, but British Electric Traction shows no diminution of its strength. The ordinary stock is 1 up at 117½. The persistent buying that has taken the price to its present level is based upon what is regarded as the practical certainty of an early improvement in the dividend. Some of the prior-charge stocks of the British Railways have eased off. London Electric 4 per cent. preference, as an example, declined to 71½.

The Lisbon Electric Tramways re-enters the dividend list with a payment on account of the arrears of interest on the preference shares for the period from July, 1917, to December 31st, 1919. This is the first dividend that the shares have received since 1917. The preference stand at about 13s. 9d. and the ordinary were done a few days ago at 6s., although the official quotation for the latter is, anomalously, no better than 2s. 6d.—5s.

To the rise in Automatic Telephones there seems to be no end. The price is half-a-crown higher at 47s. 6d. On the basis of the last dividend, the yield is now but 2½ per cent. on the money. International Automatic Telephones have risen to 28s. It may be that some of the recent buyers are unacquainted with the fact that an American syndicate has the option to purchase these at 30s. Chili Telephones have risen to 5⅜ and United River Plates are 3/16 up at 7 11/16. Orientals are also a better market at 2 1/16. Brazilian Tractions, after a rise to 75, reacted a trifle, and Anglo-Argentine Tramways first preference at 3⅜ show a small reaction. The Mexican stocks, generally speaking, are hard. The best feature is a rise of 3 to 65 in Mexican Light & Power preferred. Amongst Colonials, Melbourne Electric ordinary gained 2 points at 151, and in the foreign traction group, Rio Tramways 5 per cent. second debentures at 86 are harder.

A slight decline occurred amongst a few of the shares of the manufacturing group. General Electrics, British Insulated, British Aluminiums and Brush are a little easier. On the other hand, Telegraph Constructions advanced to 26¾. British Electric Transformer preference strengthened to 19s. 6d. The engineering group is dull, though Babcocks keep steady at 2½.

The Rubber market ferments in a state of incipient buoyancy, with buyers eagerly clamouring for shares. Those men whose business lies principally in this market have as much as they can do to cope with the orders that they receive, amongst which orders those for the purchase of shares largely predominate.

Share List of Electrical Companies

	Nom. £	Dividend 1923	Dividend 1924	Price Sept. 14. 1925	Rise or fall	Yield p.c.

The Properties of Some Aluminium Alloys.—In a paper presented at the annual autumn meeting of the Institute of Metals, Mr. Harry Hyman, Ph.D., said that aluminium alloys available for sand castings for engineering purposes generally possessed low ductility; this rendered them difficult to manipulate in workshop practice. If used as part of apparatus on board ship they were readily susceptible to corrosion. A series of alloys was prepared with a view to passing a minimum test of 5 tons yield point, 10 tons breaking stress, and 5 per cent. elongation on sand cast test-bars, and at the same time capable of undergoing a severe salt spray corrosion test without marked loss in weight. The alloy B.S.7, containing copper, nickel, iron and magnesium, gave the most promising results and had been adopted on a commercial scale. The mechanical tests could be readily maintained; fatigue tests showed the metal to be reliable under alternating stress, and it could be remelted several times without deterioration. Under the corrosion test its behaviour was as good as other alloys with which it was compared. When the magnesium content was increased, an alloy readily responding to heat treatment at temperatures about 50 degrees higher than those generally in use was obtained; owing to the increased mobility of the constituents at the higher temperatures the period of heating could be materially reduced.

A Large Condenser.—An exceptionally large single steam condenser has been built by the Westinghouse Electric and Manufacturing Co. for the new Richmond station of the Philadelphia Electric Co. It weighs almost 1,000,000 lb. and stands nearly 30 ft. high; when operating at maximum capacity it will require approximately 150,000,000 gallons of circulating water per day. It has a cooling surface of 70,000 square feet. Provision has been made for the ultimate installation of 12 condensers of this type.

The British Association.—IV.

The Southampton Meeting.

lectricity Supply and Electrical Plant at the Southampton Docks.

By H. Wauchope.

(*Abstract of Paper read before Section G.—Engineering.*)

The Southampton Docks provide a good example of the rapid increase in the use of electrically-operated machinery in docks. Fifteen years ago, with the exception of grain-handling machinery and one 50-ton crane, electricity as a power agent was unknown in the Docks, although electric lighting had been in use for a number of years. The power was originally supplied by a small generating station in the docks, but at the time when the building of the Trafalgar Graving Dock

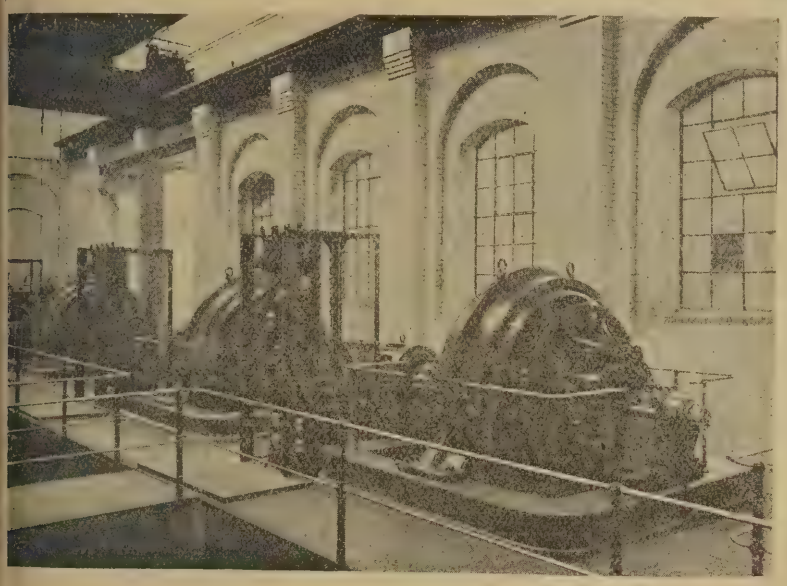

Fig. 1.—G.E.C. Rotary Converters in the Main Sub-Station.

was entered upon, this station was found to be inadequate to meet the increased demand, and a new station was built. This was completed in 1903, and housed two reciprocating steam sets of 500 kW each, either of which was capable of meeting the requirements. The present supply of electricity provides for a maximum demand of 3,500 kW. When the Outer Dock was completed in 1911, it was decided to use electrically-operated wharf cranes, and the first batch of these cranes, supplied by Messrs. Stothert & Pitt, Ltd., of Bath, were erected in that year. The cranes were found to be highly economical and successful in operation, and from that time further cranes have been rapidly added, some of them replacing hydraulic cranes. In 1923 an extension of electrification was decided upon. This development was given an impetus by the purchase by the Southern Railway Co. of a 60,000-ton floating dock, the operation of which requires 1,200 kW.

The first consideration was obviously to provide for a larger supply of electricity, and an agreement was entered into with the Southampton Corporation for the supply of all the necessary electricity. At that time the maximum load had already increased to approximately 1,000 kW. The total new requirements aggregated 4,000 kW, but the maximum demand was reduced by refraining, as far as possible, from pumping the three larger docks at the same time.

The No. 6 Pumping Station was retained as the main supply point, and the Corporation supply enters at this building at 6,600 V, three-phase, 50 cycles. A portion is converted to the standard Dock supply of 480 V, d.c. (three-wire). High-pressure current is also distributed from the station to Nos. 3, 4, and 5 pumping stations. At No. 5 Pumping Station the current is used to drive the dry dock pumps and a portion is converted to 480 V d.c. in order to cope with the growing load for power at this extreme end of the Docks and also to drive a hydraulic pressure pump. At No. 4 Pumping Station the current used is for dry docking purposes only, and at No. 3 Pumping Station for dry docking and hydraulic pressure pumps.

In order to economise space and unify supervision the layout of the sub-station has been arranged in three storeys. On the main pump floor 25 ft. 6 in. below the ground level is situated the dry dock pumping machinery. On the ground level, carried on a steel joist structure, is the converting machinery and the switchgear, while an intermediate gallery accommodates the transformers for supplying the rotary converters and the e.h.p. stator switchgear operating two of the main pumps. The Corporation supply is fed into two e.h.p. metal-clad switches of Messrs. Reyrolle & Co.'s manufacture, which in turn supply the seven-panel e.h.p. consumers' distributing switchboard, which is of the draw-out truck type manufactured by the Mentropolitan-Vickers Electrical Co., Ltd. Three of the panels of this switchboard supply three 1,000-kW rotary converters of the six-phase type, supplied by the General Electric Co., Ltd. (fig. 1), which are of their patent self-starting and synchronising type. The transformers, manufactured by the British Electric Transformer Co., are of that company's usual air-cooled type. From the converters, l.p. direct current is led to the main d.c. distribution board which supplies the general Dock load, the floating dock, and one main de-watering pump for the dry dock. The equipment for pumping the dry dock comprises two 48-in. centrifugal de-watering pumps, each capable of discharging an average of 450 tons per minute against a head varying from 0 to 37 ft. and one 48-in. impounding pump designed to deliver 200 tons of water per minute in order to raise the level of the water in the dock above the tide level as required, to a maximum of 10 ft. These pumps, and all the dry docking pumps supplied under the electrification scheme, were manufactured by Messrs. Gwynnes Engineering Co., Ltd., who were the main contractors for this section of the work. In order to provide for slow pumping operations which are sometimes called for, advantage was taken of the fact that sufficient d.c. had to be available to operate the floating dock, and one of the two de-watering pumps was arranged to be driven by a d.c. variable-speed motor of 1,200 b.h.p. running at 210-245 r.p.m. (fig. 2). The other pumps, for economy of operation, were arranged to be driven by motors fed direct from the e.h.p. main. In order to comply with the power-factor agreement with the Corporation these machines are of the asynchronous-synchronous type, giving a power factor on full load up to 0.9 leading. The motor driving the a.c. de-watering pump is of 1,200 b.h.p. running at 231 r.p.m., and the motor driving the impounding pump is of 350 b.h.p. running at 214 r.p.m. These machines were manufactured by the English Electric Co., Ltd.

The starting and stopping of the motors is entirely automatic, by means of push-button contactor control gear, manufactured by Electric Control, Ltd., of Glasgow. In addition to the main docking pumps at No. 6 Pumping Station, there are also one 12-in. draining pump, one 4-in. sump pump, and two charging units for the purpose of extracting the air from the various pumps for priming purposes.

As previously stated, the power is supplied from No. 6 Pumping Station for the operation of the floating dock situated near by. (This dock was described in our issue of November 7th, 1924, p. 713.) The power required to operate the dock, 1,200 kW at full load, is conveyed by means of three 1-sq.-in. lead-covered, paper-insulated cables per pole. These

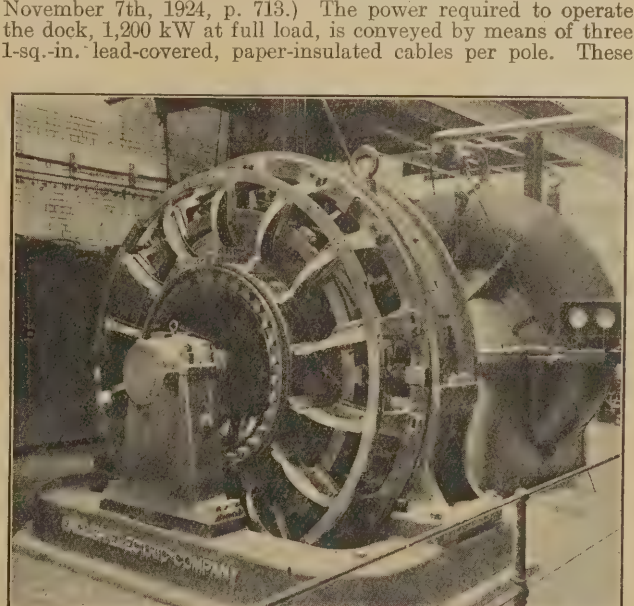

Fig. 2.—A 1,200-h.p. English Electric d.c. Motor driving a de-watering Pump.

cables are carried under one of the mooring booms and up the dock wall to the main switchboard which is erected in a cabin on the top of the starboard wall.

The No. 5 Sub-station and Pumping Station houses three groups of machinery. In the dry docking well, the floor of which is 24 ft. below ground level, are situated two 48-in. diameter de-watering pumps of similar design to those at No. 6 Pumping Station, the duty, however, being considerably less. The average amount of water displaced is about 350

tons per minute against a head varying from 0 to 36 ft. As there is not sufficient d.c. supply available at the south end of the Docks, it was necessary to install motors of the asynchronous-synchronous type. The equipment and operation is similar in all respects to that at No. 6 Pumping Station, with the exception that owing to the limited space available the exciters had to be staggered and are driven from the rotor shafts by means of chain drives, the driving wheels being connected to the rotors by means of centrifugal clutches to avoid sudden shocks. Similar plant for draining, charging, &c., is installed as in the case of No. 6 Pumping Station. Situated at the side of the pumping well, six feet below the ground level, are two rotary converters and a hydraulic pump. This machinery occupies the space previously taken up by

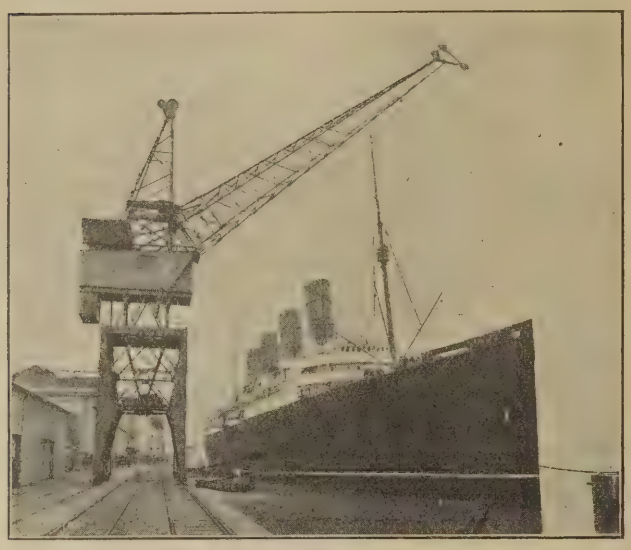

Fig. 3.—A 5-ton Horizontal Luffing Crane (Messrs. Stothert & Pitt, Ltd.).

the steam-driven ram pressure pump. The rotary converters are each of 250 kW capacity, and are similar in design to the machines at No. 6 Sub-station. The transformers are also in this case arranged under the machines.

The No. 4 Pumping Station is used solely for de-watering purposes. Two 24-in. diameter pumps are installed which can be used for emptying either No. 4 or No. 3 dry docks by the operation of electrically-driven sluice gates. The pumps are driven by three-phase induction motors, each of 175 b.h.p. running at 416 r.p.m. supplied at 415 V by means of a 300-kVA transformer, and controlled by push buttons.

The No. 3 Dry Dock and hydraulic pumping station houses two 24-in. diameter de-watering pumps used for emptying either Nos. 1, 2, or 3 dry docks. The pumping plant is similar to that at No. 4 Pumping Station, except that the pumps are of the normal single inlet type. In addition to dry dock pumping, No. 3 Pumping Station is the main centre for hydraulic power pumping for dock use. There are installed for this purpose two 17-stage turbine pumps, manufactured by Messrs. Mather & Platt, Ltd. Each pump is designed to deliver 200 gal. of sea water per minute against a pressure of 750 lb. per sq. in. The pumps are driven by three-phase slip-ring, 165-b.h.p., 415-V induction motors running at 1,450 r.p.m. For this supply, together with that for the dry dock pump motors are installed two 400-kVA transformers. The starting and stopping of the hydraulic pumps is automatically controlled by tappets on the hydraulic accumulator.

At No. 5 Pumping Station a similar pump to the two at No. 3 Pumping Station is being erected. This pump will, however, be driven by a direct-current variable speed motor. The use of direct current allows a ready adjustment of load between the pumps at Nos. 3 and 5 Pumping Stations when running together.

The majority of the berths used by the largest ocean-going liners are equipped with high-speed electrically-operated portal cranes. With the completion of the batch of cranes at present being erected, there will be an unbroken line of modern electric cranes from Berth No. 34 on the Itchen side of the Docks right round to Berth No. 47, including the whole of the Test Quays. With the exception of three cranes on No. 41 Berth which were supplied by Messrs. Babcock & Wilcox, Ltd., in 1915, and two second-hand small radius cranes on No. 45 Berth, the whole of the electric cranes, to the number of 28, have been supplied by Messrs. Stothert & Pitt, Ltd., of Bath. All those cranes are of the level luffing type using a minimum amount of power for this important motion. The first 14 cranes situated around the Ocean Dock are of solid girder construction. The actual rotating part is carried on a horizontal roller path and is centrally held by means of the usual centre post. The whole of the cranes are of the free barrel type which permits an instant and rapid lowering of the load as required, by gravity. The power consumption of this type of crane is particularly low; it is found that with the average cargo load, 4 or 5 cycles of operation can be effected with one kWh. The electrical equipment of these cranes, which in common with all the cranes in the Docks is supplied at 480 V direct current, consists of an independent motor drive for each motion.

All cranes south of No. 40 Berth are constructed throughout on the lattice principle and are of the mast type. The rotating portion of the cranes of this type is pivoted on a foot-step bearing, suspended considerably below the gantry top and the roller path and the axis of the rollers are in the vertical plane on a level with the gantry top. No separate centre post is therefore required as the whole superstructure in a sense takes the place of the centre post.

The tendency of late has been towards increased radii. The cranes under construction at No. 34 Berth are of 86 ft. radius and the 5-ton cranes erected at No. 41 Berth which were intended for use with liners boomed off considerably from the quay have a maximum radius of 90 ft. (fig. 3). All these cranes are of Messrs. Stothert & Pitt's latent mono-rope, balanced jib type, the luffing being effected by a bell crank mechanism arranged that over-luffing is impossible. If the luffing is carried beyond the limit, the jib merely begins to return to the minimum or maximum position as the case may be. The newer cranes are all equipped with power-operated travelling gear, whereas the older cranes previously described are moved by manually-operated gear.
